rococo, style in architecture, especially in interiors and the decorative arts, which originated in France and spread throughout 18th-cent. Europe. In contrast with heavy BAROQUE grandiloquence, rococo was an art of exquisite refinement and linearity. The engravers J.A. Meissonier and Nicholas Pineau helped to spread the style through Europe. Parisian tapestry weavers, cabinetmakers, and bronze workers followed the trend. Motifs such as shells, scrolls, branches, and flowers appeared in delicate and ingenious compositions; the style also incorporated chinoiserie motifs. The major French exponents were the painters WATTEAU, BOUCHER, and FRAGONARD, and the architect GABRIEL. In Germany and Austria, CUVILLIÈS was the pioneer. The brilliantly decorated Italian rococo, especially important in Venice, was epitomized by TIEPOLO. In England the furniture of CHIPPENDALE was especially notable.

rodent, member of the largest mammalian order, Rodentia, characterized by front teeth adapted for gnawing and cheek teeth adapted for chewing. The approximately 1,800 species of Rodentia are worldwide in distribution and are divided into three suborders. The Sciuromorpha, or squirrellike rodents, include SQUIRRELS, CHIPMUNKS, and BEAVERS. The Myomorpha, or mouselike rodents, include a variety of MOUSE and RAT species, as well as species of HAMSTER, LEMMING, and GERBIL. The Hystricomorpha, or porcupinelike rodents, include the PORCUPINE, GUINEA PIG, and CHINCHILLA.

rodeo, form of entertainment based on the riding and roping skills of the Western cowboy. It is also an organized sport in which professional rodeo cowboys compete for millions of dollars in prizes. Staged in outdoor arenas, the modern rodeo comprises five classes: bareback bronc-riding, saddle bronc-riding, bull riding, calf roping, and steer wrestling (bulldogging). The first formal rodeo was held (1888) in Prescott, Ariz. Rodeos have gained popularity in many parts of the U.S. and Canada.

Roderick, d. 711?, last Visigothic king in Spain (710–711?). Although little is known about his reign, colorful legends about this "last of the Goths" are included in Spanish and English literature. He was overthrown in 711 by the invading Moors.

Rodgers, Bill (William Henry Rodgers), 1947–, American distance runner; b. Hartford, Conn. He helped to popularize distance running in the U.S. He won the Boston Marathon and the New York City Marathon four times each between 1975 and 1980.

Rodgers, Richard (Charles), 1902–79, American composer; b. N.Y.C. With Lorenz HART, he wrote such MUSICALS as *The Girl Friend* (1926), *Babes in Arms* (1937), and *Pal Joey* (1940). With Oscar HAMMERSTEIN, 2d, he composed such musicals as *Oklahoma!* (1943; Pulitzer), *Carousel* (1945), and *The King and I* (1951).

Rodilla, Simon: see WATTS TOWERS.

Rodin, Auguste [rōdăN'], 1840–1917, French sculptor. In the Salon of 1877 he exhibited a male nude, *The Age of Bronze* (1876; Paris), which was both praised and condemned. His critics unjustly accused him of casting it from life, but the furor gained him the patronage of the undersecretary of fine arts, and the government gave him a studio in Paris. From 1880 Rodin worked on studies for the *Gate of Hell,* two great bronze doors that were never finished; among the 186 figures intended for them are *Adam and Eve* (1881; Metropolitan Mus.) and *The Thinker* (1879–1900; Paris). These, together with his group *The Burghers of Calais* (completed in 1894) are among his most famous works. Rodin's work is realistic, but imbued with a profound, romantic poetry. He is also known for his drawings, portrait busts, and marble groups, e.g., *Ugolino* (1882), *The Kiss* (1886), and *The Hand of God* (1897–98; all Rodin Mus., Paris).

Roebling, John Augustus, 1806–69, American engineer; b. Prussia. After coming to the U.S. in 1831, he demonstrated the practicability of steel cable and began manufacturing it at Trenton, N.J. A pioneer in the building of suspension BRIDGES, Roebling designed, beginning in 1844, suspension bridges of increasing size at Pittsburgh; Niagara Falls, N.Y.; Wheeling, W.Va.; and Cincinnati. Shortly after beginning his most ambitious project, the BROOKLYN BRIDGE, he died from a tetanus infection following an accident at the site. His son **Washington Augustus Roebling,** 1837–1926, b. Saxonburg, Pa., completed (1883) the bridge and took over (1888) the Trenton plant.

Roemer, Olaus or **Ole,** 1644–1710, Danish astronomer. Through observations of the eclipses of Jupiter's satellites, he discovered that light travels through space at a finite, noninstantaneous velocity; his measurement of this velocity was a reasonable first approximation of the currently accepted value. Roemer made the first practical transit instrument (1690) and the earliest transit circle (1704).

Roentgen or **Röntgen, Wilhelm Conrad** [both: rĕnt'gĭn, rŭnt'–], 1845–1923, German physicist. For his discovery of a short-wave ray—the Roentgen ray, or X RAY—he received (1901) the first Nobel Prize in physics.

Roethke, Theodore, 1908–63, American poet; b. Saginaw, Mich. He combined a love of the land of the Midwest with a vision of individual development, and his tone ranged from acid wit to simple feeling. His volumes include *Open House* (1941), *The Waking* (1953; Pulitzer), and *The Far Field* (1964).

Roe v. Wade, case decided in 1973, with a companion case, *Doe* v. *Bolton,* by the U.S. SUPREME COURT. Justice Blackmun, for the Court, ruled that states may not ban abortions in the first six months of pregnancy; that a fetus is not a "person" protected by the 14th amendment to the U.S. CONSTITUTION; and that the amendment protects a woman from state intrusion into her decision as to whether or not to bear a child. Blackmun asserted, however, that the right to an abortion is not absolute: After the first trimester the state may regulate that right for health reasons; after six months it may ban abortions except in cases in which the woman's health is in danger. The Court, in later decisions, limited the scope of *Roe* (see ABORTION).

Rogers, Carl R(ansom), 1902–87, American psychologist; b. Oak Park, Ill. He introduced what he called a nondirective approach to the treatment of psychological problems. In *Client-Centered Therapy* (1951), he explained that by neutrally reflecting clients' feelings, the therapist can create an empathetic and accepting environment in which patients regulate the direction and speed of their own growth. Rogers's method greatly influenced the course of PSYCHOTHERAPY. His works include *On Becoming a Person* (1966) and *On Personal Power* (1977).

Rogers, John, 1829–1904, American sculptor; b. Salem, Mass. His anecdotal clay sculptures ("Rogers groups") attained great popularity, and thousands of copies were made by machine of such subjects as *Going to the Minister* and *The Wounded Scout.*

Rogers, Robert, 1731–95, American colonial soldier; b. Methuen, Mass. During the last FRENCH AND INDIAN WAR, Major Rogers commanded (1758–63) British rangers in daring expeditions against French outposts and helped to defend Fort DETROIT. He fell into disgrace for trading illicitly with Native Americans but was acquitted of treasonable dealings with the French. He fought for the Loyalists in the Revolution.

Rogers, Will(iam Penn Adair), 1879–1935, American humorist, the "cowboy philosopher"; b. Oolagah, Indian Territory (now Okla.). Through movies, books, radio, and newspaper columns,

his salty political and social comments gained him wide popularity.

Roger van der Weyden: see WEYDEN, ROGER VAN DER.

Roget, Peter Mark [rōzhā'], 1779–1869, English physician and lexicographer. His *Thesaurus of English Words and Phrases* (1852), later edited by his son and by his grandson, is a standard reference work.

Rohmer, Eric, 1920–, French film director and writer; b. Jean Marie Maurice Schérer. His studies of relationships between men and women include *My Night at Maude's* (1968), *Claire's Knee* (1970), *Chloe in the Afternoon* (1972), *The Marquise of O.* (1976), *Le Beau Mariage* (1982), *Summer* (1986), and *My Girlfriend's Boyfriend* (1988).

Rojas, Fernando de [rō'häs], 1465?–1541?, Spanish novelist. His dramatic novel of passion, *La Celestina* (1499), is considered a masterpiece of Spanish literature.

Rojas Zorrilla, Francisco de [thôrē'lyä], 1607–48, Spanish dramatist of the GOLDEN AGE. Of his many plays, the best known is *None Beneath the King* (1650), a drama of honor. His plots were borrowed by others, including CORNEILLE.

Roland, French hero of the medieval epic *Song of Roland* (11th or 12th cent.). Historically, Roland was one of Charlemagne's commanders, killed when the rear guard of the Frankish army, returning from Spain, was ambushed by the Basques in the Pyrenees in 778. Legend makes Roland one of Charlemagne's peers and his nephew, transforms the Basques into Saracens, and locates the pass at Roncesvalles. The poem is marked by its unified conception, its vivid and direct narrative, and its predominantly warlike spirit. Roland is also the hero of other CHANSONS DE GESTE.

Rolfe, John, 1585–1622, English colonist in Virginia. He immigrated (1610) to JAMESTOWN and introduced tobacco cultivation. Rolfe married (1614) POCAHONTAS, daughter of a Powhatan chief, who went (1616) with him to England. After her death, he returned to Virginia and remarried.

Rolland, Romain [rôläN'], 1866–1944, French author and pacifist. He wrote biographies of Beethoven (1903), Michelangelo (1908), Tolstoy (1911), and Mahatma Gandhi (1924). His major fictional work is *Jean-Christophe* (1906–12), a 10-volume study of a German-born musician and of contemporary European civilization. His best-known play is *The Wolves* (1898). He received the 1915 Nobel Prize in literature.

Rolling Stones, English ROCK MUSIC group that rose to prominence in the mid-1960s and continues to exert great influence. Members have included singer Mick Jagger (1943–); guitarists Brian Jones (1944–69), Keith Richards (1943–), and Ron Wood (1941–); bassist Bill Wyman (1941–), who left the band in 1993; and drummer Charlie Watts (1941–). The group's songs, written mostly by Jagger and Richards, include "Satisfaction," "Sympathy for the Devil," and "Paint It Black." They have appeared widely in concert and in films, e.g., *Gimme Shelter* (1970).

Rølvaag, Ole Edvart [röl'vôkh], 1876–1931, Norwegian-American novelist; b. Norway; came to U.S. in 1896. He is famous for the trilogy *Giants in the Earth* (1927), *Peder Victorius* (1929), and *Their Father's God* (1931), powerful novels treating the struggles of Norwegian pioneers in America.

Roman architecture. Early Roman architects were inspired by post-and-lintel and more refined Greek forms, and drew on Etruscan and Asian models for the semicircular arch, VAULT, and DOME. To these elements they added the use of concrete, leading, after the 2d cent. B.C., to revolutionary structural forms. Of early Rome and the republic (c.500 B.C.–27 B.C.), the aqueducts outside the city of Rome are the most impressive remains. The principal Roman works belong to the period 100 B.C.–A.D. 300. The reign of AUGUSTUS initiated centuries of vast building enterprises. The special feature of Roman design was the combined use of ARCHES (eventually the main structural element) and columns, which served as buttresses or decoration. Concrete replaced cut-stone construction after the 2d cent. B.C. Brick was used in all periods, especially baked brick for facing during the Empire. Stucco, porphyry, alabaster, and marble were also used to finish buildings. Brick vaults were developed fully, their buttresses integrated into the interior. Immense unencumbered vaults, e.g., those of the PANTHEON, created pure spatial effects. Splendor and utility were the Roman ideals, as opposed to the subtle refinement of the Greeks. Urban planning was extensive. Towns were laid out according to a logical plan, focusing on a forum, with colonnades and principal buildings surrounding it. In Rome itself successive forums were built by the emperors. Temples, conforming to the Etruscan type, were elevated on high bases. Facing the forum, they were without side porticos. The type is seen at the Maison Carrée, Nîmes, France. Circular temples included that of Vesta at Tivoli (1st cent. B.C.). The Romans developed the BASILICA, baths, AMPHITHEATER, and triumphal arch. Roman theaters combined stage and auditorium in a unified structure. Baths, probably derived from Greek gymnasia, were built on a totally unprecedented scale, in luxurious detail. Houses typically had an atrium with a roof opening, and the Greek peristyle was used. Four- or five-story urban houses suggested the modern tenement. A third house type was the luxurious country villa.

Roman art. From the 7th to the 3rd cent. B.C., ETRUSCAN ART flourished in central Italy, including Latium and Rome. After 400 B.C., the imitation of Greek models, combined with a trend toward naturalism, e.g., *Mars of Todi* (Vatican), produced the establishment of Hellenistic realism by the beginning of the Roman Empire, e.g., *Orator* (Museo Archeologico, Florence). After the Roman conquest of Greece (c.146 B.C.), Greek artists came to Rome and found a ready market for works done in the classical manner or as copies of Greek originals. Their influence was important and indicates the eclecticism of Roman taste. Roman portraits, however, had a very remote and Italianate origin—the custom of having death masks taken and preserved with busts copied from them. By the time of the Empire, art had become allied with the ideal of service to the state. It led to a distinctly Roman style of portrait bust, concerned with pictorial refinement and psychological penetration. The magnificent reliefs from the Arch of Titus, Rome, commemorating the conquest of Jerusalem in A.D. 70, mark the climax of illusionism in historical relief sculpture. From the time of TRAJAN (A.D. 98–117), the art of the Eastern provinces began to have greater influence. The spiral band of low reliefs on Trajan's Column (Rome) suggests the Middle Eastern or Egyptian illustrative tradition. After a brief return to the classical style under HADRIAN and the Antonines, e.g., the equestrian statue of Marcus Aurelius (Rome), a tendency toward abstraction became more apparent. It later developed into the stiff, iconographic forms of the early Christian and Byzantine eras. The last example of Roman monumental sculpture is in the reliefs of the Arch of Constantine, Rome (c.315). Roman painting was also influenced by Greece; unfortunately, much of it has perished. What remains suggests that the art was mainly one of interior decoration. The largest group of paintings exists in POMPEII. Many paintings, e.g., the *Aldobrandini Wedding* and the *Odyssey Landscapes* (Vatican), are thought to be Roman copies of Greek originals. These three-dimensional techniques were duplicated in MOSAICS, extensively produced throughout the empire. The famous pottery of Arretium (now Arezzo) was mass-produced and widely exported. Early pots had a black finish, and later examples had a red glaze with low-relief decorative figures. Roman minor arts emphasized sumptuous materials. CAMEOS and gold jewelry were extensively produced. During the 1st cent. A.D., new processes were invented for making glass and imitating precious stones, which made possible the production of fine murrhine vases.

Roman Catholic Church, Christian church headed by the pope, the bishop of Rome. "Roman Catholic" is a 19th-cent. British coinage, but is now in common use among English-speaking people. Roman Catholics are spread worldwide and probably number in the hundreds of millions, although no census has been made. The vast majority belong to the Roman rite. Even in the West, however, there are variant rites such as the Ambrosian, the Dominican, and the Mozarabic. In the East there are groups in communion with the pope that also have other rites—Byzantine, Antiochene, Chaldean, Alexandrian, and Armenian. All members of the church accept the gospel of Jesus as handed down by the church, the teachings of the Bible, and the church's interpretations of those teachings. They also believe that God conveys His grace directly to humanity through the SACRAMENTS. The Eucharist (see MASS) is the center of Catholic worship. The clergy, except for parish priests of the East-

ern rites, do not marry, and the church structure, from the parish priests through the bishops to the pope, is administered in the papal court at Rome. Outside the secular organization of the church are the orders of regular priests, monks, and nuns (see MONASTICISM). In the early centuries of CHRISTIANITY, the pope came to command great authority in Western Europe. The contest between the PAPACY and lay rulers over ecclesiastic and lay power was very important in the Middle Ages. The pope was under French domination at Avignon (1309–78), and the church was later rocked by the Great SCHISM. The Protestant REFORMATION in the 16th cent. split the church, and the Counter Reformation (see REFORMATION, CATHOLIC) corrected many abuses. In the 19th cent. Pope PIUS IX proclaimed the doctrine of papal INFALLIBILITY, and in the 19th and 20th cent. the church moved to adjust to modern political and social conditions. Since the Second VATICAN COUNCIL (1962–65) more simplicity and flexibility have been introduced. The first U.S. diocese was formed in 1790, and the U.S. church grew steadily as waves of Roman Catholic immigrants arrived in the 19th and 20th cent. In 1990 there were 58,568,015 Roman Catholics in the U.S.

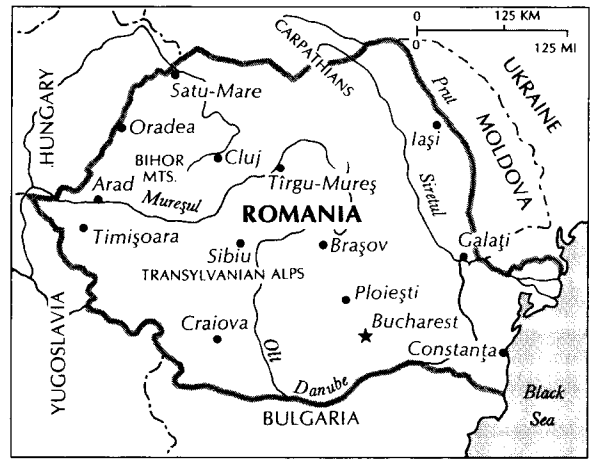
romance [O.Fr., = something written in the popular language, i.e., a Romance language]. The *roman* of the Middle Ages in Europe was a chivalric and romantic narrative (see CHIVALRY). It was lengthened into the *roman d'aventure*, or romance of love and adventure, from which the modern romance derives (see NOVEL).

Romance languages, group of languages belonging to the Italic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Roman Empire: see BYZANTINE EMPIRE; HOLY ROMAN EMPIRE; ROME.

Romanesque architecture and art prevailed throughout Europe from the mid-11th to the mid-12th cent. ROMAN ARCHITECTURE was the main inspiration, but Byzantine and Eastern components were incorporated. Certain characteristics—the massive west facades crowned by a tower or twin towers, the complex eastern parts housing the sanctuary, the rhythmic alternation of piers and columns in the nave—represent advanced stages of a long evolution. The development of Romanesque architecture owes much to the primacy accorded to vaulting. Early Christian architecture had confined masonry vaulting (see VAULT) to small structures. Larger basilican buildings had wood roofs. Romanesque churches sustained massive barrel vaults, which required the reinforcement of load-bearing walls. The presence of galleries above the aisles and the few wall openings are doubtless due originally to structural considerations. They, in turn, created a somberly impressive atmosphere. Monastic communities were centers of development: Cluniac churches at Tours, Toulouse, and Compostela, connected with the great pilgrimages, featured large ambulatories with radiating chapels, designed to facilitate access to the relics. Noted Romanesque buildings include: France—the abbey church of St. Madeleine Vezelay (c.1090–1130); Germany—the cathedral of Speyer (1060; reconstructed after 1082); Italy—the cathedral (1063–92) and baptistery (1153) in Pisa, and the church of San Miniato al Monte, Florence (c.1070). In the late 12th cent. developments in N France and in England pointed towards the Gothic (see NORMAN ARCHITECTURE). Romanesque art was marked by the revival of monumental forms, notably sculpture and fresco painting, developed in close association with architecture. An element of realism, paralleling the first flowering of vernacular literature, came to the fore in direct and naïve observation of details from daily life and a heightened emphasis on emotion and fantasy. The pilgrimages and crusades contributed to a broadened formal vocabulary. Ornamental complexity, ecstatic expression, and a profusion of zoomorphic, vegetal, and abstract motifs abounded. In France, themes portrayed on the tympanums of such churches as Moissac and Autun emphasized the majesty of Jesus and the terrors of hell. Metalwork was an important art, and crucifixes and other church objects were highly refined. Limoges became a major metal and enamelwork center. The large walls of the churches encouraged fresco painting, and manuscript illumination, with a greatly expanded fund of pictorial imagery, also flourished.

Romania or **Rumania,** republic (1992 est. pop. 23,170,000), 91,699 sq mi (237,500 sq km), SE Europe; bordered by Hungary (NW), Yugoslavia (SW), Bulgaria (S), the Black Sea (SE), and Ukraine and Moldova (E and N). Major cities include BUCHAREST (the capital), CLUJ-NAPOCA, Timişoara, and IAŞI. The CARPATHIAN Mts., which include the Transylvanian ALPS, cut through Romania from north to southwest; the highest peak is at Moldoveanu (8,343 ft/2,543 m). The principal rivers are the DANUBE and its tributary, the Prut. Traditionally an agricultural country, Romania greatly expanded its industrial base after World War II, and by 1980 industry contributed over 65% of national income. Leading manufactures include iron and steel, machinery, transport vehicles, and chemicals. The chief farm products are corn and other grains, sugar beets, potatoes, and fruits (notably grapes for wine). Romania is a major producer of petroleum and natural gas, but oil reserves are being depleted and some fuel must be imported. Coal, copper, and iron ore are mined. Romanian is the official language. The vast majority of the people are Romanian, but there are Hungarian, Gypsy, German, and other minorities. Gypsies have faced increasing public violence since the end of Communist rule. By far the largest religious body is the Romanian Orthodox Church.



History. Present-day Romania corresponds roughly to the ancient province of DACIA, which, after Romanization (2d–3d cent.), was overrun successively by the Goths, Huns, Avars, Bulgars, Magyars, and Mongols. After the 13th cent. two Romanian principalities, Moldavia and WALACHIA, were formed. They became vassal states of the OTTOMAN EMPIRE and, later, Russian protectorates. In 1861 the two principalities were united as Romania, which obtained full independence in 1878 and was proclaimed a kingdom in 1881. Romania won S Dobruja in the second BALKAN WAR (1913) and joined (1916) the Allies in WORLD WAR I, after which it was awarded Bukovina, TRANSYLVANIA, part of the Banat, and Crişana-Maramureş. Romanian politics in the years that followed were marked by violence, turmoil, and corruption; assassination as a political instrument was not unusual. In the 1930s violence increased with the rise of the fascist IRON GUARD, and in 1940 Ion ANTONESCU overthrew King CAROL II and established a dictatorship. Romania joined Germany in the war against the USSR in 1941. After Soviet troops entered the country in 1944, Romania surrendered and Antonescu's regime was overthrown. In 1947 a Communist-led government came to power, forced King MICHAEL to abdicate, and established a republic. Nationalization of industry and agriculture was completed by 1948. From 1965 to 1989, Romania was ruled by Nicolae CEAUSESCU, who pursued a foreign policy independent of the Soviet Union that won him favor in the West. At home, however, he reduced the country to poverty to pay for a radical program of modernization. In Dec. 1989 antigovernment violence broke out in Timişoara and spread to other cities. Army units joined the uprising and Ceausescu fled, but he was captured, tried, and executed. The National Salvation Front, headed by Ion Iliescu, subsequently won (1990) a national election marred by violence, and Iliescu became president. Iliescu was reelected in 1992. Iliescu's government has failed to reorganize state-run industries, creating an economic crisis.

Romanian language, member of the Romance group of the Italic

subfamily of the Indo-European family of languages. See LANGUAGE (table).

Romanic: see ROMANCE LANGUAGES.

Roman law, system of law of the Romans, from the founding of ROME (753 B.C.) to the fall of the Eastern Empire (A.D. 1453); it is the basis of modern CIVIL LAW. First codified in 450 B.C. in the Twelve Tables (tablets on which the laws were inscribed), early Roman law was highly formalistic. Procedural knowledge was restricted to a body of patrician priests, but as a result of plebeian pressure this material was reduced to writing (c.250 B.C.), thus broadening the law's social base. By the late 3d cent. B.C. Roman law comprised the *jus civile,* governing relations among Romans, and the *jus gentium,* governing dealings with foreigners; the latter, more flexible, eventually became universal. After c.100 B.C. new principles, notably the *jus honorarium,* a body of magisterial law to supplement, aid, and correct existing law, were vigorously developed. With the establishment (27 B.C.) of the Roman Empire, the development of law passed into the hands of the emperors, and imperial enactments were abundant. The growing complexity of the law gave birth to a class of trained jurists, most prominent of whom was PAPINIAN (d. A.D. 212), and by the early 4th cent. most branches of Roman law were fully developed. Codification was completed (535) during the reign of JUSTINIAN I in the *Corpus Juris Civilis,* the culminating work of Roman legal scholarship and the model for most of the legal systems in continental Europe. After the fall of the Western Empire, Roman law persisted as part of GERMANIC LAW and CANON LAW, and in the Eastern (Byzantine) Empire. Revival of classical studies during the Renaissance led to the resurrection of Roman law as the basis for the civil law that developed in a large part of the world. Even COMMON LAW countries, such as England, have felt the influence of Roman law, particularly in commercial law and the rules of EQUITY.

Romano, Giulio: see GIULIO ROMANO.

Romanov [rō'mənŏf, Rus. rəmä'nəf], ruling dynasty of Russia, 1613–1917. The first wife of Czar IVAN IV was Anastasia Romanov, whose grand-nephew Michael was chosen czar in 1613. In the following list of Michael's successors, the names of rulers not descended from him are in brackets: Alexis, 1645–76; Feodor III, 1676–82; Ivan V, 1682–89; PETER I, 1682–1725 (ruled jointly with Ivan V until 1689); [CATHERINE I, 1725–27]; Peter II, 1727–30; Anna, 1730–40; IVAN VI, 1740–41; ELIZABETH, 1741–62; PETER III, 1762; [CATHERINE II, 1762–96]; PAUL I, 1796–1801; ALEXANDER I, 1801–25; NICHOLAS I, 1825–55; ALEXANDER II, 1855–81; ALEXANDER III, 1881–94; NICHOLAS II, 1894–1917. After the murder of Nicholas II and his immediate family in 1918, the surviving Romanovs fled abroad.

Roman Question: see LATERAN TREATY.

Roman religion. The indigenous ancient Italic religion was essentially animistic, holding that spirits (numina) dwelling in natural objects controlled human destiny. The earliest unit for their worship was the family and household. When the early agricultural communities coalesced into the Roman state, the family ritual formed the basis for state ritual, ruled by the king as chief priest. The supreme triad of deities was that of JUPITER, MARS, and Quirinus. Many foreign gods were adopted from the 7th cent., and from the 3d cent. B.C. the old Roman deities were equated with the Greek gods whose attributes they took on. The influence of EPICURUS and STOICISM were also felt. In the last two centuries of the republic the people, grown distant from the formalistic state religion, sought salvation and a promise of afterlife in the Greek MYSTERIES and various Middle Eastern cults, e.g., those of the GREAT MOTHER OF THE GODS, ISIS and OSIRIS, and MITHRA, creating a religious climate in which Christianity would flourish and eventually triumph.

Romans, EPISTLE of the NEW TESTAMENT, sixth book in the usual order, by St. PAUL, probably written A.D. c.58. It is addressed by Paul to the Christian church at Rome, apparently to introduce himself and his teaching before his visit. Its subject, the achieving of salvation through faith, is central in Paul's teaching and is the theme also of GALATIANS. In Romans, Paul argues that reliance on the Mosaic Law is not enough, and that God has not broken His promise to His chosen people but is working toward universal redemption. The epistle is claimed as an authority by many divergent theologies, e.g., by both Lutherans and Roman Catholics.

Romansh: see RHAETO-ROMANIC.

romanticism, term applied to literary and artistic movements of the late 18th and 19th cent., in revolt against CLASSICISM and against philosophical rationalism, with its emphasis on reason. Spurred in part by the libertarian and egalitarian ideals of the FRENCH REVOLUTION, the romantics are associated with belief in a return to nature and in the innate goodness of humans, as expressed by Jean Jacques ROUSSEAU; admiration for the heroic and for the individuality and imagination of the artist; exaltation of the senses and emotions over reason and intellect; and interest in the medieval, exotic, primitive, and nationalistic. Critics date English literary romanticism from the publication of William WORDSWORTH and S.T. COLERIDGE'S *Lyrical Ballads* (1798), though William BLAKE'S mysticism foreshadowed the movement. Romantic poets like Lord BYRON, John KEATS, and P.B. SHELLEY focused on the individual's highly personal response to life, as did Thomas DE QUINCEY and William HAZLITT in prose. The gothic romance and the historical novels of Sir Walter SCOTT witnessed the cult of medievalism. German romanticism flourished in the STURM UND DRANG drama of GOETHE and SCHILLER, the lyric poetry of NOVALIS and HEINE, and the philological and folk researches of HERDER and the brothers GRIMM. Romanticism was exemplified in France by CHATEAUBRIAND, Victor HUGO, DUMAS PÈRE, LAMARTINE, Alfred de MUSSET, and George SAND. The movement's influence, however, was worldwide, as evidenced by the works of the Russian Aleksandr PUSHKIN; the Italian Giacomo LEOPARDI; and the Americans J.F. COOPER, E.A. POE, and the transcendentalists (see TRANSCENDENTALISM). In the visual arts, romantics rejected classical formalism while remaining outside the 19th-cent. realist mainstream, as with DELACROIX and J.M.W. TURNER. Romanticism in music, stressing emotion and freedom of form, reached its zenith in the work of BERLIOZ, MENDELSSOHN, SCHUMANN, CHOPIN, LISZT, and WAGNER, who attempted in his operas a synthesis of all the arts.

Romanus, Byzantine emperors. **Romanus I,** d. 948 (r.914–44), deposed the young CONSTANTINE VII. Romanus defended CONSTANTINOPLE against the BULGARS. His two sons overthrew him. **Romanus II,** 939–63 (r.959–63), was the profligate son of Constantine VII. Romanus's wife, Theophano, was the actual ruler. His reign saw the victories of NICEPHORUS II over the Arabs. When Romanus died, Nicephorus married Theophano and became emperor. **Romanus III,** c.968–1034 (r.1028–34), succeeded Constantine VIII by marrying his daughter, ZOË. He depleted the treasury and abolished needed taxes. His general George Meniaces took Edessa from the Saracens (1032). **Romanus IV,** d. 1072 (r.1067–71), succeeded Constantine X by marrying his widow. He was routed by the Seljuk Turks at Manzikert. His stepson deposed and blinded him, succeeding as Michael VII.

Romany [rŏm'ənē, rō-'], language belonging to the Dardic group of the Indo-Iranian subfamily of the Indo-European family of languages. Romany is the mother tongue of the GYPSIES. See LANGUAGE (table).

Romberg, Sigmund, 1887–1951, Hungarian-American composer. He wrote over 70 romantic OPERETTAS, including *The Student Prince* (1924), *The Desert Song* (1926), and *The New Moon* (1928).

Rome, Ital. *Roma,* city (1990 pop. 2,803,931), capital of Italy and seat of the pope, whose residence, VATICAN CITY, is a sovereign state within the city of Rome. Rome is also the capital of Latium, a region of central Italy, and of Rome prov. It lies on both banks of the Tiber R. Called the Eternal City, it is one of the world's richest cities in history and art, and one of its great cultural, religious, and intellectual centers. Modern Rome retains many of the great monuments of its rich past. Among them are the Forum and the COLOSSEUM, the LATERAN, SAINT PETER'S CHURCH and other great churches (e.g., St. Mary Major, St. Lawrence without the Walls, St. Paul's without the Walls, St. Peter in Chains), and graceful palaces and villas (e.g., Farnese Palace, Farnesina, Borghese Villa). The immense riches of art and its religious importance make Rome one of the most visited cities of the world. It is also a great center of commerce with varied industries, e.g., printing, publishing, manufacturing, and motion pictures. The remainder of this article treats the history of Rome and of the **Roman Empire.**

Rome before Augustus. Ancient Rome was built on the east, or left, bank of the Tiber. The seven hills of the ancient city are the

The key to pronunciation appears on page xiii.

RULERS OF THE ROMAN EMPIRE *(including dates of reign)*

Augustus, grandnephew of Julius Caesar, 27 B.C.–A.D. 14
Tiberius, stepson of Augustus, A.D. 14–A.D. 37
Caligula, grandnephew of Tiberius, 37–41
Claudius, uncle of Caligula, 41–54
Nero, stepson of Claudius, 54–68
Galba, proclaimed emperor by his soldiers, 68–69
Otho, military commander, 69
Vespasian, military commander, 69–79
Vitellius, military commander, 69
Titus, son of Vespasian, 79–81
Domitian, son of Vespasian, 81–96
Nerva, elected interim ruler, 96–98
Trajan, adopted son of Nerva, 98–117
Hadrian, ward of Trajan, 117–38
Antoninus Pius, adopted by Hadrian, 138–61
Marcus Aurelius, adopted by Antonius Pius, 161–80
Lucius Verus adopted by Antonius Pius; ruled jointly with Marcus Aurelius, 161–69
Commodus, son of Marcus Aurelius, 180–92
Pertinax, proclaimed emperor by the Praetorian Guard, 193
Didius Julianus, bought office from the Praetorian Guard, 193
Severus, proclaimed emperor, 193–211
Caracalla, son of Severus, 211–17
Geta, son of Severus, ruled jointly with Caracalla, 211–12
Macrinus, proclaimed emperor by his soldiers, 217–18
Heliogabalus, cousin of Caracalla, 218–22
Alexander Severus, cousin of Heliogabalus, 222–35
Maximin, proclaimed emperor by soldiers, 235–38
Gordian I, made emperor by the senate, 238
Gordian II, son of Gordian I, ruled jointly with his father, 238
Balbinus, elected joint emperor by the Senate, 238
Pupienus Maximus, elected joint emperor with Balbinus by the senate, 238
Gordian III, son of Gordian II, 238–44
Philip (the Arabian), assassin of Gordian III, 244–49
Decius, proclaimed emperor by the soldiers, 249–51
Hostilianus, son of Decius, colleague of Gallus, 251
Gallus, military commander, 251–53
Aemilianus, military commander, 253
Valerian, military commander, 253–60
Gallienus, son of Valerian, coemperor with his father and later sole emperor, 253–68
Claudius II, military commander, 268–70
Aurelian, chosen by Claudius II as successor, 270–75
Tacitus, chosen by the senate, 275–76
Florianus, half brother of Tacitus, 276
Probus, military commander, 276–82
Carus, proclaimed by the Praetorian Guard, 282–83
Carinus, son of Carus, 283–85
Numerianus, son of Carus, joint emperor with Carius, 283–84
Diocletian, militiary commander, divided the empire; ruled jointly with Maximian and Constantius I, 284–305
Maximian, appointed joint emperor by Diocletian, 286–305
Constantius I, joint emperor and successor of Diocletian, 305–6
Galerius, joint emperor with Constantius I, 305–10
Maximin, nephew of Galerius, 308–13
Licinius, appointed emperor in the West by Galerius; later emperor in the East, 308–24
Maxentius, son of Maximian 306–12
Constantine I (the Great), son of Constantius I, 306–37
Constantine II, son of Constantine I, 337–40
Constans, son of Constantine I, 337–50
Constantius II, son of Constantine I, 337–61
Magnentius, usurped Constans' throne, 350–53
Julian (the Apostate), nephew of Constantine I, 361–63
Jovian, elected by the army, 363–64
Valentinian I, proclaimed by the army; ruled in the West, 364–75
Valens, brother of Valentinian I; ruled in the East, 364–78
Gratian, son of Valentinian I; coruler in the West with Valentinian II, 375–83
Maximus, usurper in the West, 383–88
Valentinian II, son of Valentinian I, ruler of the West, 375–92
Eugenius, usurper in the West, 392–94
Theodosius I (the Great), appointed ruler of the East by Gratian, later sole emperor; last ruler of united empire, 375–95

Emperors in the East

Arcadius, son of Theodosius I, 395–408
Theodosius II, son of Arcadius, 408–50
Marcian, brother-in-law of Theodosius II, 450–57
Leo I, chosen by the senate, 457–74
Leo II, grandson of Leo I, 474

Emperors in the West

Honorius, son of Theodosius I, 395–423
Maximus, usurper in Spain, 409–11
Constantius III, named joint emperor by Honorius, 421
Valentian III, nephew of Honorius and son of Constantius III, 425–55
Petronius Maximus, bought office by bribery, 455
Avitus, placed in office by Goths, 455–56
Majorian, puppet emperor of Ricimer, 457–61
Libius Severus, puppet emperor of Ricimer, 461–65
Anthemius, appointed by Ricimer and Leo I, 467–72
Olybrius, appointed by Ricimer, 472
Glycerius, appointed by Leo I, 473–74
Julius Nepos, appointed by Leo I, 474–75
Romulus Augustulus, put in office by Orestes, his father, 475–76

Palatine, Capitoline, Quirinal, Viminal, Esquiline, Caelian, and Aventine. Tradition tells of the founding of Rome by ROMULUS in 753 B.C. and of rule by the TARQUIN family, the Etruscan royal house (see ETRUSCAN CIVILIZATION). The young city was probably under Etruscan rule until c.500 B.C., when the Romans overthrew the monarchy and established the Roman republic. The PATRICIAN class controlled the government, but the majority PLEBS in time gained much power and privilege. In 390 B.C. Rome was sacked by the Gauls, but during the 4th and 3d cent. B.C. it extended its influence over W Latium and S Etruria, conquered the Samnites, and became master of central and S Italy. Rome also came in full contact with Greek culture, which modified Roman life tremendously. Rome's rapid conquests met the like ambitions of CARTHAGE, which ruled the W Mediterranean. In a titanic struggle called the PUNIC WARS, Rome utterly destroyed Carthage. The Roman Republic then turned its attention eastward and rapidly expanded Roman dominion. At home, however, class dissension produced slave uprisings, e.g., that of SPARTACUS, and attempts were made at reform (see GRACCHI, family). Rome was forced by the Social War (90–88 B.C.) to extend citizenship widely in Italy, but the republic was nevertheless doomed. The struggle between Marius and SULLA led to a civil war. POMPEY emerged as a popular champion and found an ally in Julius CAESAR, a popular democratic leader. With Marcus Licinius Crassus (see CRASSUS, family), Pompey and Caesar formed the First Triumvirate (60 B.C.). Caesar then left Rome and acquired fame in the GALLIC WARS. Within ten years Pompey and Caesar fell out, and by his victory at Pharsala (48 B.C.) Caesar became master of Rome. The rule of Caesar completed the destruction of the republic and laid the foundations of the empire.

The Roman Empire. After Caesar's assassination (44 B.C.) the Second Triumvirate was formed by Caesar's grandnephew, Octavian (later AUGUSTUS), ANTONY, and Marcus Aemilius Lepidus (see LEPIDUS, family). This alliance dissolved as well, and in 31 B.C. Octavian's forces defeated Antony and CLEOPATRA at Actium. Octavian emerged supreme and is usually considered the first Roman emperor. He organized provincial government and the army, rebuilt Rome, and patronized the arts and letters. His rule began a long period (200 years) of peace called the *Pax Romana* in which

the empire prospered. An extensive system of Roman roads made transportation easier, and commerce and industry were developed. Literary and artistic interests were important, although they nearly always tended to imitate Greek and Eastern styles. Augustus died in A.D. 14 and was succeeded in turn by his stepson TIBERIUS; by CALIGULA, a cruel tyrant; and by CLAUDIUS I, who conquered half of Britain. The emperor NERO (r.A.D. 54–68), an unparalleled tyrant, began the persecution of CHRISTIANITY, which was spreading throughout the empire. Under TRAJAN (r.A.D. 98–117) the empire's eastern boundaries were pushed past Armenia and Mesopotamia. Marcus Aurelius (r.161–180) ruled in what is commonly called the Golden Age of the empire, but the 3d cent. was a time of turmoil. In 284 DIOCLETIAN was made emperor by the army. He reformed the government and divided the empire into four regions, two in the East and two in the West. CONSTANTINE I (r.306–37) moved the capital from Rome to Byzantium, renamed Constantinople, and granted religious toleration to Christians. After the death (395) of THEODOSIUS I, the empire was permanently divided into E and W sections, and Rome rapidly lost its political importance. The West sank into anarchy, and Italy was ravaged by invaders. Rome was taken by ALARIC I (410) and by Gaiseric (455), and Pope LEO I is said to have kept ATTILA from sacking it. In 476 the last emperor of the West, Romulus Augustulus, was deposed by the Goths under ODOACER; this date is commonly accepted as the end of the W Roman Empire. The Eastern or BYZANTINE EMPIRE continued until the 15th cent. The so-called Dark Ages that followed in Western Europe could not eradicate the profound imprint left by Roman civilization. Italy itself, however, did not recover from the fall of Rome until the 19th cent.

Later History. The history of Rome in the Middle Ages is essentially that of two institutions, the PAPACY and the commune of Rome. Rome was ruled by the Goths in the 5th cent. and fell under Byzantine rule from the 6th to the 8th cent. With the emergence (8th cent.) of the PAPAL STATES, Rome, their capital, once again rose to importance. CHARLEMAGNE and later Holy Roman emperors visited the city to be crowned by the popes. Papal authority was challenged unsuccessfully in the 12th cent. by the communal movement led by Arnold of Brescia, and civil strife arose between GUELPHS AND GHIBELLINES. During the "Babylonian captivity" of the popes at AVIGNON (1309–78), conditions in Rome were in constant turmoil, but in the 15th cent. the city became a center of the RENAISSANCE. Countless artists and architects served the papal court, and Rome, as it is today, is largely a product of their work. Noble and baroque monuments were erected in the 17th and early 18th cent. In 1809 Rome and the Papal States were annexed to France by NAPOLEON I, but papal rule was restored in 1814. After a republic was declared (1849) in Rome, French troops intervened to restore the pope. When the kingdom of Italy was proclaimed (1861), it included most of the Papal States, but not Rome, which remained a virtual French protectorate under NAPOLEON III. After Napoleon III's fall, Rome became (1871) the Italian capital, but the conflict between the pope and Italy was not solved until the LATERAN TREATY (1929), which gave the pope sovereignty over Vatican City. In WORLD WAR II Rome fell to Allied forces on June 4, 1944.

Rømer, Olaus: see ROEMER, OLAUS.

Rommel, Erwin, 1891–1944, German field marshal, known as the "desert fox" and regarded as one of the most brilliant generals of WORLD WAR II. He commanded the Afrika Korps in the North African campaigns (1941–43). His string of victories was broken by the British at EL ALAMEIN (1942). In 1944 he took part in the attempt on Hitler's life and was forced to take poison when the plot failed.

Romney, George, 1734–1802, English portrait painter. After studying in Italy, he rivaled Sir Joshua REYNOLDS in popularity. His portraits of women are facile and charming, e.g., his many portraits of Lady Emma HAMILTON, and those of men are studied and impressive, e.g., *Self-portrait* (1782; National Portrait Gall., London). In his last years, he turned to literary subjects such as *Milton and his Daughters.*

Romulus, in Roman legend, founder of Rome. He and his twin, Remus, were sons of MARS and Rhea Silvia, daughter of Numitor, king of Alba Longa. Amulius, usurper of Numitor's throne, threw them in the Tiber, but they floated ashore. They were suckled by a she-wolf and reared by a shepherd. When grown, they slew Amulius and made Numitor king. They then founded a city (traditionally 753 B.C.) on the spot where they were rescued from the Tiber. They later quarreled, and Romulus killed Remus. Romulus populated Rome with fugitives from other countries and gave them wives abducted from the SABINE tribe. After a long reign Romulus vanished in a thunderstorm; he was thereafter worshiped as the god Quirinus.

Romulus Augustulus, d. after 476, last West Roman emperor (475–76). His father, Orestes, ruled for him. He was deposed by ODOACER and sent away with a pension.

Ronsard, Pierre de [rôNsär'], 1524?–1585, French Renaissance poet, leader of the Pléiade (see under PLEIAD). Named poet royal, he wrote prolifically, producing poems on many themes, especially patriotism, love, and death. His best-known love poems appear in *Sonnets pour Hélène* (1578). *La Franciade* (1572), an unfinished epic, was his most ambitious effort. He was one of France's greatest poets.

Röntgen, Wilhelm Conrad: see ROENTGEN.

Roosevelt, Eleanor, 1884–1962, b. N.Y.C. She was a niece of Theodore ROOSEVELT and a distant cousin of Franklin ROOSEVELT, whom she married. She worked for social betterment as a lecturer, newspaper columnist, and world traveler. A U.S. delegate to the UN, she was made chairman of the Commission for Human Rights in 1946. In the 1950s she led the liberal wing of the Democratic party.

Roosevelt, Franklin Delano, 1882–1945, 32d president of the U.S. (1933–45); b. Hyde Park, N.Y. The scion of an old, wealthy New York family, he earned (1905) a law degree at Columbia Univ. and entered politics by winning election (1910) to the state senate. As leader of the anti-Tammany Democratic reformers, he campaigned for Woodrow WILSON in the 1912 election. He served as assistant secretary of the navy (1913–20) and ran as vice presidential candidate with James Cox on the losing Democratic ticket in 1920. The next year he was stricken with poliomyelitis; though crippled for life, he eventually regained partial use of his legs. He supported Gov. Al SMITH's presidential candidacy and, at Smith's urging, ran successfully for governor in 1928. Reelected in 1930, Gov. Roosevelt learned to deal with the problems of the GREAT DEPRESSION. Nominated by the Democrats in 1932, he defeated Pres. HOOVER. The new president, taking office at the height of the economic crisis, assured troubled Americans that "the only thing we have to fear is fear itself." He acted quickly during the so-called Hundred Days (Mar.–Jan. 1933) to rush through Congress a flood of fiscal and social reform measures aimed at reviving the economy by a vast expenditure of public funds. He set up many new agencies, including the NATIONAL RECOVERY ADMINISTRATION and the PUBLIC WORKS ADMINISTRATION, to reorganize industry and agriculture under government regulation. These programs and social reforms, such as SOCIAL SECURITY, became known as the NEW DEAL. He was aided by a BRAIN TRUST of advisers, including Raymond Moley and Rex Tugwell, cabinet officers Henry WALLACE and Harold ICKES, and special counselor Harry HOPKINS. Roosevelt was the first president to

Franklin Delano Roosevelt and Eleanor Roosevelt

broadcast over the radio; his "fireside chats" explained issues and policies to the people. He easily won reelection in 1936. But the U.S. SUPREME COURT declared a number of New Deal measures unconstitutional, and he failed (1937) in an attempt to reorganize the Court. In foreign affairs his administration recognized (1933) the Soviet Union and initiated a "good neighbor" policy toward Latin America. With the outbreak (1939) of World War II, Roosevelt extended aid to Britain and began LEND LEASE, while building up U.S. armed forces by the first peacetime SELECTIVE SERVICE (1940). He broke precedent by seeking and winning (1940) a third presidential term and, later (1944), a fourth. After the Japanese attack on PEARL HARBOR, Roosevelt, as commander in chief, directed the nation's immense war effort, held conferences with Winston CHURCHILL and other Allied leaders, and worked to establish the UN. On April 12, 1945, he died suddenly from a cerebral hemorrhage.

Roosevelt, Theodore, 1858–1919, 26th president of the U.S. (1901–9); b. N.Y.C. The delicate son of a distinguished family, he made determined efforts to overcome the frail health that would markedly affect his character. After graduating (1880) from Harvard, he served (1882–84) as a Republican state legislator. Bereaved by the deaths (1884) of his mother and his wife, Alice Hathaway Lee, he retired to his ranch in the Dakota Territory. Returning to New York in 1886, he married Edith Kermit Carow and served on the Civil Service Commission, as head (1895–97) of the New York City police board, and as assistant secretary (1897–98) of the navy. In 1898 he formed, with Leonard WOOD, the ROUGH RIDERS regiment that fought in Cuba during the SPANISH-AMERICAN WAR; he came home a hero. He was elected (1900) vice president under William MCKINLEY, and upon McKinley's assassination in Sept. 1901 became president at the age of 42. An activist and an innovative leader, he set about "trust busting" by initiating some 40 lawsuits against the big trusts. He also fathered important conservation legislation. His championship of the rights of the "little man" captured the people's imagination, and he was reelected (1904) by a landslide. His second administration secured passage of the Pure Food and Drug Act of 1906. His progressive reforms aimed at regulation, not abolition, of big business. Roosevelt decisively increased the power of the president, particularly in foreign affairs. Claiming that the U.S. had the right to impose order in Latin America, he intervened (1903) in a civil war in Panama to foster construction of the PANAMA CANAL. He mediated (1904) the end of the RUSSO-JAPANESE WAR, for which he won the 1906 Nobel Peace Prize. Although he had hand-picked William Howard TAFT to succeed him, he became angry at Taft's apparent lack of progressive principles and split the Republican party in 1912 by running for president as the third-party PROGRESSIVE, or Bull Moose, candidate. He outpolled Taft but lost the election. During his busy career he found time for big game hunting and for writing many books.

Root, Elihu, 1845–1937, American public official; b. Clinton, N.Y. A successful corporation lawyer, he served (1899–1904) as U.S. secretary of war and was responsible for the PLATT AMENDMENT, permitting U.S. intervention in Cuba. As secretary of state (1905–9) under Theodore ROOSEVELT, he concluded (1908) an agreement with Japan to keep peace in the Pacific. He received the 1912 Nobel Peace Prize.

root, in botany, the descending axis of a plant (as contrasted with the STEM), usually growing underground but also growing in air (see EPIPHYTE) and water. Roots serve to absorb and conduct water and dissolved minerals (see SAP); to anchor the plant; and, often, to store food. Some plants have a main root (tap root) that is larger than the branching roots; others have many slender root branches. Roots grow primarily in length, with growth occurring at the tip, which is protected by a cap of cells (root cap) that break off and are replaced as the root probes through the soil. Root hairs, tiny cellular projections from the surface of the growing portion, absorb water and minerals from the soil. Root systems help prevent soil EROSION.

rootstock: see RHIZOME.

Rorem, Ned, 1923–, American composer and author; b. Richmond, Ind. Although he has written a wide range of compositions, he is best known for his vocal works, e.g., *Air Music* (1975; Pulitzer) and *5 Prayers for the Young* (1977). He has also published a series of deftly written journals.

Rosa, Salvator, 1615–73, Italian BAROQUE painter, etcher, and satiric poet of the Neapolitan school. He established his reputation with *Prometheus* (Corsini Palace, Rome). Rosa worked in Florence and Rome. He is best known for his spirited battle pieces, for his marines, and especially for his tempestuous landscapes.

Rosario, city (1991 pop. 1,095,301), E central Argentina, on the Paraná R. It is a railroad hub with fine port facilities and is an export center for the central and northern provinces. Settled in the 17th cent., it grew after 1870 with the development of the PAMPA, which extends to the west.

Rosas, Juan Manuel de, 1793–1877, Argentine dictator, governor of Buenos Aires prov. (1829–32, 1835–52). He led his gaucho (cowboy) troops in support of the conservatives and federalism in 1820. He became governor of Buenos Aires (1829) and temporarily destroyed the unitarian cause. Returned to office in 1835, he assumed dictatorship over most of Argentina and instituted a regime of terror. In 1852, because of foreign difficulties and an economic crisis, a revolt led by Urquiza and backed by Brazil and Uruguay succeeded, and Rosas fled to England.

Rose, Pete(r Edward), 1941–, American baseball player; b. Cincinnati. A switch-hitter who played outfield and infield positions, he played for the Cincinnati Reds (1963–78, 1984–87), Philadelphia Phillies (1979–83), and Montreal Expos (1984). Nicknamed "Charlie Hustle," he won three National League batting titles (1968, 1969, 1973), set (1978) a modern league record by hitting safely in 44 straight games, and broke (1985) Ty COBB's record of 4,191 hits. Rose's 4,256 hits and his 10 seasons with over 200 hits are both records. He also managed the Reds from 1984 to 1989. For betting on baseball games, Rose received a lifetime suspension from baseball in 1989 and was later denied admission to the Hall of Fame while the suspension was in effect. In 1990 he pled guilty to federal income tax evasion.

rose, common name for some members of the family Rosaceae, herbs, shrubs, and trees distributed over most of the earth. Roses are often thorny, and many typically have a fleshy fruit, such as a rose hip or an apple. The largest genera are *Rubus,* including the blackberry, raspberry, loganberry, and other BRAMBLES; *Rosa,* the true roses; and *Prunus,* including the ALMOND, APRICOT, CHERRY, NECTARINE, PEACH, and PLUM. Other members of the family, also of economic importance, are the APPLE, PEAR, QUINCE, and STRAWBERRY. The true roses, the most popular ornamentals of the family, are esteemed as cultivated plants and as cut flowers for their often fragrant, showy blossoms. Attar of rose, a PERFUME oil, is obtained from the damask rose, and the rose hips of *R. rugosa* are a source of VITAMIN C. Favorite flowers in many lands since prehistoric times, roses have been used medicinally and eaten in preserves and salads. New York, North Dakota, Iowa, and the District of Columbia have adopted different species of rose as their emblems.

Roseau, town and seaport (1991 pop. 20,755), capital of DOMINICA.

rose hip: see ROSE.

rosemary, evergreen, shrubby perennial (*Rosmarinus officinalis*) of the MINT family, native to the Mediterranean region. It has small blue flowers and aromatic leaves; the latter are used for seasoning. An extract of the flowers is used in perfumes and medicines.

Rosenberg, Alfred, 1893–1946, German NAZI leader. His book *The Myth of the 20th Century* (1930) supplied HITLER with the spurious philosophical and scientific basis for the Nazi racist doctrines. As minister to the occupied E European countries after 1941, he was responsible for the Nazi atrocities there. He was hanged as a war criminal.

Rosenberg Case, in U.S. history, an espionage case in which Julius Rosenberg (1918–53), an electrical engineer who had worked for the army signal corps, and his wife, Ethel (1916–53), were found guilty of transmitting top-secret data on nuclear weapons to the USSR. Much of the evidence against the Rosenbergs came from Mrs. Rosenberg's brother, David Greenglass. Despite many appeals for clemency, the Rosenbergs were executed on June 19, 1953. The case aroused great controversy; many claimed that the COLD WAR political climate made a fair trial impossible and that the evidence against the Rosenbergs came from a confessed spy; others ques-

tioned the value of the material they had allegedly passed to the USSR and argued that the death penalty was too severe.

Rosenfeld, Morris, 1862–1923, American Yiddish poet; b. Russian Poland as Moshe Jacob Alter. He worked as a tailor by day and a poet by night, writing of the hell of the sweatshops. He also edited several Yiddish periodicals. *Songs of the Ghetto* (1897) is well known.

rose of Sharon, name for several plants, especially *Hibiscus syriacus,* of the MALLOW family. The rose of Sharon of the Bible is thought to be either a NARCISSUS or the MEADOW SAFFRON.

Roses, Wars of the, name given to the struggle (1455–85) for the throne of England between the houses of LANCASTER (whose badge was a red rose) and YORK (whose badge was a white rose). In the mid-15th cent. the weak Lancastrian king HENRY VI was controlled by a faction including William de la Pole, duke of Suffolk, Edward Beaufort, duke of Somerset, and MARGARET OF ANJOU, Henry's queen. They were opposed by Richard, duke of York, who gained support from the popular unrest caused by the reverses of the HUNDRED YEARS WAR and by the corruption at court. York was appointed protector during the king's insanity (1453–54), but was excluded from the royal council when the king recovered. He then resorted to arms. The factions met at St. Albans (1455), the Yorkists won, and York again became protector (1455–56). The wars, however, continued. In 1460 the Yorkists captured the king at Northampton and struck a compromise whereby Henry remained king and York was named his successor. Queen Margaret, whose son was thus disinherited, raised an army and defeated the Yorkists at Wakefield in 1460. Here York was killed, and his son Edward assumed his claim. Margaret's army rescued the king at the second battle of St. Albans (1461), but Edward meanwhile was victorious at Mortimer's Cross and assumed the throne as EDWARD IV. Henry was recaptured (1465) and the Yorkists seemed to be in command. A quarrel then developed over the king's marriage, and Richard Neville, earl of Warwick, and the king's brother George, duke of Clarence, deserted Edward. They allied (1470) with Queen Margaret, drove Edward into exile, and restored Henry VI. Edward soon returned and triumphed at Barnet and Tewkesbury in 1471. Margaret was imprisoned and Henry VI died, probably slain on Edward's orders. After 12 years of peace, Edward was succeeded (1483) by his 12-year-old son EDWARD V, but the boy's uncle Richard, duke of Gloucester, usurped the throne as RICHARD III. Opposition to Richard advanced the fortunes of Henry Tudor, now the Lancastrian claimant, and he defeated and killed Richard at Bosworth Field in 1485. Henry seized the throne as HENRY VII, and his marriage to Edward IV's daughter Elizabeth united the houses of Lancaster and York. It is generally said that the wars ended feudalism in England, because the nobles who participated in them suffered a great loss of life and property, and were, as a class, unable to contest the strong Tudor monarchy.

Rosetta Stone, basalt slab inscribed by priests of PTOLEMY V in hieroglyphic, demotic, and Greek. Found (1799) by troops of NAPOLEON I near the city of Rosetta, N Egypt, it is now in the British Museum. The stone provided J.F. CHAMPOLLION and other scholars with the key to translating Egyptian hieroglyphics.

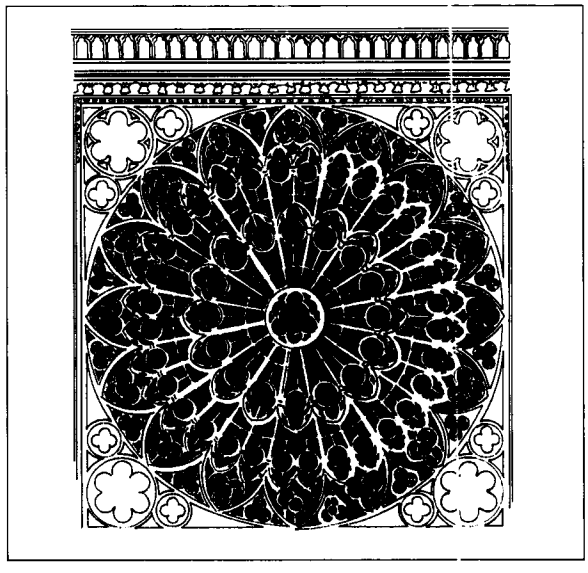
rose window, large, stone-traceried, circular window of medieval churches. It developed from the Romanesque wheel window. In Gothic CATHEDRALS it appears over the west front or on a transept end. Early examples, e.g., at CHARTRES, were filled with plate tracery. The typical rose, as at Rheims, was filled with radiating and intermediate bars. In the final, flamboyant period, wavy curves and more intricate patterns suggest an open rose.

Rosh Hashanah: see under JEWISH HOLIDAYS.

Ross, Betsy, 1752–1836, American seamstress; b. Philadelphia as Elizabeth Griscom Ross. Although she did make flags during the AMERICAN REVOLUTION, the legend that she designed and made the first American national flag is generally discredited.

Ross, Sir James Clark, 1800–1862, British explorer and naval officer. He studied Eskimo life on several voyages. On an expedition with his uncle, John ROSS, he located the north magnetic pole. Studying earth magnetism in Antarctica (1839–43), he discovered Ross Sea and followed the Ross ice shelf for hundreds of miles. He also found Victoria Land and much of Graham Land.

Ross, Sir John, 1777–1856, British explorer. Searching (1818) for the NORTHWEST PASSAGE, he explored BAFFIN BAY. In 1829–33 he discovered the Gulf of Boothia (named for his patron, Sir Felix Booth) and King William Island. He wrote two books about his search for the Northwest Passage.



Rose window (Cathedral of Notre-Dame, Paris)

Ross, John, or **Kooweskoowe,** 1790–1866, CHEROKEE chief; b. Tennessee, of Scottish and Cherokee parents. He resisted removal of his people from ancestral Tennessee lands, but a Cherokee minority ceded (1835) the area to Georgia. In 1838–39 he led his people on an arduous journey to Oklahoma (known as the "trail of tears") and became chief of the united Cherokee nation.

Rossellini, Roberto [rōs-sĕl-lē'nē], 1906–77, Italian film director. His *Open City* (1945), and *Paisan* (1946) were key neorealist films; his other works include *General Della Rovere* (1959), *The Rise of Louis XIV* (1966), and *Socrates* (1970).

Rossetti, Dante Gabriel, 1828–82, English poet and artist. In 1848, with the painters W. Holman Hunt and John Everett MILLAIS, he founded the brotherhood of PRE-RAPHAELITES. John RUSKIN championed the group and bought many of Rossetti's paintings. Rossetti's poetry, like his paintings, is noted for its pictorial effects and atmosphere of luxurious beauty. His early poem "The Blessed Damozel" and the sonnet sequence "The House of Life" are his finest works. The first edition of his collected poems appeared in 1870. His sister, **Christina (Georgina) Rossetti,** 1830–94, was also a poet. Deeply religious, she lived a reclusive life. Much of her poetry is melancholy or religious; "Uphill" and "When I Am Dead, My Dearest" concern death. Her best work is in *Goblin Market and Other Poems* (1862).

Rossini, Gioacchino Antonio, 1792–1868, Italian composer. Of his many lively operas, *The Barber of Seville* (1816) is his comic masterpiece. After composing the opera *William Tell* (1829), he wrote only songs, piano pieces, and the *Stabat Mater* (1842).

Rosso, Il, 1495–1540, Italian painter. A founder of MANNERISM, he was known for his distorted treatment of space, e.g., *Daughters of Jethro* (Uffizi). As court painter to FRANCIS I of France, he worked on the palace at Fontainebleau.

Ross Sea, arm of the Pacific Ocean between Victoria Land and Marie Byrd Land in ANTARCTICA, discovered in 1841 by Sir James Clark ROSS. Its southern extension is the Ross Ice Shelf, a great frozen area which is the source of huge ICEBERGS. McMurdo Sound, on its western side, has been the most important staging point for exploration and scientific investigation of Antarctica.

Rostand, Edmond [rôstäN'], 1868–1918, French poet and dramatist. He is best known for *Cyrano de Bergerac* (1897), a tour de force of dramatic poetry. Other plays include *L'Aiglon* (1900) and the barnyard fable *Chantecler* (1910).

Rostenkowski, Dan(iel David), 1928–, U.S. politician; b. Chicago.

A Democrat, he was elected as a U.S. representative from Illinois in 1958. Rostenkowski became chairman of the House Ways and Means Committee in 1981. He helped secure (1983) legislation to keep the SOCIAL SECURITY system solvent and played a major role in the passage (1986) of a new federal tax code.

Rostock or **Rostock-Warnemünde,** city (1989 est. pop. 254,000), Mecklenburg–West Pomerania, N Germany, on the Baltic Sea. It is an industrial center and major seaport. Manufactures include ships, machinery, and chemicals; the fishing industry is also important. Chartered in the 13th cent., Rostock became a leading member of the HANSEATIC LEAGUE. It was heavily damaged in WORLD WAR II.

Rostropovich, Mstislav, 1927–, Russian cellist, pianist, and conductor. He made his cello debut in 1940, toured with the Moscow Philharmonic, and taught at the Moscow Conservatory until his friendship with Aleksandr SOLZHENITSYN and his support for Soviet dissidents brought him into official disfavor in the early 1970s. Since 1977 he has been musical director of the National Symphony Orchestra, Washington, D.C. His wife is the soprano Galina Vishnevskaya.

Roszak, Theodore [rô'shäk], 1907–81, American sculptor; b. Poland. His abstract metal sculptures are irregular and explosive in form, symbolic and fantastic in content. *Thorn Blossom* (Whitney Mus., N.Y.C.) is representative.

Roth, Philip, 1933–, American novelist; b. Newark, N.J. His witty, ironic fiction, dealing chiefly with middle-class Jewish life, includes his comic masterpiece, *Portnoy's Complaint* (1969), as well as the more sober novels *My Life as a Man* (1974), *Zuckerman Unbound* (1981), *Zuckerman Bound* (1985), *The Counterlife* (1987), and *Operation Shylock* (1993). The short stories in *Goodbye Columbus* (1959) gained Roth his initial recognition. He also wrote the autobiographical *Patrimony: A True Story* (1991), which deals with the death of his father.

Rothermere, Harold Sidney Harmsworth, 1st **Viscount** [rŏth'ərmēr], 1868–1940, English publisher. He was the financial wizard of the publishing firm headed by his brother Alfred, Viscount NORTHCLIFFE, and headed the vast newspaper empire after his brother's death.

Rothko, Mark, 1903–70, American painter; b. Russia; emigrated to the U.S. in 1913. He was a leading exponent of ABSTRACT EXPRESSIONISM, and his mature works are often huge canvases with floating rectangles of luminous color. An example is *No. 10* (1950; Mus. Mod. Art, N.Y.C.).

Rothschild, prominent family of European bankers. **Mayer Amschel Rothschild,** 1743–1812, son of a money-changer in the Jewish ghetto in Frankfurt, laid the foundations of the family fortune as the financial agent for the landgrave of Hesse-Kassel. Of his five sons, the oldest continued the business in Frankfurt, while the other four established branches in Vienna, London, Naples, and Paris. All five were created barons (1822) by Francis I of Austria, a title that continues in the family. The ablest of the brothers was **Nathan Meyer Rothschild,** 1777–1836, who opened the London branch in 1805. As an agent of the British government in the Napoleonic Wars, he was instrumental in the ultimate defeat of NAPOLEON I. Under his guidance and that of his son, **Baron Lionel Nathan de Rothschild,** 1808–79, the family gained immense power by floating large international loans (e.g., the Irish famine loan, 1847; the Crimean War loan, 1856), but its virtual monopoly was broken as state financing improved. Lionel became (1858) the first Jewish member of Parliament, and many members of the family were prominent philanthropists, patrons of the arts, sportsmen, writers, or physicians.

rotifer, microscopic aquatic or semiterrestrial tubelike worm (phylum Rotifera). As a rule, only female rotifers are seen; in some species the male has never been observed. Eggs usually develop parthenogenetically, i.e., without fertilization, to produce only females.

rotor: see GENERATOR; MOTOR, ELECTRIC.

Rotterdam, city (1991 est. pop. 583,000), W Netherlands, on the Nieuwe Maas R. near the North Sea. One of the world's largest, most modern ports, it has a huge transit trade and such industries as shipyards, oil refineries, and petrochemical plants. The city was chartered in 1328. It grew rapidly after construction (1866–90) of the New Waterway gave ocean vessels access to the port. During World War II the city's center was destroyed by German bombs.

Rouault, Georges [rōō-ō'], 1871–1958, French expressionist artist. His thickly encrusted, powerfully colored images, outlined in black, are suggestive of icons and STAINED GLASS. He painted sorrowful clowns, corrupt judges, and prostitutes, but the sufferings of Jesus was his favorite subject. His best-known works include the series of 60 prints called *Miserere,* and the paintings *Three Judges* and *Christ Mocked by Soldiers* (both: Mus. Mod. Art, N.Y.C.).

roughage: see FIBER, DIETARY.

Rough Riders, popular name for the 1st Regiment of U.S. Cavalry Volunteers in the SPANISH-AMERICAN WAR (1898), organized largely by Theodore ROOSEVELT. Commanded by Leonard WOOD, it fought chiefly in Cuba, and its exploits, especially at San Juan Hill, were highly publicized.

Roundheads, derisive name for the supporters of Parliament in the ENGLISH CIVIL WAR (1642–48). The name referred to the short haircuts worn by some Puritans in contrast to the wigs worn by the king's supporters, called Cavaliers.

roundworm: see NEMATODE.

Rousseau, Henri [rōōsō'], 1884–1910, French primitive painter. Self-taught, he is best known for his fantastic landscapes, e.g., *The Snake Charmer* (1907; Louvre), and his haunting *Sleeping Gypsy* (1897; Mus. Mod. Art, N.Y.C.).

Rousseau, Jean Jacques, 1712–78, Swiss-French philosopher and political theorist; b. Geneva. A member of DIDEROT's circle, he was one of the great figures of the French ENLIGHTENMENT and probably the most significant of those who shaped 19th-cent. ROMANTICISM, influencing such figures as KANT, GOETHE, ROBESPIERRE, TOLSTOY, and the French revolutionists. Rousseau's most celebrated theory was that of the "natural man." In his *Discourse on the Inequalities of Men* (1754) and *Social Contract* (1762) he maintained that human beings were essentially good and equal in the state of nature but were corrupted by the introduction of property, agriculture, science, and commerce. People entered into a SOCIAL CONTRACT among themselves, establishing governments and educational systems to correct the inequalities brought about by the rise of civilization. *Émile* (1762), a didactic novel, expounds Rousseau's theory that education is not the imparting of knowledge but the drawing out of what is already in the child. From the 1760s Rousseau was tormented by persecution mania, and he lived his later years in seclusion. His *Confessions* (1781) created a new, intensely personal style of autobiography.

Rousseau, Théodore, 1812–67, French landscape painter, leader of the BARBIZON SCHOOL. His landscapes are grave and full of a deep love of solitude.

Roussel, Albert [rōōsĕl'], 1869–1937, French composer. His early works are influenced by IMPRESSIONISM and 18th-cent. music; he later experimented with Eastern techniques. His late works, e.g., his Second Symphony (1920), feature subtle melodic inflections and sharp dissonances.

Rowe, Nicholas, 1674–1718, English dramatist. His best plays, *The Fair Penitent* (1703) and *Jane Shore* (1714), stories of men's cruelty to women, prefigure later 18th-cent. domestic tragedies. His edition of SHAKESPEARE (1709) was the first to divide the plays into acts and scenes.

rowing, the art of propelling a boat by means of oars operated by hand. In racing, each member of the rowing team, or crew, uses both hands to pull one oar through the water. The boat, or shell, is sometimes steered by a coxswain, who also directs the speed and rhythm of the crew's strokes. Sculling is a variant of rowing in which each oarsman controls two oars, one in each hand. Rowing crews have two, four, or eight members, with or without a coxswain; sculling teams consist of one, two, or four members. The most famous annual rowing event is the Oxford-Cambridge race, in England, held since 1829.

Rowlandson, Thomas, 1756–1827, English caricaturist. As a humorous and critical commentator on the social scene, he quickly gained celebrity for his drawings such as *Vauxhall Gardens* (1784), and his famous *Tour of Dr. Syntax* with text by William Combe. The fluidity of his line is likened to French ROCOCO, but his spirited, and sometimes coarse, humor is in the English style.

Roxana or **Roxane,** d. 311 B.C., wife of ALEXANDER THE GREAT. She

and Alexander's posthumous son, Alexander IV, were embroiled in the wars of the DIADOCHI and were imprisoned by CASSANDER. They were later killed.

Roxas, Manuel [rō'häs], 1894–1948, Philippine statesman. In WORLD WAR II he joined the Japanese puppet government, but secretly aided the Philippine underground. In 1946 he became the first president of the Republic of the PHILIPPINES.

Royal Ballet, the principal British ballet company, based at the Royal Opera House, Covent Garden, London. It was formed from Sadler's Wells Ballet and Sadler's Wells Theatre Ballet. Its prima ballerinas have included Alicia MARKOVA and Margot FONTEYN. Choreographers have included Frederick ASHTON and Antony TUDOR. Its performances are noted for lavish classic drama.

Royal Canadian Mounted Police, constabulary organized (1873) as the Northwest Mounted Police to bring law and order to the Canadian west and to prevent tribal disorders. The present name was adopted in 1920. The corps' daring exploits in pursuit of criminals earned it a romantic reputation and the popular name Mounties. It now numbers more than 19,000 and includes the police forces of all provinces but Ontario and Quebec.

Royal Danish Ballet, one of the oldest major ballet companies. It was established (1748) at the opening of Denmark's Royal Theater in Copenhagen and was developed by Vincenzo Galeotti, Auguste BOURNONVILLE, and Harold Lander. Its style is noted for light, precise footwork. Star dancers have included Erik BRUHN and Peter MARTINS.

Royal Highlanders: see BLACK WATCH.

Royal Society, organization est. 1660 in London by a group of learned men to promote scientific discussion. It stimulates scientific research and publishes its *Proceedings* and *Philosophical Transactions.* Granted a royal charter in 1662, the Royal Society advises the British government (from which it receives subsidies) on scientific matters.

royalties: see COPYRIGHT.

Rozelle, Pete (Alvin Rozelle), 1926–, American football executive, b. South Gate, Calif. Commissioner of the National Football League (1960–89), he guided the NFL through its merger with the American Football League and its expansion from 12 to 28 teams, and negotiated lucrative television contracts.

Ru, chemical symbol of the element RUTHENIUM.

Ruanda-Urundi, former colonial territory in central Africa, now divided between the independent states of RWANDA and BURUNDI.

rubber, any solid substance, usually elastic, that can be vulcanized to improve its elasticity and add strength; the term includes natural rubber, or caoutchouc, and a wide variety of synthetic rubbers, which have similar properties. Rubbers are composed chiefly of CARBON and HYDROGEN, but some synthetics also have other elements, e.g., chlorine, fluorine, nitrogen, or silicon. All are compounds of high molecular weight; each consists of a series of one kind of molecule (e.g., isoprene in natural rubber) hooked together in a long chain to form a very flexible, larger molecule, the POLYMER. Natural rubber is obtained as latex, a milky suspension of rubber globules found in a large variety of plants, chiefly tropical and subtropical. An important source is the PARÁ RUBBER TREE. Latex can be shipped for processing either as a liquid or coagulated by acid and rolled into sheets. For most purposes rubber is ground, dissolved in a solvent, and compounded with other ingredients, e.g., fillers, pigments, and plasticizers. Known in pre-Columbian times by the indigenous peoples of South and Central America, rubber first attracted interest in Europe in the 18th cent. Vulcanization, a process invented (1839) by Charles GOODYEAR, revolutionized the rubber industry. It usually involves heating raw or compounded rubber with SULFUR, causing sulfur bridges to form between molecules. The product is nonsticky, elastic, and resistant to heat and cold. Natural rubber is used chiefly to make tires and inner tubes because it is cheaper than synthetic rubber and has greater resistance to tearing when hot. Natural rubber can be treated to make foam rubber and sponge rubber. The first synthetic rubber was made in Germany in World War I. Today synthetics, e.g., Buna S, neoprene, butyl, and nitrile, account for most of the world's rubber production. Made from COAL, PETROLEUM, NATURAL GAS, and ACETYLENE, synthetic rubbers are resilient over a wider temperature range than natural rubber and are more resistant to aging, weathering, and attack by certain substances, notably, oil, solvents, oxygen, and ozone. SILICONE rubbers are used in insulation. POLYURETHANES are used in tires, in shoes, and as foams. Neoprene is used for making hose and tank linings. Butyl rubber is used in inner tubes and as insulation.

rubber plant, name for several plants, e.g., PARÁ RUBBER TREE, Castilla tree, Ceará tree, and guayule, all of which are sources of the milky fluid, called latex, used to make RUBBER. The India-rubber tree (*Ficus elastica*), a common houseplant, is an Asian FIG.

Rubbia, Carlo, 1934–, Italian physicist. He shared the 1984 Nobel Prize in physics with Simon VAN DER MEER for their discovery of the W AND Z PARTICLES, which convey the WEAK INTERACTION, one of the four fundamental forces of nature. Rubbia also led a team at CERN that produced theoretical evidence for the sixth QUARK.

rubella or **German measles,** acute infectious viral disease, causing a rash and fever. It is mild and uncomplicated unless contracted during the first three months of pregnancy, when it can cause serious damage to the fetus (see BIRTH DEFECTS). VACCINATION against rubella is given to children and advised for young women who have not had the disease.

Rubens, Peter Paul, 1577–1640, foremost Flemish painter of the 17th cent.; b. Siegen, Westphalia. He served (1600–1608) as court painter to the duke of MANTUA, who sent him to Spain where he painted the magnificent equestrian portrait of the duke of Lerma (Conde Valdelagrana Coll., Madrid). In 1608 he returned to Antwerp, where within five years he became known as the greatest painter of his country. He organized an enormous workshop of skilled apprentices and associates, among them VAN DYCK and JORDAENS. *Raising of the Cross* and *Descent from the Cross* (1610 and 1611; cathedral, Antwerp) date from this period. He also executed a series of large allegorical paintings of the life of Marie de' Medici (Louvre). His associates did much of the work on them, but Rubens designed them and added the finishing touches. In this way, his workshop produced numerous monumental works. In 1626 Rubens entered the diplomatic service. In Spain on a diplomatic mission (1628), he became acquainted with Velázquez, and painted the royal family. While in England, he painted *Allegory of War and Peace* (National Gall., London), and was knighted for his peacemaking efforts. During the last 10 years of his life, he did his most joyous and finest pictures. *The Judgement of Paris* and *Three Graces* (Prado) and *Venus and Adonis* (Metropolitan Mus.) belong to this period. The volume of his work is enormous; more than 2,000 paintings have been attributed to his studio, and each shows the mark of his genius. The influence of the Italians is clear in his monumental compositions, but his color, technique, and lusty spirit are Flemish. Despite his superb religious painting, a pagan joy of life is his most characteristic quality. He explored all fields of painting, and some of his small works, e.g., *Peasant Dance* (Prado) are among his masterpieces.

rubeola: see MEASLES.

Rubicon, stream that in the days of early Rome divided GAUL from Italy. In 49 B.C. Julius CAESAR led his army across it, defying the Roman senate and commencing civil war. He reportedly said, "The die is cast." Thus, to cross the Rubicon is to take an irrevocable step.

rubidium (Rb), metallic element, discovered spectroscopically by Robert BUNSEN and Gustav KIRCHHOFF in 1861. A very soft, silver-white ALKALI METAL, it is extremely reactive, and must be kept out of contact with air and water. It has few commercial uses. See ELEMENT (table); PERIODIC TABLE.

Rubinstein, Anton Grigoryevich, 1829–94, Russian virtuoso pianist, composer, and educator. He founded the St. Petersburg Conservatory in 1862 and was its director. His brother, **Nicholas Grigoryevich Rubinstein,** 1835–81, also a pianist and teacher, founded (1864) and headed the Moscow Conservatory.

Rubinstein, Arthur, 1887–1982, Polish-American pianist; b. Poland. He was particularly known for his lyric interpretations of CHOPIN and for his championing of Spanish works.

ruby, gem, transparent red variety of CORUNDUM, found chiefly in Myanmar, Thailand, and Sri Lanka. Star rubies (showing an internal star when cut with a rounded top) are rare. Synthetic rubies are produced by fusing aluminum oxide; chromium oxide is added to provide the appropriate color.

The key to pronunciation appears on page xiii.

rudder, in aviation: see AIRPLANE.

Rudolf, rulers of the HOLY ROMAN EMPIRE. **Rudolf I** or **Rudolf of Hapsburg,** 1218–91, German king (1273–91), first ruler of the HAPSBURG dynasty, was elected king after an interregnum of 20 years in which there was no accepted German king or emperor. His defeat of Ottocar II of Bohemia greatly added to the Hapsburg lands. **Rudolf II,** 1552–1612, emperor (1576–1612), was mentally unbalanced and delegated imperial power to his brother Matthias. Rudolf's reign was turbulent and a prelude to the THIRTY YEARS WAR.

Rudolf, 1858–89, Austrian archduke, only son of Emperor FRANCIS JOSEPH. Rudolf's mysterious death (officially ruled a double suicide with his mistress, Baroness Mary Vetsera), at Mayerling left his cousin, FRANCIS FERDINAND, heir to the Austro-Hungarian throne. The "Mayerling tragedy" has been the subject of novels, plays, and films.

Rudolf of Hapsburg: see Rudolf I under RUDOLF, rulers of the Holy Roman Empire.

rue, common name for various members of the family Rutaceae, mostly woody shrubs or small trees, often evergreen and spiny, of temperate and tropical regions. They are typified by glands that produce an essential oil widely utilized for flavorings, perfume oils, and drugs; the foliage, fruits, and flowers are noticeably fragrant. Chief in importance are the CITRUS FRUITS. Several species of the family yield lumber used in cabinetmaking, e.g., the ORANGE and the species called satinwood. More specifically, the name *rue* refers to the shrubby herbs of the genus *Ruta,* found from the Mediterranean to E Siberia. The common rue (*R. graveolans*) has greenish-yellow flowers, blue-green leaves, and a strong odor. Its leaves are sometimes used in flavorings, beverages, and cosmetics.

Rufinus, d. 395, Roman statesman, minister to THEODOSIUS I and virtual ruler for ARCADIUS. He was assassinated by Gothic mercenaries, perhaps by order of STILICHO.

Rugby, town (1986 est. pop. 84,900), Warwickshire, central England. Rugby is known chiefly as the seat of one of the great English public schools, Rugby School (est. 1567). RUGBY football originated at the school in 1823.

rugby, game that originated (1823) on the playing fields of Rugby School, in England. It is similar in some respects to SOCCER and American FOOTBALL. The amateur version is played by two teams of 15 players on a field about 160 yd (146 m) long and 75 yd (69 m) wide, with goal lines 110 yd (101 m) apart and two in-goals (corresponding to football's end zones). The ball may be kicked, carried, or passed (to the sides or rear); tackling is permitted, but blocking is forbidden. Scoring is by carrying the ball into the in-goal or by kicking it between the goal posts. Professional rugby, known as Rugby league, is played by 13-player teams under somewhat different rules.

Ruhr, region, NW Germany, located along and N of the Ruhr R. and E of the Rhine R. Its concentration of industries, begun in the 19th cent. when the KRUPP and Thyssen concerns built large coal and steel empires, made it one of the world's greatest industrial complexes. In the 1980s the coal and steel industries declined; by the 1990s more than half the workforce was employed in services. Among the principal cities are ESSEN, DUISBURG, Bottrop, Gelsenkirchen, Bochum, and DORTMUND.

Ruisdael or **Ruysdael, Jacob van** [both: rois'däl], c.1628–1682, Dutch painter and etcher, the most celebrated of the Dutch landscape painters. His work shows northern nature in a somber mood. Overcast skies throw restless light on gnarled oak and beech trees. His later work emphasizes humanity's insignificance amid the splendor of nature. Important works include *Jewish Cemetery* (Detroit Inst. of Art) and *Wheatfields* (Metropolitan Mus.). He also produced some very fine etchings. He influenced French and English landscapists for 200 years.

Ruiz, Juan [rōōēth'], 1283?–1350?, Spanish poet and archpriest of Hita. For his *Book of Good Love* (c.1330), a satirical panorama of medieval society, he has been called the Spanish CHAUCER.

rum, fermented, distilled, and aged spirituous liquor made from the molasses and foam that rise to the top of boiled sugarcane juice. Naturally colorless, it becomes brown when caramel is added and the liquor is stored in casks. The best-known producer is Jamaica, but rum is also made in Cuba, Brazil, Trinidad, Puerto Rico, and the U.S.

Rumania: see ROMANIA.

Rumelia or **Roumelia** [both: rōōmē'lēə], region of S Bulgaria, between the Balkan and Rhodope mountains. Historically, Rumelia denoted the Ottoman Empire's Balkan possessions; the Ottoman province of Rumelia included much of present-day Yugoslavia, Bosnia and Hercegovina, Bulgaria, European Turkey, N Greece, Macedonia, and part of Albania. **Eastern Rumelia,** in present-day S Bulgaria, was created in 1878 (see BERLIN, CONGRESS OF) and was annexed by Bulgaria in 1885.

Rumford, Benjamin Thompson, Count, 1753–1814, American-British scientist and administrator; b. Woburn, Mass. After leaving America (1776), he served as the British undersecretary of the colonies (1780–81). In contrast to the prevalent belief that HEAT was a substance, he stated that it was produced by the motion of particles. Rumford made valuable experiments with gunpowder, introduced improved methods of heating and cooking, and founded the Royal Institution in England.

Rumi, Jalal ed-Din or **Jalal ud-Din** [rōō'mē], 1207–73, Persian poet, one of the greatest Sufi poets. Rumi's lyrics express mystic thought in finely wrought symbols. His main work is *Mathnawi,* a poetic exposition of SUFISM in eight books.

ruminant, any of a group of even-toed mammals that chew their cud, i.e., regurgitate and rechew already swallowed food. Ruminants have three- or four-chambered stomachs. In the first chamber (the rumen), food is mixed with fluid to form a soft mass (the cud or bolus), which, after regurgitation and rechewing, passes through the rumen into the other stomach chambers for digestion. Goats, sheep, cows, camels, and antelope are ruminants.

rummy, card game played by two to six players with a standard deck. Seven cards are dealt to each player; remaining cards are left in a stock pile. Drawing and discarding, a player's objective is to meld (put down three or four cards of the same rank or sequence in the same suit); the first player to meld all his cards wins. Variants are gin rummy and canasta.

Runcie, Robert Alexander Kennedy, 1921–, archbishop of Canterbury (1980–91). Bishop of St. Albans from 1970 to 1980, he was enthroned as the 102d archbishop of Canterbury in 1980, succeeding Donald Coggan. He is noted for developing links with the Orthodox Eastern Church and for his work on behalf of the Anglican ministry in Africa.

runes, ancient characters used in Teutonic, Anglo-Saxon, and Scandinavian inscriptions, probably first used c.300 by the OSTROGOTHS, who may have derived them from Hellenic-Italian writing. Adapted to carving, they consisted of perpendicular, oblique, and a few curved lines. They were used extensively in N Europe, Iceland, and the British Isles before Christianity, persisting in Scandinavia into the Middle Ages.

Runnymede or **Runnimede,** historic meadow, near Egham, Surrey, S England, on the south bank of the Thames R., W of London. Either on this meadow or on nearby Magna Carta Island, King JOHN accepted the MAGNA CARTA (1215).

Runyon, (Alfred) Damon, 1884–1946, American writer and journalist; b. Manhattan, Kans. He is best known for his humorous stories, written in the slangy idiom of New York City's Broadway and underworld characters, e.g., *Guys and Dolls* (1931).

Rupert, Prince, 1619–82, count palatine of the Rhine; b. Prague. He was the son of FREDERICK THE WINTER KING and grandson of James I of England. He served the Dutch in the THIRTY YEARS WAR and was an outstanding royalist general during the ENGLISH CIVIL WAR. After the English RESTORATION he was a privy councillor to Charles II and, as an admiral, played an important part in the Dutch Wars. He was one of the founders of the HUDSON'S BAY COMPANY.

Rupert's Land, Canadian territory held (1670–1870) by the HUDSON'S BAY COMPANY. The area, named for Prince RUPERT, the first governor of the company, comprised the drainage basin of HUDSON BAY. In 1869–70 the company transferred Rupert's Land to Canada for £300,000 but retained certain blocks of land for trading and other purposes.

Rupp, George Erik, 1942–, American educator, president of Columbia Univ. (1993–); b. Summit, N.J. A Presbyterian minister, he was on the faculty of the Harvard Divinity School from 1974 to 1977

and was later dean (1979–85) of the school. President of Rice Univ. from 1985, he was named president of Columbia in 1993.

Rush, Benjamin, 1745?–1813, American physician; b. Byberry (now in Philadelphia), Pa. He was the first professor of chemistry in the colonies, at the College of Philadelphia. He signed the Declaration of Independence and was a member (1776–77) of the Continental Congress. He established (1786) in Philadelphia the first free dispensary in the U.S. and became (1792) professor of medicine at the Univ. of Pennsylvania. His bleeding and purging of patients aroused controversy. A pioneer in psychiatry and a prolific writer, he also founded the first American antislavery society and served (1797–1813) as treasurer of the U.S. mint in Philadelphia.

rush, any plant of the family Juncaceae; more loosely, a tall, grasslike, often hollow-stemmed plant of various families. The common, or bog, rush (*Juncus effusus*) is widely distributed in swamps and moist places of the Northern Hemisphere; the slender rush (*J. tenuis*) is found in drier surroundings. Some wood rushes (genus *Luzula*), which grow on dry ground, are relished by livestock. Rushes are used for basketwork, mats, and chair seats, and as wicks. The scouring rush is a HORSETAIL.

Rush-Bagot Convention, 1817, agreement between the U.S. and Great Britain concerning the Canadian border. It consisted of an exchange of notes by Acting U.S. Secy. of State Richard Rush and Charles Bagot, British minister in Washington, and provided for disarmament of the U.S.-Canadian frontier. The convention set a precedent for the amicable settlement of Anglo-American difficulties, and inaugurated a policy of peace between the U.S. and Canada.

Rushdie, Salman, 1947–, British author; b. Bombay. His first novels, including *Shame* (1983) and *Midnight's Children* (1981), are examples of magical realism. His allegorical novel *The Satanic Verses* (1988) enraged many Muslims, including the Ayatollah KHOMEINI, who sentenced Rushdie to death, and Rushdie went into hiding. *Haroun and the Sea of Stories,* a novel, was published in 1990.

Rusk, (David) Dean, 1909–, U.S. secretary of state (1961–69). After serving in the State Dept. (1946–51) and as president of the Rockefeller Foundation (1952–61), he became secretary of state in Pres. John F. KENNEDY's cabinet and continued to hold the post under Pres. Lyndon B. JOHNSON. A firm believer in the use of military force to prevent Communist expansion, he strongly defended the VIETNAM WAR.

Ruskin, John, 1819–1900, English critic and social theorist. His first work, *Modern Painters* (5 vol., 1843–60), begun as a defense of J.M.W. TURNER, held that art is a "universal language" based on national and individual integrity and morality. *The Seven Lamps of Architecture* (1849) and *The Stones of Venice* (1851–53) applied this idea to architecture. Ruskin began to address social and political questions c.1857; in *Unto This Last* (1860) and *Munera Pulveris* (1862–63) he attacked the ugliness and waste of modern industrial England. *Sesame and Lilies* (1865) and other works proposed social reforms, some of which—old-age pensions, nationalization of education, organization of labor—are now widely accepted. In 1870 Ruskin was appointed Slade Professor at Oxford, the first professor of art in England.

Russell, Bertrand Arthur William Russell, 3d **Earl,** 1872–1970, British philosopher, mathematician, and social reformer; b. Wales. The grandson of Lord John Russell, the 1st Earl Russell, he succeeded to the earldom in 1931. While teaching at Cambridge Univ. Russell produced his most important works, *Principles of Mathematics* (1903) and, with Alfred North WHITEHEAD, *Principia Mathematica* (3 vol., 1910–13), in which he attempted to show how the laws of mathematics could be deduced from the basic axioms of logic. His work influenced 20th-cent. symbolic logic (see LOGIC), SET theory in mathematics, and LOGICAL POSITIVISM, especially in the work of his student Ludwig WITTGENSTEIN. An undogmatic but zealous rationalist, Russell was deeply convinced of the logical independence of individual facts and the dependence of knowledge on the data of original experience. Well known for his social views, he was an active pacifist during World War I. In 1927 he and his wife founded the highly experimental Beacon Hill School. His liberal views on marriage, sex, adultery, and homosexuality made him controversial during most of the 1930s. He abandoned pacifism during World War II in the face of the Nazi threat, but reverted to it after the war, becoming a leader in the "ban the bomb" movement to halt the manufacture of nuclear weapons. In the 1960s he and Jean-Paul SARTRE organized European opposition to U.S. involvement in the Vietnam War. Russell's radicalism kept him from a traditional academic career, and he supported himself chiefly by his writings, many of them widely read, e.g., *Marriage and Morals* (1929), *A History of Western Philosophy* (1945), and his autobiography (3 vol., 1967–69). In 1950 he was awarded the Nobel Prize in literature.

Russell, Bill (William Felton Russell), 1934–, African-American basketball player; b. Monroe, La. Named All-American while on the Univ. of San Francisco team, he played on the gold-medal-winning U.S. team at the 1956 Olympics. That year he joined the Boston Celtics; in his 13 seasons with the team he won the most valuable player award five times. Since leaving the Celtics in 1969, he has been a television sports announcer and a coach (1973–77) for the Seattle SuperSonics. His biography, *Second Wind,* appeared in 1979.

Russell, George William, pseud. **A.E.,** 1867–1935, Irish author. An Irish nationalist, editor, reformer, and painter, he was a major figure in the Irish literary renaissance. His poems and plays, mystical and melodious, include *Homeward: Songs by the Way* (1894) and *The Candle of Vision* (1918).

Russell, Henry Norris, 1877–1957, American astronomer; b. Oyster Bay, N.Y. At Princeton Univ. he taught (1905–47) astronomy and directed (1912–47) its observatory. Russell showed that a study of the motion of the periastron of the orbit of eclipsing variable stars could provide information on the internal structure of the component stars. He developed a theory of STELLAR EVOLUTION that led him to construct, independently of Ejnar Hertzsprung, the HERTZSPRUNG-RUSSELL DIAGRAM, and he determined the abundance of various chemical elements in the solar atmosphere. He also analyzed the spectra of several chemical elements.

Russell, Lillian, 1861–1922, American singer and actress; b. Clinton, Iowa, as Helen Louise Leonard. Beautiful and flamboyant, she excelled in light opera.

Russia or **Russian Federation,** Rus. *Rossiya,* republic (1992 est. pop. 149,527,000), 6,591,100 sq mi (17,070,949 sq km), occupying most of E Europe and N Asia, extending c.5,000 mi (8,000 km) from the Baltic Sea to the Pacific Ocean. It is bounded by Ukraine, Belarus, Latvia, Estonia, the Gulf of Finland, Finland, and Norway (W); the Barents, Kara, Laptev, East Siberian, and Chukchi seas—arms of the Arctic Ocean (N); the Bering Sea, Sea of Okhotsk, and Sea of Japan—arms of the Pacific Ocean (E); China, Mongolia, Kazakhstan, the Caspian Sea, Azerbaijan, Georgia, and the Black Sea (S). The Kaliningrad oblast is a Russian exclave on the Baltic, bordered by Lithuania and Poland. The capital and largest city is MOSCOW. From 1922 to 1991 Russia, as the Russian Soviet Federative Socialist Republic, was the largest and most important constituent republic of the UNION OF SOVIET SOCIALIST REPUBLICS and, in most respects, it is the USSR's successor. The term *Russia* also designates the area inhabited by the Russian people as distinguished from other East Slavs and from non-Slavic peoples, and is often loosely applied to the entire former Soviet Union.

Geography. Covering more than a tenth of the earth's land area, Russia is the world's largest nation and ranks sixth in population. The climate, generally continental, varies from extreme cold in N Russia and Siberia (where Verkhoyansk, the world's coldest settled place, is located), to subtropical along the Black Sea. Most of European Russia is flatland, except for the URALS, the CAUCASUS (the site of Mt. Elbrus, 18,481 ft/5,633 m, Russia's highest peak), and scattered highlands; it includes TAIGA, TUNDRA, and the largest lakes in Europe, Ladoga and Onega. The fertile Russian Plain is drained by such rivers as the DNEIPER, DON, and VOLGA. The vast majority of the population lives in European Russia. In the central European region Moscow and NIZHNY NOVOGOROD (Gorky) are among the major cities; SAINT PETERSBURG (Leningrad), the second largest city, is in NW European Russia. KAZAN, SAMARA, and VOLGOGRAD are the major cities in the Volga region, and YEKATERINBURG (Sverdlovsk) is in the Urals. Asian Russia is divided into SIBERIA, occupying the vast central region of the country, and the RUSSIAN FAR EAST, bordering on the Pacific.

The key to pronunciation appears on page xiii.

Economy. Despite the end of Communist rule and the disintegration of the USSR, Russian industry and agriculture remain largely owned and managed by the remnants of the bureaucratic state. Collapse of Communist rule has brought severe disruptions to the economy, with increased shortages of food and consumer goods and high inflation. Laws have been passed that permit private and foreign purchase of state enterprises, and many barriers to private ownership of agricultural land were removed by decree in 1993. The government has also ended most price controls in an effort to stimulate the economy and begin a transition to capitalism. In 1992 the sale, through a voucher system, of state enterprises to Russian citizens began, about half the state-owned businesses were privatized by the end of 1993. Farmland is divided into state farms, COLLECTIVE FARMS, and privately held plots; land reform is expected to lead to the breakup of many state and collective farms. Major crops are rye, wheat, and other grains, potatoes, sugar beets, and flax. Other important farm products include dairy products, meat, and furs. Russia is the world's major producer of timber and a leading fishing nation. It has substantial mineral resources, including major deposits of coal, iron, petroleum and natural gas, bauxite, asbestos, copper, and gold. Among its other energy resources are hydropower and nuclear energy. The nation's vast industries produce a wide range of both capital and consumer goods. Russian ports include KALININGRAD, Saint Petersburg, and VLADIVOSTOK.

People. Russians make up 83% of the country's population; there are Ukrainian and non-Slavic minorities. Russian is the official language. Although religious practice was long suppressed or discouraged under Soviet rule, many people worship in the Russian Orthodox Church (see ORTHODOX EASTERN CHURCH); other religions include Roman Catholicism, Protestantism, Judaism, Islam, and Buddhism.

Government. The Russian government is headed by a popularly elected executive president (established 1991). Under the constitution approved in 1993, the Federal Assembly consists of two chambers, the 178-member indirectly elected Federation Council (the upper house) and the 450-member popularly elected State Duma (the lower house). Ethnically non-Russian areas are constituted as 21 republics (formerly autonomous republics), 1 autonomous oblast (region), and 10 autonomous okrugs (national areas); there are 49 Russian oblasts (the cities of Moscow and St. Petersburg also have oblast status) and 6 Russian krays (territories). Oblasts and krays are roughly equivalent to provinces.

History. Russia was inhabited in the Paleolithic period. By the 7th cent. B.C. the Scythians (see SCYTHIA) controlled the north shore of the BLACK SEA and the CRIMEA. The KHAZARS built (7th–10th cent. A.D.) a powerful state in S Russia, and by the 9th cent. the East SLAVS had settled in the N UKRAINE and nearby regions. The Russian state is said to have been established by Rurik, leader of a band of Scandinavian traders and warriors (the Varangians), who founded (862) a dynasty at NOVGOROD. His successor, Oleg, made (882) KIEV the capital of KIEVAN RUSSIA, and Christianity became the official religion under VLADIMIR I, who adopted (988–89) the Greek rite. Kievan Russia broke up into principalities in 1054 and was destroyed (1237–40) by invading Mongols (see TATARS) who established the empire of the GOLDEN HORDE.

Imperial Russia. In the 15th cent. IVAN III, grand duke of MOSCOW, ceased to pay tribute to the Tatars and expanded his territory of conquest. IVAN IV further extended Russian rule and took the title "czar of all Russia" in 1547. The death of Czar Boris GODUNOV in 1605 was followed by the "Time of Troubles," a period marked by the appearance of pretenders (see DMITRI) and an invasion (1609) by SIGISMUND III of Poland. The Poles were expelled in 1612 and in 1613 Michael ROMANOV was made czar, thus beginning a dynasty that ruled Russia until 1917. PETER I (r.1689–1725) undertook the Westernization of Russia and enacted many administrative re-

forms, but he also increased autocracy and enserfment (see SERF). In 1703 Peter founded SAINT PETERSBURG, the new capital, on land won in the NORTHERN WAR. He also began the RUSSO-TURKISH WARS. Under CATHERINE II (r.1762–96), Russia became a great power, expanding its borders in the west and south (see POLAND, PARTITIONS OF). The suppression of the PUGACHEV revolt (1773–75) strengthened the privileged classes. During the reign of ALEXANDER I, the French under NAPOLEON I took (1812) Moscow; but after Napoleon's defeat and the peace arranged at the Congress of VIENNA, Russia and Austria emerged as the chief powers on the Continent (see HOLY ALLIANCE). Liberalism in the Russian upper classes led to an unsuccessful revolt (1825) by the DECEMBRISTS. Under the reactionary rule of NICHOLAS I, Russia crushed an uprising (1830–31) in Poland and helped Austria subdue a revolt (1848–49) in Hungary. Its attempts to dominate the Turks led to the CRIMEAN WAR (1854–56). ALEXANDER II freed the serfs in 1861 (see EMANCIPATION, EDICT OF), but grew increasingly conservative. Meanwhile, Russia's expansion continued into the CAUCASUS, Turkistan, and E Asia (see RUSSIAN FAR EAST). Alexander II's assassination (1881) was followed by a period of reaction under ALEXANDER III and NICHOLAS II, the last Russian czar. The disastrous RUSSO-JAPANESE WAR (1904–5) led to the Revolution of 1905; Nicholas was forced to grant a constitution and a parliament (see DUMA). Repression continued, however, under Nicholas's premier, P.A. STOLYPIN. Leftist militancy (see BOLSHEVISM AND MENSHEVISM) and WORLD WAR I completed Russia's collapse. During the RUSSIAN REVOLUTIONS of 1917, Nicholas II was forced to abdicate; the Bolsheviks, led by LENIN, took power. Russia withdrew from the war by the Treaty of BREST-LITOVSK, but civil war ensued and lasted until the Soviet regime emerged victorious in 1920. In 1917 Russia was proclaimed the Russian SFSR and in 1922 it became part of the USSR. For the history of Russia as part of the USSR (1922–91), see UNION OF SOVIET SOCIALIST REPUBLICS.

Post-Soviet Russia. Under Soviet Pres. GORBACHEV, the end of repressive political controls permitted nationalist movements to arise in the constituent republics of the USSR. In 1990 Boris YELTSIN and other nationalists and reformers were elected to the Russian parliament; Yeltsin was subsequently chosen Russian president. Under Yeltsin, Russia declared its sovereignty (but not its independence) and began to challenge the central government's authority. In 1991 Yeltsin was reelected in the first popular election for president in the history of the Russian Republic. He and the leaders of eight other republics reached a power-sharing agreement with Gorbachev, but its imminent signing provoked a coup attempt (Aug. 1991) by Soviet hard-liners. In the aftermath, the USSR disintegrated. With Ukraine and Belarus, Russia established the COMMONWEALTH OF INDEPENDENT STATES. When Gorbachev resigned (Dec. 1991), Yeltsin had already taken control of most of the central government, and Russia assumed the USSR's UN seat. Yeltsin also moved rapidly to end or reduce state control of the economy, but control of parliament by former Communists led to conflicts and power struggles. In Sept. 1993 Yeltsin suspended the parliament and called for new elections. Parliament retaliated by naming Vice Pres. RUTSKOI acting president, and attempted an armed uprising, which was crushed by the army. Rutskoi and others were jailed, and the parliament dissolved. In Dec. 1993 voters approved a new constitution that strengthened presidential power, but they also supported many of Yeltsin's opponents, such as ultranationalist Vladimir ZHIRINOVSKY, in the legislative elections. The Russian Federation has had to confront movements for autonomy or independence in several ethnically based regions and republics, such as Tatarstan (see TATARS) and Chechenya (a republic in the N Caucasus), and there have been violent conflicts between ethnic groups, particularly in the Caucasus.

Russia Company: see MUSCOVY COMPANY.

Russian Blue cat: see under CAT.

Russian Far East, formerly the Soviet Far East, region (1989 est. pop. 7,941,000), c.2,400,000 sq mi (6,216,000 sq km), E Russia, comprising the entire NE coast of Asia. Often considered part of SIBERIA, the area was treated separately in Soviet regional schemes. It borders Sakha (formerly Yakutia, NW); the East Siberian Sea (N); Bering Sea (NE); Sea of Japan (SE); China (S); and Yablonovy Mts. (SW). The region includes mountains, TAIGA, and TUNDRA. It is virtually self-sufficient economically. VLADIVOSTOK and other cities produce iron, steel, petroleum, lumber, and other products. Resources include coal, oil, and gold. Farming, fishing, and hunting are major occupations. Over 25 ethnic groups inhabit the region. Russian colonization began in the late 16th cent. From the mid-19th to early 20th cent. various parts of the region were acquired from China and Japan, and it was incorporated into the USSR in 1922. In the 1960s and 70s there were Sino-Soviet border clashes along the AMUR and USSURI rivers.

RUSSIAN AND SOVIET RULERS FROM 1462
(including dates of reign or in power)

House of Rurik
Ivan III (the Great), 1462–1505
Vasily III, 1505–33
Ivan IV (the Terrible), 1533–84
Feodor I, 1584–98

House of Godunov
Boris Godunov, 1598–1605
Feodor II, 1605

Usurpers
Dmitri, 1605–6
Vasily IV, 1606–10

Interregnum, 1610–13

House of Romanov
Michael, 1613–45
Alexis, 1645–76
Feodor III, 1676–82
Ivan V and Peter I (the Great), 1682–96
Peter I (the Great), 1696–1725
Catherine I, 1725–27
Peter II, 1727–30
Anna, 1730–40
Ivan VI, 1740–41
Elizabeth, 1741–62
Peter III, 1762
Catherine II (the Great), 1762–96
Paul I, 1796–1801
Alexander I, 1801–25
Nicholas I, 1825–55
Alexander II, 1855–81
Alexander III, 1881–94
Nicholas II, 1894–1917

Provisional Government
Prince Georgi Lvov, Mar.–July 1917
Aleksandr Kerensky, July–Nov. 1917

Soviet Russia and the USSR
Vladimir Lenin, 1917–24
Joseph Stalin, Lev Kamenev, and Grigori Zinoviev, 1924–26
Joseph Stalin, 1926–53
Nikita Khrushchev and Georgi Malenkov, 1953–55
Nikita Khrushchev and Nikolai Bulganin, 1955–58
Nikita Khrushchev, 1958–64
Leonid Brezhnev, 1964–82
Yuri Andropov, 1982–84
Konstantin Chernenko, 1984–85
Mikhail Gorbachev, 1985–91

Russian Federation
Boris Yeltsin, 1991–

Russian Federation: see RUSSIA.

Russian language, member of the East Slavic group of the Slavic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Russian Revolution, violent upheavals in Russia ending in the overthrow of the czarist government in 1917. By 1905 discontent permeated all classes: the peasants, workers, army, intelligentsia,

national and religious minorities, and segments of the bourgeoisie and aristocracy. The RUSSO-JAPANESE WAR (1904–5) revealed the corruption and incompetence of the regime of NICHOLAS II. The Revolution of 1905 began in January, when troops fired on a peaceful crowd of workers who, led by a priest, were marching to the Winter Palace in St. Petersburg to petition the czar. This "bloody Sunday" was followed by months of disorders throughout Russia. In October the czar granted basic civil liberties and a parliament, or DUMA, but the first and second dumas were soon dissolved and the revolutionary movement was ruthlessly suppressed. WORLD WAR I, which began in 1914, brought the situation to a head. By March 1917 (February in the Old Style calendar), military defeats, acute civilian suffering, and government ineptness had led to food riots and strikes in Petrograd (the capital's new, less Germanic name) and Moscow. Many soldiers refused to help put down the disorders. In mid-March the czar tried unsuccessfully to dissolve the fourth duma. The insurgents seized Petrograd, the duma appointed a provisional government under Prince LVOV, and Nicholas was forced to abdicate. Most welcomed the end of autocracy, but the new government had little support, and its power was limited by the Petrograd workers' and soldiers' council, or SOVIET, which controlled troops, communications, and transport. The government called for a general amnesty, civil liberties, and a constituent assembly elected by universal suffrage, but said nothing about the war or about redistribution of land. The soviet demanded peace, and demonstrations forced the foreign minister to resign in May. In April, LENIN had returned to Russia to lead the small Bolshevik party (see BOLSHEVISM AND MENSHEVISM) under the slogans "end the war," "all land to the peasants," and "all power to the soviets." KERENSKY replaced Lvov as head of the government in July. Those who wanted to limit the soviet's power rallied around General Z.G. Kornilov, whose attempt in September (October, Old Style) to seize Petrograd was put down with the help of the Bolsheviks and other socialists. Lenin urged the soviet, in which the Bolsheviks now had a majority, to take power. On the night of Nov. 6 (Oct. 24, Old Style) Bolshevik workers and sailors captured the government buildings and the Winter Palace. The Second All-Russian Congress of Soviets approved the coup, after the Menshevik and SOCIALIST REVOLUTIONARY PARTY delegates had left the meeting. A cabinet (the Council of People's Commissars) was set up with Lenin as chairman. The Congress of Soviets called for an end to the war and gave private and church lands to the village soviets. Bolsheviks soon took Moscow and other cities. Workers' control was established in factories, banks were nationalized, and an economic council was formed. The constituent assembly met in Jan. 1918, but was disbanded by Bolshevik troops. The Cheka (political police) was set up to eliminate the opposition. In March, Russia made peace (see BREST-LITOVSK, TREATY OF). Civil war between Bolshevik (Red) and anti-Bolshevik (White) forces raged until 1920, centering in S Russia, Ukraine, and Siberia. It was accompanied by the intervention of British, American, French, and other armies, allegedly to protect Allied supplies. The Bolsheviks' military victory, due partly to the lack of cooperation among their opponents and partly to the reorganization of the Red Army by TROTSKY, was won at the cost of vast devastation.

Russian Soviet Federative Socialist Republic (RSFSR), former constituent republic of the UNION OF SOVIET SOCIALIST REPUBLICS, since 1991 the independent nation of RUSSIA.

Russian wolfhound: see BORZOI.

Russo-Japanese War, 1904–5, imperialistic conflict growing out of rival designs on MANCHURIA and Korea. Russia had penetrated those territories and refused (1904) to negotiate with Japan over spheres of influence there. Japan then bottled up the Russian fleet at Port Arthur (now Lüshun, China), defeated a Russian army at Mukden (now Shenyang), and destroyed the Russian fleet off the Tsushima islands. Peace was brought about by U.S. Pres. Theodore ROOSEVELT. Japan emerged as a world power. Russia's defeat contributed to the 1905 RUSSIAN REVOLUTION.

Russo-Turkish Wars, 1697–1878, series of campaigns in which Russia expanded at the expense of the OTTOMAN EMPIRE (Turkey). In 1696 PETER I won the first Russian victory by capturing the fortress at Azov; it was recaptured (1711) by AHMED III. In 1736 war broke out again, with Austria as a Russian ally. The Russians recaptured Azov and won a spectacular battle at Jassy, Moldavia (1739), but the treaty forced on Russia by Austria erased most of Russia's gains. The first major Russo-Turkish War (1768–74) began when Sultan Mustafa III, encouraged by France, declared war on CATHERINE II of Russia. The Russians conquered the Crimea, installed a pro-Russian khan there, and overran Moldavia and Walachia. The treaty ending the war solidified Russia's Crimea gains (Catherine annexed it outright in 1783), gave Russia a voice in Turkish domestic matters, and allowed it navigation rights on the Black Sea. These developments alarmed the Western powers, exacerbating what became known as the EASTERN QUESTION. Catherine's second war (1787–92) gave Russia the SW UKRAINE, with Odessa. The war of 1806–12 gave it Bessarabia. The war of 1828–29, linked with the Greek War of Independence, completed the conquest of the Caucasus and brought Russian power to its zenith. But in 1853 Turkey had the backing of Great Britain and France in the CRIMEAN WAR; the Congress of PARIS (1856) ending that war was a significant setback for Russian influence in the Middle East. The last Russo-Turkish War resulted from an anti-Turkish uprising (1875) in Bosnia and Hercegovina. Serbia and Montenegro joined in, and Russia openly entered the war in 1877. The Treaty of San Stefano (1878) ended the war on terms so beneficial to Russia that the Western powers, in alarm, revised the terms at the Congress of BERLIN.

rust, in chemistry, the result of the corrosion of iron, by way of OXIDATION, in the presence of water. The combination of iron with oxygen results in the deterioration of the surface of the metal. Rust is brittle and easily flakes off the metal.

rust, in plant pathology, name for a FUNGUS of the order Uredinales and for the plant diseases such fungi cause. Rusts form reddish patches of spores on their hosts. Some species grow entirely on one host; others need host plants of two separate species to complete their life cycles (e.g., the cedar rust, which grows on CEDAR and APPLE trees). Rusts attack GRAIN crops and many fruits, vegetables, ornamentals and trees.

Rust Belt, economic region in the NE U.S., centered on Illinois, Indiana, Michigan, Ohio, and Pennsylvania. The term gained currency in the 1970s as this formerly dominant industrial area suffered from factory abandonment and manufacturing shifts to SUNBELT cities and Mexico, unemployment, outmigration, loss of electoral votes, and overall decline. The states began to recover, however, in the early 1990s.

rutabaga: see TURNIP.

Ruth, Babe (George Herman Ruth), 1895–1948, American baseball player; b. Baltimore. He was the most famous player in the game's history. Signed at 19 by the minor-league Baltimore Orioles, he was sold to the Boston Red Sox, for whom he became an outstanding pitcher (1914–19), winning 87 games and losing 44. After being moved to the outfield because of his hitting prowess, he was sold (1920) to the New York Yankees, where he became a baseball legend. As a Yankee he led the league in home runs for 10 seasons, setting (1927) the existing record of 60 home runs in one season. (Roger MARIS hit 61 in a longer schedule.) "The Bambino" hit 714 home runs in his career, a record finally broken (1974) by Henry AARON. He led the Yankees to seven pennants, and Yankee Stadium, built in 1923, came to be known as "the house that Ruth built." He played briefly for the Boston Braves in 1935.

Ruth, book of the OLD TESTAMENT, eighth in the Authorized Version, tells the story of the fidelity of a Moabite widow (Ruth) to her widowed mother-in-law (Naomi). Ruth returns with Naomi to Bethlehem from Moab and there marries Naomi's kinsman Boaz. Ruth and Boaz were ancestors of DAVID. The story probably dates in final form from 450 to 250 B.C.

Ruthenia, Latinized form of *Russia.* The term was applied to Ukraine when the medieval princes of Galich took the title kings of Ruthenia. Later, in Austria-Hungary, *Ruthenians* denoted the Ukranian population of W Ukraine. After 1918 *Ruthenia* referred only to the easternmost province of Czechoslovakia, also known as the Carpathian, or Transcarpathian, Ukraine; it became part of the Soviet Ukraine in 1945.

ruthenium (Ru), metallic element, discovered in 1827 by G.W. Osann in crude platinum ore. It is a hard, lustrous, silver-gray metal

that is usually alloyed with other metals to provide hardness and corrosion resistance. Its compounds are used to color ceramics and glass. See ELEMENT (table); PERIODIC TABLE.

Rutherford, Ernest Rutherford, 1st **Baron,** 1871–1937, English physicist; b. New Zealand. He taught at McGill Univ., Montreal (1898–1907) and the Univ. of Manchester (1907–19) and was director from 1919 of the Cavendish Laboratory, Cambridge. Rutherford discovered and named alpha and beta radiation (see RADIOACTIVITY) and helped propose a theory of radioactive transformation of atoms for which he received the 1908 Nobel Prize in chemistry. On the basis of experiments carried out under his direction, he concluded (1911) that the ATOM is a small, heavy nucleus surrounded by orbital electrons. Rutherford was the first to split atomic nuclei artificially.

rutherfordium (Rf), artificial radioactive TRANSURANIUM ELEMENT. Claims for its production have been made by a Soviet group in Dubna who, in 1964, bombarded plutonium with neon ions to obtain, apparently, the Rf^{260} isotope, and by an American group at the Univ. of California, Berkeley who, in 1969, bombarded californium with carbon nuclei to obtain the Rf^{257} and Rf^{259}, and possibly the Rf^{258}, isotopes. It is also called kurchatovium (Ku) and unnilquadium (Unq). See ELEMENT (table); PERIODIC TABLE.

rutile, mineral, one of three forms of titanium dioxide (TiO_2). It occurs in crystals, often in twins or rosettes, and is typically brownish red, although there are black varieties. Rutile is found in igneous and metamorphic rocks, chiefly in Switzerland, Norway, Brazil, and parts of the U.S.

Rutland, city (1990 pop. 18,230), seat of Rutland co., W Vt., on the Otter and East creeks; settled c.1770, inc. as a city 1892. It has diverse small industries, and marble quarrying, begun c.1845, still flourishes nearby. Headquarters for the Green Mountain National Forest, Rutland is a tourist center located near many lakes and ski areas.

Rutledge, Ann, 1813?–1835, American innkeeper's daughter, linked in romantic speculation to Abraham LINCOLN; lived in New Salem, Ill. Her death grieved Lincoln deeply, and from this one fact, W.H. Herndon wove the story (denied by Mrs. Lincoln and found unconvincing by historians) of Lincoln's love for her. Actually, Ann was engaged to Lincoln's friend John McNamar.

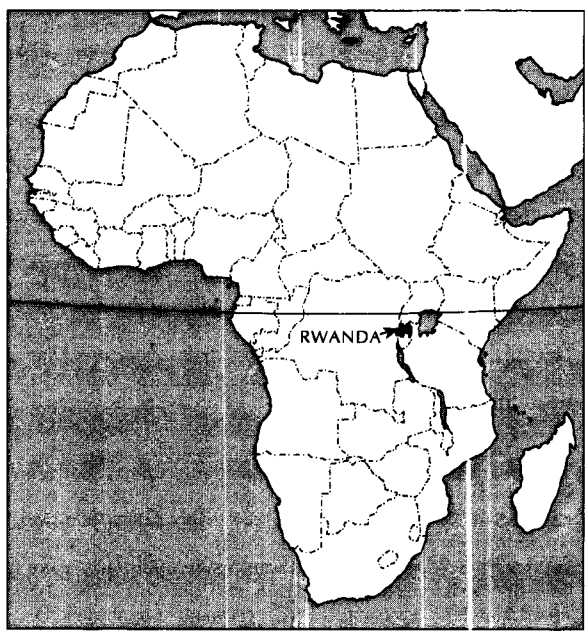
Rutledge, John, 1739–1800, American statesman and jurist; b. Charleston, S.C. A political force in South Carolina, where he served as president (1776–78) and governor (1779–82), he was twice a delegate (1774–76, 1782–83) to the CONTINENTAL CONGRESS and was a delegate to the 1787 FEDERAL CONSTITUTIONAL CONVENTION. He served as associate justice of the U.S. SUPREME COURT (1789–91) and was named second chief justice in 1795, but the Senate rejected the nomination and he sat for only five months.

Rutskoi or **Rutskoy, Aleksandr Vladimirovich,** 1947–, Russian politician; b. Ukraine. A Russian nationalist and former air force officer who fought in AFGHANISTAN, he was YELTSIN's vice presidential running mate in 1991. As vice president, Rutskoi supported Yeltsin during the coup attempt against GORBACHEV, but he later became Yeltsin's critic and rival. In 1993, after Yeltsin suspended the parliament, its deputies named Rutskoi acting president. Rutskoi called for an armed uprising to oust Yeltsin, but it was crushed by the army and he was jailed.

Ruysdael, Jacob van: see RUISDAEL, JACOB VAN.

Rwanda [rʊōän'dä], officially Republic of Rwanda, republic (1992 est. pop. 8,206,000), 10,169 sq mi (26,338 sq km), E central Africa, bordered by Zäire (W), Uganda (N), Tanzania (E), and Burundi (S). KIGALI is the capital. Most of the country, consisting of steep mountains and deep valleys, is situated at 5,000 ft (1,520 m) or higher. The Virunga mountain range N of Lake Kivu rises to 14,787 ft (4,507 m) at Mount Karisimbi. The economy is overwhelmingly agricultural, largely of the subsistence type. The major cash crops are coffee, tea, and pyrethrum; plaintains, cassava, sweet potatoes, pulses, and sorghum are among the food crops. Tin ore, wolframite, beryl, and colombo-tantalite are mined in large quantities. Manufacturing is limited to basic consumer goods, textiles, and chemicals. Economic development is impeded by a large population and lack of easy access to the sea. About 90% of the population are Hutu, 9% are Tutsi, and 1% are Twa (PYGMIES). About half follow traditional beliefs. Most of the rest are Roman Catholic; there are some Muslim Tutsi. Kinyarwanda and French are the official languages, but Swahili is widely used.

History. The early history of Rwanda is similar to that of BURUNDI. By the late 18th cent. a single Tutsi-ruled state, headed by a *mwami* (king), occupied much of Rwanda and dominated the Hutu, the vast majority of the population. In 1890 Rwanda accepted German overrule without resistance and became part of German East Africa. Belgian forces occupied the country in WORLD WAR I, and in 1919 it became part of the Belgian mandate of RUANDI-URUNDI (a UN trust territory in 1946). In 1957 the Hutu demanded a greater voice in the country's affairs, and on the accession (1959) of Kigeri V fighting erupted between them and the Tutsi. The victorious Hutu gained control of the country, and some 100,000 Tutsi fled to nearby states. Rwanda became independent in 1962, with Grégoire Kayibanda as president. In 1973 a coup installed Maj. Gen. Juvénal Habyarimana as head of a military regime. Civilian rule was restored under a new constitution that established (1978) a one-party state, but Habyarimana remained president. In 1990 Rwanda was invaded by forces composed largely of Tutsi exiles. Intermittent warfare continued into 1993, when a peace accord was signed. The treaty calls for power-sharing and the repatriation of Tutsi exiles.



Ryan, Nolan 1947–, American baseball pitcher; b. Refugio, Texas. A right-hander with a blazing fastball, he played with the New York Mets, California Angels, Houston Astros, and Texas Rangers while in the major leagues (1967–93). He had 324 career wins, including a record seven no-hitters, and set records for career (5714) and single-season (383) strikeouts.

Ryder, Albert Pinkham, 1847–1917, American painter; b. New Bedford, Mass. He produced only about 160 canvases, now considered among the finest in American art. Small in size, they are grand in design and feeling, luminous and subtle in color. Moonlight and the sea predominate in paintings that evoke a lonely, poetic mood. Ryder's paintings are in most major American museums, e.g., *Death on a Pale Horse* (Cleveland Mus.) and *The Flying Dutchman* (National Gall., Wash., D.C.).

rye, cereal plant (*Secale cereale*) of the GRASS family, important chiefly in central and N Europe. The GRAIN, or seed, is used for pumpernickel and the lighter-colored rye bread (made from a mixture of rye and wheat flour), as a stock feed, and in the distillation of whiskey and gin. The plant, which grows well in areas where the soil is too poor and the climate too cool for wheat, is also grown for hay and pasturage and as green manure and a cover crop.

Russia leads in world production. ERGOT, a fungous infection, is poisonous and can make rye unsafe for use.

Rye House Plot, conspiracy (1683) to assassinate CHARLES II of England and his brother (later JAMES II) at Rumbold's Rye House in Hertfordshire. The plot miscarried, and its discovery led to the executions of the great Whig leaders Lord John Russell and Algernon Sidney on flimsy evidence.

Ryukyu Islands, archipelago (1990 est. pop. 1,500,000), SW Japan, c.1,850 sq mi (4,790 sq km), extending c.650 mi (1,050 km) SW from Kyushu, between the East China and Philippine seas. The Ryukyus consist of three principal groups: the Amami Islands (N); Okinawa Islands, including OKINAWA; and Sakishima Islands (S). The climate is subtropical, with heavy rains and frequent typhoons. The entire archipelago was incorporated into the Japanese empire in 1879 and passed to the U.S. in 1945. The Amami group was returned to Japan in 1953, the rest of the archipelago in 1972.

S

S, chemical symbol of the element SULFUR.

Sá, Mem de [sä], d. 1572, Portuguese governor general of Brazil (1557?–1572). He founded the city of RIO DE JANEIRO.

Saadi: see SADI.

Saadia ben Joseph al-Fayumi, 882–942, Jewish scholar, known as Saadia Gaon; b. Egypt. Under his leadership the great Jewish Academy at Sura, Babylonia, became the highest seat of Jewish learning. He compiled a prayer book, or *siddur;* translated the Bible into Arabic; and wrote on Hebrew grammar, on philosophy, and on religion.

Saarinen, Eero [sä'rĭnĕn], 1910–61, Finnish-American architect. He established a reputation with the General Motors Technical Center, Warren, Mich. (1951–55). An innovator, he is famous for the circular chapel and concrete-dome auditorium (1955) at the Massachusetts Institute of Technology, and for the Trans World Airlines terminal, N.Y.C. His Dulles International Airport, Chantilly, Va., was finished posthumously. His father, **Eliel Saarinen,** 1873–1950, was an architect and city planner. He built the Helsinki railway station, and many buildings in the U.S.

Saarland, state (1990 est. pop. 1,065,000), 991 sq mi (2,567 sq km), SW Germany. The area was formerly called the Saar or the Saar Territory. Saarland is highly industrialized, with iron and steel manufacturing based on vast coal fields. Saarbrücken is the capital. The autonomous Saar Territory was created by the Treaty of VERSAILLES. In 1935 a plebiscite reunited it with Germany. After WORLD WAR II it was again made autonomous, but French economic influence there caused friction between France and West Germany. From 1957 until German reunification in 1990, Saarland was a state in West Germany.

Sabah, self-governing E Malaysian state (1990 est. pop. 1,470,000), 29,545 sq mi (76,522 sq km), on the South China and Sulu seas, bordered by Kalimantan (Indonesian Borneo, S) and Brunei and Sarawak (W). The capital is Kota Kinabalu. Mountainous and densely forested, it exports oil, timber, rubber, and copra. It constituted the British protectorate of North Borneo from 1882 until it joined the Federation of Malaysia in 1963.

Sabbatai Zevi [säbätī' tzvē'], 1626–76, Jewish mystic and pseudo-Messiah; b. Turkey. A student of the CABALA, in 1648 he proclaimed himself the Messiah, named 1666 as the millennium, and gathered a host of followers. He attempted to land in Constantinople in 1666, was captured, and, to escape death, embraced Islam. The Sabbatean movement was revived in the 18th cent. by Jacob FRANK.

Sabbath [Heb., = repose], last day of the week (Saturday), observed as a holy day of rest by the Jews. Early Christians observed the first day of the week in commemoration of the Resurrection; hence Sunday became the Christian Sabbath.

Sabin, Albert Bruce, 1906–93, American physician and microbiologist; b. Belostok, Russia (now Białystok, Poland); came to U.S., 1921. In 1939 he began teaching research pediatrics at the Univ. of Cincinnati. A researcher on viral and other infectious diseases, he developed (c.1959) a live-virus vaccine for immunization against POLIOMYELITIS.

Sabines, ancient people of central Italy, in the Sabine Hills, NE of Rome. From the earliest days there was a Sabine element in Rome. The Sabines warred with Rome, but by the 3d cent. B.C., they were completely amalgamated.

Sacajawea, Sacagawea, or **Sakakawea,** sometimes called **Bird Woman,** 1784–1884?, Shoshone woman, sole woman and guide on the LEWIS AND CLARK EXPEDITION. She had been captured and sold to a Mandan, then traded to Toussaint Charbonneau, interpreter for the expedition. When the expedition reached her native upper Missouri R. region, she proved invaluable as a guide and interpreter. On the return journey, she and Charbonneau remained with the Mandan. Some historians believe that she died c.1812.

Sac and Fox, closely related Native American tribes with an Eastern Woodlands culture and some Plains traits (see NORTH AMERICA, INDIGENOUS PEOPLES OF), belonging to the Algonquian branch of the Algonquian-Wakashan language stock (see NATIVE AMERICAN LANGUAGES). In the 17th cent. about 6,500 Sac and Fox lived by farming and hunting in NE Wisconsin. The Fox, fierce warriors, fought the French, who by 1730 had all but exterminated the tribe. Survivors joined the Sac (or Sauk) and went to Illinois. A fraudulent treaty forced them to move (1831) to Iowa, but they returned (1832) and fought the BLACKHAWK WAR against U.S. troops. In 1990 there were 4,517 Sac and Fox in the U.S.

Sacco-Vanzetti Case. In Apr. 1920, Nicola Sacco and Bartolomeo Vanzetti were arrested for the murder of a paymaster and his guard in South Braintree, Mass. Both men were anarchists (see ANARCHISM) and feared deportation; they gave false statements and were armed. Despite contradictory evidence, both were found guilty in July 1921 and sentenced to death. Many believed that the trial had been unfair and that the two men's political beliefs had convicted them. By 1927, when the Massachusetts supreme court and a governor's commission upheld the proceedings, the case had become a cause célèbre. The execution of Sacco and Vanzetti on Aug. 22, 1927, was preceded by worldwide sympathy demonstrations, and debate on the case continued in later years.

Sachs, Hans [zäks], 1494–1576, German poet, leading MEISTERSINGER of the Nuremberg school. A shoemaker, he wrote many songs, tales in verse (*Schwänke*), and Shrovetide plays. "The Nightingale of Wittenberg" is a poem in LUTHER's honor. Sachs is a key figure in Richard WAGNER's *Die Meistersinger.*

Sachs, Nelly, 1891–1970, German poet and translator. After 1940 she lived in Sweden. Her poetry describes the suffering of the European Jews, e.g., *O the Chimneys* (1967). She shared the 1966 Nobel Prize in literature with S.Y. AGNON.

Sackville-West, V(ictoria Mary), 1892–1962, English writer; wife of Sir Harold NICOLSON. A member of the BLOOMSBURY GROUP, she published poetry, e.g., *The Land* (1926), but is better known for her novels *The Edwardians* (1930) and *All Passion Spent* (1931).

sacrament, an outward sign of something sacred. Christians generally believe sacraments were instituted by Jesus and are visible signs of invisible GRACE. Traditionally, the Orthodox, Roman Cath-

olics, and certain Anglicans believe in seven sacraments—Eucharist (see COMMUNION), BAPTISM, CONFIRMATION, PENANCE, ANOINTING THE SICK, matrimony (see MARRIAGE), and HOLY ORDERS—which, they hold, bestow grace. Most Protestant denominations recognize two sacraments, baptism and communion, and hold that faith, rather than the sacraments, provides grace.

Sacramento, city (1990 pop. 369,365; met. area 1,481,102), state capital and seat of Sacramento co., central Calif., on the Sacramento R. at its confluence with the American R.; settled 1839, inc. 1850. A deepwater port, it is the shipping and processing center for a rich fruit-growing and truck-farming area, and important in electronics and missile manufacture. Government and the military are major employers. Points of interest include Fort Sutter, the capitol building (1860), and the Crocker Art Gallery. The city grew after gold was discovered (1848) at nearby Sutter's Mill, and it became state capital in 1854.

Sacramento, longest river in California, flowing c.380 mi (610 km) SW from near Mt. Shasta to join the San Joaquin R. in a wide delta at San Francisco Bay. Navigable c.260 mi (420 km) to Red Bluff by small vessels, the Sacramento contributes irrigation water to arid S California as part of the Central Valley Project. Keswick and Shasta are the chief dams.

Sadat, Anwar al-, 1918–81, Egyptian president (1970–81). He succeeded NASSER as president. In 1973 he led Egypt into war with Israel (see ARAB-ISRAELI WARS), but later he joined (1978) with Israeli premier Menachem BEGIN in negotiating the CAMP DAVID ACCORDS. He and Begin shared the 1978 Nobel Peace Prize. He was assassinated by Muslim zealots.

Sade, Donatien Alphonse François, comte de [säd], 1740–1814, French author, known as the **marquis de Sade.** Charged with numerous sexual offenses, he spent 27 years in prisons or asylums, writing obscene romances, including *Justine* (1791). His theory that since sexual deviation and criminal acts exist in nature, they are natural, foreshadowed modern psychological thought. *Sadism,* the infliction of pain to attain sexual pleasure, is named for him.

Sadi or **Saadi,** 1184–1291, Persian poet, one of the finest Sufi writers (see SUFISM). His masterpiece is *Garden of Roses* (1258), a miscellany of prose and poetry suffused with warmth of feeling and lofty religious thought.

Safdie, Moshe, 1938–, Israeli-Canadian architect. He was the designer of "Habitat," a system of prefabricated housing modules originally built for Montreal's Expo '67. His more recent work includes the Museum of Civilization, Quebec (1984) and the National Gallery of Canada, Ottawa (1984).

safflower, Eurasian thistlelike herb (*Carthamus tinctorius*) of the COMPOSITE family; also called false saffron. It has long been cultivated in S Asia and Egypt for food and medicine, and as a substitute for true SAFFRON dye; in the U.S. it is important as the source of safflower oil, used in cooking.

saffron, fall-flowering plant (*Crocus sativus*) of the IRIS family, and the yellow dye obtained from it. Native to Asia Minor, it has long been cultivated for the orange-yellow stigmas of its pistils (see FLOWER), which yield saffron powder, the source of the dye. The powder is used in perfumes and medicines and for flavoring. One ounce of saffron powder requires stigmas from about 4,000 flowers.

Safire, William L., 1929–, American journalist and speechwriter; b. N.Y.C. Since 1973, his editorial columns in the New York *Times* have provided a consistent conservative editorial voice. His *On Language* column decries abuses of language. From 1969 to 1973 he was a speechwriter for Pres. NIXON.

saga, in Old Norse Literature, a narrative in prose or verse centering on a legendary or historical figure or family. Sagas were composed from the 11th to the mid-14th cent. and first written down c.1200. Exemplary are the *Sturlungasaga* (a history saga), *Njala* (a family saga), and *Volsungasaga* (a mythical heroic saga), in all of which the epic element is strong and the depiction of heroic society vivid. Other noted sagas are the *Heimskringla* of SNORRI STURLUSON, the *Laxdœla,* the *Grettla,* the *Frithjof,* and *Gisli.*

Sagan, Carl (Edward), 1934–, American astronomer and popularizer of science; b. N.Y.C. Sagan is known for his research on the possibilities of extraterrestrial life (see EXOBIOLOGY), including the experimental production of amino acids from basic chemicals by radiation, and has been involved with several NASA space probes. His books include *The Dragons of Eden* (1977; Pulitzer), *A Path Where No Man Thought* (1990), with Richard Turco, on NUCLEAR WINTER, and *Shadows of Forgotten Ancestors* (1992), with Ann Druyan. He created and hosted the television science series *Cosmos* (1980).

Sagan, Françoise, pseudonym of **Françoise Quoirez,** 1935–, French novelist. She became famous with her precocious first work, *Bonjour tristesse* (1954), acclaimed for its portrayal of a sophisticated, disillusioned French society. Her many other novels include *Un Certain Sourire* (1956) and *Aimez-vous Brahms?* (1959).

sage, aromatic herb or shrub (genus *Salvia*) of the MINT family. The common sage of herb gardens (*S. officinalis*), native from S Europe to Asia Minor, is a strongly-scented shrubby perennial; its dried leaves are used as a seasoning and in a tea. Ornamental sages, popularly called salvia, include the scarlet sage (*S. splendens*), noted for its neat spikes of usually red flowers.

sagebrush, name for several species of the genus *Artemesia,* deciduous shrubs of the COMPOSITE family, especially abundant in arid regions of W North America. The common sagebrush (*A. tridentata*) is a silvery-gray, low shrub with a pungent odor of sage, although it is unrelated to true SAGE. Common in the West, sagebrush is an important forage plant. It is the state flower of Nevada.

Saginaw, city (1990 pop. 69,512), seat of Saginaw co., S Mich., on the Saginaw R., 15 mi (24 km) from Lake Huron; inc. 857. Located in an agricultural area long inhabited by Native Americans, it was a 19th-cent. fur and lumber center, and is now an industrial city producing diverse manufactures. Salt, coal, and oil deposits are nearby.

Sahara, world's largest desert, c.3,500,000 sq mi (9,065,000 sq km), extending c.3,000 mi (4,830 km) east to west and c.1,200 mi (1,930 km) north to south across N Africa; it is bordered on the south by the SAHEL. Rainfall ranges from less than 5 in. (12.7 cm) to 10 in. (25 cm), with dry periods occasionally lasting for years. Nighttime temperatures often drop below freezing, and daytime temperatures have been recorded at over 135°F (57°C) in the shade. The surface of the desert ranges from sand dunes (erg), covering about 15%, to stone plateaus (hammada) and gravel surfaces (reg), covering about 70%, to several deeply dissected mountain massifs (Ahagger, Tibesti, and Aïr), infamous in the past for the shelter they provided to marauders preying on desert travelers. Vast underground aquifers, filled with water thought to date from the Pleistocene epoch, when the Sahara was wetter, underlie much of the region, and there are important deposits of iron ore, phosphates, oil, and natural gas.

Sahel, semiarid region extending across N central Africa from Senegal (W) to Ethiopia (E). It has more rainfall (8–16 in./20–40 cm) and better grazing lands than the SAHARA desert, to the north, but it is periodically afflicted by droughts that reduce its normally meager water supply and shatter its grazing and agricultural economy. The drought of 1967–74 was particularly devastating, causing mass migration and contributing to the starvation of hundreds of thousands of people.

Saida: see SIDON.

Saigon: see HO CHI MINH CITY.

sailfish, marine game and food FISH of the family Istiophoridae, related to the SWORDFISH and MARLIN. Its high, wide dorsal fin, or sail, is deep blue with black spots. The average length of a sailfish is 6 ft (180 cm). The Atlantic species (*Istiophorus americanus*), found as far north as Cape Cod in summer, averages 60 lb (27 kg). The Pacific *I. orientalis* grows to 100 lb (45 kg).

sailing, as a sport, the art of navigating a sailboat for recreational or competitive purposes. In racing, competition is generally restricted to boats of the same class. Boats are classified according to their sails and masts. The most common types are the sloop (one mast, two sails), schooner (usually two masts and five sails), yawl (two masts, four sails), and ketch (two masts, five sails). Sloops, from 10 to 70 ft (3.05–21.34 m) are generally used for racing, and the other types, usually more than 20 ft (6.1 m) long, for recreational cruising. Especially popular today are the 16 to 23 ft (4.88–7.01 m) one-design boats, such as the Star (designed 1911), Snipe, Comet, Mercury, and Lightning. Although sailing is popular throughout the

world, international competition since World War II has been dominated by the U.S., Great Britain, Australia, and the USSR (now Russia). The oldest and most prestigious event in international racing is the *America*'s Cup series for large sloops, begun in 1851 and won by the U.S. until 1983, when it was taken by the Australians. In 1987 the U.S. regained the cup. The results of the 1988 race, in which New Zealand unsuccessfully challenged the U.S. and nonstandard boats were used, were disputed in court but upheld on appeal. Since 1992, larger, faster boats have been used in the cup races. Other important sailboat events include the Admiral's Cup, the Bermuda Race, the Trans-Pacific Race, and the Whitbread Round the World Race. Sailing competition has been part of the Olympics since 1900.

sailplane: see GLIDER.

Saint. For canonized and uncanonized saints, see under the proper name, e.g., THOMAS AQUINAS, SAINT. For surnames and place names beginning thus, see in alphabetical position here: thus, SAINT EXUPÉRY, ANTOINE DE; SAINT LOUIS.

saint, in Christian theology, a person who shares in the holiness of God. To New Testament authors, the church was the community of saints, but the word came to be used for those who live in heaven. The Virgin MARY is the chief saint, and the ANGELS are counted as saints. The Roman Catholic and Orthodox LITURGIES commemorate the saints with special feast days. In East and West criteria for recognition of sainthood are martyrdom, holiness of life, miracles in life and after death, and a popular cult. The addition of a name to the official list of saints is called canonization. In 1969 the Roman Catholic Church dropped certain saints, including St. Christopher, from its liturgical calendar because of doubts about their historicity.

Saint Augustine, city (1990 pop. 11,692), seat of St. Johns co., NE Fla.; founded 1565, inc. 1824. The oldest city in the U.S., it is a port and tourist and fishing center with some light industry. Famous sights include two Spanish structures that are now national monuments, the Castillo de San Marcos (1672–96) and Fort Matanzas (1742). The city's strategic importance made it the object of fighting on many occasions from 1586, when it was attacked by Sir Francis DRAKE, through the CIVIL WAR, when it was occupied by Union forces.

Saint Bartholomew's Day, massacre of, murder of French Protestants, or HUGUENOTS, by Roman Catholics, beginning on Aug. 24, 1572. The presence of many Huguenots in Paris for the wedding of Henry of Navarre (later HENRY IV) gave CATHERINE DE' MEDICI and the reluctant King CHARLES IX a chance to plan a general massacre. Admiral COLIGNY was the first victim. The massacre spread to other parts of France and caused the resumption of the WARS OF RELIGION (1562–98).

Saint Bernard, massive WORKING DOG; shoulder height, 25–29 in. (64–74 cm); weight, 140–170 lb (64–77 kg). There is a smooth-coated and a rough-coated variety, both in mixtures of white, red, and brindle. Bred (18th cent.) by monks of the Hospice of the St. Bernard Pass, in the Swiss Alps, for rescue and guide work, the breed was perfected in 19th-cent. England.

Saint Catharines, city (1991 pop. 129,300), SE Ontario, Canada, part of the regional municipality of Niagara (1991 pop. 393,936). It is an industrial city located on the WELLAND SHIP CANAL. Manufactures include canned fruit, wine, automobile parts, and electrical equipment. The city was founded in 1790. Port Dalhousie, site of the annual Royal Henley Regatta, became part of St. Catharines in 1961.

Saint Christopher and Nevis: see SAINT KITTS-NEVIS.

St. Clair, Arthur, 1743–1818, American general; b. Scotland. During the AMERICAN REVOLUTION, he abandoned Fort TICONDEROGA without a fight (1777) but was exonerated by a court-martial (1778). He was the first governor of the NORTHWEST TERRITORY (1787–1802), and was defeated by Native American forces there in 1792.

Saint Clair, Lake, on the U.S.-Canada border, NE of Detroit, Mich. Part of the St. Lawrence & Great Lakes Waterway, it is connected with Lake Huron to the north by the St. Clair R. and with Lake Erie to the south by the Detroit R. Its area is c.490 sq mi (1,270 sq km).

Saint Croix [sānt kroi], largest of the U.S. VIRGIN ISLANDS.

St. Denis, Ruth [dĕn'ĭs], 1877?–1968, American dancer; b. Newark, N.J., as Ruth Dennis. She is known for "Oriental" dances that had widespread influence on MODERN DANCE. With her husband Ted Shawn, she founded the Denishawn schools in Los Angeles and New York City (1920). Works include *Radha* (1906) and *The Nautch* (1908).

Sainte-Beuve, Charles Augustin [sănt-böv], 1804–69, French literary critic and historian. Much of his vast critical output was collected as *Monday Chats* (1851–62). His great work was *Port-Royal* (1840–59), a six-volume history of 17th-cent. French culture. Though his work reveals his taste, learning, and passion for truth, his biographical approach to literature has been largely abandoned.

Saint Exupéry, Antoine de [sănt'ĕgzüpārē'], 1900–44, French author and aviator, lost in action in World War II. His writings, e.g., *Night Flight* (1931), reflect his feeling for the open skies and his love of freedom of action. His fable *The Little Prince* (1943) is beloved by adults and children alike.

Saint Gall, Ger. *Sankt Gallen,* city (1990 pop. 73,191), capital of Saint Gall canton, NE Switzerland, on the Lake of Constance. The textile center of E Switzerland, it grew around the hermitage of St. Gall and joined the Swiss Confederation in 1454. Its library of medieval manuscripts is world famous.

Saint-Gaudens, Augustus [sānt-gôd'ənz], 1848–1907, foremost American sculptor of his time; b. Ireland. He is best known for his heroic public monuments, such as the figures of Abraham Lincoln (Lincoln Park, Chicago) and Gen. Sherman (Central Park, N.Y.C.). He also did portrait tablets, plaques, and low reliefs.

Saint George's, city (1989 est. pop. 7,800), capital of GRENADA.

Saint Gotthard, mountain massif in the Swiss ALPS, rising to 10,472 ft (3,192 m). It is crossed by the Saint Gotthard Pass (6,935 ft/2,114 m) and by the Saint Gotthard Tunnel (9¼ mi/15 km long), one of the world's longest rail tunnels. A second, 31-mi (50-km) tunnel is planned; it would be completed in 2010.

Saint Helena, island (1992 est. pop. 6,700), 47 sq mi (122 sq km) in the S Atlantic, 1,200 mi (1,931 km) W of Africa. With ASCENSION and TRISTAN DA CUNHA, it comprises the British dependency of St. Helena. Discovered uninhabited by the Portuguese in 1502, it became a crown colony in 1834. It is best known as the place of exile (1815–21) of NAPOLEON I.

Saint Helens, Mount, active volcano, 8,365 ft (2,551 m; 9,677 ft/2,950 m before its 1980 eruption), SW Washington, in the Cascade Range. Dormant for 120 years, it erupted violently on May 18, 1980, following a series of earth tremors beginning Mar. 20. The eruption killed some 65 persons, sent a volcanic plume 60,000 ft (18,300 m) into the air, triggered fires and mudslides, and blanketed a large area with volcanic ash. Less violent eruptions followed, notably in Apr. 1982. The volcano and surrounding area are now a national monument.

Saint John, city (1991 pop. 74,969), S New Brunswick, E Canada, at the mouth of the Saint John R. on the Bay of Fundy. It has an excellent, ice-free harbor and is the commercial, industrial, and transportation center of New Brunswick. There are pulp and paper mills, oil refineries, large shipyards, and food-processing plants. The city was established (1631–35) as a French trading post and passed several times between France and England before coming under permanent English rule in 1758. Its most rapid growth began with the arrival in 1783 of a large party of UNITED EMPIRE LOYALISTS from the newly independent U.S. Then known as Paar Town, the city became St. John in 1785. The "reversing falls" of the St. John R., caused by the exceptionally high Fundy tides, are famous.

Saint John: see VIRGIN ISLANDS.

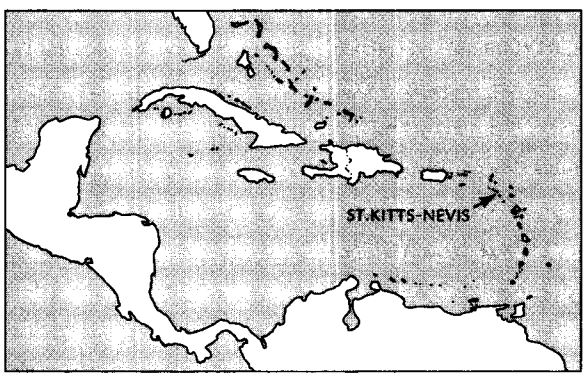
Saint John's, city (1986 est. pop. 36,000), capital of ANTIGUA AND BARBUDA.

Saint John's, city (1991 pop. 95,770), provincial capital, SE Newfoundland, E Canada, overlooking a fine harbor. Its major industries include fish processing and the manufacture and repair of fishing equipment, boats, and marine engines. One of the oldest settlements in North America, its site was discovered and named by John CABOT in 1497 and thought to have been settled shortly thereafter. It was formally occupied by England in 1583 and taken several times by the French before coming under permanent English rule in 1762.

Saint John the Divine, Cathedral of, New York City. Chartered by the Episcopal diocese in 1873 and begun in 1892, it is still under

construction. In 1911 the original Romanesque design was altered to the Gothic style design of Ralph Adams CRAM. The nave was built (1916–43), but other construction was interrupted by World War II. In 1979 work on the cathedral was resumed.

Saint Kitts-Nevis, officially Federation of Saint Kitts and Nevis, island nation (1992 est. pop. 40,100), 101 sq mi (262 sq km), West Indies, in the Leeward Islands. The capital is Basseterre, on St. Kitts. Nevis, the smaller island, has its own assembly and a large degree of political autonomy with respect to its own internal affairs. Agriculture dominates economy, with sugar growing and refining providing the largest share of the islands' export income. In recent years tourism has grown in importance, and the government has encouraged diversification of the agricultural sector and development of manufacturing. The vast majority of the population are descendants of Africans originally brought to the islands as slaves. English is the official language. The Anglican and other Protestant churches are the predominant faiths. The islands were visited (1493) by Columbus but not settled until 1623 (by the British) and 1625 (by the French). They were awarded (1783) to Britain. In 1967, together with ANGUILLA, which returned to British rule in 1971, they became autonomous in internal affairs, and achieved full independence in 1983. Since 1980 the government has been led by Prime Min. Kennedy Simmonds of the People's Action Movement.



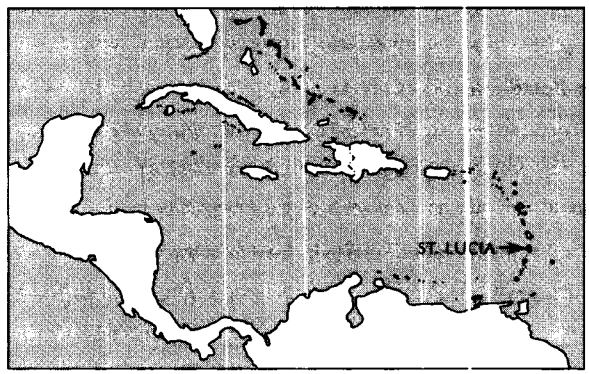
St. Laurent, Louis Stephen [săN lōräN'], 1882–1973, prime minister of CANADA (1948–57). He was minister of internal affairs (1946–48) in Mackenzie KING's government, and succeeded him as Liberal party leader and prime minister.

Saint Lawrence, major North American river, flowing 744 mi (1,197 km) NE from Lake Ontario to the Gulf of St. Lawrence and forming 120 mi (193 km) of the U.S.-Canada border. Although closed by ice from mid-December to mid-April, the river is the chief outlet for shipping on the Great Lakes, having been canalized as part of the SAINT LAWRENCE SEAWAY.

Saint Lawrence Seaway, international waterway, E North America, built by the U.S. and Canada and opened in 1959, that allows oceangoing vessels access to Lake Ontario through a 27-ft (8-m) channel on the SAINT LAWRENCE R. Principal locks on the seaway are St. Lambert (18 ft/5.5 m lift); Côte Ste Catherine (30 ft/9.1 m), bypassing Lachine Rapids; Lower and Upper Beauharnois (82 ft/25 m, including the Beauharnois Canal, built 1932); Bertrand H. Snell (45 ft/13.7 m); Dwight D. Eisenhower (38 ft/11.6 m); and the Iroquois Guard Lock (3 ft/91 cm). Hydroelectric facilities are operated along the seaway, which, together with improved channels between the GREAT LAKES, forms the St. Lawrence & Great Lakes Waterway, linking all of the lakes with the Atlantic Ocean.

St. Leger, Barry, 1737–89, British officer in the AMERICAN REVOLUTION. During the SARATOGA CAMPAIGN (1777) he laid siege to Fort Stanwix. He was forced to retreat to Canada when his frightened troops, mostly Native Americans, deserted.

Saint Louis, city (1990 pop. 396,685; met. area 2,444,099), E Mo., on the Mississippi R., below the mouth of the Missouri; settled 1764, inc. as a city 1822. The second largest city in the state, it is a major river port, rail hub, financial center, and market. Its manufactures include chemicals, transportation equipment, electronic components, textiles, and beer. Originally a fur-trading post, it was held by the French and the Spanish and passed to the U.S. by the LOUISIANA PURCHASE. The gateway to the Missouri R. and the West, St. Louis grew rapidly after the War of 1812. Eero SAARINEN's Gateway Arch, 630 ft (192 m) high, is its best-known landmark. Washington Univ. and the St. Louis Symphony Orchestra are two of the city's many well-known institutions.



Saint Lucia [sānt lōō'shə], island nation (1992 est. pop. 152,000), 238 sq mi (616 sq km), West Indies, one of the Windward Islands. The capital is Castries. A lush volcanic island with mountains rising abruptly from the sea, St. Lucia is much favored by vacationers. It also earns foreign exchange from traditional exports—bananas, cocoa beans, coconut oil, and copra—and its oil refinery and oil transshipment facilities. The population is largely of African descent. English is the official language, but a French patois is widely spoken. Roman Catholicism is the predominant religion. COLUMBUS probably sighted St. Lucia in 1502, but hostile Caribs prevented early colonization attempts. The first successful settlement was by the French in the late 1600s, but Britain gained control in 1803. A member of the short-lived WEST INDIES Federation (1958–62), St. Lucia gained self-government in 1967 and independence in 1979. The conservative United Workers' party, with John Compton as prime minister, has been in power since 1982.

Saint Mark's Church, Venice, named after the city's tutelary saint. The reconstruction of the original Romanesque basilical church was completed c.1071. From the 12th cent. on, it became through alterations and adornments a splendid Byzantine monument, reflecting Venice's prominence in trade with the East. In the 14th cent. the facade received Gothic additions. The plan is a Greek cross, with a central dome and a dome over each arm. The west front's five portals open on the Piazza San Marco. The facade is encrusted with marble and mosaics; the lower interior walls are sheathed in marble; and the vaults and domes are covered with mosaics set against a gold background. The bronze Four Horses of Saint Mark's, probably from a Roman triumphal arch, stand on the gallery over the main entrance.

Saint Martin, island, 37 sq mi (96 sq km), in the Leeward Islands, West Indies. Since occupation (1648) by the Dutch and French, it has been divided. The northern part (1990 pop. 28,518; capital, Marigot) is in GUADELOUPE. The southern part (1989 est. pop. 29,500; chief town, Philipsburg) is in the NETHERLANDS ANTILLES. It is a tourist resort.

Saint Moritz, Ger. *Sankt Moritz,* town (1990 est. pop. 5,300), Grisons canton, SE Switzerland, in the Upper Engadine. It is a famous winter sports center and year-round resort with mineral springs. The winter Olympic games were held there in 1928 and 1948.

Saint Patrick's Cathedral, New York City, largest Roman Catholic cathedral in the U.S., on Fifth Ave. between 50th and 51st St. Planned by James Renwick, the cathedral was built between 1858 and 1879. It has 12 side chapels. The Lady Chapel behind the high altar was added later.

The key to pronunciation appears on page xiii.

Saint Paul, city (1990 pop. 272,235), state capital and seat of Ramsay co., E Minn., a port at the head of navigation on the Mississippi R., next to MINNEAPOLIS, with which it forms the Twin Cities; inc. 1854. The industrial, commercial, and cultural center of a vast fertile region, it is also a railroad hub. Computers, electronic equipment, petroleum products, automobiles, appliances, and abrasives are major manufactures. The area was settled in the early 1800s, and the site was an important river landing by 1823. St. Paul, mapped out along the river in 1846, became territorial capital in 1849 and state capital in 1858. The railroad arrived in 1862 and the city subsequently became the center of a railroad empire. St. Paul is noted for its parks; for over 900 lakes in the vicinity; for its capitol (1904) designed by Cass GILBERT, with its huge marble dome; and for its annual Winter Carnival.

Saint Paul's Cathedral, London, masterpiece of Sir Christopher WREN and of the English BAROQUE, on Ludgate Hill. A Saxon cathedral there burned in 1087 and was replaced by a Norman structure (13th cent.). In 1561 St. Paul's burned again. Inigo JONES appended a classical facade after 1628, but the great fire of London (1666) almost destroyed the church. In 1668 Wren was given permission to demolish the church and build a new one. His Greek cross design was modified to include a long nave and choir. Construction of the cathedral took place between 1675 and 1710. The three-aisled nave and choir extend east and west from a central crossing, over which rises a huge DOME, pierced at the crown to allow a view of the lantern. The exterior dome rises above a colonnaded drum and supports the lantern and cross. St. Paul's was damaged by bombs in World War II and was not completely reconstructed until 1962.

Saint Petersburg, formerly **Leningrad,** city (1990 est. pop. 5,036,000), NW European Russia, at the head of the Gulf of Finland on both banks of the Neva R. and on the islands of its delta. The second largest Russian city, it is a major sea and river port and rail junction. Principal industries include the production of electric equipment, machinery, chemicals, drugs, ships, and refined oil. The city is also a center for education and scientific research. Construction of Saint Petersburg began (1703) under PETER I, who employed Italian and French architects. The city's landmarks include the Winter Palace, HERMITAGE museum, Alexander Nevsky monastery, the Cathedral of St. Isaac, and a university. From 1712 to 1918 it replaced MOSCOW as the capital. A brilliant cultural center, the city was immortalized by such writers as PUSHKIN and TOLSTOY. In 1914 it was renamed Petrograd. The city was in the forefront of the RUSSIAN REVOLUTION. On LENIN's death in 1924, it was renamed Leningrad. Many thousands of its citizens died during WORLD WAR II when the people heroically withstood the prolonged German siege (1941–44). The city's original name was restored in 1991.

Saint Petersburg, city (1990 pop. 238,629), W Fla., a port of entry on Tampa Bay and the Gulf of Mexico, at the southern end of the Pinellas peninsula; inc. 1892. It is a winter resort and residential community, with an annual average of 360 sunny days. Citrus fruit, fishing, and recreational and electronic equipment industries are important. Its huge yacht basin and two bridges crossing the bay to Tampa are notable.

Saint Peter's Church, Rome, principal church of Roman Catholicism and one of the largest churches in world, built mainly between 1506 and 1626 on the site of earlier churches. Appointed by Pope Julius II in 1506, BRAMANTE, the first architect, seems to have planned a Greek cross. He was succeeded by RAPHAEL (1514), Antonio da San Gallo (1520), and MICHELANGELO (1547), who completed the structure up to the drum of the great DOME. Giacomo della Porta modified the design and finished the dome. In the 16th cent. there was controversy over whether the church would be built in the form of a Greek or a Latin cross. The problem was resolved in favor of the Latin cross when Carlo Maderno added the nave and facade (1607–14). Urban VIII dedicated the church in 1626. BERNINI completed (1629–62) the great design, creating a forecourt with an elliptical piazza bounded by quadruple colonnades. The Dome of St. Peter's stands 404 ft (123 m) from the pavement and has an interior diameter of 137 ft (42 m).

Saint Pierre and Miquelon, French territorial collectivity (1990 pop. 6,392), 93 sq mi (241 sq km), nine largely barren islands S of Newfoundland, Canada, in the Gulf of St. Lawrence. St. Pierre, on the like-named island, is the capital. Fishing is the main occupation; the Grand Banks are nearby. The islands were colonized (1604) by France, taken by the British three times, and restored to France in 1814. They became a French overseas department in 1976 and a territorial collectivity in 1985.

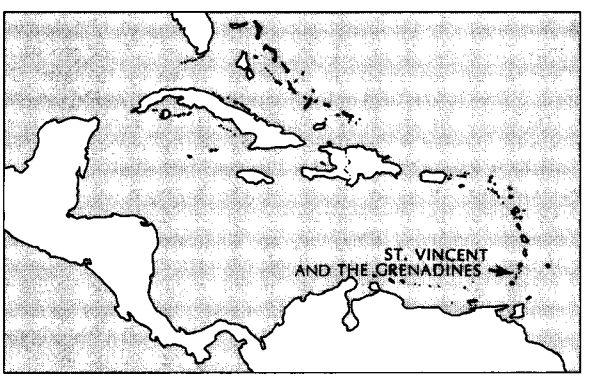
Saint-Saëns, (Charles) Camille [săN-säNs], 1835–1921, French composer. His many works are brilliantly crafted and orchestrated, but often lack imaginative force. Best known for the opera *Samson et Dalila* (1877), he also wrote symphonies, concertos, and SYMPHONIC POEMS.

Saint-Simon, Claude Henri de Rouvroy, comte de [săN-sēmôN'], 1760–1825, French social philosopher. He advocated a society led by scientists and industrialists and based on a scientific division of labor resulting in spontaneous social harmony. His works, among them *The New Christianity* (1825), influenced later socialist thought.

Saint-Simon, Louis de Rouvroy, duc de, 1675–1755, French courtier, author of voluminous memoirs (pub. 1788) of the court of LOUIS XIV. Remarkable for their psychological observation and brilliant sketches, the memoirs, despite a disregard for literary technique, are a monument of French literature. Based on his own notes and on contemporary journals covering the years 1691–1751, Saint-Simon's account is intensely personal and emotional, reflecting his inability to accept the rise of the bourgeoisie and his resentment against Louis XIV. Though full of errors, the memoirs are an indispensable historical source.

Saint Thomas: see VIRGIN ISLANDS.

Saint Valentine's Day (Feb. 14). Originally the Roman feast of Lupercalia, it was Christianized in memory of the martyr **St. Valentine** (d. A.D. 270). In the Middle Ages, Valentine became associated with the union of lovers under conditions of duress. Today the holiday is celebrated with the exchange of romantic or comic messages called "valentines."



Saint Vincent and the Grenadines, independent Commonwealth nation (1992 est. pop. 115,000), 150 sq mi (388 sq km), West Indies, in the Windward Islands, comprising the island of St. Vincent (140 sq mi/363 sq km) and the northern islets of the Grenadines, an archipelago that extends southward from the main island. The capital is Kingstown. St. Vincent is mountainous and forested, with mild climate. SOUFRIÈRE volcano, 4,048 ft (1,234 m) high, dominates St. Vincent; it erupted in 1902 and 1979. Exports include bananas, arrowroot, and copra, and tourism is important, but per capita income remains very low. The people are mainly descendants of Africans who were brought as slaves during the colonial period; English is spoken. The main religions are Methodism, Anglicanism, and Roman Catholicism. St. Vincent was visited by COLUMBUS in 1498 and colonized by the British in the late 1700s. Attempts to subdue the hostile Caribs failed, and the British deported most of them in 1797. Self-government was granted in 1969, full independence in 1979. Since 1984 the islands have been governed by the centrist New Democratic party under Prime Min. James Mitchell.

St. Vitus's dance: see under CHOREA.

Saipan, island (1990 pop. 38,896), capital of the NORTHERN MARIANA ISLANDS.

sake, Japanese fermented liquor, from 12% to 16% alcohol. Made from rice, it is yellowish and sherrylike in flavor.

Sakhalin, formerly Saghalien, island, c.29,500 sq mi (76,400 sq km), E Russia, off the mainland in the Sea of Okhotsk, N of Hokkaido, Japan. With the KURIL ISLANDS to the east, it forms Sakhalin oblast. Cold and damp, with heavily forested mountain ranges, Sakhalin is important to the economy of the RUSSIAN FAR EAST for its coal, iron, oil, and offshore gas deposits. Japan ceded Sakhalin to Russia in 1875 in exchange for the Kuril Islands, regained control (1905) of areas south of lat. 50°N (called Karafuto), and, in 1951, renounced all claims to Sakhalin, though not to the Kuriles, which Soviet forces had occupied in 1945.

Sakharov, Andrei Dmitriyevich, 1921–89, Soviet nuclear physicist and human-rights advocate; first Soviet citizen to receive the Nobel Peace Prize (1975). From 1948 to 1956 he helped develop the USSR's hydrogen bomb. In the 1960s he became a critic of the arms race and of Soviet repression. His internal exile to the city of Gorky (now Nizhny Novgorod) in 1980 inspired worldwide protest; it was lifted by Gorbachev in 1986. In 1989 he was elected to the Soviet parliament.

Saki: see MUNRO, HECTOR HUGH.

Saladin, 1137?–1193, Muslim warrior and sultan of Egypt, the great opponent of the Crusaders; b. Mesopotamia, of Kurdish descent. He used his position as vizier to overthrow the Fatimid dynasty and establish himself (1171) as the first Ayyubid sultan. He greatly expanded his territories, thereby clashing with the Crusaders (see CRUSADES). With a large force of Muslims (called Saracens by the Christians) he won the battle of Hattin (1187), which led to his capture of Jerusalem. The Third Crusade (1189) was gathered to regain Jerusalem. During this Crusade Saladin and King RICHARD I of England met in the conflict celebrated in chivalric romance. Saladin triumphed over the Crusaders and left the Latin Kingdom of Jerusalem with only a thin strip of coastline. Saladin was a learned man and a great patron of the arts.

Salamanca, city (1988 est. pop. 159,000), capital of Salamanca prov., W central Spain, in León, on the Tormes R. Food processing and tourism are important industries. Taken by Hannibal (220 B.C.), the city was held by the Romans, Visigoths, and Moors (8th–11th cent.). Its university (founded early 13th cent.) was world famous. Among the city's landmarks are the colonnaded Plaza Mayor, a Roman bridge, and a 12th-cent. cathedral.

salamander, AMPHIBIAN (order Urodela) having a tail and small, weak limbs that can regenerate. Found in damp regions of the northern temperate zone, they are abundant in North America. Most are under 6 in. (15 cm) long, although the giant salamander of Japan may reach 5 ft (1.5 m). Usually nocturnal and feeding on small animals such as insects and worms, salamanders are mostly terrestrial as adults, although some are aquatic and a few arboreal. **Newts** are a large, widely distributed family of salamanders.

Salamis, island, E Greece, in the Saronic Gulf. Off its shore, during the PERSIAN WARS, the Greek fleet, led by THEMISTOCLES, decisively defeated the Persians (480 B.C.).

Salazar, Antônio de Oliveira [səlәzär'], 1889–1970, dictator of PORTUGAL (1932–68). A professor of political economy, he became finance minister (1926, 1928) and stabilized the nation's finances. As premier he established (1933) a corporate state and suppressed the opposition. Although he supported FRANCO, he allowed the Allies to use the Azores as a military base in World War II. Later he encouraged Portugal's economic development and tried to suppress revolts in its African colonies. After suffering a stroke in 1968, he was replaced as premier by Marcello CAETANO.

Salem. **1** City (1990 pop. 38,091), seat of Essex co., NE Mass., on an inlet of Massachusetts Bay; inc. 1629. Once a world-famous port and center of the China trade, it is now a tourist center with light industries. Salem was the scene (1692) of infamous witchcraft trials. The birthplace of Nathaniel HAWTHORNE is preserved, along with the House of Seven Gables (1668). Pioneer Village is a reproduction of a 1630 settlement. **2** City (1990 pop. 107,786), state capital and seat of Marion co., NW Oreg., on the Willamette R.; inc. 1857. A major food-processing center, it has wood product, paper, and electronics industries, in addition to state government offices. Founded 1840–41 by Methodist missionaries, it became capital of Oregon Territory in 1851 and remained so with statehood (1859).

sales tax: see TAXATION.

Salic law, rule of succession in some noble families of Europe forbidding the succession by females or those descended in the female line to titles or offices. It was mistakenly thought to be part of the *Lex Salica* (see GERMANIC LAWS), which concerned only succession to property. The VALOIS and BOURBON families in France maintained it, notably in the successions of PHILIP V and PHILIP VI. In Spain the Salic law was rescinded in favor of ISABELLA II. It prevented the succession in Hanover of Queen VICTORIA of England.

Salinas, city (1990 pop. 108,777), seat of Monterey co., W Calif.; inc. 1874. It is the shipping and processing center for a valley famous for its lettuce. Fruits, artichokes, and dairy goods are also produced, and rubber is manufactured. The home of John STEINBECK, a Salinas native, is open to visitors.

Salinas de Gortari, Carlos, 1948–, Mexican economist and government official, president of Mexico (1988–). A member of the Institutional Revolutionary party (PRI) since 1966, he held a series of finance ministry posts (1971–79) before serving (1979–81) in the ministry of planning and budget under Miguel DE LA MADRID HURTADO. After de la Madrid became president, Salinas became (1982) his minister of planning and budget. In 1987 de la Madrid supported Salinas for the presidency, and as the PRI candidate he subsequently won (1988) an election marred by allegations of fraud. Salinas worked to revive Mexico's economy by curbing inflation and reducing government involvement. He also improved political and economic relations with the U.S., signing the NORTH AMERICAN FREE TRADE AGREEMENT in 1992.

Salinger, J(erome) D(avid), 1919–, American author; b. N.Y.C. With pathos and humor he depicts the individual caught in a banal, restricting world. His only novel, *The Catcher in the Rye* (1951), quickly became a classic; also popular are his short stories, e.g., *Nine Stories* (1953), *Franny and Zooey* (1961).

Salisbury, Robert Arthur Talbot Gascoyne-Cecil, 3d marquess of, 1830–1903, British statesman. The Conservative foreign minister under Benjamin DISRAELI, he attended the Congress of Berlin (1878). As prime minister (1885–86, 1886–92, 1895–1902), he avoided alignments in European affairs and dealt with the SOUTH AFRICAN WAR. His governments provided for free public education (1891) and workers' compensation (1897).

Salisbury, Robert Cecil, 1st earl of, 1563–1612, English statesman, son of William Cecil, Baron BURGHLEY. He succeeded his father as principal secretary to ELIZABETH I in 1598 and arranged the peaceful accession (1603) of JAMES I. Under James he directed virtually the entire government, reduced the king's debts, and tried to curb James's extravagance.

Salisbury or **New Sarum,** city (1991 pop. 105,318), Wiltshire, S England. It was founded in 1220, when the bishopric was moved there from Old Sarum. Its great cathedral (1220–60) is a splendid example of Early English architecture and has the highest spire (404 ft/123 m) in England.

Salisbury, Zimbabwe: see HARARE.

Salish or **Flathead,** indigenous people of W Montana who spoke a Salishan language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). They were called "flatheads" by neighboring Columbia R. peoples who shaped the front of the head to a point. After acquiring horses, the Salish adopted the buffalo and TEPEE culture of the Plains (see NORTH AMERICA, INDIGENOUS PEOPLES OF) and struggled with the BLACKFOOT for hunting lands. Most now live on a Montana reservation that they share with a small band of Kootenai. In 1990 there were over 5,000 Salish in the U.S.

Salishan [sā'lĭshən, săl'–], branch of the Algonquian-Wakashan linguistic family of North America; spoken by Native Americans of the NW United States and Canada. See NATIVE AMERICAN LANGUAGES (table).

Salk, Jonas Edward, 1914–, American physician and microbiologist; b. N.Y.C. He taught at the universities of Michigan and Pittsburgh and was director (1963–75) of the Salk Inst. for Biological Studies at the Univ. of California, San Diego. While at Pittsburgh he developed a killed-virus vaccine against POLIOMYELITIS

Sallust (Caius Sallustius Crispus) [săl'əst], 86 B.C.–c.34 B.C., Ro-

man historian. His major work is *War of Catiline,* or *Catiline,* an account of the conspiracy of CATILINE.

salmon, marine FISH of the family Salmonidae that spawn in fresh water, including salmon, trout, and char. The herring like Salmonidae are characterized by soft, rayless, adipose fins and live in cold, oxygen-rich waters. They are generally a uniform silver in color. The Atlantic salmon (genus *Salmo*), once abundant, is threatened by pollution, damming, and overfishing. It feeds on CRUSTACEANS at sea and small fish while spawning and reaches 15 lb (6.8 kg). The Pacific salmon (genus *Oncorhynchus*), comprising five species, is commercially the most important. The largest, the chinook, may reach 100 lb (45 kg); the blueback forms the bulk of canned salmon. Pacific salmon are famed for their grueling journeys of hundreds of miles to their headwater breeding grounds. The genus *Salvelinus* includes the European chars and the North American brook trout.

salmonellosis, infection caused by intestinal bacteria of the genus *Salmonella.* The most common form is gastroenteritis, an intestinal disease usually resulting from contaminated food. Symptoms include nausea, abdominal pains, diarrhea, and fever; it can lead to death, especially in people with impaired immune systems. Treatment includes rest, replacement of lost body fluids, and ANTIBIOTICS. The generalized form is often called paratyphoid fever because it resembles TYPHOID FEVER. Milk, especially unpasteurized (raw) milk, undercooked chicken and eggs, and food prepared in an unsanitary manner are major sources of the disease; it is also contracted through exposure to infected pets, such as turtles and iguanas. Increased rates of salmonellosis have led to recommendations to keep foods refrigerated, cook them thoroughly, and wash cooking surfaces, utensils, and hands immediately after preparing foods.

Salome [səlō′mē], daughter of Herod Philip and Herodias. She is generally supposed to be the daughter who danced to obtain the head of JOHN THE BAPTIST.

Salonica: see THESSALONIKI.

salsa, American popular music, developed largely in New York City in the 1970s. It blends the rhumba and other dance forms; Cuban, Puerto Rican, Dominican, and other Latin American strains; ROCK MUSIC; and JAZZ. Salsa is chiefly performed, and often danced simultaneously, by singers; percussionists; and brass, guitar, and keyboard players. Artists include Machito, Eddie Palmieri, Tito PUENTE, and Rubén BLADES.

SALT (Strategic Arms Limitation Talks): see DISARMAMENT, NUCLEAR.

salt, chemical compound (other than water) formed by a chemical reaction between ACIDS AND BASES; by direct combination of metal with nonmetal, e.g., SODIUM CHLORIDE (common table salt); by reaction of a metal with a dilute acid; by reaction of a metal oxide with acid; by reaction of a nonmetallic oxide with a base; or by reaction of two salts with each other to form two new salts. Most salts are ionic compounds. The chemical formula indicates the proportion of atoms of the elements making up the salt. A salt is classified as acidic, basic, or normal if it has, respectively, hydrogen (H), hydroxyl (OH), or neither in its formula. A salt undergoes dissociation when dissolved in a polar solvent, e.g., water (see HYDROLYSIS).

salt, common: see SODIUM CHLORIDE.

Salt Lake City, city (1990 pop. 159,936; met. area 1,072,227), state capital and seat of Salt Lake co., N central Utah, on the Jordan R., near the GREAT SALT LAKE, at the foot of the Wasatch Range; inc. 1851. Food-processing, oil-refining, smelting, computer and electronics, and warehousing industries are important. Founded (1847) by Brigham YOUNG as the capital of the MORMON community, it has become a major religious center. The gigantic Temple (1853–93) is at the city's heart. Other points of interest include the state capitol (1914), and the Brigham Young home (1877) and Memorial (1897).

saltpeter or **potassium nitrate,** chemical compound (KNO_3), occurring as colorless prismatic crystals or as a white powder. When heated, it decomposes to release oxygen. Saltpeter has been used in gunpowder manufacture since about the 12th cent.; it is also used in explosives, fireworks, matches, and fertilizers, and as a food preservative.

Salvador or **Bahia,** city (1990 est. pop. 2,050,000), capital of Bahia state, E Brazil. An Atlantic port, it processes and ships cacao, tobacco, sugar, and other products of a fertile crescent, the Recôncavo. The city was found in 1549, flourished with the rise of sugar plantations, and was the leading center of colonial Brazil and the capital of Portugal's possessions in America until 1763. An influx of plantation slaves was the source of its African heritage. It is now a tourist center noted for its 16th-cent. cathedral.

Salvation Army, Protestant denomination and international nonsectarian Christian organization for evangelical and philanthropic work. Begun (1865) in England as the East London Revival Society by William BOOTH, with his wife, Catherine, it was designated the Salvation Army in 1878. It was organized along military lines and sought to minister to physical as well as spiritual needs. In the U.S. work began in 1880 with a branch in Pennsylvania. The beliefs of the group generally agree with those of most Protestant evangelicals, but SACRAMENTS are not practiced. The Salvation Army is distinguished by its work with the armed services and by its aid to the victims of disasters all over the world.

salvia: see SAGE.

Salween, river, c.1,750 mi (2,820 km) long, Southeast Asia. It rises in Tibet and flows through SW China and Myanmar to enter the Gulf of Martaban, in E Myanmar, near Moulmein. Flowing through gorges for much of its length, the river is navigable for only c.75 mi (120 km). It varies up to 65 ft (20 m) in depth between wet and dry seasons.

Salyut: see SPACE EXPLORATION, table.

Salzburg, city (1991 pop. 143,971), capital of Salzburg prov., W central Austria. It is an industrial, tourist, and transportation center. Settled by the Celts and later a Roman trading center, it was long the residence of powerful archbishops. The city was secularized in 1802 and passed to Bavaria (1809), but was returned (1815) to Austria by the Congress of VIENNA. Salzburg's superb landmarks include a 7th-cent. Benedictine abbey and a monument to PARACELSUS. MOZART was born in Salzburg and is honored with an annual music festival; HOFMANNSTHAL's morality play *Everyman* is performed annually in the cathedral square.

Samara, city (1990 est. pop. 1,256,000), E central European Russia, on the left bank of the Volga and at the mouth of the Samara R.; called **Kuybyshev** from 1935 to 1991. A port and rail center, located near a hydroelectric plant, it manufactures automobiles, aircraft, and other industrial products. Grain and livestock are the chief exports. Founded in 1586, Samara was the Volga's grain center. Industry grew as railroads to Siberia and central Asia were built (early 20th cent.). During World War II the USSR's central government was moved (1941–43) from Moscow to the city.

Samaras, Lucas [sämär′əs], 1936–, American sculptor; b. Greece. Using unusual materials such as colored string, plastics, chicken wire, and feathers, he has created variations on everyday forms like boxes, scissors, and chairs. He is known for his reclusiveness.

Samaria, ancient city, central Palestine, NW of Nablus (Shechem), Jordan. Samaria was built by King Omri as the capital of the northern kingdom of Israel in the early 9th cent. B.C. It fell in 721 B.C. to Assyria. Destroyed in 120 B.C. by John Hyrcanus (see MACCABEES), it was rebuilt by HEROD the Great. It is the traditional burial place of JOHN THE BAPTIST. The city gave its name to the **Samaritans,** a sect recognizing only the Pentateuch of the Bible. In Jesus' time a great enmity existed between them and the Jews since each claimed to be the only true inheritors of Abraham and Moses. A small group of Samaritans still live at Nablus. The Samaritan language is a type of Aramaic.

samarium (Sm), metallic element, discovered in 1879 by P.E. Lecoq de Boisbaudran. It is a lustrous, silver-white RARE-EARTH METAL of the LANTHANIDE SERIES. Uses include pyrophoric alloys in cigarette-lighter flints, magnets in computer memories, and nuclear-reactor control rods. See ELEMENT (table); PERIODIC TABLE.

Samarkand or **Samarqand,** city (1987 est. pop. 388,000), UZBEKISTAN, on the Trans-Caspian RR. A major cotton and silk center, it also produces wine, tea, and such industrial goods as vehicle parts. The oldest central Asian city—and one of the world's oldest cities—Samarkand was on the ancient trade route between the Middle East and China. It was conquered (329 B.C.) by ALEXANDER THE GREAT, fell (8th cent. A.D.) to the Arabs, and became (9th cent.) a center of Islamic culture. Sacked (1220) by JENGHIZ KHAN, it revived as the capital of TIMUR's empire (14th–15th cent.). Sa-

markand fell to the Uzbeks c.1500 and to Russia in 1868. The city's old quarter contains Timur's mausoleum and many ancient mosques.

Samoa: see AMERICAN SAMOA; WESTERN SAMOA.

Sámos, island (1991 pop. 41,850), c.181 sq mi (469 sq km), SE Greece, in the Aegean Sea, near Turkey; one of the Sporades island group. Its economy is based on agriculture, wine-making, tobacco processing, and shipbuilding. A cultural and maritime center in ancient times, it was the home of AESOP and the birthplace of PYTHAGORAS.

Samoyed, muscular WORKING DOG; shoulder height, 19–23.5 in. (48.3–59.7 cm); weight, 35–65 lb (15.9–29.5 kg). Its weather-resistant double coat may be white, biscuit, or cream. Raised by the Samoyed people of N Siberia thousands of years ago, it was used to herd reindeer and haul sledges.

Sampras, Pete, 1971–, American tennis player; b. Washington, D.C. The youngest man ever to win the U.S. Open (1990), he is known for his powerful serve and well-placed shots. In 1993–94 he won Wimbledon and the U.S. and Australian open titles, becoming the first man to win three majors in a row since the mid-1960s.

Samson, in the BIBLE, judge of Israel whose strength lay in his long hair. The Philistines accomplished his destruction through the woman Delilah, who cut off his hair. Captured and blinded, Samson regained his strength as his hair grew long again. He then pulled down the Philistine temple, killing both himself and his captors.

Samuel, two books of the OLD TESTAMENT, 9th and 10th in the Authorized Version, a narrative of events in Hebrew history, covering the careers of Samuel, SAUL, and DAVID (roughly the 11th cent. B.C.). Scholars detect at least two main strands, based on divergent attitudes toward the establishment of the monarchy. One section (2 Sam. 9–20) is apparently the oldest piece of narrative in the Bible. The prophet Samuel (fl. 1050 B.C.) was the last judge of Israel.

Samuelson, Paul A., 1915–, American economist; b. Gary, Ind. Winner of the 1970 Nobel Prize in economics, he has been on the faculty of the Massachusetts Institute of Technology since 1941 and has held a variety of government posts. As adviser to Presidents KENNEDY and JOHNSON, he helped shape the tax legislation and antipoverty efforts of the 1960s. A supporter of Keynesian economics (see KEYNES), he is known for his work *Economics* (1948; 12th ed. 1985), a standard textbook for many years.

samurai, knights of feudal Japan, retainers of the daimyo, or barons. This aristocratic class arose in the 12th cent. and was consolidated in the TOKUGAWA period. Samurai followed a code of honor called the bushido. The class was abolished after the MEIJI restoration (1868).

San, African people who live largely in the Kalahari and surrounding areas of Namibia and Botswana. They number about 85,000. Traditionally, the San were nomadic hunters and food-gatherers who traveled in groups of 25–60 and had no social classes and few private possessions. Many, however, now live in settlements and work on cattle ranches or farms. Their languages include clicking sounds that are rarely found in other languages. They were called Bushmen by whites, but that term is now considered derogatory.

Sana, San'a, or **Sanaa,** city (1986 pop. 427,150), capital of Yemen. The largest city in S ARABIA, it lies inland on a high plain and is linked to the Red Sea port of Hodeida by road. An Islamic cultural center, it is also a trade center for grapes and other crops grown nearby. A pre-Islamic settlement, it was held by Ethiopia in the 6th cent. and by the Ottoman Turks in the 17th cent. and from 1872 to 1918, when Yemen became independent. In 1990, when Yemen and Southern Yemen merged, it became the unified nation's capital.

San Andreas fault, the principal FAULT in a network of faults extending more than 600 mi (965 km) from NW California to the Gulf of California. It marks the boundary of two crustal plates (see PLATE TECTONICS) moving in relation to each other, causing horizontal displacement along the fault. Total displacement has been estimated at c.350 mi (560 km) since the fault's formation over 30 million years ago. Such movement causes EARTHQUAKES, thousands of which, mostly of low magnitude, occur annually.

San Antonio, city (1990 pop. 935,935; met. area 1,302,099), seat of Bexar co., S central Tex., at the source of the San Antonio R.; inc. 1837. The third largest city in Texas and the tenth largest in the U.S., it is the site of a military training and medical complex, and the industrial, trade, and financial center of an agricultural region. Manufactures include processed foods, aircraft, and chemicals. The Spanish visited the area long before they established (1718–31) a series of missions. San Antonio was the leading Texas settlement in the Spanish and Mexican days. In the Texas Revolution, Texans captured it (1835) and Mexicans attacked its ALAMO. The Mexican flavor remains today, and the city has a large Spanish-speaking population. It is known for its artists' colonies and museums, its many educational institutions, and numerous historical sites.

San Bernardino, city (1990 pop. 164,164), seat of San Bernardino co., S Calif., at the foot of the San Bernardino Mts.; inc. 1854. Its manufactures include steel, aerospace, and electronics products. San Bernardino is in a growing metropolitan area that includes the cities of Ontario and Riverside. Explored (1772) and settled by the Spanish, the city was laid out by MORMONS in the 1850s.

Sánchez Ferlosio, Rafael [sän'chĕth fārlō'syō], 1927–, Spanish novelist; b. Italy. A master of the Spanish language, he has written such novels as *The Labors and Fortunes of Alfanhuí* (1951) and *The One Day of the Week* (1956).

Sand, George [säN], pseud. of **Amandine Aurore Lucie Dupin, baronne Dudevant,** 1804–76, French novelist. Her unconventional life was symbolized by the male attire she adopted to protest the unequal treatment accorded to women, and by her open and notorious liaisons with the writer Jules Sandeau, with Alfred de MUSSET, and with CHOPIN. After her divorce from Baron Dudevant (1836), she supported herself and her two children chiefly by her writing. Of her 80-odd novels, *The Haunted Pool* (1846) and *Fanchon the Cricket* (1850) are masterpieces. Notable also are *Indiana* (1832) and *Lélia* (1833), espressing her feminist beliefs. All her works are distinguished by a romantic love of nature and an extravagant moral idealism. Much of her work was autobiographical, notably *She and He* (1859), which concerns her life with Musset, and *A Winter on Majorca* (1841), about her life with Chopin.

sand, rock material occurring in the form of loose, rounded or angular grains, varying in size from 0.06 to 2 mm in diameter. It is formed by the WEATHERING and decomposition of all types of ROCK, its most abundant mineral constituent being QUARTZ. Sand has numerous uses, particularly in the manufacture of bricks, cement, glass, concrete, explosives, and abrasives. See also DESERT; QUARTZITE; SANDSTONE.

sandalwood, name for several fragrant tropical woods, especially that of *Santalum album,* a partially parasitic evergreen tree native to India. Oil distilled from the wood is much used as a perfume and in medicine. Red sandalwood, obtained from *Pterocarpus santalinus,* is used in dyes.

Sandburg, Carl, 1878–1967, major American poet; b. Galesburg, Ill. His experiences as a laborer, soldier, socialist political worker, and journalist informed his poetry. Drawing his inspiration from America's past and present, influenced by Walt WHITMAN, Sandburg wrote vigorous, impressionistic free verse that celebrated ordinary people and things. Collections of his poems include *Chicago Poems* (1916), *Cornhuskers* (1918; Pulitzer), *The People, Yes* (1936), *Complete Poems* (1950; Pulitzer), and *Harvest Poems 1910–1960* (1960). Sandburg also collected folk ballads and songs in *The American Songbag* (1927) and wrote an epic biography of Lincoln (6 vol., 1926–39; vol. 3–6, Pulitzer); children's books, e.g., *Rootabaga Stories* (1922); and the autobiographical *Always the Young Strangers* (1953).

sand dollar, marine invertebrate animal (an ECHINODERM), related to the STARFISH. The sand dollar has a rigid, flattened, circular shell consisting of numerous small skeletal plates. Small spines enable the animal to burrow under the surface of the sand. Tube feet on the underside of the body are used for locomotion and to convey food particles to the mouth.

San Diego, city (1990 pop. 1,110,549; met. area 2,498,016), seat of San Diego co., S Calif., on San Diego Bay. The city is the second largest in California and the sixth largest in the U.S. Its excellent natural harbor has made it a fishing and shipping port, and a major naval center. Aerospace, electronics, shipbuilding, biotechnology,

The key to pronunciation appears on page xiii.

and other industries are important. Tourism and convention business are large factors in the economy. Explored and claimed by Spain in 1542, it was the site of the first of Fr. Junípero SERRA's missions and a historic fort, the Presidio (both 1769). The area has many other historic sites, including the Cabrillo National Monument. San Diego is also a cultural, medical, oceanographic, and research center, and its aquatic park and enormous zoo are well known. Since 1988 the *America*'s Cup sailing races have been held at San Diego.

Sandinistas, members of a left-wing Nicaraguan political group, the Sandinist National Liberation Front (FSLN). The group, named for Augusto Cesar SANDINO, a former insurgent leader, was formed in 1962 to oppose the regime of Anastasio SOMOZA-DEBAYLE. In 1979 they launched an offensive from Costa Rica and Honduras that toppled Somoza. The Sandinistas established a ruling junta that nationalized such industries as banking and mining, postponed elections, and moved steadily to the left, eventually espousing Marxist-Leninist positions. They were opposed by U.S.-supported guerrillas known as contras (see NICARAGUA). In 1984, Sandinista Daniel Ortega Saavedra became president in a national election that was boycotted by some opposition groups. In 1990 the opposition candidate, Violeta Barrios de Chamorro, defeated Ortega, but the Sandinistas continued to dominate the police and army.

Sandino, Augusto Cesar, 1893–1934, Nicaraguan patriot. He waged a successful guerrilla resistance against the U.S. Marine occupation of Nicaragua (1927–33). When he came out of hiding for peace talks, he was murdered by National Guardsmen led by Anastasio SOMOZA.

sandpiper, name for some shore BIRDS of the family Scolopacidae, including the SNIPE and CURLEW. Sandpipers are small wading birds with long, slender bills for probing in sand or mud for small invertebrates. Their plumage is usually brown or gray streaked above and buff with streaks or spots below. Most are found in flocks on seacoasts throughout the Northern Hemisphere.

sandstone, sedimentary ROCK formed by the cementing together of SAND grains. The hardness varies depending on the cementing material. Sandstone is widely used in construction and industry. It can also be crushed and used like sand.

Sandwich, John Montagu, 4th earl of, 1718–92, British politician. He was secretary of state (1763–65, 1770–71) and first lord of the admiralty (1748–51, 1763, 1771–82). He was unpopular for charges (1763) of obscenity against John WILKES and was later blamed for British defeats in the American Revolution. He supposedly invented the sandwich.

San Francisco, city (1990 pop. 723,959; met. area 1,603,678), W Calif., on a peninsula between the Pacific and San Francisco Bay, which are connected by the strait called the Golden Gate; inc. 1850. It is an industrial nucleus, a market for mine and farm products, a transportation hub, and a financial and insurance center. With the Bay area it forms one of the nation's largest ports and a major center of trade with E Asia, Hawaii, and Alaska. Its industries are increasingly white-collar but processed food and clothing are produced; tourism is an economic mainstay. The city is also one of the nation's cultural centers. Founded by the Spanish (1776) as Yerba Buena, it was taken and renamed by the Americans in 1846. The California gold rush (1848) led to great growth; with the arrival of newcomers from all over the world in the late 19th cent. the city took on a cosmopolitan air. The earthquake and fire of April 18–20, 1906, devastated the city, but it was quickly rebuilt. The opening of the Panama Canal and San Francisco's role as a supply and embarkation point in World War II increased the city's importance. On Oct. 17, 1989, another earthquake damaged the city, especially its Marina district. A gracious, picturesque city with a mild climate, it is famous for its individuality. Points of interest include its cable cars, which carry passengers on its steep hills; the San Francisco–Oakland Bay Bridge (opened 1936) and Golden Gate Bridge (opened 1937); Chinatown; Fisherman's Wharf; Telegraph Hill; the mansions of Nob Hill; the opera house; symphony hall (1980); and numerous institutions of learning.

Sanger, Frederick, 1918–, British biochemist. One of the few recipients of two Nobel prizes, he won the chemistry award in 1958 for identifying the amino-acid sequence of insulin and shared the 1980 award in chemistry for developing a method, important in recombinant DNA research, for rapidly determining the chemical structure of pieces of DNA.

Sanger, Margaret (Higgins), 1883–1966, American leader in the BIRTH-CONTROL movement; b. Corning, N.Y. Personal experience and work as a nurse convinced her that family limitation, especially where poverty was a factor, was a necessary step in social progress. Her promotion of birth control brought indictment and arrests, but public and court support gradually grew. She organized the first American (1923) and international (1925) birth-control conferences, formed (1923) a committee to lobby for birth-control laws, and helped establish clinics around the world.

Sanhedrin, ancient Jewish legal and religious institution in Jerusalem. There probably were two Sanhedrins: one, like a legal court, political and civil; the other, the Great Sanhedrin, purely religious. The political Sanhedrin perished after the destruction of the Temple in A.D. 70, but the religious Sanhedrin continued as the rabbinic patriarchate until about A.D. 425.

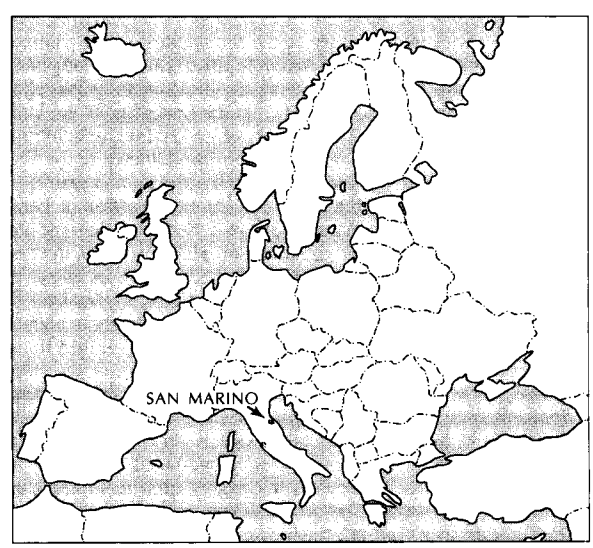
San Joaquin, river, central California, flowing c.320 mi (510 km) N from the Sierra Nevada to join the Sacramento R. in a vast delta on an inlet of San Francisco Bay. It is navigable by oceangoing vessels c.40 mi (60 km) to Stockton. Its valley, now irrigated by water from the Central Valley Project, is one of the state's chief agricultural areas.

San José, city (1989 pop. 287,535), central Costa Rica, capital of Costa Rica. It is the country's largest city and its economic, political, and social center, dominating the central plateau. It is also the distribution point for imports. A modern city with many parks, it has a mixture of Spanish and North American architecture. The city was founded c.1738 and has two universities.

San Jose, city (1990 pop. 782,248; met. area 1,497,557), seat of Santa Clara co., W Calif.; founded 1777, inc. 1850. In a rich wine- and fruit-producing area, San Jose is a fast-growing industrial city in SILICON VALLEY. Manufactures include aerospace, computer, and other high-technology products. At the southern end of San Francisco Bay, San Jose was the capital of California from 1849 to 1851. The city was damaged by an earthquake in 1989.

San Juan, city (1990 pop. 426,832), capital, chief port, and commercial center of PUERTO RICO, on the NE coast. Sugar, tobacco, coffee, fruit, and other agricultural products are exported. Tourism is a major industry. Sugar refining, rum distilling, metalworking, clothing, publishing, and various light manufactures are also important. Its bay was named Puerto Rico [rich port] by PONCE DE LEÓN, who began a settlement at nearby Caparra in 1508. It has one of the finest harbors in the WEST INDIES and fine beaches. The old city (founded 1521) is noted for its colonial atmosphere; El Morro castle (begun 1539) is the most famous of its buildings.

San Marino, officially Republic of San Marino, republic (1992 est. pop. 23,400), 24 sq mi (62 sq km), in the APENNINES, SW of Rimini, Italy. San Marino (1988 est. pop. 4,140) is the capital; Serravalle is



the only other town. Tourism, light industries, farming, and the sale of postage stamps and duty-free consumer goods are the chief sources of income. Major products include building materials, textiles, ceramics, and wine. The Italian-speaking Sanmarinese are largely Roman Catholic.

History. San Marino claims to be Europe's oldest existing state. According to tradition, in the 4th cent. A.D. Marino, a Christian stonecutter, took refuge on Mt. Titano, the chief geographical feature of San Marino. A community was formed by the mid-5th cent. and its independence recognized by the papacy in 1631. San Marino volunteers served with the Italians in both world wars, and Allied aircraft bombed the tiny republic in 1944. Following a period (1947–57) of Communist-led coalition governments, a series of coalitions headed by Christian Democrats held sway until 1978, when a Communist-led coalition again came to power. A coalition of Communists (renamed Progressive Democrats in 1990) and Christian Democrats governed the country from 1986 to 1992, when the Christian Democrats formed a coalition with the Socialists.

San Martín, José de [sän märtēn'], 1778–1850, South American revolutionary leader. A professional soldier, he joined (1812) the revolution against Spain in his native ARGENTINA and commanded patriot forces in Upper Peru. In 1817 he invaded CHILE by a daring march across the Andes and defeated the Spanish at Chacabuco with the aid of Bernardo O'HIGGINS; they soon completed (1818) the liberation of Chile. San Martín seized (1821) Lima and became protector of Peru, but he resigned (1822) the post and permitted Simón BOLÍVAR to liberate the country.

San Pedro Sula, city (1988 pop. 460,600), NW Honduras. A Caribbean port serving the banana and sugar plantations of the north, it has an increasing number of light industries.

San Salvador, city (1990 est. pop. 485,000), central El Salvador, the country's capital and largest city and a trade and communications center. Situated on a volcanic slope, it is subject to severe earthquakes and has been rebuilt often. It was founded in the early 1600s and was (1831–38) the capital of the Central American Federation. It is a modern city with broad avenues and many parks.

Sanskrit [săn'skrĭt], language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. Sanskrit was the classical standard language of ancient India, and some of the oldest surviving Indo-European documents are written in Sanskrit. The oldest known stage of Sanskrit is Vedic or Vedic Sanskrit, so called because it was the language of the VEDA, the most ancient extant scriptures of HINDUISM. See LANGUAGE (table).

Sanskrit literature, main body of the classical literature of India. The literature is divided into two main groups and periods—the Vedic (c.1500–c.200 B.C.), when the Vedic form of Sanskrit prevailed, and the Sanskrit (c.200 B.C.–A.D. c.1100), when classical Sanskrit (a development of Vedic) predominated. Early Sanskrit literature, however, overlapped the Vedic. The early Vedic period (c.1500–c.800 B.C.), that of the VEDA, was a poetic and creative age. Subsequently (c.800–c.500 B.C.), the priestly class concerned itself more with ritual and wrote the *Brahmanas,* prose commentaries explaining the Vedas' relation to ritual. Later portions of the *Brahmanas* are theosophical treatises; these include the philosophical *Upanishads* (see VEDANTA). In the final stage of the Vedic period (c.500–c.200 B.C.) the *Sutras,* which deal with Vedic ritual and customary law, were written. A sutra well known in the West is the *Kamasutra* of Vatsyayana, concerning the art and practice of love. In the middle of the sutra period, the grammar of Panini (c.350 B.C.) formalized classical Sanskrit. Nearly all Sanskrit literature, except for works on grammar and philososphy, is in verse. The early Sanskrit period (c.500–c.50 B.C.) is one of epics; the greatest of these are the MAHABHARATA, which includes the BHAGAVAD-GITA, and the RAMAYANA. Sanskrit lyric poetry is artificial in technique and mainly stanzaic. Many lyrics are gemlike miniatures, portraying emotion and nature, and most are erotic. Nonetheless, there are many lyrics that are ethical in tone. Sanskrit drama probably derived from dance and religious ritual (see ASIAN DRAMA). In its fables and fairy tales (A.D. c.400–1100) the didactic quality of Sanskrit literature is most pronounced, and often the characters in a tale themselves tell stories until there are many levels to the narrative. The PANCHATANTRA is the most important work in this style. Sanskrit today is chiefly used in academic exercises. Modern INDIAN LITERATURE is mostly written in vernacular languages and English.

Santa Ana, city (1990 pop. 293,742), seat of Orange co., S Calif., in the fertile Santa Ana valley; inc. 1886. A light industrial center, it produces such manufactures as aerospace and electronic equipment, sporting goods, and electrical connectors. The insurance industry is also economically important.

Santa Anna, Antonio López de, 1794–1876, Mexican general and dictator. A clever opportunist, he ruled MEXICO during most of the period from 1824 to 1855, his fortunes rising and falling rapidly as he shifted his allegiance from party to party. His victory (1829) over the Spanish at Tampico gained him popularity and the presidency (1833). He was defeated and captured (1836) by the Texas rebels at San Jacinto, but he quickly regained his power. He commanded the Mexican troops in the MEXICAN WAR, where his defeats forced him into exile. He returned to power (1853–55) until exiled again.

Santa Barbara, city (1990 pop. 85,571), seat of Santa Barbara co., S Calif., on the Pacific Ocean; inc. 1850. A beautiful residential and resort city, it has electronics and aerospace firms and an orchid industry. The city is known for its Spanish architecture, and its mission (est. 1786, present building 1820) is famous. Oil fields are in the area and offshore; a 1969 oil-rig leak caused great damage.

Santa Barbara Islands, eight rugged islands off the coast of S Calif., extending c.150 mi (240 km) W into the Pacific Ocean. They include Anacapa, Santa Barbara, San Miguel, Santa Cruz, and Santa Rosa islands (all now part of Channel Islands National Park), and San Nicolas, Santa Catalina (a tourist center), and San Clemente islands. They were discovered in 1542 by Juan Rodríguez Cabrillo, a Portuguese explorer.

Santa Claus: see NICHOLAS, SAINT.

Santa Fe, city (1990 pop. 55,854), state capital and seat of Santa Fe co., N N.Mex., at the foot of the Sangre de Cristo Mts. It is an administrative and tourist center. Founded c.1609 by the Spanish, it was a Spanish–Native American trade center for over 200 years. Taken by the U.S. in 1846, it has been a seat of government since its founding, the oldest capital city in the U.S. It has many historic churches and an outstanding opera company.

Santa Fe Trail, caravan route of the W U.S., extending c.780 mi (1,260 km) from INDEPENDENCE, Mo., to SANTA FE, N.Mex. Following the first party of traders, led by William Becknell in 1822, annual wagon caravans made the 40- to 60-day trip over the trail to Santa Fe, returning after a 4- to 5-week stay. In 1880 the Santa Fe RR reached Santa Fe, marking the death of the trail. It became a national historic trail in 1987.

Santander, Francisco de Paula [säntăndār'], 1792–1840, Colombian revolutionary. He helped to liberate COLOMBIA from Spanish rule and served (1821–28) as vice president under BOLÍVAR, who later accused him of complicity in a plot (1828) to assassinate Bolívar and banished him. Later, he returned and was president of New Granada (Colombia and Panama).

Santa Rosa, city (1990 pop. 113,313), seat of Sonoma co., W Calif.; inc. 1868. Located in the fertile Sonoma Valley, the city is a rapidly growing industrial, retail, and financial center. Luther BURBANK lived there, and his gardens are preserved as a monument. Also notable is the Church of One Tree (1874), now housing the Ripley Memorial Museum.

Santa Sophia: see HAGIA SOPHIA.

Santayana, George, 1863–1952, American philosopher; b. Spain. He emigrated to the U.S. in 1872, graduated from Harvard Univ., and was (1889–1912) a noted teacher there. In 1912 he retired from teaching and thereafter lived in Europe. Santayana viewed the mind as being placed in and responsive to a physical, biological context; at the same time he emphasized the mind's rational and imaginative vision of physical beauty. He considered religion an imaginative creation of real value but without absolute significance. His philosophical works include *The Sense of Beauty* (1896), *The Life of Reason* (1905–6), *The Realms of Being* (4 vol., 1927–40), and *Dominations and Powers* (1951). His only novel, *The Last Puritan* (1935), had great success.

Santería, religion originating in W Africa, developed by YORUBA slaves in Cuba, and practiced by an estimated one million in the U.S. Blending African beliefs with those of Roman Catholicism, it fuses Christian saints with African deities (orishas). Rites are led

The key to pronunciation appears on page xiii.

by a priest or priestess, and reincarnation is a main belief. One of its most important rituals involves animal sacrifice, which was ruled a constitutional religious practice in a 1993 Supreme Court decision.

Santiago, city (1992 pop. 4,233,060), central Chile, capital of Chile and of Santiago prov., on the Mapocho R. Chile's largest city, housing a third of the country's population, it is the commercial and political heart of the republic and a manufacturing center with iron and steel foundries. The city is modern in appearance, but its ground plan is colonial. Since its founding in 1541, Santiago has survived floods, earthquakes, and an attack by the Mapuche people. In the early 1970s it was the scene of mass political demonstrations.

Santiago de Cuba, city (1989 est. pop. 405,000), SE Cuba, capital of Oriente prov. It is Cuba's second largest city and a major port, with some industrial plants. A former capital of Cuba founded by the Spanish in the 16th cent., it was the scene of heavy fighting (1898) during the SPANISH-AMERICAN WAR. Fidel CASTRO's attack on an army garrison here (July 26, 1953) launched the Cuban Revolution.

Santiago de los Caballeros, city (1981 pop. 278,638), N Dominican Republic. The second largest city in the country, it is the commercial hub of its most densely populated area, the fertile Cibao lowland. It was founded c.1495 and is one of the oldest cities in the Americas.

Santillana, Iñigo López de Mendoza, marqués de [säntēl yä'nä], 1398–1458, Spanish poet, critic, and literary patron. The chief literary figure of his day, he wrote the first literary criticism and SONNETS in Spanish, and commissioned translations of works by VERGIL, PETRARCH, and DANTE. He is best known, however, for his popular songs, or *serranillas*.

Santo Domingo, former colony of Spain, on the island of HISPANIOLA. It included what is now the DOMINICAN REPUBLIC and, in its early days, HAITI. COLUMBUS discovered the island and founded the first settlement there in 1492. Spanish colonists established an agricultural economy in the east. The west was undeveloped until settled by French planters in the 1600s; it was ceded to France in 1697. In 1795 Spain ceded the rest of the island to France, but the settlers in the east rebelled and restored (1808–9) Spanish rule. They declared independence in 1821 but were conquered by Haiti the next year. The Haitians were expelled in 1844, and the Dominican Republic was established.

Santo Domingo, city (1981 pop. 1,313,172), S Dominican Republic, capital and largest city and port of the Dominican Republic, on the Caribbean Sea. Founded Aug. 4, 1496, by Bartholomew Columbus, it may be the oldest continuously inhabited settlement in the Western Hemisphere. It was the first seat of Spanish colonial administration in the New World and was the capital of the colony of SANTO DOMINGO. Almost entirely destroyed by a hurricane in 1930, it was rebuilt and was called Ciudad Trujillo (after Rafael TRUJILLO) until 1961. Now a city of wide avenues and modern buildings, it has the oldest cathedral in the Americas (begun 1514). The world's largest lighthouse is just outside the city.

Santorini: see THERA.

Santos-Dumont, Alberto [sän'tōōzh-dümôN'], 1873–1932, Brazilian aeronaut active in France. He was the first to construct and fly (1898) a gasoline-motored AIRSHIP. He made several pioneering lighter-than-air flights; established (1903) the first airship base, at Neuilly, France; and built (1909) a successful small monoplane.

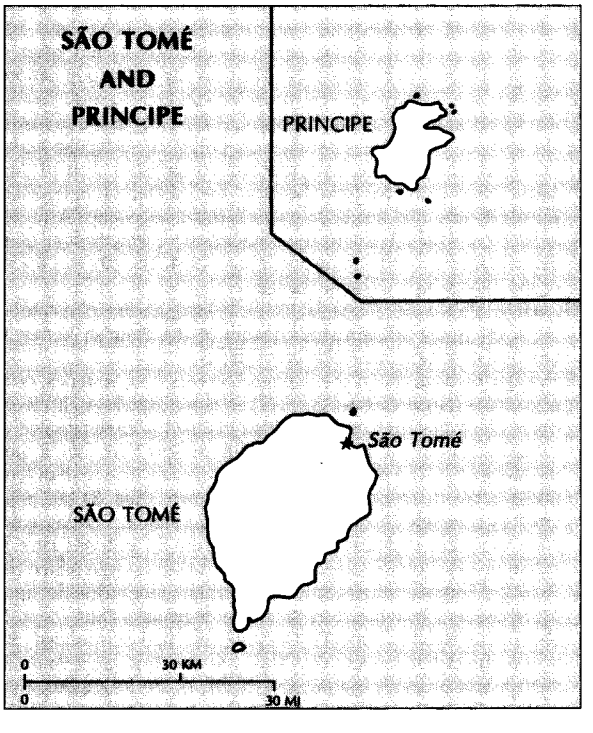
Sanzio, Raphael: see RAPHAEL SANTI.

São Paulo, city (1990 est. pop. 11,129,000), capital of São Paulo state, SE Brazil, on the Tietê R. The largest city in South America, it is an ultramodern metropolis dominating a vast, agriculturally rich hinterland. It is Brazil's commercial, financial, and industrial center, manufacturing textiles, processed food, chemicals, and other products, and is the nation's major transportation hub, with (since 1975) its first subway system. It is also a cultural and educational center, with several symphony orchestras and art museums, and four universities. The city is the site of the Bienal, an important international art exposition. Founded by Jesuits in 1554, São Paulo was the site at which Emperor Dom PEDRO I declared Brazil's independence from Portugal in 1822. It was a minor commercial city until the start of coffee cultivation in the state in the 1880s. More recent growth owes much to hydroelectric power development.

São Tomé [souN tōōmĕ], city, (1984 pop. 34,997), capital of SÃO TOMÉ AND PRINCIPE.

São Tomé and Principe [ōōomĕ, prēn' sēpə], officially Democratic Republic of São Tomé and Principe, island republic (1992 est. pop. 132,000), 372 sq mi (964 sq km), W Africa, in the Gulf of Guinea, c.150 mi (240 km) W of Gabon. São Tomé is the capital and chief town. The country consists of the volcanic islands of São Tomé, Principe, Pedras, Tinhosas, and Rolas, which rise to 6,640 ft (2,024 m) on São Tomé. Lying just north of the equator, the islands are covered with thick vegetation. The economy is based entirely on the export of tropical produce, notably cocoa (about 80% of export earnings), copra, coffee, bananas, and palm oil. Small processing factories are the only industry. The native inhabitants are mainly descendants of African slaves brought from the mainland. The official language is Portuguese, and Roman Catholicism is the predominant faith.

History. The islands were discovered in 1471 by the Portuguese explorers Pedro Escobar and Jaõa Gomes; the São Tomé settlement was founded in 1483. Except for a century of Dutch rule (1641–1740), the islands were held by the Portuguese until independence was granted in 1975. The plantation economy was established in the 18th cent. Upon independence, Manuel Pinto da Costa, leader of a Gabon-based nationalist movement, became president. The first years were marked by economic hardship caused by the departure of the Portuguese and of a large number of contract and migrant workers. The government has sought to strengthen the economy through agrarian reforms and by seeking foreign investment in industry and tourism. In 1991 Pinto da Costa was succeeded by Miguel Trovoada, who won the country's first free presidential election.



sap, plant fluid consisting of water and dissolved substances. The term is generally applied to all the fluid that moves through the xylem (see WOOD) and phloem (see BARK) of the STEMS of higher plants. Water with dissolved minerals ascends to the leaves via the xylem vessels; the solution with food produced by the leaves descends to other parts via the phloem.

Sapir, Edward [səpēr'], 1884–1939, American linguist and anthropologist; b. Germany. His studies on the ethnology and linguistics

of certain Native American groups contributed greatly to the development of descriptive linguistics.

sapphire, GEM, transparent blue variety of CORUNDUM, found chiefly in Thailand, India, Sri Lanka, and Myanmar. Like rubies, some sapphires show an internal star when cut with a round top. Synthetic stones are made by fusing aluminum oxide, with titanium oxide added for color.

Sappho, fl. early 6th cent. B.C., greatest of the early Greek lyric poets; b. Lesbos. Facts on her life are scarce and only fragments of her poetry survive, the longest seven stanzas. She wrote in Aeolic dialect, in many meters, one of which (the Sapphic) is named for her. Her love lyrics, characterized by passion and simplicity, greatly influenced CATULLUS, OVID, and SWINBURNE.

Sapporo, city (1990 pop. 1,671,765), capital of Hokkaido prefecture, SW Hokkaido, Japan. One of Japan's most rapidly growing urban centers, Sapporo is famous for its annual snow festival. It was the site of the 1972 winter Olympics. Food processing, lumbering, woodworking, and printing are the major industries.

saprophyte, any plant that relies on dead organic matter for its food; most do not have CHLOROPHYLL and therefore cannot photosynthesize. Saprophytes include most fungi (see FUNGUS) and a few flowering plants, e.g., some ORCHIDS. They aid in the breakdown of dead plants and animals.

sapsucker: see WOODPECKER.

Sara or **Sarah,** wife of ABRAHAM and mother of ISAAC. She was one of the four Jewish matriarchs. After she gave birth to Isaac in her old age, she became jealous of her handmaid Hagar, Abraham's concubine, whom she drove (with Hagar's son ISHMAEL) into the desert.

Saracens, term used by Christians in the Middle Ages to designate Muslims in general, although strictly the term applied only to the people of NW Arabia. In Spain the term MOORS was used.

Sarajevo [sär"əyä'vō], city (1987 est. pop. 341,250), capital of BOSNIA AND HERCEGOVINA, on the Bosnia R. Its traditional manufactures include metal products and textiles, and lignite and other metals were mined nearby, but economic activity has been depressed by civil war since 1992. The majority of the population is Muslim, and the city is noted for its Muslim architecture. Founded in 1263, it was held by the Turks from 1429 and passed to Austria-Hungary in 1878. The assassination (1914) of Archduke FRANCIS FERDINAND and his wife there sparked WORLD WAR I. Part of Yugoslavia after 1918, Sarajevo became the capital of independent Bosnia in 1992 and has been under Serbian siege since Apr. 1992. A NATO ultimatum led to the withdrawal or inactivation of the Serbian artillery surrounding Sarajevo in 1994. The city was the site of the 1984 winter Olympic games.

Sarasate, Pablo de [säräsä'tā], 1844–1908, Spanish violin virtuoso. He wrote many brilliant violin pieces in the Spanish idiom; his most popular work was *Zigeunerweisen.*

Saratoga campaign, in the AMERICAN REVOLUTION, a series of engagements fought (June–Oct. 1777) in NEW YORK. To split the colonies along the Hudson, the British planned a three-pronged advance on Albany—S from Canada, N from New York City, E along the Mohawk R. The northern force never arrived. The eastern force, under Barry ST. LEGER, besieged Fort Stanwix (Aug. 3) but, frightened by a rumor (Aug. 22), retreated to Canada. Coming south, John BURGOYNE captured TICONDEROGA (July 6), but was later defeated in a raid on Bennington (Aug. 14–16). Burgoyne halted near Saratoga Springs, where American forces, under Horatio GATES, prevented him from breaking through at Freeman's Farm (Sept. 19) and Bemis Heights (Oct. 7). Outnumbered and surrounded, Burgoyne surrendered (Oct. 17). This was the first great American victory, and probably the decisive battle, of the Revolution.

Saratoga Springs, resort and residential city (1990 pop. 25,001), E N.Y.; inc. as a city 1915. Skidmore College is a major employer; the city has dairy and light manufacturing industries. The scene of a battle (1777) in the Revolution, Saratoga Springs was famous in the 19th cent. for its mineral waters; it became one of the country's most fashionable resorts, with a casino, horse racing, and other attractions.

Sarawak, self-governing state (1990 est. pop. 1,669,000), 48,342 sq mi (125,206 sq km), Malaysia, in NW Borneo and on the South China Sea, bordered by Brunei and Sabah (NE) and Kalimantan or Indonesian Borneo (S, W). Kuching is the capital. Its chief products are petroleum, rice, sago, and rubber. Sarawak was ceded (1841) by the sultan of BRUNEI to James BROOKE, an Englishman, who became rajah of the independent state. A British protectorate from 1888, it remained under the rule of the Brookes until they ceded it to Britain in 1946. In 1963 it joined the Federation of Malaysia.

sarcodinian, member of a phylum (Sarcodina) of ameboid PROTOZOANS, unicellular organisms that move and capture food by means of pseudopods, flowing temporary extensions of the cytoplasm and body wall. The phylum is divided into the flagellates and the sarcodines (including the AMEBAS and foraminiferans)

sardine: see HERRING.

Sardinia, island (1990 pop. 1,657,562), 9,032 sq mi (24,092 sq km), W Italy, in the Mediterranean Sea. The capital, Cagliari, is on the south coast. It is mainly mountainous, rising to 6,0 .6 ft (1,834 m) in Mt. Gennargentu, with sheep and goat pastures in and and some agriculture in upland valleys and southwest coastal regions. Mining (lead, zinc, antimony) and fishing are important industries. Sardinia, a source of grain and salt for ancient Rome, was for centuries under the nominal authority of outside overlords. After it was granted (1720) to VICTOR AMADEUS II of SAVOY, he and his successors, as kings of Sardinia, exercised feudal privileges until 1835. Part of the Kingdom of Italy from 1861, the Sardinians were granted limited regional autonomy in 1947.

Sardinia, Kingdom of, name given to the holdings of the house of SAVOY in 1720, when the Treaty of London awarded the island of Sardinia to Savoy to compensate for its loss of Sicily to Austria. The kingdom included Sardinia, Savoy, Piedmont, and Nice. The Congress of VIENNA (1815) added Liguria. It grew during the RISORGIMENTO, and in 1861 VICTOR EMMANUEL II of Sardinia became king of Italy.

sardonyx: see ONYX.

Sardou, Victorien [särdōō'], 1831–1908, French dramatist. He wrote some 70 plays, ranging from light comedy to historical melodrama. His best farce is *Divorçons!* (1880). Other works include such BERNHARDT vehicles as *Fédora* (1882) and *La Tosca* (1887), the basis of Puccini's opera.

Sargasso Sea, part of the north Atlantic Ocean between the West Indies and the Azores, at about 30°N lat. This relatively still sea is the center of a great swirl of ocean currents and is noted for the abundance of seaweed on its surface. Bermuda is in the northwestern part of the sea.

Sargent, John Singer, 1856–1925, American painter; b. Italy. In 1884 he moved to London, where he spent most of his life, painting the dashing, flattering portraits of social celebrities for which he is famous. A prolific painter of great facility, he was brilliant in his treatment of textures and a virtuoso in his handling of brush stroke. Sargent also painted many impressionistic watercolor landscapes early and late in his career. Notable portraits are Isabella Stewart GARDNER (Gardner Mus., Boston) and Mme X (Metropolitan Mus.).

Sargon I (Sargon of Akkad), c.2334–2279 B.C., Mesopotamian ruler. One of the earliest empire-builders, he founded the first Semitic dynasty, which flourished for 150 years and controlled much of southwestern Asia.

Sargon II, d. 705 B.C., king of Assyria (721–705 B.C.) and founder of the last Assyrian dynasty. He completed the conquest of Samaria begun by his predecessor Sahalmaneser V and deported the Israelites so widely throughout Assyria that they became "the lost tribes of Israel."

Sarmatia, ancient district about the Don R. occupied by the Sarmatians, 3d cent. B.C.–2d cent. A.D. They spoke an Indo-Iranian language, and were nomadic relatives of the Scythians. The term Sarmatia is also used for the land along the Danube and over the Carpathians, where the Sarmatians were later driven by the HUNS. The Sarmatians allied with Rome against the GERMANS, by whom they had been scattered by the 3d cent. A.D.

Sarney, José, 1930–, president of Brazil (1985–90). He became vice president when Brazil's military rulers voluntarily surrendered power to a conservative civilian government in 1985, and president when president-elect Tancredo Neves (Apr. 1985) died. He failed to cope with Brazil's massive foreign debt and runaway inflation.

Sarnoff, David, 1891–1971, American radio and television pioneer;

b. Russia. He worked for the Marconi Wireless Co., winning recognition as the narrator of the *Titanic* disaster (1912). After the Radio Corp. of America absorbed (1921) Marconi, Sarnoff became general manager. As president (after 1930) and chairman of the board (from 1947) of RCA, he played a major role in the development of television.

Saroyan, William, 1908–81, American author; b. Fresno, Calif. A prolific writer, he combined optimism, sentimentality, and love of country in plays, e.g., *The Time of Your Life* (1939; Pulitzer); novels, e.g., *The Human Comedy* (1942); short stories, e.g., *My Name Is Aram* (1940); and autobiographical works.

Sarraute, Nathalie [särōt'], 1900–, French novelist; b. Russia. Her experimental "anti-novels" focus upon the psychological preoccupations and passing sensations of individuals. They include *Tropisms* (1939), *The Planetarium* (1959), and *Fools Say* (1976).

sarsaparilla, name for various plants and for an extract from their roots, used in medicine and beverages. True sarsaparilla is obtained from tropical American species of the genus *Smilax* of the LILY family; these have thick rootstalks and thin roots several feet long. Wild sarsaparilla (*Aralia nudicaulis*), related to GINSENG, is used as a substitute source for the extract.

Sarto, Andrea del, 1486–1531, Florentine High RENAISSANCE painter. He was given the title "faultless painter" for his FRESCOES of St. Philip's life (Cloisters of the Annunziata, Florence). His harmonious color and consonance of figure and background are seen in *Madonna of the Harpies* (Uffizi) and *Holy Family* (Metropolitan Mus.).

Sartre, Jean-Paul [sär'trə], 1905–80, French philosopher and author, a leading exponent of EXISTENTIALISM. His writings examine the individual as a responsible but lonely being, adrift in a meaningless universe with a terrifying freedom to choose. His existentialist works include the monumental treatise *Being and Nothingness* (1943); the plays *The Flies* (1943), *No Exit* (1944), and *The Respectful Prostitute* (1947); and the novels *Nausea* (1938) and *The Age of Reason* (1945; first of a trilogy). *The Critique of Dialectical Reason* (1960) combined MARXISM and existentialism whereas *The Family Idiot* (1982) explored FLAUBERT from a Freudian viewpoint. Sartre declined the 1964 Nobel Prize in literature.

Saskatchewan, province (1991 pop. 988,928), 251,699 sq mi (651,900 sq km), W Canada, bounded by the Northwest Territories (N), Manitoba (E), North Dakota and Montana (S), and Alberta (W). Northern Saskatchewan is part of the desolate but mineral-rich CANADIAN SHIELD, and to the south is a mixed forest belt of marketable timber. The CHURCHILL and the Saskatchewan are the main rivers. Only in S Saskatchewan has there been substantial settlement or development. Except for small areas of grazing and mixed farming, this region is basically devoted to the growing of hard wheat. Oil and natural gas are the most important minerals; other minerals include uranium, copper, zinc, gold, coal, and potash. Most industries process raw materials. REGINA, the capital, and SASKATOON are the chief cities.

History. The area's first trading posts were established (c.1750) by the French, but the HUDSON'S BAY COMPANY made the first permanent settlement at Cumberland House in 1774. In 1870 the company ceded its rights to the Canadian government, and the area became part of the NORTHWEST TERRITORIES. The building of the railway (1882) attracted many settlers and opened trade through the GREAT LAKES. A rebellion (1884–85) led by Louis RIEL was suppressed, and Saskatchewan became a province in 1905. The Progressive Conservatives were in power from 1982 to 1992, when they lost to the New Democrats. Saskatchewan sends 6 senators (appointed) and 14 representatives to the national parliament.

Saskatoon, city (1991 pop. 186,058), Saskatchewan, W Canada, on the South Saskatchewan R. It is the chief center of central and N Saskatchewan, with oil refineries, grain elevators, flour mills, stockyards, and meat- and potash-processing plants. Saskatoon was settled in 1883 and grew rapidly after the coming of the railroad (1890). The Univ. of Saskatchewan is there.

sassafras: see LAUREL.

Sassanid or **Sassanian,** last dynasty of native rulers to reign (A.D. c.224–c.640) in Persia before the Arab conquest. ARDASHIR I was the first of the dynasty. They were much occupied with wars, and their enemies included the Romans, White Huns, and Armenians. They restored the ancient religion of ZOROASTRIANISM, which virtually disappeared again after the dynasty fell. The last Sassanid ruler, Yazdagird III, fled the country when it was overrun by Arab invaders.

Sassoon, Siegfried, 1886–1967, English poet and novelist. An officer in World War I, he wrote of war's brutality and wastefulness in grim, forceful verse in *The Old Huntsman* (1917), *Counter-Attack* (1918), and other collections. His novels include the semiautobiographical trilogy collected as *The Memoirs of George Sherston* (1937).

Sassou-Nguesso, Denis, 1943?–, Congolese army officer, president of Congo (1979–92). He served (1977–79) as the minister of national defense. As president he won approval for a new Marxist constitution, signed (1981) a friendship treaty with the USSR, and maintained strong economic ties with France. The increasing economic impoverishment of the Congo, however, led to a national political conference (1991) that stripped him of many powers. In 1992 he ran for reelection in a democratic contest and came in third.

Sastre, Alfonso [sä'strā], 1926–, Spanish dramatist. His controversial plays, including *Condemned Squad* (1953), *Death Thrust* (1960), and *The Gloomy Comrade* (1972), deal with injustice, alienation, and violence from a Marxist and existentialist point of view.

Satan [Heb., = adversary], in Judaism, Christianity, and Islam, the principle of evil conceived as a person; also called the Devil. In Christian tradition Satan was the leader of the angels who rebelled against God and who were cast out of heaven. He and his followers are seen as tempters of humanity and the source of evil in the world. He has numerous other names, such as Lucifer, Beelzebub, Evil One, and Prince of Darkness.

satellite, artificial, object launched by a ROCKET into orbit around the earth or, occasionally, another solar-system body (see SPACE PROBE). A satellite in circular orbit at an altitude of 22,300 mi (35,880 km) has a period of exactly 24 hr, the time it takes the earth to rotate once on its axis; such an orbit is called synchronous. If such an orbit also lies in the equatorial plane, it is called geostationary, because the satellite will remain stationary over one point on the earth's surface. The first artificial satellite, *Sputnik 1,* was launched by the USSR on Oct. 4, 1957. *Explorer 1,* the first American satellite, was launched on Jan. 31, 1958. The principal types of satellites are COMMUNICATIONS SATELLITES, NAVIGATION SATELLITES, RECONNAISSANCE SATELLITES, and WEATHER SATELLITES. Major U.S. scientific research satellites include many Explorer satellites and various orbiting OBSERVATORIES, such as the HUBBLE SPACE TELESCOPE. Major Soviet or Russian space-science satellite programs include Elektron, Proton, Prognoz, and many Cosmos satellites. The U.S. has also launched several Landsat remote-imaging satellites to survey the earth's resources by means of special television cameras and radiometric scanners. The similar French SPOT satellite provides higher-resolution photographs of the earth.

satellite, natural, celestial body orbiting a planet. The earth's only satellite is the MOON; thus satellites of other planets are often referred to as moons. The largest in the solar system is Jupiter's Ganymede, whose radius of 1,639 mi (2,638 km) is larger than that of the planet Mercury. See also PLANET (table); articles on individual planets.

Satie, Erik [sätē'], 1866–1925, French composer. He rejected ROMANTICISM and IMPRESSIONISM and developed an abstract, often witty, and deceptively simple style. Satie's harmonic innovations are evident in such early piano pieces as *Sarabandes* (1887) and *Gymnopédies* (1888), while some of his later works, e.g., *Socrate* (1918), foreshadowed the neoclassicism of STRAVINSKY. He was the center of the group of young composers known as "les SIX."

satin spar: see GYPSUM.

satire, a work of literature or art that, by inspiring laughter, contempt, or horror, seeks to correct the follies and abuses it uncovers. The Roman poets HORACE and JUVENAL became models for the two leading types of satire: Horatian satire is mild, amused, and sophisticated; Juvenalian is vitriolic and indignant. Noted satirists include VOLTAIRE, Alexander POPE, William HOGARTH, Jonathan SWIFT, Oscar WILDE, Mark TWAIN, Evelyn WAUGH, James THURBER, Kingsley AMIS, and Philip ROTH.

Sato Eisaku, 1901–75, Japanese prime minister (1964–72). A Liberal-Democrat, he signed (1969) a treaty with the U.S. that re-established (1972) Japanese sovereignty in Okinawa. Sato was awarded the 1974 Nobel Peace Prize for his efforts to halt the spread of nuclear weapons.

Saturday: see WEEK; SABBATH.

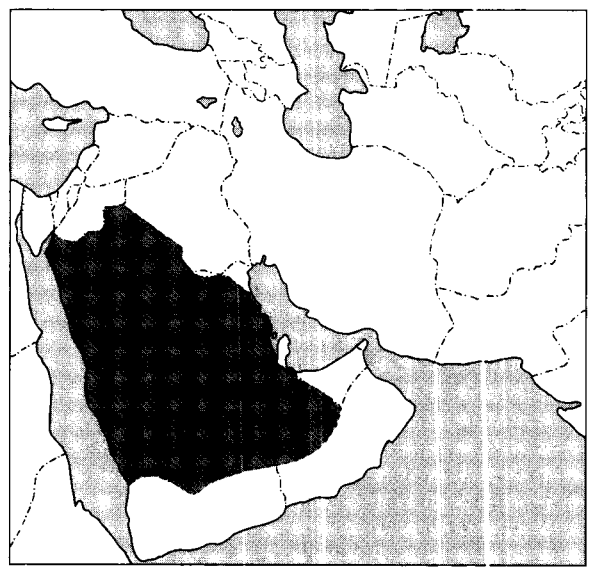
Saturn, in astronomy, 6th PLANET from the sun, at a mean distance of 886.7 million mi (1.4270 billion km). It has an equatorial diameter of 74,980 mi (120,660 km) and an atmosphere of hydrogen, helium, and traces of methane and ammonia. Like Jupiter, Saturn has counterflowing easterly and westerly winds. Saturn's most remarkable feature is its ring system, composed of billions of water-ice particles orbiting around the planet. The main rings are at distances ranging from 4,140 to 49,880 mi (6,670 to 80,270 km) above the cloud tops, and two other tenuous rings orbit much more distantly. Saturn also has at least 18 natural satellites. The largest is **Titan** (diameter: 3,200 mi/5,150 km); discovered by Christiaan HUYGENS in 1655, it is the only natural satellite in the solar system with a substantial atmosphere. Saturn has six major icy satellites. The most prominent feature of heavily cratered **Mimas,** the innermost, is a large impact crater about one third the diameter of the satellite. Certain broad regions of **Enceladus** are uncratered, indicating geological activity that has somehow resurfaced the satellite within the last 100 million years. **Tethys** also has a very large impact crater, as well as an extensive series of valleys and troughs that stretches three quarters of the way around the satellite. Both **Dione** and **Rhea** have bright, heavily cratered leading hemispheres and darker trailing hemispheres with wispy streaks thought to be produced by deposits of ice inside various surface troughs or cracks. **Iapetus,** the outermost of the large icy satellites, has a dark leading hemisphere and a bright trailing hemisphere. The remaining eleven satellites, some sharing orbits with others, are smaller in size. The two largest of these, dark-surfaced **Phoebe** and irregularly shaped **Hyperion,** orbit far from the planet. Saturn has been encountered by three SPACE PROBES: *Pioneer 11* (1979), *Voyager 1* (1980), and *Voyager 2* (1981). Photos and other data from *Voyager 2* indicate the possibility of at least five more small satellites.

Saturn, in Roman religion, god of harvests; husband of Ops; father of JUPITER, JUNO, CERES, PLUTO, and NEPTUNE; identified with CRONUS. After the TITANS' fall, he was said to have fled to Italy, settled on the CAPITOLINE HILL, civilized the people, and taught them agriculture. On his festival, the Saturnalia, work ceased, gifts were exchanged, and war was outlawed.

satyr, in Greek myth, a forest and mountain creature. Part human, with a horse's tail and ears, and a goat's horns and legs, satyrs were merry, drunken, lustful devotees of DIONYSUS.

Saudi Arabia, officially Kingdom of Saudi Arabia, kingdom (1992 prelim. pop. 16,929,294), 829,995 sq mi (2,149,690 sq km), SW Asia, occupying most of the Arabian peninsula, bounded by Jordan, Iraq, and Kuwait (N), the Persian Gulf, Qatar, and the United Arab Emirates (E), Yemen and Oman (S), and the Red Sea (W). RIYADH is the capital, JIDDA the principal port. Saudi Arabia has five major physical regions: the great Rub al-Khali, a sand desert occupying the entire south and southeast; the Nejd, a vast, barren plateau in the center; the Hejaz and Asir, along the RED SEA, with mountains rising from an arid coastal plain; and the Eastern Province, along the PERSIAN GULF, site of the country's rich oil resources. The climate is usually hot and dry, although the humidity along the coasts is high. Saudi Arabia has at least one quarter of the world's oil reserves, and the oil industry dominates the economy. Huge revenues from oil exports have been used to diversify the industrial base; metals, chemicals, plastics, cement, and fertilizer are now produced. Irrigation projects have reclaimed many acres of desert, and grains, dates, citrus fruits, and vegetables are grown. Nomadic BEDOUINS raise camels, sheep, goats, and horses. Income is also derived from Muslim pilgrims who travel from all parts of the world to the holy cities of MECCA and MEDINA. The overwhelming majority of the population are Arabs who adhere to the Wahhabi sect of Islam, but 27% of the population consists of resident foreigners. Arabic is the official language.

History. ARABIA has been inhabited for thousands of years by nomadic Semitic tribes. With the birth (A.D. 570) of MUHAMMAD, in Mecca, Arabia was briefly the center of Islam, but by the end of the 7th cent. the area was disunited. Modern Saudi Arabia owes its existence to IBN SAUD, an adherent of the puritanical WAHHABI Muslim sect. Beginning in 1902 he conquered the Nejd, Al Hasa, and Hejaz regions, and in 1932 he proclaimed himself king of a united Saudi Arabia. Oil was discovered in 1936; commercial production began in 1938. Ibn Saud died in 1953 and was succeeded by his eldest son, Saud. In 1964 Saud was deposed by FAISAL, who secured (1974) an agreement giving the Saudis a 60% majority ownership of foreign oil concessions in their country. Under both monarchs, Saudi Arabia aided (1962–67) royalist forces against Egyptian-backed republican rebels in YEMEN. In 1975 Faisal was assassinated; he was replaced by KHALID, who inaugurated a program of industrialization and social welfare. In the conflict with Israel, Saudi Arabia has generally supported the Arab states, although as a friend of the U.S. it is a somewhat moderating force. Its moderating influence has also been felt in the ORGANIZATION OF PETROLEUM EXPORTING COUNTRIES (OPEC), in which it has acted to stabilize petroleum prices. Khalid died in 1982 and was succeeded as king by FAHD. Military clashes, oil-policy disputes, and rioting Iranian pilgrims in Mecca led Saudi Arabia to sever diplomatic relations with Iran in 1989. In 1990 the kingdom joined the coalition that opposed Iraq's forcible annexation of Kuwait, and the forces of the coalition were largely based in N Saudi Arabia (see PERSIAN GULF WAR). In 1992 King Fahd decreed a new constitution; among its features were an appointed national council (est. 1993) with the right to review, but not overrule, government acts, but the royal family's power was basicly undiminished.



Saul, fl. 11th cent. B.C., first king of the ancient Hebrews. DAVID was first the protégé, then the rival, finally the successor, of Saul. Defeated and wounded in battle with the Philistines on Mt. Gilboa, Saul committed suicide rather than be captured. Though he was unsuccessful in defeating the Philistines, Saul paved the way for national unity under David.

Saul of Tarsus: see PAUL, SAINT.

Sault Sainte Marie Canals [sōō sānt mərē'], popularly called the **Soo Canals,** two toll-free ship canals on the U.S.-Canada border. Bypassing rapids in the St. Marys R. between lakes Huron and Superior, they are a vital link in the St. Lawrence & Great Lakes Waterway. The deeper U.S. canal (1.6 mi/2.6 km long and 80 ft/24 m wide) accommodates larger vessels than the Canadian canal (1.4 mi/2.3 km long and 60 ft/18 m wide).

Saussure, Ferdinand de, 1857–1913, Swiss linguist. One of the founders of modern LINGUISTICS, he established the structural study of language, emphasizing the arbitrary relationship of the linguistic sign to that which it signifies. Saussure distinguished synchronic linguistics (studying language at a given moment) from diachronic

linguistics (studying the changing state of a language over time); he further opposed what he named *langue* (the state of a language at a certain time) to *parole* (the speech of an individual). Saussure's most influential work is the *Course in General Linguistics* (1916), a compilation of notes on his lectures.

Savage's Station: see SEVEN DAYS BATTLES.

savanna or **savannah,** tropical or subtropical grassland lying in the margin of the trade-wind belts. Its climate is characterized by a rainy period in summer and a dry winter when the grass withers. The largest savannas are in Africa.

Savannah, city (1990 pop. 137,560), seat of Chatham co., SE Ga., near the mouth of the Savannah R.; inc. 1789. A busy commercial port, the city has chemical, plastics, lumber, paper, and other industries. The oldest city in Georgia, founded in 1733 by James OGLETHORPE, Savannah was the commercial rival of CHARLESTON. It was the object of fighting in the American Revolution and in the Civil War. Its historic district has fine old homes, churches, and shady streets.

Savimbi, Jonas, 1934–, Angolan rebel leader. In 1966 he founded the National Union for the Total Independence of Angola (UNITA), a guerrilla group opposed to Portuguese rule in Angola. When independence came (1975), UNITA was the weakest of three groups competing for power, but Savimbi benefited from support from the U.S. and South Africa, who were opposed to Angola's Marxist government, and civil war ensued. In 1991 Savimbi and the Angolan government agreed to a truce, and multiparty elections, but when Savimbi and UNITA lost (1992) in the elections they resumed fighting.

savings and loan association, also known as **building and loan association,** type of financial institution that accepts savings from the public and invests those savings primarily in home MORTGAGES. A savings and loan association (S&L) may be organized as either a mutual or capital-stock institution. Of the 4,700 associations in the U.S., 55% operate under a federal charter, the others being chartered by the states. The first U.S. S&L was founded in 1831. A period of rapid expansion came after World War II, fed by the boom in new housing. In the late 1970s, however, many S&Ls were in serious difficulty. While receiving low interest on old outstanding mortgages, the S&Ls had to pay much higher rates for new funds, because of record-high INTEREST rates. Many depositors had also switched into other investments, such as MONEY-MARKET FUNDS. In response to these problems the legal restrictions on S&Ls were eased in 1982. A new crisis arose when bad loans, poor investments, and fraud caused an increasing number of S&Ls to fail and the Federal Savings and Loan Insurance Corporation (FSLIC) became insolvent. In 1989 the FSLIC was dissolved, its insurance functions given to a new entity supervised by the FEDERAL DEPOSIT INSURANCE CORPORATION, and the Resolution Trust Corporation was established to take over failed S&Ls and dispose of their assets. The bailout of the failed S&Ls is expected to cost as much as $400–500 billion over 30 years.

savings bank: see BANKING.

Savonarola, Girolamo, 1452–98, Italian religious reformer. A DOMINICAN, he became popular in Florence for his eloquent attacks on moral laxity and for his predictions, some of them accurate. After the MEDICI were exiled (1494), he became spiritual ruler of Florence and imposed a severe regime. He supported the invasion of Italy by CHARLES VIII of France, hoping that Charles would help in forming a democratic government in Florence and reforming the scandalously corrupt court of Pope ALEXANDER VI. Excommunicated (1497) after ignoring the pope's order to stop preaching, Savonarola was finally executed as a false prophet.

Savoy, house of, dynasty that ruled Savoy and Piedmont from the 11th cent., Sicily (1713–20), Sardinia (1720–1861), and Italy (1861–1946). Its first historical member was an 11th-cent. count who held lands in Savoy and Piedmont. Through marriage and diplomacy his successors expanded their holdings in France, Switzerland, and Italy. AMADEUS VIII acquired the ducal title in 1416. By 1536 Savoy had lost its Swiss possessions, and FRANCIS I of France occupied the rest of the duchy. In 1559 EMMANUEL PHILIBERT obtained the restoration of his duchy and made Turin his capital. His grandson VICTOR AMADEUS II became (1713) king of Sicily for his role in the War of the SPANISH SUCCESSION. Sicily was exchanged (1720) with Spain for Sardinia, and the state became known as the kingdom of Sardinia. In 1831 Charles Albert, of the cadet line of Savoy-Carignano, became king. He involved Sardinia in the RISORGIMENTO, by which his son, VICTOR EMMANUEL II, became (1861) king of Italy. Victor Emmanuel II's son, Humbert I (r.1878–1900), was assassinated. Humbert's son and successor, VICTOR EMMANUEL III, abdicated after World War II. His son, Humbert II, reigned briefly (1946) before Italy became a republic.

Saxe, Maurice, comte de [säks], 1696–1750, marshal of France, an illegitimate son of AUGUSTUS II of Poland. A brilliant commander, he led the French to victory at Fontenoy (1745) and Raucoux (1746) in the War of the AUSTRIAN SUCCESSION. His *Mes Rêveries* (1757) is a remarkable work on the art of war.

saxifrage, name for some members of the Saxifragaceae, a diverse family of herbs, shrubs, and small trees of cosmopolitan distribution. The true saxifrages (primarily the genus *Saxifraga*) comprise a group of low rock plants often cultivated as rock-garden and border plants, e.g., the strawberry geranium (*S. sarmentosa*). The Eastern early saxifrage (*S. virginiensis*) and the Western umbrella plant (*S. peltata*) are American wildflowers. The arctic and alpine *S. oppositifolia* is one of the northernmost of flowering plants. The genus *Ribes*, a group of berry-bearing shrubs including the gooseberry and CURRANT, is of minor economic importance. The mock orange, or syringa (genus *Philadelphus*), has white, sometimes fragrant flowers similar to orange blossoms, and the hydrangea (genus *Hydrangea*), another member of the family, has showy flat-topped clusters of white, pink, or blue flowers.

Saxo Grammaticus, c.1150–c.1220, the first important Danish historian. The first nine books of his *Gesta Danorum* record oral tradition and legends; the remaining seven are a valuable record of contemporary events.

Saxons, Germanic people living in S Jutland in the 2d cent. In the 3d and 4th cent. they raided the coasts of the North Sea, and by the 5th cent. they had settled in N Gaul. Raiding Saxons began (c.450) to settle in Britain. By the 6th cent. they and the Angles were founding ANGLO-SAXON kingdoms, with WESSEX dominant. Continental or "Old Saxons" in 566 became tributaries of the FRANKS, and were finally conquered (804) by CHARLEMAGNE. The treaty of Verdun (843) included Saxon lands in the area that is modern Germany.

Saxony, Ger. *Sachsen,* state (1990 est. pop. 4,970,000), 6,561 sq mi (16,993 sq km), E Germany. DRESDEN is its capital; other important cities are CHEMNITZ and LEIPZIG. Saxony was originally the land of the SAXONS, which in Frankish times was in NW Germany. In the 9th cent. the first duchy of Saxony, one of the five stem duchies of medieval Germany, was created. The duchy was broken up after Holy Roman Emperor FREDERICK I ousted (1180) HENRY THE LION from the fief. In 1356 the duke of Saxe-Wittenburg was made a permanent elector of the Empire. His territory, called **Electoral Saxony,** lay east of the original stem duchy. In 1425 it passed to the WETTIN family. It was a center of the German REFORMATION in the 16th cent. In 1697 the elector of Saxony became king of Poland as AUGUSTUS II. The death (1763) of his son, AUGUSTUS III, ended the union with Poland. The period 1697 to 1763 was one of cultural and artistic flowering in Saxony and in its capital, Dresden. Saxony had retained the Polish crown in the War of the POLISH SUCCESSION (1733–35) but lost prestige in the War of the AUSTRIAN SUCCESSION (1740–48) and the SEVEN YEARS WAR (1756–63). Saxony was raised (1806) to a kingdom by NAPOLEON I in return for changing sides (1806) in the FRENCH REVOLUTIONARY WARS, but after his defeat it lost nearly half of its land to Prussia. The remaining **kingdom of Saxony** was defeated by Prussia in the AUSTRO-PRUSSIAN WAR (1866) and joined the German Empire in 1871. Under the Weimar Republic it became (1918) the state of Saxony. In 1949 it became part of East Germany. It was abolished as an administrative unit in 1952 but reconstituted upon German reunification (1990).

saxophone: see WIND INSTRUMENT.

Sayers, Dorothy Leigh, 1983–1957, English writer. Her erudite detective stories feature the nobleman-detective Lord Peter Wimsey and include *Strong Poison* (1930), *Murder Must Advertise* (1933), and *The Nine Tailors* (1934).

Sb, chemical symbol of the element ANTIMONY.

Sc, chemical symbol of the element SCANDIUM.

scabies: see MANGE.

Scalawags, derogatory term used in the South after the CIVIL WAR to describe white Southerners who joined the Republican party and aided the RECONSTRUCTION program.

scale, in music, any series of TONES arranged in a step-by-step rising or falling of PITCH. The scale most used in Western musical composition until the end of the 19th cent. was the diatonic scale, a series of seven tones. (The addition of a final top note, with a frequency twice that of the lowest note, defines this sequence as an *octave.*) The intervals of the diatonic scale were defined by PYTHAGORAS in the 6th cent. B.C. as five whole tones (t) and two semitones (s) in the order ttsttts. By the time of J.S. BACH, the chromatic scale of 12 equal semitones (as in the white and black keys of a keyboard scale) had become established, and the scales beginning on these notes remained the basis of Western TONALITY until the innovations of such modern composers as SCHOENBERG. DEBUSSY used a scale of six equal whole tones in his works. The pentatonic scale of five whole tones is prevalent in Asian music.

scale, in zoology, a flattened bony or horny outgrowth of the skin of an animal, particularly in FISHES and REPTILES, that serves primarily as protection. Fish scales, composed mostly of bone, form directly in the skin membrane; the type and number of scales figure in the identification of a species. Most reptiles have horny scales, or scutes, but some (e.g., the CROCODILE) have both horny and bony scales. In SNAKES, scales aid in movement. Birds have scales on the feet and sometimes the legs. Some mammals (e.g., the rat and the mouse) have tail scales.

Scalia, Antonin: see SUPREME COURT, UNITED STATES (table 1).

Scaliger, Joseph Justus, 1540–1609, French classical scholar. He became (1562) a Protestant and taught at Geneva (1572–74) and Leiden (from 1593). He was learned in mathematics, philosophy, and many languages, and established rules of criticism for studying texts and the classics. He surveyed known methods of measuring time and placed the study of calendars and dates on a scientific basis.

Scaliger, Julius Caesar, 1484–1558, Italian philologist and physician in France. In his *De causis linguae Latinae* (1540) he analyzed CICERO's style, criticizing the earlier studies of his humanist predecessors. He wrote commentaries on the medical and botanical works of HIPPOCRATES, Theophrastus, and ARISTOTLE, and urged an improved classification of plants. In his *Poetics* (1561), he extolled VERGIL and SENECA.

scallion: see ONION.

scallop or **pecten,** marine BIVALVE mollusk distinguished by rounded, ridged shells with radiating ribs and flared "wings" at the hinge. Scallops swim by flapping their shells with a powerful adductor muscle, the only part that is eaten as food.

Scanderbeg or **Skanderbeg,** c.1404–1468, Albanian national hero. The son of an Albanian prince, he was born George Castriota. He abjured Islam in 1443, styled himself prince of Albania, and devoted the rest of his life to defending Albania against Turkish invasion, on occasion allying himself with Venice, Naples, Hungary, and the pope. After his death Albania fell to the Turks.

Scandinavia, region of N Europe, consisting of NORWAY and SWEDEN (on the Scandinavian Peninsula), DENMARK, and usually also including FINLAND, ICELAND, and the FAEROE ISLANDS. Its people share similar histories and cultures, and most, except for the Finns and Lapps (see LAPLAND), speak closely related Germanic languages.

scandium (Sc), metallic element, discovered in 1879 by L.F. Nilson. A soft, silver-white RARE-EARTH METAL, it is in relatively greater abundance in the sun and certain stars than on earth. It is used in nickel alkaline storage batteries and as a radioactive tracer. See ELEMENT (table); PERIODIC TABLE.

scanning tunneling microscope, device for imaging and manipulating individual atoms on the surfaces of materials. The underlying principle of the microscope is the TUNNELING of electrons between a probe and the surface of the sample under study; the flow of electrons will vary as the distance between the probe and the sample changes. As the probe is moved above the surface, its height is continually adjusted, however, to keep the flow constant, and the fluctuations in height are recorded to produce a map of the surface. Microscopic manipulation of atoms is accomplished by applying a voltage pulse or a combination of electrostatic and chemical forces between the probe and the sample; a single atom can be extracted and deposited on the probe, which can then be moved and the atom redeposited on the surface. The microscope was developed in the early 1980s by Gerd Binnig and Heinrich Rohrer, who were awarded the 1986 Nobel Prize in physics for their work.

scarab beetle or **scarab,** heavy-bodied, oval, often brightly colored or iridescent BEETLE. Some, called dung beetles, feed on animal dung and are important in recycling organic matter and disposing of disease-breeding wastes. Another group, which feeds on living plants and includes the Japanese and June beetles, are major crop and garden pests. Representations of scarabs, carved in stone or other materials, were popular in ancient Egypt and Rome.

Scarlatti, Alessandro, 1660–1725, Italian composer. A leader of the Neapolitan school, he helped establish the conventions of *opera seria,* perfecting the *aria da capo* and the three-part OVERTURE. He wrote over 100 operas, church music, songs, and hundreds of CANTATAS. His son, **(Giuseppe) Domenico Scarlatti,** 1685–1757, a harpsichord virtuoso known chiefly for his over 500 harpsichord SONATAS, is considered the founder of modern keyboard technique.

scarlet fever, acute, contagious respiratory infection caused by streptococci bacteria. Symptoms include a sore throat, fever, headache, white-coated tongue with red spots (strawberry tongue), and a skin rash. The disease usually occurs before age ten and is spread by direct contact. ANTIBIOTICS are used to treat severe cases and reduce the possibility of complications.

Schacht, Hjalmar Horace Greeley, 1877–1970, German financier. He conceived the plan that stabilized the German currency in the 1920s and was president of the Reichsbank (1923–30, 1933–39). Although he supported the NAZIS, he was placed in a concentration camp for his alleged part in the plot against HITLER (1944). He was acquitted (1946) of war crimes by the Nuremberg tribunal.

Schapiro, Meyer, 1904–, American art historian; b. Lithuania. A champion of modern art in the 1930s, he has since done important studies in early Christian, medieval, and contemporary art, exploring such areas as the relationship of art to sociology and psychoanalysis. His essays include "The Nature of Abstract Art" (1937) and "Leonardo and Freud" (1956). His books include *Romanesque Art* (1977) and *Modern Art: 19th and 20th Centuries,* (2 vol., 1978–79).

Schechter, Solomon, 1847–1915, Hebrew scholar; b. Romania. Schechter's identification of the hitherto missing Hebrew version of Ecclesiasticus won him international acclaim. As president of Jewish Theological Seminary (N.Y.C.), he brought together a faculty of scholars whose work defined the Conservative movement (see JUDAISM).

Scheele, Karl Wilhelm [shā'lə], 1742–86, Swedish chemist. A pharmacist, he prepared and studied OXYGEN (c.1773), but his published account (1777) appeared after Joseph PRIESTLEY's. He discovered NITROGEN independently of Daniel Rutherford and showed it to be a constituent of air. His treatise (1774) on MANGANESE aided in the discovery of that element and also of barium and chlorine. He isolated glycerin and many acids.

Scheherazade: see THOUSAND AND ONE NIGHTS.

Schelling, Friedrich Wilhelm Joseph von, 1775–1854, German philosopher. First influenced by the IDEALISM of J.G. FICHTE, he held the concept of the Absolute to represent the ultimate unity of mind and matter. Later Schelling saw history as a series of stages progressing toward that unity, and (unlike Fichte) held that nature itself progressed toward the Absolute. His concept of art as the unity of the natural and the spiritual, a bridge between German idealism and ROMANTICISM, influenced COLERIDGE.

scherzo [Ital., = joke], term denoting various types of musical compositions, primarily lively and surprising in rhythm or melody. The term may also refer to a movement of a symphony or sonata.

Schiaparelli, Giovanni Virginio [skyäpärĕl'lē], 1835–1910, Italian astronomer. He discovered (1861) the asteroid Hesperia. While director (1862–1900) of the Brera Observatory, Milan, he observed what he called canals on the surface of the planet Mars and showed that meteor swarms move through space in cometary orbits.

Schick test, a diagnostic test (developed c.1910) to evaluate susceptibility to DIPHTHERIA. A small amount of dilute diphtheria TOXIN

is injected into the skin. The appearance of redness and swelling at the infection site within a week indicates low levels of antibody (i.e., little IMMUNITY) against the toxin and thus susceptibility to the disease.

Schiele, Egon [shē'lə], 1890–1918, Austrian expressionist painter and draftsman. His taut, linear style emphasizes anatomical structure. With KOKOSCHKA, he led the Austrian expressionist movement until his death from influenza at 28.

Egon Schiele's Woman in Yellow, *1914*

Schiller, Friedrich von, 1759–1805, German dramatist, poet, and historian, one of the greatest of German literary figures, second only to GOETHE. Educated at the duke of Württemberg's military academy, where he was forced to study medicine, Schiller soon turned to writing. His attack on political tyranny in *The Robbers* (1781) brought him fame, and Schiller fled his post as army surgeon to become a dramatist for the Mannheim theater. His second youthful success was *Don Carlos* (1785, performed 1787). In 1787 he settled in Weimar, where he was appointed a professor at the Univ. of Jena (1789), married (1790) the writer Charlotte von Lengefeld, and became close to Goethe, in whom his classical idealism, nobility of mind, and high ethical principles found a receptive spirit. Together they edited the literary periodicals *Horen* (1795–97) and *Musenalmanach* (1796–1800). Influenced by the philosophy of KANT, Schiller developed his aesthetic theories, stressing the sublime and the creative powers of humanity. He wrote several important treatises on aesthetics. Among his masterpieces are the dramatic trilogy *Wallenstein* (1798–99); *Mary Stuart* (1800), his most popular play; and *Wilhelm Tell* (1804), a technically masterful study of history and hero. Also noteworthy are his translations of SHAKESPEARE and RACINE, and his ballades and philosophical lyrics. His "Ode to Joy" (1785) was used by BEETHOVEN for the finale of the Ninth Symphony.

Schism, Great, or **Schism of the West,** division (1378–1417) within the Roman Catholic Church. Shortly after GREGORY XI returned the PAPACY from Avignon to Rome, he died (1378). URBAN VI was elected pope, but soon alienated those in the church. The cardinals declared his election null and elected Robert of Geneva (Antipope Clement VII). Clement set up court in Avignon, but Urban continued to reign at Rome. They and their successors formed two lines of popes. The Council of Pisa (1409) tried unsuccessfully to depose GREGORY XII of the Roman line and Benedict XIII of the Avignon line, and elected a second antipope, Alexander V, who was soon succeeded by the energetic Baldasarre COSSA as John XXIII. The schism was ended by the Council of Constance (1414–18) that accepted Gregory's resignation, deposed Benedict and John, and elected MARTIN V as pope.

schist, metamorphic ROCK (see METAMORPHISM) having a foliated (plated) structure in which the component flaky minerals are visible to the naked eye. Schists' mineral crystals are larger than those of SLATES and smaller than those of GNEISSES (the other two foliated metamorphic rocks).

schistosomiasis, bilharziasis, or **snail fever,** disease caused by a parasitic blood FLUKE of the genus *Schistosoma.* The larvae of the parasites are harbored by snails and infect humans who bathe in infested waters. In the body, the flukes settle in the blood vessels of the intestines or bladder and use the body's own immune system to trigger part of their life cycle. The disease often affects the liver. It is treated with the drug praziquantel.

schizophrenia, severe mental disorder characterized by delusions (e.g., a belief that one's thoughts are being broadcast to the world so that others can hear them), hallucinations (e.g., voices that insult, continually comment, or give commands), loosening of associations or incoherence, a flat or inappropriate facial expression, and physical rigidity or agitation. It occurs most commonly, but not always, in late adolescence or early adulthood. Possible causes under study include viral infection during pregnancy, genetic inheritance, abnormal fetal brain development, or a combination of these. In the past a high percentage of patients required long-term hospitalization, but advances in the use of antipsychotic drugs, which apparently act by blocking the NEUROTRANSMITTERS serotonin and dopamine in the brain, have made the outlook for remission of schizophrenia more hopeful.

schizophyte, member of a division of the plant kingdom consisting of the BACTERIA and BLUE-GREEN ALGAE. These organisms are now usually placed in the MONERAN kingdom.

Schlegel, Friedrich von [shlā'gəl], 1772–1829, German philosopher, critic, and writer, the most prominent founder of German ROMANTICISM. Educated in law, he turned to writing. With his brother, August Wilhelm, he published the *Athenaeum,* the principal organ of the romantic school. His lectures in Jena (1800) and in Paris (1802) on history, language, and literature had a widespread influence. His study of Sanskrit and of Indian civilization, *On the Language and Wisdom of India* (1808), was outstanding. In his early period, Schlegel held that wisdom depends on the recognition of what he called "romantic irony"—that truth changes from experience to experience. Later he joined (1808) the Roman Catholic Church, and his views became more conservative. His brother, **August Wilhelm von Schlegel,** 1767–1845, was a scholar and poet. He is most noted for his extraordinary translations of SHAKESPEARE (1797–1810).

Schleiden, Matthias Jakob, 1804–81, German botanist. With Theodor SCHWANN, he is credited with establishing the foundations of the CELL theory. An 1838 paper, though mistaken in some aspects, recognized the significance of the nucleus in cell propagation.

Schleiermacher, Friedrich Daniel Ernst [shlī'ərmäkh"ər], 1768–1834, German Protestant theologian. Originally a Moravian, he became (1794) a Reformed preacher and was a professor at Halle (1804–7) and Berlin (from 1810). His *Religion: Speeches to Its Cultured Despisers* (1799) defined religion as an absolute dependence on a monotheistic God, reached through intuition and independent of dogma, and showed both his closeness to the Romantics and his Pietist background. *The Christian Faith* (1821–22), his major work, systematically developed his earlier ideas and viewed Christianity as the highest manifestation of religion.

Schlesinger, Arthur M(eier), 1888–1965, American historian; b. Xenia, Ohio. He taught at Harvard (1924–54). His well-known works on colonial history include *The Colonial Merchants and the American Revolution* (1918). He is also known for his interest in social history, as in *The Rise of the City* (1933). In 1928 he became an editor of the *New England Quarterly.* His son, **Arthur M(eier) Schlesinger, Jr.,** 1917–, b. Columbus, Ohio, is also a historian. His brilliant *Age of Jackson* (1945; Pulitzer) stimulated a reconsid-

eration of the Jacksonian period. *The Age of Roosevelt* (3 vol., 1957–60) is a sweeping analysis of the NEW DEAL period. Schlesinger was an aide to Pres. KENNEDY and wrote a study of Kennedy's White House years, *A Thousand Days* (1965; Pulitzer); he also wrote a biography of the president's brother, *Robert Kennedy and His Times* (1978).

Schleswig-Holstein, state (1990 est. pop. 2,595,000), c.6,050 sq mi (15,670 sq km), N Germany. Kiel is the capital and chief port. Flanked on the W by the North Sea and on the E by the Baltic, Schleswig-Holstein occupies the base of the Jutland Peninsula and extends from the Elbe R. north to the Danish border. Farming, fishing, and manufacturing are important occupations; tourism is also a mainstay. The duchy of Schleswig, created in 1115, was a hereditary fief held from the kings of Denmark. The duchy of Holstein was part of the HOLY ROMAN EMPIRE after 1111. Both were inherited (1460) by CHRISTIAN I of Denmark. In the 19th cent., disputes over their status led to conflict between Denmark and the GERMAN CONFEDERATION. In 1864 Austria and Prussia declared war on Denmark, which was easily defeated. In 1866, after the AUSTRO-PRUSSIAN WAR, Schleswig and Holstein were annexed by Prussia. Schleswig-Holstein was a West German state from 1946 until German reunification in 1990.

Schliemann, Heinrich, 1822–90, German archaeologist who discovered the ruins of TROY. A student of HOMER from childhood, he amassed a fortune in business and retired at 41 to search for Homeric sites. Relying on details from Homer's poems, he began (1871) excavations at Hissarlik, now accepted as the site of Troy, and uncovered four superimposed towns. His other notable discoveries, described in his vast writings, were at Mycenae (1876–78), ITHACA (1878), and Tiryns (1884–85).

Schlüter, Andreas [shlü'tər], 1664–1714, German sculptor. He was the most important German exponent of the BAROQUE style. His works include the statue of King Frederick I in front of Königsberg castle, and the *Great Elector,* an equestrian group on the Long Bridge, Berlin.

Schmidt, Helmut, 1918–, German political leader, chancellor of West Germany (1974–82). A member of the Social Democratic party, he was minister of defense (1969–72) and of finance (1972–74) in the cabinet of Willy BRANDT. He became chancellor upon Brandt's resignation. Schmidt's aims were to improve relations with East Germany and the USSR, and to maintain the prosperous West German economy. In 1982 he lost a confidence vote in the lower house of the German parliament to Helmut KOHL of the Christian Democratic party.

Schmidt-Rottluff, Karl, 1884–1976, German painter and woodcut artist. He cofounded and named the BRÜCKE, and is known for his WOODCUTS.

schnauzer, sturdy, wirehaired dog. Developed in S Germany, it is divided into three breeds. The standard—shoulder height, 17–20 in. (43.1–50.8 cm); weight, 27–37 lb (12.3–16.8 kg)—is a WORKING DOG that dates to the 15th cent., when it was used as a ratter, farm dog, and guardian. The giant—shoulder height, 21½–25½ in. (54.6–64.8 cm); weight, 65–78 lb (29.5–35.4 kg)—and the miniature, a TERRIER—shoulder height, 12–14 in. (30.5–35.6 cm); weight, 13–15 lb (5.9–6.8 kg)—were both developed at the end of the 19th cent. All three breeds may be pepper and salt, silver, or black in color.

Schneiderman, Rose, 1884–1972, American labor leader; b. Poland. After emigrating to the U.S. in 1890, she was for many years active in the Women's Trade Union League, becoming national president in 1928. Probably the best-known woman trade unionist in the U.S., she was also an official of the NATIONAL RECOVERY ADMINISTRATION, secretary of the New York state department of labor (1937–44), and a member of Pres. F.D. Roosevelt's BRAIN TRUST.

Schnitzler, Arthur [shnĭts'lər], 1862–1931, Austrian dramatist and novelist. His works are known for their sparkling wit and brilliant style, unique mixture of melancholy and cheerfulness, and clinical observations of the pathological. Dramas such as *Anatol* (1893) and *The Reckoning* (1895) are studies of the problems of love and sexual faithfulness.

Schoenberg, Arnold, 1874–1951, Austrian composer. He became a U.S. citizen in 1941. Schoenberg revolutionized modern music by establishing the 12-tone technique of SERIAL MUSIC as an important organizational device. His early works, e.g., *Verklärte Nacht* (1899), expanded WAGNER's and MAHLER's use of the chromatic scale. His later works are highly contrapuntal (see COUNTERPOINT). In 1908 he completely abandoned TONALITY (see ATONALITY) in a set of piano pieces and a song cycle. He first employed the 12-tone technique in a work in his Suite for Piano (1924). Schoenberg's other compositions include two chamber SYMPHONIES (1906; 1906–40), a piano CONCERTO (1942), various chamber works, and an unfinished opera, *Moses und Aron* (1932–51), considered his masterpiece. He was also a teacher; his students included Alban BERG and Anton von WEBERN.

scholasticism, philosophy and theology of Western Christendom in the Middle Ages. Basic to scholastic thought is the use of reason to deepen the understanding of what is believed on faith, and ultimately to give a rational content to faith. Its formal beginnings are identified with St. ANSELM (late 11th cent.), who tried to prove the existence of God by purely rational means. ABELARD stressed the rational approach in considering the most important philosophical question of the 12th cent., the question of universals (see NOMINALISM; REALISM). The early church fathers, notably St. AUGUSTINE, incorporated PLATO's doctrines and NEOPLATONIC thought into Christian theology. The 13th cent., the golden age of medieval philosophy, was marked by two important developments: the growth of universities (especially at Paris and Oxford); and the availability in Latin translation of the works of ARISTOTLE and the commentaries of AVICENNA and AVERROËS. The closely wrought, rational system of St. THOMAS AQUINAS is regarded as the greatest achievement of the scholastic age and the ultimate triumph of the effort to "Christianize Aristotle." Later opponents of Aquinas, e.g., St. BONAVENTURE, DUNS SCOTUS, and WILLIAM OF OCCAM, broke the synthesis of faith and reason. The secular currents of the Renaissance and the growth of the natural sciences brought on the decline of scholastic metaphysics, although its approach continued to be followed in politics and law. In 1879 Pope LEO XIII proclaimed the system of Aquinas to be the official Catholic philosophy.

Scholem, Gershom Gerhard, 1897–1982, Jewish scholar; b. Berlin. His work made the study of the history of CABALA and Jewish mysticism an important scholarly discipline. A professor at the Hebrew Univ., Jerusalem, he wrote over 500 articles and books, including *Major Trends in Jewish Mysticism* (1941) and *Kabbalah* (1974).

Schongauer, Martin [shōn'gou-ər], 1430–91, German engraver and painter. He is known for his ENGRAVINGS of religious subjects, e.g., *The Wise and Foolish Virgins.* He was one of the earliest engravers to use copper plates, and his 115 engravings, signed M+S and executed with amazing virtuosity, were important to the development of German art.

Schoolcraft, Henry Rowe, 1793–1864, American ethnologist; b. near Albany, N.Y.; foremost pioneer in Native American studies. As an Indian agent (1822–41) in the Great Lakes region he conducted ethnological research among the OJIBWA, and after 1841 he continued his studies in the East. His chief work is *Historical and Statistical Information Respecting . . . the Indian Tribes of the United States* (6 vol., 1851–57).

school of Paris. The center of international art until after World War II, Paris was a mecca for artists. The school of Paris includes many styles and movements. The practitioners and adherents of FAUVISM, CUBISM, and ORPHISM all belonged to the school of Paris, as did many others whose styles fit no one category. After the war, New York City challenged Paris's preeminence, though the school of Paris continued to produce major figures, e.g., Jean DUBUFFET.

Schopenhauer, Arthur, 1788–1860, German philosopher. A solitary figure who failed to rival HEGEL as a lecturer in Berlin, he considered himself the successor of KANT, but equated Kant's "thing-in-itself" with a blind, impelling force manifesting itself in individuals as the will to live. Schopenhauer saw the world as a constant conflict of individual wills resulting in frustration and pain. Pleasure is simply the absence of pain and can be achieved only through the renunciation of desire (a concept that reflects Schopenhauer's studies of Hindu scripture). His most important work is *The World as Will and Representation* (1818). His doctrine of the primacy of the will influenced NIETZSCHE and FREUD.

Schreiner, Olive, pseud. **Ralph Iron,** 1855–1920, South African

writer and feminist. Her best-known work is the autobiographical novel *The Story of an African Farm* (1883).

Schröder, Friedrich Ludwig, 1744–1816, German actor, manager, and dramatist. The most celebrated German actor of his day, he introduced SHAKESPEARE to Germany, raised theatrical standards, and furthered the STURM UND DRANG movement.

Schrödinger, Erwin, 1887–1961, Austrian theoretical physicist. For his mathematical development (1926) of wave mechanics, a form of QUANTUM MECHANICS, and his formulation of the wave equation that bears his name, he shared with Paul DIRAC the 1933 Nobel Prize in physics.

Schubert, Franz (Peter), 1797–1828, Austrian composer, one of the foremost exponents of ROMANTICISM. German LIEDER reached their finest expression in his lyrical songs, especially in the great cycles *Die schöne Müllerin* [fair maid of the mill] (1823) and *Die Winterreise* [the winter's journey] (1827). His SYMPHONIES are the final extension of the classical SONATA forms, and the Fifth (1816), Eighth (the *Unfinished,* 1822), and Ninth (1828) rank with the finest orchestral music. Well known for such chamber works as the Quartet in D Minor (*Death and the Maiden,* 1824) and the Quintet in A Major (*The Trout,* 1819), Schubert also wrote stage music, choral music, MASSES, and much piano music.

Schulberg, Budd, 1914-, American novelist and screenwriter; b. N.Y.C. Tending to deal with characters from a sociological perspective, his works include novels, e.g., *What Makes Sammy Run?* (1941) and *The Disenchanted* (1950), and screenplays, e.g., the Oscar-winning *On the Waterfront* (1954) and *A Face in the Crowd* (1957)

Schuller, Robert, 1926–, American Protestant minister, b. Alton, Iowa. His Reformed Church in America is housed in a multimillion-dollar "Crystal Cathedral" in Garden Grove, Calif. Since 1970 his evangelical television program has become one of the top religious broadcasts in the U.S.

Schultz, Theodore W., 1902–, American economist; b. Arlington, S.D. He taught at Iowa State College (1930–43) and the Univ. of Chicago (1943–61). A specialist in agricultural economics and the economic problems of underdeveloped countries, he shared the 1979 Nobel Prize in economics. His books include *Economic Growth and Agriculture* (1968).

Schulz, Charles M., 1920–, American cartoonist; b. Minneapolis. Creator of the COMIC STRIP *Peanuts,* he expresses a droll philosophy through the children and animals that populate his cartoon world, including the puzzled and victimized Charlie Brown, his bossy friend Lucy, and Snoopy, a romantic, self-deluded beagle.

Schuman, Robert, 1886–1963, French statesman. He was finance minister (1946, 1947), premier (1947–48), and foreign minister (1948–53) in the Fourth Republic. The Schuman Plan led to the formation (1952) of the European Coal and Steel Community, the first step in the creation of the EUROPEAN UNION.

Schuman, William (Howard), 1910–92, American composer; b. N.Y.C. He was head of the Juilliard School of Music (1945–62) and president of Lincoln Center (1962–69). Among his works are symphonies, an opera, a ballet, the American Festival Overture (1939), concertos, and chamber works. His CANTATA *A Free Song* (1943) won the first PULITZER PRIZE in music.

Schumann, Robert (Alexander), 1810–56, German composer, a leader of the romantic movement. His brilliant piano music (e.g., *Carnaval, Kinderszenen*) occupied him until 1840, when he began to write orchestral music and songs, in which he achieved a superb fusion of vocal melody and piano accompaniment. His orchestral works (e.g., Piano Concerto in A Minor, 1841–45; *Rhenish* Symphony, 1850) infuse classical forms with an emotional intensity that foreshadowed his later nervous breakdown. An articulate critic, he championed younger composers such as CHOPIN and BRAHMS. His wife, **Clara Josephine (Wieck) Schumann,** 1819–96, was an outstanding concert pianist.

Schumpeter, Joseph Alois [sho͝om'pā"tər], 1883–1950, Austrian-American economist. After practicing law and teaching at the Univ. of Graz and at Bonn, he emigrated (1932) to the U.S. and later became a professor at Harvard. His major contributions to economics were the theory of the entrepreneur as the dynamic factor in the business cycle and the theory of the economic development of CAPITALISM.

Schurz, Carl [sho͝orts], 1829–1906, American political leader; b. Germany. As U.S. senator from Missouri (1869–75), he helped form the LIBERAL REPUBLICAN PARTY (1872). Later he was secretary of the interior (1877–81). In 1884 he led the MUGWUMPS against James G. BLAINE (1884). Schurz supported William MCKINLEY for president in 1896 (for his currency views) and William J. Bryan in 1900 (for his anti-imperialism). An active editor and writer, he gained broad influence through honesty and fearlessness.

Schuschnigg, Kurt von [sho͝osh'nĭk], 1897–1977, Austrian chancellor. He became chancellor after the assassination (1934) of Engelbert DOLLFUSS. In 1936 he forced E.R. von Starhemberg to resign as vice chancellor and became sole head of the semi-Fascist Austrian government. He prevented Austria's annexation to Germany until he lost (1937) the support of MUSSOLINI. German troops occupied Austria in 1938, and Schuschnigg was held prisoner until 1945. He later settled in the U.S.

Schütz, Heinrich, 1585–1672, German composer. His *Dafne* (1627; now lost) has been called the first German OPERA. The outstanding master of 17th-cent. church music, he wrote ORATORIOS and settings of the Passion that combined the Venetian style of alternating choirs and the dramatic declamation of Florentine monody with German POLYPHONY. This choral style influenced German music through the time of HANDEL and BACH.

Schuyler, Philip John [skī'lər], 1733–1804, American Revolutionary general; b. Albany, N.Y. He was accused of negligence and replaced by Horatio GATES as commander of the SARATOGA CAMPAIGN when TICONDEROGA was abandoned without a shot (1777). He was later acquitted by a court-martial.

Schwann, Theodor, 1810–82, German physiologist and histologist. Originator with Matthias SCHLEIDEN of the cell theory, he demonstrated that the cell is the basis of animal as well as plant tissue. He also demonstrated the living nature of yeasts and described the nerve sheath known by his name.

Schwartz, Delmore, 1913–66, American poet; b. Brooklyn, N.Y. His extremely intellectual poetry is in such books as *In Dreams Begin Responsibilities* (1938) and *Summer Knowledge* (1959). He also wrote short stories and a verse play, *Shenandoah* (1941).

Schwarzkopf, Elisabeth, 1915–, German lyric soprano. She gained an international reputation for subtlety and versatility in recitals, ORATORIOS, and opera. She is particularly renowned for her LIEDER interpretations.

Schwarzkopf, H. Norman, 1934–, American general, b. Trenton, N.J. He served two tours of duty during the VIETNAM WAR, the first (1965–66) as an adviser and the second (1969–70) in command of an infantry battalion. In 1983 he was deputy commander of U.S. forces in the invasion of Grenada. As commander in chief (1988–91) of the U.S. Central Command (responsible for the Middle East and Africa), he led U.S. and Western forces in the PERSIAN GULF WAR.

Schweitzer, Albert, 1875–1965, Alsatian theologian, musician, and medical missionary. A doctor, he established (1913) a hospital at Lambaréné, Gabon, which received broad international support and at which he lived most of his life. An organist and expert on the music of BACH, He wrote a biography of the composer (1905) and coedited his music (1912–14). Schweitzer's ethical philosophy, developed in his *Philosophy of Civilization* (1923), rests on his concept of "reverence for life." As a theologian, in works such as *The Quest of the Historical Jesus* (1906, tr. 1910), he rejected the historical infallibility of Jesus while following him spiritually. Honored for his many accomplishments, Schweitzer was awarded the 1952 Nobel Peace Prize.

Schwenkfeld, Kaspar von [shvĕngk'fĕlt], 1490–1561, German religious reformer. After meeting Thomas MÜNZER and CARLSTADT at Wittenberg, he devoted himself to the reform movement in Silesia. Martin LUTHER opposed his supposed Anabaptist learnings, and after Lutheranism became dominant in Silesia, Schwenkfeld was forced to move to Strasbourg and then to Ulm. An anathema was proclaimed against him by the Lutherans, and his books were banned. He offered (1540) a full statement of faith, which enunciated the distinction between the outward and transitory word of God as given in the Scriptures and an inward spirit, which was divine, eternal, and necessary for salvation. His followers, known as **Schwenkfeldians** or **Schwenkfelders,** were persecuted and

Albert Schweitzer

fled in the 18th cent. to America and other parts of Europe. The sect still exists in Pennsylvania.

Schwitters, Kurt [shvĭt'ərs], 1887–1948, German artist. He invented *Merz* (trash) constructions. His COLLAGES are among the outstanding creations in this medium.

science fiction, literary genre to which a background of science or pseudoscience is integral. Although fantastic, it contains elements within the realm of future possibility. Science fiction began with the late-19th-cent. work of Jules VERNE and H.G. WELLS. The appearance of the magazines *Amazing Stories* (1926) and *Astounding Science Fiction* (1937) encouraged good writing in the field, which was further spurred by post–World War II technological developments. Contemporary writers of science fiction include Robert HEINLEIN, Isaac ASIMOV, A.E. van Voght, Alfred Bester, Arthur C. CLARKE, Frederik Pohl, Stanisław LEM, William Gibson, Doris LESSING, and Ursula K. LeGuin. The genre's effectiveness as an instrument for social criticism can be seen in such works as Aldous HUXLEY's *Brave New World* (1932), Ray BRADBURY's *Fahrenheit 451* (1953), and Kurt VONNEGUT's *Cat's Cradle* (1963).

scientific notation, means of expressing very large or very small numbers in a compact form, to simplify computation. In this notation any number is expressed as a number between 1 and 10 multiplied by the appropriate power of 10 (see DECIMAL SYSTEM; EXPONENT). For example, 32,000,000 in scientific notation is 3.2×10^7, and 0.00526 is 5.26×10^{-3}.

Scientology, Church of, quasireligious sect founded (1954) by science fiction writer L. Ron Hubbard (1911–86) and largely based on his book *Dianetics* (1950). The church believes that the soul can be cleared of its negative energy through "processing." Often viewed as a cult, Scientology's tenets have been widely challenged and its practices subject to various governmental investigations. Membership figures are unavailable, but by 1987 there were over 450 church facilities worldwide.

scintillation counter: see PARTICLE DETECTOR.

scion, in horticulture: see GRAFTING.

Scipio, ancient Roman patrician family of the Cornelian gens. During the 3d and 2d cent. B.C. they were distinguished by their love of Greek culture and learning. Their wealth and extravagance were detested by the family of CATO the Elder, who worked hard to ruin them. **Scipio Africanus Major** (Publius Cornelius Scipio Africanus) 234?–183 B.C., a Roman general, was the conqueror of HANNIBAL in the PUNIC WARS. In the Second Punic War, Scipio conquered Spain and ended the war by defeating Hannibal at Zama (202) in Africa. He returned home in triumph and retired from public life; he was named Africanus after the country he conquered. **Scipio Africanus Minor,** c.185–129 B.C., Roman general, was the destroyer of CARTHAGE. He was adopted by the eldest son of Scipio Africanus Major and earned a great reputation as a patron of Greek literature and of Roman writers, notably TERENCE and Laelius, and he was the lifelong friend of POLYBIUS, his protégé. As consul (147) he went to Africa and terminated the Third Punic War with the capture and destruction of Carthage. On his return to Rome he attempted to destroy the Gracchan reforms (see GRACCHI). A great public quarrel arose, and Scipio was found dead in his bed. No inquiry was made, and it was generally said that he was murdered by someone of the Gracchan party.

Scofield, Paul, 1922–, English actor. He gained international renown for his portrayal of Sir Thomas MORE in *A Man for All Seasons* (stage, 1961; film, 1966). He has also starred in *King Lear* (film, 1971), *A Delicate Balance* (film, 1973), and *Volpone* (1977).

Scopas, Greek sculptor, fl. 4th cent. B.C. He was the first to express violent feeling in marble faces. His style is seen in fragments from the Temple of Athena Alea, Tegea, and in Roman copies of his work, e.g., *Ludovisi Ares* (Rome).

Scopes trial, July 1925, the trial of public school teacher John T. Scopes, in Dayton, Tenn., for teaching Charles DARWIN's theory of EVOLUTION, the teaching of which was against state law. C.S. DARROW was defense attorney, and W.J. BRYAN aided the prosecutor. Scopes was convicted but released on a technicality. The law was repealed in 1967.

Scoresby, William, 1789–1857, English explorer. On yearly voyages (1803–22) to Greenland, he mapped, made soundings, and noted the flora and fauna. He studied terrestrial magnetism there and in Australia (1856). His books helped to lay the foundations of arctic geography.

scorpion, invertebrate animal (order Scorpionida) with a pair of powerful, pincerlike claws and a hollow, poisonous stinger at the tip of the tail; an ARACHNID. Most are 1–3 in. (2.5–7.6 cm) long, but some measure as much as 6 in. They seize and crush prey with their large claws, immobilizing it by stinging if necessary. With the exception of the fatal stings of *Androctonus australis* of the Sahara and several Mexican species, scorpion stings, although painful, are not usually dangerous to humans.

Scotch: see WHISKEY.

Scotland, political division of the United Kingdom of Great Britain and Ireland (1991 pop. 4,962,152), 30,414 sq mi (78,772 sq km), comprising the northern portion of the island of Great Britain and many surrounding islands, including the ORKNEYS, SHETLANDS, and HEBRIDES. It is bounded by England (S), the Atlantic Ocean (N and W), and the North Sea (E). It has 2,300 mi (3,700 km) of deeply indented coastline. Scotland may be divided into three main geographical regions: the southern uplands, the central lowlands, and the HIGHLANDS of the north, location of Great Britain's highest peak, Ben Nevis (4,406 ft/1,343 m). EDINBURGH is the capital and GLASGOW the largest city and chief port. Principal rivers are the Clyde, Forth, Dee, Tay, and Tweed. In 1707 Scotland was united with ENGLAND and WALES as the United Kingdom of GREAT BRITAIN. They share one PARLIAMENT, but Scotland retains its own systems of law (based on Roman law) and education. The Church of Scotland, which is Presbyterian, is legally established. English is the predominant language, although some 60,000 Scots also speak Gaelic; few speak only Gaelic.

History. The Picts, in Scotland from prehistoric times, along with Gaels or Celts from Ireland, prevented the Romans from penetrating far into Scotland, although the Romans did succeed in introducing Christianity before they left in the 5th cent. After the Roman evacuation, four Scottish kingdoms emerged. In the mid-9th cent. KENNETH I united and established the nucleus of the kingdom of Scotland, and by the 11th cent. his descendants ruled most of present-day Scotland. The following centuries were marked by dissension and turbulence among the nobles and struggle for independence from England, especially under Robert the Bruce (later

ROBERT I). A brief respite of internal peace during the reign of James IV was followed by the turmoil of the REFORMATION, brought to Scotland primarily by John KNOX. By the time MARY QUEEN OF SCOTS arrived (1561) in Scotland, Catholicism had almost disappeared from the Lowlands. Mary's struggle against Protestantism ended in her loss (1567) of the throne and her subsequent execution (1587). Mary's son, James VI of Scotland, succeeded (1603) ELIZABETH I on the English throne as JAMES I, thus uniting the two crowns. In 1707 the Act of Union formally united the governments of the two kingdoms. Union eventually proved economically favorable for Scotland, and its textile and metallurgical industries flourished in the 18th and 19th cent. The concentration of heavy industry made Scotland an important arsenal in both world wars, and in the 1970s Aberdeen became the center of North Sea oil development. Scotland's limited home rule was extended in 1978. However, there remains a persistent nationalist movement for greater autonomy.

Scotland, Church of, the established national church of Scotland. Under John KNOX Scotland came under the influence of Calvinism. Parliament abolished the jurisdiction of the Roman Catholic Church in 1560 and established (1592) PRESBYTERIANISM. However, James VI (JAMES I of England) and later Stuart monarchs attempted to restore episcopacy, and much confusion and unrest resulted (see COVENANTERS). A Presbyterian church was finally ensured by the Act of Settlement (1690) and the union (1707) of England and Scotland. In a dispute over patronage and state interference, Thomas Chalmers led a secession (1843) and formed the Free Church of Scotland. This church merged (1900) with the United Presbyterian Church to form the United Free Church of Scotland. In 1929 most of this body rejoined the Church of Scotland.

Scotland Yard, headquarters of the Criminal Investigation Department (CID) of the London Metropolitan Police. Named after a street in London, it became police headquarters in 1829. Other CID headquarters, New Scotland Yard, were built along the Thames embankment in 1890. Scotland Yard moved to new premises in 1967 but retains its name.

Scott, Sir George Gilbert, 1811–78, English architect. He was prominent in the GOTHIC REVIVAL as a designer and as a restorer of Gothic edifices, notably Ely Cathedral (1847) and WESTMINSTER ABBEY. He also designed (1860–70) the buildings for the home office and foreign office, the Albert Memorial, and St. Pancras Station, London. His grandson, **Sir Giles Gilbert Scott,** 1880–1960, also an architect, designed ecclesiastical buildings, including the Liverpool Cathedral (1904–27).

Scott, Robert Falcon, 1868–1912, British naval officer who commanded two antarctic expeditions. On the first (1901–4), in the *Discovery,* he discovered Edward VII Peninsula, surveyed the coast of Victoria Land, and explored the continent itself. On a second voyage, launched in 1910, he left his base on the Ross Sea and headed for the SOUTH POLE. Pulling sledges by hand, the party of five arrived there on Jan. 18, 1912, only to find that Roald AMUNDSEN had preceded them by a month. On their return, beset by illness, hunger, and blizzards, they all died.

Scott, Sir Walter, 1771–1832, Scottish novelist and poet. After translating Goethe's *Götz von Berlichingen* in 1799, Scott published *Minstrelsy of the Scottish Border* (2 vol., 1802; enl. ed., 3 vol., 1803), a collection of old ballads. *The Lay of the Last Minstrel* (1805), his first major poem, was followed by *Marmion* (1808) and *The Lady of the Lake* (1810). *Waverley* (1814) was a great success, becoming the first of the "Waverley Novels," romances of Scottish life that reveal Scott's gift for storytelling and vivid characterization. The series included *Guy Mannering* (1815), *Old Mortality* (1816), *Rob Roy* (1818), *The Heart of Midlothian* (1818), and *The Bride of Lammermoor* (1819). In 1820, at the height of his fame, Scott was made a baronet. *Ivanhoe* (1820) was his first historical romance in prose. Most of the novels that followed were in the historical style; they include *Kenilworth* (1821), *Quentin Durward* (1823), and *The Talisman* (1825). In 1825 Scott faced financial catastrophe. He had assumed responsibility for a printing firm, Ballantyne's, in 1813 and had been meeting its expenses out of advances from his publishers, Constable and Co. When a depression ruined both firms in 1825, Scott, instead of declaring bankruptcy, set out to pay both his debt and much of Constable's; in the process his health was destroyed. After his death the rest of the debt was paid from the earnings of his books.

Scott, Winfield, 1786–1866, American general; b. near Petersburg, Va. A hero of the WAR OF 1812, he also served the U.S. as a peacemaker in the CAROLINE AFFAIR and the AROOSTOOK WAR. Appointed supreme commander of the U.S. army (1841–61), in the MEXICAN WAR he led the southern expedition in a triumphant campaign from Veracruz to Mexico City (1847), which confirmed him as a daring strategist and bold fighter. Now very much a national hero, he ran (1852) for president as the Whig candidate but was defeated by Franklin PIERCE. Scott was vain and pompous—his nickname was "Old Fuss and Feathers"—but he was also generous and fair. He is generally considered the greatest American general between G. WASHINGTON and R.E. LEE.

Scottish terrier, short-legged TERRIER; shoulder height, c.10 in. (25 cm); weight, 18–22 lb (8.2–10 kg). Its wiry coat may be gray, brindle, grizzle, black, sandy, or wheaten. Perfected in Scotland in the mid-19th cent., the scottie was used to hunt small game, particularly badgers.

Scotto, Renata, 1934–, Italian soprano. She made her debut at La Scala, in Milan, in 1953 and at the METROPOLITAN OPERA, in New York City, in 1965. Noted for her versatility and dramatic intensity, she excels in the Italian repertory, e.g., BELLINI's *Norma* and PUCCINI's *Madame Butterfly.*

Scottsboro Case. In 1931 nine African-American youths were tried in Scottsboro, Ala., on charges of having raped two white women in a freight car passing through Alabama. The nine were sentenced to death or to 75 to 99 years in prison. The U.S. SUPREME COURT twice reversed the convictions on procedural grounds. At the second trial one of the women recanted her testimony. In 1937 charges against five were dropped. Three others were freed in the 1940s, and the last escaped in 1948 to Michigan, which refused to return him to Alabama. The last known surviving "Scottsboro boy" was pardoned by Alabama's parole board and governor in 1976.

Scottsdale, city (1990 pop. 130,069), Maricopa co., central Ariz., a suburb of Phoenix; settled 1895, inc. 1951. It is a resort and retirement center in a rapidly expanding metropolitan area. Electronic equipment is an important manufacture. Taliesin West, an architectural community and school founded by Frank Lloyd WRIGHT, is N of the city.

Scotus: see DUNS SCOTUS.

scouring rush: see HORSETAIL.

Scranton, city (1990 pop. 81,805), seat of Lackawanna co., NE Pa., in a mountain region on the Lackawanna R.; inc. 1866. It is the commercial and industrial center of Pennsylvania's anthracite region. Iron was first forged there in 1797. When mining decreased after World War II, a successful citizens' plan brought about diversified industry, much of it textile. The city is in a popular recreational area.

Scribe, Augustin Eugène [skrēb], 1791–1861, French dramatist. He wrote over 300 plays and many librettos for composers such as MEYERBEER and VERDI. Among the best of his well-structured comedies is *The Ladies' Battle* (1851).

Scriblerus Club, English literary group (c.1713–14), formed to satirize "false tastes in learning." ARBUTHNOT, GAY, POPE, and SWIFT were members. *Memoirs of . . . Martinus Scriblerus* (1741) was primarily Arbuthnot's work.

Scripps, Edward Wyllis, 1854–1926, American newspaper publisher; b. Rushville, Ill. He started the Cleveland *Penny Press* (later the *Press*) in 1878. Having purchased additional papers, he set up the Scripps-McRae League (1895), the first chain of newspapers in the U.S. It developed its own news service, and in 1907 Scripps set up the United Press Association. He also organized the Newspaper Enterprise Association to furnish his papers with features and illustrations.

scuba: see DIVING, DEEP-SEA.

sculling: see ROWING.

scurvy, deficiency disorder caused by a lack of vitamin C (ascorbic acid) in the diet. See VITAMIN (table).

scutage, feudal payment, usually cash, by a vassal to his lord, especially to a king, instead of military service. Its incidence increased in the 12th cent. with the rise of professional military knights. Kings of England financed wars for their French lands by

scutage. In the MAGNA CARTA (1215), King JOHN of England pledged not to impose scutage without the consent of his barons. The growth of taxes after the reign of EDWARD III displaced scutage in England.

Scylla and Charybdis [sĭl'ə, kərĭb'dĭs], in Greek mythology, sea monsters. They lived on either side of the Strait of Messina. Scylla seized sailors and devoured them, and Charybdis, the whirlpool, created shipwrecks. ODYSSEUS passed safely between them, as did JASON and the Argonauts.

Scythia, ancient region from the Danube to the borders of China, occupied by the Scythians, warlike mounted nomads who came from Russia in the 1st millennium B.C. Before the 9th cent. B.C. they formed a kingdom in the E Crimea. In the 7th cent. B.C. they invaded Mesopotamia, Syria, and the Balkans. Surviving attacks by DARIUS I of Persia (512 B.C.) and ALEXANDER THE GREAT (c.325 B.C.), they were driven back to S Russia after 300 B.C. but were displaced there (2d or 1st cent. B.C.) by the related Sarmatians (see SARMATIA).

SDI: see STRATEGIC DEFENSE INITIATIVE.

Se, chemical symbol of the element SELENIUM.

sea, law of the, international agreement regulating the use and exploitation of the world's oceans. The UN-sponsored Law of the Sea Treaty (1982) calls for limited, and strictly controlled, mining of the seabed; establishes in general the 12-mile limit for territorial waters; gives all nations' ships the right of "innocent passage" through crucial straits; and sets up international antipollution regulations. Most of the industrial nations opposed the restrictions on seabed mining, but Third World nations, the chief beneficiaries of the agreement, favored the treaty and created the majority that passed it. The U.S., Britain, and Germany have not signed the treaty, and the U.S. and other nations have sought to renegotiate the provisions on seabed mining. The treaty will officially come into force when it is ratified by 60 nations, but many provisions are already internationally accepted.

sea anemone, predominantly solitary marine polyp (see POLYP AND MEDUSA), usually attached to submerged objects. Many of these animals are beautifully colored and look like flowers when their tentacle-encircled feeding end is open. They are mostly 1–4 in. (2.5–10 cm) long; a few are 3 ft (90 cm) in diameter. Most sea anemones are predators, immobilizing their prey with stingers located in the tentacles.

Seaborg, Glenn Theodore, 1912–, American chemist. Professor and later chancellor at the Univ. of California, Berkeley, he worked at the Univ. of Chicago during World War II on the development of the atomic bomb and later was chairman (1961–71) of the U.S. Atomic Energy Commission. He shared with Edwin M. McMillan the 1951 Nobel Prize in chemistry for work on transuranium elements. Seaborg is codiscoverer of the elements PLUTONIUM, AMERICIUM, CURIUM, BERKELIUM, CALIFORNIUM, EINSTEINIUM, FERMIUM, MENDELEVIUM, and NOBELIUM.

Seabury, Samuel, 1729–96, American clergyman, first bishop of the Protestant EPISCOPAL CHURCH; b. Connecticut. Although a Loyalist during the American Revolution, he was chosen (1783) to be bishop of Connecticut and was consecrated (1784) by bishops of the Scottish Episcopal Church at Aberdeen.

sea cow: see SIRENIAN.

sea cucumber, flexible, elongated invertebrate animal with a cucumber-shaped, leathery body; an ECHINODERM. Most are under 1 ft (30.5 cm). Many sea cucumbers eject most of their internal organs when sufficiently irritated, later regenerating a new set.

seafloor spreading: see OCEAN; PLATE TECTONICS.

sea gooseberry: see COMB JELLY.

seahorse, small, bony-plated FISH of the family Syngnathidae, usually found in warm waters. Its elongated head and snout, flexed at right angles to its body, suggest those of a horse. Members of different species range from 2 to 8 in. (5 to 20 cm). Weak swimmers, they anchor themselves by curling their thin, prehensile tails around seaweed. While mating, the female seahorse injects eggs into a pouch on the underside of the male, where they are fertilized and then develop until the young are expelled. The related pipefish look more fishlike.

Sea Islands, chain of more than 100 low, sandy barrier islands, off the Atlantic coast of South Carolina, Georgia, and N Florida. First settled by the Spanish in the 16th cent., they became the earliest important cotton-growing area in the U.S., specializing in the production of long-staple (or sea island) cotton. Now a popular resort area, they include unspoiled Cumberland Island National Seashore (Ga.); forts Sumter and Moultrie (S.C.); Hilton Head (S.C.), and the ruins of Fort Frederica, on St. Simons Island (Ga.), built (1736–48) by James OGLETHORPE to secure the region against the Spanish.

seal, fin-footed MAMMAL (pinniped) of the family Phocidae, usually marine, with front and hind feet modified as flippers. Seals have streamlined bodies with a thick, subcutaneous layer of fat, and most inhabit cold or temperate regions. All species leave the water at least once a year to breed; some species migrate. Seals live on fish and shellfish; many dive deep to feed, navigating by means of echolocation. True seals lack external ears. They are polygamous and gregarious, and most live in one of three geographical regions: northern, antarctic, and the warm waters of the Mediterranean, Caribbean, and Hawaiian seas. Seals are extensively hunted for food, fur, hides, and oil.

sea lily: see CRINOID.

sea lion, fin-footed marine MAMMAL (pinniped) of the eared seal family. The sea lion has external ears (unlike the true SEAL), a long, flexible neck, supple forelimbs, and hind flippers. Males may reach 8 ft (2.4 m) in length. Sea lions live close to shore in the oceans of the Southern Hemisphere and in the N Pacific, feeding on fish and SQUID. To breed they gather in colonies, where the males assemble harems. Most species are protected.

seaplane, airplane designed to take off from and alight on water. The two most common types are the floatplane, whose fuselage is supported by struts attached to two or more pontoon floats, and the flying boat, whose boat-hull fuselage is constructed with the buoyancy and strength necessary to alight and float on water. First built and flown in 1911 by Glenn CURTISS, the seaplane developed rapidly in the 1920s and 30s and for a time was the largest and fastest aircraft in the world.

search warrant, in U.S. law, written order by a court directing an officer to search in a specified place for specified objects and to seize them if found. The objects sought may be stolen goods or contraband or physical evidence of the commission of a crime. The Fourth Amendment of the U.S. CONSTITUTION provides, in effect, that a search warrant may be issued only on oath or affirmation that a crime was probably committed and that the items sought are probably in the place sought to be searched. Courts generally exclude from evidence in a trial information obtained by tapping telephone conversations without a court order or objects obtained by illegal search. See also MAPP V. OHIO.

Sears Tower, Chicago, the world's tallest building. Constructed (1970–74) for Sears, Roebuck and Co., it rises 110 stories to a height of 1,454 ft (443 m), 104 ft (32 m) taller than New York City's WORLD TRADE CENTER. Designed by the firm of Skidmore, Owings and Merrill, the Sears Tower is supported structurally by square tubes of welded steel. It has an exterior of black aluminum and bronze-toned glass cut by black bands and topped by a 20-story tower.

sea slug, usually brightly colored marine GASTROPOD mollusk that lacks a shell as an adult. Most sea slugs, or nudibranchs, creep along the sea bottom or cling to vegetation below the tide line; a few swim in the open ocean. Most are under 1 in. (2.5 cm) long.

seasonal affective disorder (SAD), recurrent fall or winter depression characterized by excessive sleeping, social withdrawal, overeating, and weight gain. Thought to be due in part to decreased sensitivity of the eye's retina, SAD is treated with regular exposure to bright light.

sea spider, long-legged, spiderlike marine invertebrate animal with at least four pairs of walking legs; an ARTHROPOD. Most sea spiders are tiny and live near the shore, crawling around on the surface of animal colonies or seaweeds.

sea squirt: see TUNICATE.

sea star: see STARFISH.

Seattle, city (1990 pop. 516,259; met. area 1,972,961), seat of King co., W Wash., built on hills between Puget Sound and Lake Washington; settled 1851–52, inc. 1869. The largest city in the Pacific Northwest, it is the region's cultural, financial, commercial, transportation, and industrial hub. Aircraft, forest products, and chem-

icals are the most important of its many manufactures. Seattle's enormous port is the main link with oil-rich Alaska and is important in trade with Asia. The city is close to scenic mountain and coastal recreational areas. It is also an educational and cultural center, with many museums, theaters, and musical groups. Seattle's distinctive skyline landmark is the 600-ft (183-m) Space Needle, built for the 1962 World's Fair. Seattle prospered with the coming of the railroad in 1884 and became a boom town with the 1897 Alaska gold rush. Long a center of radical labor activity, it was the scene of a major general strike in 1919.

sea urchin, sphere-shaped marine invertebrate animal (an ECHINODERM) with a rigid body wall and long, sharp, movable, sometimes poisonous spines used for protection and locomotion. Sea urchins prefer shallow waters and rocky bottoms. The roe of some species is considered a delicacy.

seaweed, multicellular marine ALGAE. Most have a stemlike basal disk (holdfast) and a leaflike frond of varying length and shape. The simplest seaweeds are green algae and occur in shallow waters as threadlike filaments, irregular sheets, or branching fronds. Brown algae, which are the largest and most numerous of the seaweeds, grow at depths of 50–75 ft (15–23 m), and include the large kelps—sources of iodine and potassium salts, potash, fertilizer, and medicines. Red algae, some of which are fernlike, are found at the greatest depths (100–200 ft/30–61 m); commercial AGAR is obtained from a red alga. Seaweeds provide food and habitat for many marine organisms and are indispensable to the marine food web. Seaweed, especially species of red algae, is an important part of the human diet in some regions.

Sebastian, 1554–78, king of Portugal (1557–78). Sickly, headstrong, and devoutly religious, he determined to win glory by fighting the Muslims in N Africa. In 1578 he invaded MOROCCO with a large force of mercenaries, but his lack of military experience contributed to his crushing defeat at Alcazarquivir, where he was killed.

Sebastiano del Piombo [pyôm'bō], c.1485–1547, Italian painter; b. Sebastiano Luciani. He was influenced by MICHELANGELO, e.g., *Raising of Lazarus* (National Gall., London). In 1531 he was appointed *piombo* (keeper of the papal seals). His portraits include one of Christopher Columbus (Metropolitan Mus.).

Secession, War of: see CIVIL WAR.

second (sec or s), fundamental unit of time in all systems of measurement. In practical terms, the second is 1/60 of a minute and 1/3,600 of an hour. Since 1967 it has been calculated by atomic standards to be 9,192,631,770 periods of vibration of the radiation emitted at a specific wavelength by a cesium-133 atom.

secret police, secret, often terroristic, police agency operating for its government's political purposes. In democratic societies secret or quasi-secret police are usually limited to investigation, and suspects usually have the right to an open trial. Elsewhere, where they are accountable only to the executive branch of government, secret police often investigate, apprehend, judge, and punish in secrecy. The USSR's secret police (see KGB) was most active and feared during STALIN's purges (1934–39); it also operated the nation's forced-labor camp system. Under NATIONAL SOCIALISM, Germany's Gestapo and SS (headed by Heinrich HIMMLER) had vast powers of summary arrest, internment and execution. They controlled the CONCENTRATION CAMPS, carrying out atrocities throughout occupied Europe during World War II.

Secret Service, United States, law enforcement division of the U.S. Dept. of the TREASURY, created (1865) to investigate and prevent counterfeiting of currency. After the assassination of Pres. William MCKINLEY (1901), the Secret Service was also charged with protecting the president. This protection has since been extended to the vice president, president-elect, vice president-elect, major presidential candidates, former presidents, and certain members of their families.

Secretariat: see UNITED NATIONS (table 2).

Securities and Exchange Commission (SEC), U.S. government agency created by the Securities Exchange Act (1934) and charged with overseeing the public issuance and sale of corporate securities. It requires companies to submit full public-disclosure statements before issuing securities on the open market. It also regulates stock exchanges, brokers, and dealers in securities, and sets margin requirements for bank credit in security trading. The five commissioners are appointed by the president.

Security Council: see UNITED NATIONS (table 2).

sedge, common name for the Cyperaceae, a family of grasslike and rushlike herbs found worldwide but especially in subarctic and temperate marshes. More specifically, the name *sedge* is used for the genus *Carex* of this family. Sedges differ from true GRASSES in having solid, usually triangular stems. Most are perennial, reproducing by RHIZOMES. Bulrushes are sedges of the genus *Scirpus;* some species are grown as ornamentals. Other members of the family include PAPYRUS and the Asian water chestnut (*Eleocharis tuberosa*), valued by the Chinese for its edible TUBERS. Some sedges are woven into mats and chair seats; a few provide coarse hay.

sedimentary rock: see ROCK.

sedition, in law, acts or words tending to excite disaffection against governmental authority. The scope of the offense was broad in early COMMON LAW, even permitting prosecution for insults to the king. In the U.S., although sedition statutes have been enacted, constitutional protection of speech and press has confined enforcement to times of war and great stress. See ALIEN AND SEDITION ACTS.

seed, ripened ovule of the pistil of a FLOWER, consisting of the plant embryo, stored food material (endosperm), and a protective coat. True seeds vary in size from dustlike (as in some orchids) to very large (the coconut seed). Seeds undergo a period of dormancy before GERMINATION. Many seeds are frequently confused with the FRUIT enclosing them, as in the GRAINS and NUTS. The seed-bearing plants (ANGIOSPERMS and GYMNOSPERMS) are the highest plants in the evolutionary scale; lower plants (MOSSES and FERNS) propagate by means of SPORES.

Seferis, George [sĕfĕr'ēs], pseud. of **Giorgos Seferiadis,** 1900–1971, Greek poet, critic, and diplomat. His highly symbolic poetry invokes classical themes and the theme of exile. Volumes include *Turning Point* (1931), *The Cistern* (1932), and *Collected Poems, 1924–1955* (tr. 1969). He was awarded the 1963 Nobel Prize in literature.

Segal, George, 1924–, American sculptor; b. N.Y.C. Connected with the POP ART movement, he is known for his life-sized white plaster human figures in everyday situations.

segmented worm: see ANNELID WORM.

Segovia, Andrés, 1893–1987, Spanish guitarist. Famous for his transcriptions, concerts, and recordings, he was largely responsible for contemporary interest in the guitar. Such composers as FALLA, ROUSSEL, and VILLA-LOBOS wrote music for him.

seignorial system: see MANORIAL SYSTEM.

Seine, river, N France flowing generally NW c.480 mi (770 km) into an estuary on the English Channel near Le Havre. Chief cities on its route are Paris, where many bridges span the river, and Rouen, which is accessible to oceangoing vessels.

seismology, study of EARTHQUAKES and related phenomena using instruments called seismographs. In general, a recording device is connected to a heavy mass that, when earth tremors occur, remains still due to inertia. The relative motion between the EARTH and the instrument is magnified and recorded on a rotating drum by a stylus. Through the use of three such instruments the location and severity of earthquakes can be detected. Seismology is also used to locate oil (by analyzing waves from detonated explosions), to detect underground nuclear tests, and to determine the configuration and depth of the ocean floor.

Selden, John, 1584–1654, English jurist and scholar. From 1623 Selden was active in Parliament's struggle to assert its rights against the Crown. A man of great erudition, he was a legal antiquarian (*England's Epinomus,* 1610), an Orientalist (*De Diis Syris,* 1617), and a student of the origins of English law. He is popularly known through *Table Talk* (1689), a record of his conversations kept by his secretary.

selective service, in U.S. history, term for CONSCRIPTION, or mandatory service in the armed forces. It was first introduced (1863) during the Civil War, although those who were able could buy their way out of service. The Selective Service Act of 1917 required all men between the ages of 21 and 30 to register, and by the end of World War I, 2.8 million men had been inducted into military ser-

vice. Peacetime conscription, initiated in 1940, was greatly expanded after the U.S. entered World War II; between 1940 and 1947, 10 million men were inducted. Retained after the war, selective service was the basis for recruitment during the Korean and Vietnam wars. It was abolished in favor of an all-volunteer military establishment in 1973. Draft registration for 18-year-old men was reinstituted in 1980.

selenium (Se), nonmetallic element, discovered by Jöns Jakob BERZELIUS in 1817. Selenium is used in pigments, photographic exposure meters, electronics, and xerography. See ELEMENT (table); PERIODIC TABLE.

Seles, Monica, 1973–, Yugoslav tennis player. She won her first major tournament, the French Open, in 1990 at the age of 16 and since 1991 has dominated professional women's tennis. Her major tournament victories include three Australian (1991–93), three French (1990–92), and two U.S. (1991–92) opens. In 1993 she was stabbed while playing in a tournament in Hamburg, Germany.

self-help group, nonprofessional organization formed by people with a common problem or situation, for the purpose of pooling resources, gathering information, and offering mutual support, services, or care. Self-help groups began to spread in the U.S. following World War II and proliferated rapidly in the 1960s and 70s. Among these groups are such organizations as ALCOHOLICS ANONYMOUS and those for the victims and families of victims of specific diseases, child abuse, suicide, and crime. Groups concerned with a shared situation include those for the elderly, single parents, and homosexuals. The definition of such groups sometimes includes social-advocacy organizations and halfway services (e.g., drug rehabilitation centers). Although self-help groups may draw on, or offer a bridge to, professional assistance, free services are usually provided by the members themselves through meetings, publications, and individual contacts.

Selim, sultans of the OTTOMAN EMPIRE (Turkey). **Selim I** (the Grim), 1467–1520 (r.1512–20), deposed his father and killed his brothers. His defeat (1514) of the Persians added territory to the empire but began the long rivalry between Persia and Turkey. By assuming the CALIPHATE, he made himself and his successors spiritual as well as temporal rulers. Although bloodthirsty and inflexible, he was an able organizer and reformer. **Selim II** (the Drunkard), c.1524–1574 (r.1566–74), suffered the Turkish naval defeat at Lepanto (1571), the first severe setback at the hands of the Christians. **Selim III,** 1761–1808 (r.1789–1807), suffered defeats (but no great loss of territory) in the second of the RUSSO-TURKISH WARS. He forced Napoleon's troops out of Egypt (1801), which was restored to him. However, Egypt, Albania, and Serbia all became virtually independent during his reign. He was strangled at the order of Mustafa IV, who had succeeded him.

Seljuks: see TURKS.

Selkirk, Alexander, 1676–1721, Scottish sailor whose adventures suggested to DEFOE the story of *Robinson Crusoe.* Put ashore at his own request in the Juan Fernández Islands, Selkirk remained there for over four years before his rescue (Feb. 1709).

Selkirk, Thomas Douglas, 5th **earl of,** 1771–1820, Scottish philanthropist. Emigration to America seemed to him the best solution for the poverty of his countrymen, so he acquired and successfully settled (1803) a large tract on Prince Edward Island. A later attempt—the RED RIVER SETTLEMENT (1812–16) in what is now S Manitoba and N North Dakota and Minnesota—led to violence between rival settlers and litigation that cost Selkirk most of his fortune.

Selma, city (1990 pop. 23,755), seat of Dallas co., S central Ala., on the Alabama R., in a fertile farm area; inc. 1820. A market center, its light industries make farm implements and other products. It was ravaged in 1865, but antebellum houses remain. In 1965 Selma was a focus of world attention during a voter registration drive led by Dr. Martin Luther KING, Jr.

Selznick, David O., 1902–65, American film producer; b. Pittsburgh. After founding Selznick International Pictures in 1936, he made such films as *Gone with the Wind* (1939), *Rebecca* (1940), and *The Third Man* (1949).

semantics [Gr., = significant], in general, the study of the relationships between words and meanings. The empirical study of word meanings in existing languages is a branch of linguistics; the abstract study of meaning in relation to language or symbolic logic systems is a branch of philosophy. Both are called semantics. The field has three basic concerns: the relations of words to the objects denoted by them; the relations of words to the interpreters of them; and, in symbolic logic, the formal relations of signs to one another (syntax). Among the major linguistic semanticists is Noam CHOMSKY. A related theoretical orientation has been developed by such anthropologists as LÉVI-STRAUSS. Philosophical semanticists have included FREGE, Bertrand RUSSELL, and WITTGENSTEIN. A related field, general semantics, studies the ways in which the meanings of words influence human behavior.

Semarang, city (1990 pop. 1,250,971), capital of Central Java prov., N Java, Indonesia, at the mouth of the Semarang R. An important port, it is one of Java's major commercial centers. There are textile and shipbuilding industries, and tobacco, sugar, rubber, coffee, and kapok are exported.

semiconductor, solid material (see SOLID-STATE PHYSICS) whose electrical conductivity at room temperature lies between that of a conductor and that of an insulator (see CONDUCTION; INSULATION). At high temperatures its conductivity approaches that of a metal, and at low temperatures it acts as an insulator. In a semiconductor there is a limited movement of electrons, depending upon the crystal structure of the material used. Incorporation of certain impurities in a semiconductor enhances its conductive properties. The impurities either add free electrons or create holes (electron deficiencies) in the crystal structures of the host substances by attracting electrons. Thus there are two semiconductor types: the *n*-type (negative), in which the current carriers (electrons) are negative, and the *p*-type (positive), in which the positively charged holes move and carry the current. The elements germanium and silicon and the compounds indium antimonide, gallium arsenide, and aluminum phosphide are semiconductors. Semiconductors are used in electronic devices such as COMPUTERS, PHOTOELECTRIC CELLS, RECTIFIERS, and TRANSISTORS.

Seminole, indigenous people of the Eastern Woodlands (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with a Muskogean language of the Hokan-Siouan stock (see NATIVE AMERICAN LANGUAGES). They separated from the CREEK in the 18th cent. To escape white encroachment they fled to Florida, where they absorbed remnants of the Apalachee tribe and runaway slaves. They fought Andrew JACKSON (1817–18) and, led by OSCEOLA, again battled U.S forces in the Seminole War (1835–42), after which most of them moved to Oklahoma, becoming one of the FIVE CIVILIZED TRIBES. In 1990 there were 13,797 Seminoles in the U.S.

semiotics or **semiology,** the study of an aspect of a culture as a formal system of signs; it is founded on the work of the American logician C.S. PEIRCE and French linguist Ferdinand de Saussure. Saussure's recognition that the relation of words to things is not natural but arbitrary and that a language is essentially a self-contained system of signs, wherein each element is meaningless by itself and meaningful only by its differentiation from the other elements, was key to the development of modern semiotics. His linguistic model influenced literary criticism, contributing to a move away from the study of an author's biography or a work's social setting and toward the internal structure of the text and the text's relationship to other texts. Semiotics is not limited to language, however, as virtually any aspect of a culture (e.g., gesture, clothing, and toys) can function and be analyzed as a sign; see STRUCTURALISM.

Semiramis, mythical Assyrian queen, said to have founded BABYLON. After a long reign she vanished in the form of a dove; she was thereafter worshiped as a deity. Her legend is probably based on Sammuramat, regent of ASSYRIA (810–805 B.C.).

Semites, term originally designating the descendants of Shem, son of NOAH. It was later applied to speakers of related languages presumed to derive from a common tongue, Semitic, including the Arabs, Akkadians, Assyrians, Canaanites, and Hebrews. By 2500 B.C. the pastoral nomadic Semites, who had originated in the Arabian peninsula, began migrating north and west to MESOPOTAMIA, the Mediterranean coast, and the Nile R. delta. In Mesopotamia they became dominant (see ASSYRIA; BABYLONIA). In Phoenicia they were the first great seafaring people. The Hebrews, who, with other

Semites, settled in Palestine, became leaders of a new nation and religion (see JEWS; JUDAISM).

Semitic languages, subfamily of the Hamito-Semitic family of languages. See LANGUAGE (table).

Senate, United States: see CONGRESS OF THE UNITED STATES.

senate, Roman, governing council of the Roman republic. An outgrowth of the royal privy council, it gained immense power as Rome expanded in the 3d and 2d cent. B.C., sending out armies, making treaties, and organizing the new domain. Membership was limited to ex-magistrates, who belonged almost entirely to old families. Its tone tended to be reactionary, yet there was no real challenge to its authority until the agitation of the GRACCHI. This failed, but a popular party grew up to oppose the conservatives. Although it was thoroughly defeated by SULLA, the struggle was resumed later, with Julius CAESAR heading the popular group and POMPEY heading the senatorial party. Caesar triumphed (48 B.C.), and though he was assassinated, the senate was proscribed (43 B.C.) and did not regain power. Docile under AUGUSTUS, it became a mere cipher in the later empire.

Sendak, Maurice Bernard, 1928–, American writer and illustrator of children's books; b. N.Y.C. His wild, fantastic illustrations appear in over thirty children's books, including his own *Where the Wild Things Are* (1963), *In the Night Kitchen* (1970), *Outside over There* (1981), and *We Are All in the Dumps with Jack and Guy* (1993).

Sender, Ramón José [sändĕr'], 1902–82, Spanish novelist. A Loyalist in the SPANISH CIVIL WAR, he left Spain in 1939 and became a U.S. citizen in 1946. His novels, dealing with social injustice, include *Imán* (1929), *The King and the Queen* (1949), and *Requiem for a Spanish Peasant* (1960). He also wrote plays, stories, poetry, and literary criticism.

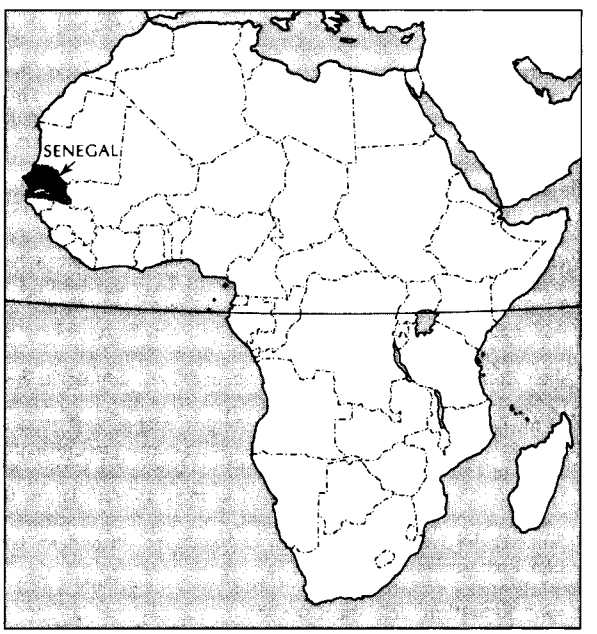
Seneca (Lucius Annaeus Seneca), c.3 B.C.–A.D. c.65, Roman philosopher, dramatist, and statesman. A noted orator, he tutored NERO and was virtual ruler in the first years of the emperor's reign. His suicide after accusations of conspiracy was considered remarkably noble by the Romans. A Stoic, he wrote moral and philosophical essays, but he is best known for his tragedies, written apparently for recitation. These, including *Hercules Furens* and *Medea,* profoundly affected Renaissance TRAGEDY with their gloomy atmosphere, bombastic rhetoric, and STOICISM.

Seneca: see IROQUOIS CONFEDERACY.

Senefelder, Aloys, 1771–1834, German lithographer; b. Bohemia. He invented LITHOGRAPHY in Munich c.1796. He published an account of the history of the invention in 1818.

Senegal, officially Republic of Senegal, republic (1992 est. pop. 8,205,000), 76,124 sq mi (197,161 sq km), W Africa, bordered by the Atlantic Ocean (W), Mauritania (N), Mali (E) and Guinea and Guinea-Bissau (S). The nation of GAMBIA is an enclave in the southwest. Major cities include DAKAR (the capital), Thiès, and Kaolack. Most of the country is low-lying and covered with savanna, which becomes semidesert in the SAHEL region of the north. The 250-mi (400-km) coastline is sandy north of Dakar and swampy or muddy to the south. Senegal is primarily agricultural, but industry is expanding. By far the most important cash crop is peanuts, which supplies 75% of farm exports; groundnut processing (oil and oilcake) is the largest industry. The main food crops are millet, sugarcane, rice, and corn. Large numbers of cattle, sheep, and goats are raised. Manufactures include cement, chemicals, textiles, fertilizers, and the processing of fish taken by the sizable coastal fleet. The principal minerals extracted are phosphate rock, limestone, and iron ore; deposits of petroleum and natural gas have been found offshore. The chief ethnic groups are the Wolof, Fulani, Serer, Tukolor, Soninke, Malinke, and Diola. About 90% of the people are Muslim, about 5% are Christian, and the rest follow traditional beliefs. French is the official language.

History. In the middle of the 1st millennium A.D. the region was settled by migrating Wolof and Serer peoples, followed (9th cent.) by the Tukolor, whose state of Tekrur dominated the Senegal R. valley until the 14th cent. The Portuguese arrived (1444–45) and established trading stations; they were displaced by the Dutch and French in the 17th cent. French influence was extended into the interior after 1697, but control of bases in Senegal alternated between France and Britain from the SEVEN YEARS WAR (1756–63) until 1815, when they were finally returned to France. Senegal became a French colony in 1895, remaining part of FRENCH WEST AFRICA until it was made an autonomous republic within the FRENCH COMMUNITY in 1958. Full independence was achieved in 1960, with Léopold SENGHOR as president. By the mid-1960s Senghor had consolidated his power by removing Prime Minister Mamadou Dia and creating a one-party state. A period of civil unrest followed, marked by demonstrations, strikes, and a worsening economic situation resulting from the drought in the Sahel region. In 1978 Senegal again held multiparty elections, which were won by Senghor's Senegalese Socialist party. After his retirement (1980), Senghor was succeeded (1981) as president by Prime Min. Abdou Diouf, who was reelected in 1988 and 1993 amid allegations of fraud. Since the early 1980s there has been sporadic fighting with separatists in the southern province of Casamance, which is largely separated from Senegal by Gambia. In 1981 Senegal joined GAMBIA in a confederation known as Senegambia, but Senegal ended (1989) the association when Gambia refused to move toward closer union. The nation's relations with neighboring Mauritania deteriorated during the late 1980s over the treatment the citizens of each received in the other country; tensions were aggravated by Senegalese opposition to Mauritania's oppression of its black minority.



Senegambia: see GAMBIA; SENEGAL.

Senghor, Léopold Sédar [säNgôr'], 1906–, African statesman and poet, president (1960–80) of SENEGAL. He was a leader of the pan-African movement and became president of the new republic of Senegal in 1960. He was one of the formulators of the concept of *négritude,* which rejected the French policy of assimilation and affirmed the African heritage. He retired voluntarily in 1980, and in 1984, became the first black member of the French Academy.

Sennacherib [sĕnăk'ərĭb] or **Senherib I,** d. 681 B.C., king of Assyria (705–681 B.C.). The son of Sargon, he spent his reign trying to maintain the empire. He defeated the Egyptians (701 B.C.) and prepared to take Jerusalem, but instead exacted only tribute. He fought successfully in Babylonia and destroyed Babylon (c.689 B.C.). At NINEVEH he built a magnificent palace. He was murdered, possibly by his sons.

Sennett, Mack, 1880–1960, American film director and producer; b. Canada. His Keystone studios (1912–35) made thousands of short and full-length slapstick comedies. Charlie CHAPLIN, Buster KEATON, and others began their film work at Keystone.

sense, faculty by which external or internal stimuli are conveyed to the brain. The special senses (sight, hearing, smell, and taste)

convey external stimuli via receptors in the EYE, EAR, NOSE, and taste buds (see TONGUE). Most somatic sensations, such as touch, heat, cold, and pain, originate with receptors in the skin; a few, such as hunger, result from internal stimuli.

Seoul or **Kyongsong,** city (1985 pop. 9,639,077), capital of South Korea, NW South Korea. The political, commercial, industrial, and cultural center of the nation, Seoul is also a highway and railroad hub. It is linked by rail with its port, INCHON. Before Korea's partition in 1945, Seoul's easy access to industrial raw materials stimulated the establishment of iron, steel, and other primary industries. With most of the raw materials now in North Korea, the city has emphasized textile manufacturing and consumer industries. Founded in 1392, Seoul served as capital of the Yi dynasty until 1910. Heavily damaged during the KOREAN WAR, the city has been extensively rebuilt along modern lines. Seoul retains three gates of its ancient wall and three imperial palaces. The city was the site of the 1988 summer Olympic games.

separation: see DIVORCE.

separation of powers, political doctrine that provides for the splitting of governmental functions into separate but equally important legislative, executive, and judicial areas. Largely modeled on the philosophy of MONTESQUIEU, it aims to prevent tyranny and promote individual freedom by relying on a system of checks and balances. In the U.S., separation of powers is outlined in Articles I–III of the Constitution. The system has been somewhat weakened by the growing strength of the presidency.

separatists, in religion, Christian groups, e.g., Pilgrims and Quakers, who withdrew from the Church of England. They desired freedom from church and civil authority, control of each congregation by its membership, and changes in ritual. They became known as Independents in the 17th cent.

Sephardim, one of the major divisions of JEWS, comprising those who in the Middle Ages resided in the Iberian Peninsula, and their descendants. With the migration of the Iberian Jews, particularly after their expulsion from Spain in 1492, Sephardic traditions were transferred to North Africa and the Middle East and adopted by local Jews; today the term *Sephardim* covers all Jews historically native to the Middle East. Sephardic ritual and liturgy follow the Babylonian tradition (the Ashkenazim, Jews from Germany and their descendants, follow Palestinian tradition). Sephardic Jews spoke a dialect called Ladino (Judeo-Spanish or Spanioli), a blend of medieval Castilian and Hebrew, Turkish, Arabic, and other elements. The Sephardim who were forced to convert to Christianity between 1391 and 1497 were given the pejorative name *Marranos* [pigs] by Christians. As they moved to more tolerant lands, the Marranos openly returned to Judaism. They and their descendants founded the Jewish communities of Hamburg, Amsterdam, London, and New Amsterdam (N.Y.C.).

sepiolite: see MEERSCHAUM.

Sepoy Rebellion: see INDIAN MUTINY.

September: see MONTH.

septicemia, invasion of the bloodstream by bacteria, a grave condition commonly known as blood poisoning. Primary causes include local infections that the body's defenses are unable to contain and progressing tissue infections. Symptoms are fever, chills, prostration, and skin eruption. The condition is treated with massive doses of ANTIBIOTICS.

sequence, in mathematics, ordered set of mathematical quantities, called *terms.* A sequence can be finite, like 1, 2, 3, . . . , 50, which has 50 terms, or infinite, like 1, 2, 3, . . . , which has no final term. An infinite sequence may or may not have a limit. Frequently there is a rule for determining the terms in the sequence, as in the FIBONACCI sequence and in various types of PROGRESSIONS. See also SERIES.

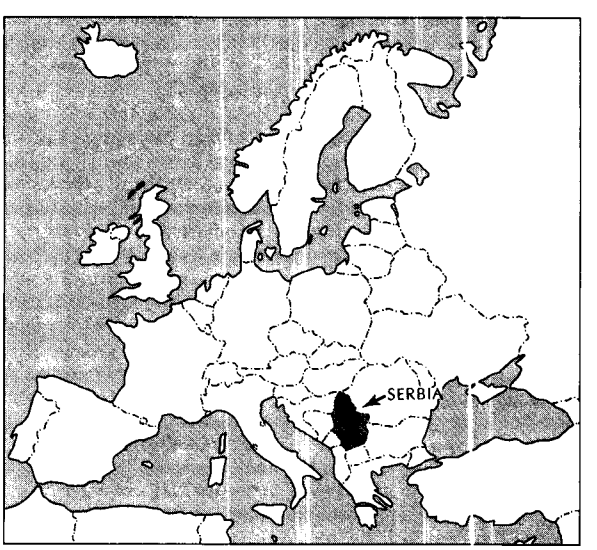
sequoia, name for the redwood (*Sequoia sempervirens*) and for the big tree, or giant sequoia (*Sequoiadendron giganteum*), both huge, evergreen CONIFERS of the BALD CYPRESS family, and for extinct related species. The redwood, which grows to 385 ft (117 m) in height, is probably the world's tallest tree; it is found along the central Pacific coast of the U.S. Its trunk is 10 to 25 ft (3 to 7.6 m) in diameter. The giant sequoia, which grows to 325 ft (99 m) in height, with a trunk of 10 to 30 ft (3 to 9.1 m), is found in California on the western slopes of the Sierra Nevadas; some are believed to be 3,000 to 4,000 years old. The reddish, decay-resistant heartwood of both species is valued for outdoor construction. Sequoias are now protected in parks.

Sequoia National Park: see NATIONAL PARKS (table).

Sequoyah, c.1766–1843, CHEROKEE leader; b. Tennessee. He created a written Cherokee language, a syllabary in which 85 English letters and variations were used as symbols for Cherokee sounds. A newspaper and parts of the Bible were printed in Cherokee. From 1822 he taught thousands of Native Americans to read and write, helping to unite the Cherokee and make them leaders among the tribes. The giant SEQUOIA tree is named for him.

Serbia, Serbo-Croatian *Srbija,* constituent republic of Yugoslavia (1988 est. pop. 9,762,000), 34,107 sq mi (88,337 sq km), E Yugoslavia, the larger of the two remaining republics (the other is MONTENEGRO) of Yugoslavia. It is bounded by Croatia (NW), Hungary (N), Romania (NE), Bulgaria (E), Macedonia (S) and Albania, Montenegro, and Bosnia and Hercegovina (W). BELGRADE is the capital. The west and south are largely mountainous; NE Serbia, part of the Danubian plain, provides most of Yugoslavia's foodstuffs. Grains, hemp, sugar beets, flax, grapes, and plums are among the chief crops. Manufactures include iron and steel, tranport vehicles, and plastics; mining is also important. Serbs make up the vast majority of the population; they belong largely to the ORTHODOX EASTERN CHURCH and use the Cyrillic alphabet. Mostly Muslim Albanians predominate in KOSOVO in the southwest, and there is a smaller Hungarian minority in Vojvodina prov. in the north.

History. Serbs settled (6th–7th cent.) in the Balkans and were Christianized in the 9th cent. A Serbian kingdom emerged (13th cent.) and under STEPHEN DUŠAN (r.1331–55) became the most powerful Balkan state. Defeat (1389) at Kosovo Field (see under KOSOVO) brought Serbia under Turkish domination from the 14th to 19th cent. In 1829 the Turks granted the Serbs autonomy under a hereditary prince, and a lengthy feud between the KARADJORDJEVIĆ and OBRENOVIĆ families ensued. Proclaimed (1882) a kingdom, Serbia emerged from the BALKAN WARS (1912–13) as a major Balkan power. When a Serbian nationalist assassinated (1914) Austrian Archduke FRANCIS FERDINAND, Austria declared war on Serbia, thus precipitating WORLD WAR I. In 1918 the country was included in the Kingdom of the Serbs, Croats, and Slovenes (later YUGOSLAVIA), with PETER I of Serbia as king. A puppet government was set up in Serbia by the Germans during World War II, and in 1946 Serbia became a republic within Yugoslavia. In the early 1990s, as CROATIA and SLOVENIA sought greater autonomy, Serbia, led by Slobodan MILOŠEVIĆ, insisted first on preserving a Serb-dominated Yugoslavia and then on a "greater Serbia" that would include Serbian areas in other republics. War erupted in Croatia and BOSNIA AND HERCEGOVINA, and UN-sponsored economic sanctions severely disrupted the Serbian economy.



The key to pronunciation appears on page xiii.

Serbo-Croatian [sûr'bō-krōā'shən], language belonging to the South Slavic group of the Slavic subfamily of the Indo-European family of languages. Although it is actually one language, Serbo-Croatian is designated as Serbian when spoken by Serbs and written in a form of the Cyrillic alphabet, but as Croatian when spoken by Croats and written in a modified version of the Roman alphabet. See LANGUAGE (table).

Serengeti plain in NE Tanzania, SE of Lake Victoria near Kenya. Part of Tanzania's central plateau, it is the site of **Serengeti National Park**, c.5,700 sq mi (14,800 sq km), est. 1941. There the world's largest concentrations of wildebeest and gazelle are found, as well as zebras, lions, hippopotamuses, giraffes, and hyenas. Poaching has decimated the park's elephants and rhinoceroses.

serf, under FEUDALISM and the MANORIAL SYSTEM, a half-free peasant attached to the land held under the lord of the manor, for whom he performed servile labor. Serfs traditionally had certain inviolable rights, and their labor service was governed by custom. In the MIDDLE AGES serfdom developed in France, Spain, and Italy, then spread to Germany and Slavic lands. In England after the Norman Conquest, most free VILLEINS became serfs. In the Hapsburg monarchy serfdom was ended (1781) by JOSEPH II, in France by the French Revolution (1789), and in Russia by ALEXANDER II (1861).

sergeanty: see SERJEANTY.

serial music, those compositions based on an arrangement (called a series or row) of patterns of pitch, rhythm, or dynamics. The term is often used synonymously with TWELVE-TONE MUSIC, which is a kind of serial music. Important composers of this music include Igor STRAVINSKY and Walter PISTON.

series, in mathematics, the indicated sum of a SEQUENCE. A series may be finite or infinite, depending on the number of terms in the sequence. As one takes sums of progressively more terms in an infinite series, these partial sums form a new sequence of values that may or may not approach a certain value, called the limit of the series. If they do, the series is said to converge to that limit; if not, the series diverges.

serigraphy: see SILK-SCREEN PRINTING.

serjeanty or **sergeanty,** a type of land tenure in English FEUDALISM in return for personal, often menial, service. Ceremonial relics of it survive at royal coronations.

Serkin, Rudolf, 1903–91, Austrian-American pianist; b. Bohemia. Serkin was an outstanding interpreter of the music of Mozart and Beethoven. He made his U.S. debut in 1933. His son **Peter Serkin,** 1947–, b. N.Y.C., is also a pianist.

serotonin, biochemical first recognized as a powerful vasoconstrictor occurring in blood serum and other tissues, and subsequently found in wasp and scorpion venom and in various fruits and nuts. One role of the compound is as a NEUROTRANSMITTER that may participate in such diverse functions as learning, sleep, and control of mood. Its structural similarity to certain mind-altering drugs, such as LSD, has prompted speculation that serotonin may have a role in mental disorders, such as schizophrenia.

serpentine, widely distributed hydrous magnesium silicate mineral ($3MgO{\cdot}2SiO_2{\cdot}2H_2O$), formed by the alteration of other minerals or rocks containing magnesium. Usually green, it may also be reddish, yellowish, black, or nearly white. It is sometimes used as a gem; massive varieties are used like marble for decoration, although they are too easily damaged by exposure to be used for exteriors. Fibrous serpentine is chrysotile, a commercial ASBESTOS.

Serra, Junípero, 1713–84, Spanish Franciscan missionary in North America. He directed the founding of nine FRANCISCAN missions in California between 1769 and 1782.

Servetus, Michael [sərvē'təs], 1511–53, Spanish theologian and physician. He early came in contact with reformers in Germany and Switzerland, but his views, particularly about the TRINITY, were condemned by both Roman Catholics and Protestants. He fled to France, where he gained fame in medicine. After he had a work on theology secretly printed (1553), the INQUISITION moved against him. He escaped from prison, but he was seized in Geneva, on John CALVIN's order, and tried and burned there.

Servile Wars, in Roman history, three uprisings of slaves (134?–132? B.C., 104?–101? B.C., 73–71 B.C.). The first two took place in Sicily. The third was the uprising by SPARTACUS in S Italy that was eventually put down with great cruelty by Marcus Licinius Crassus (see CRASSUS, family) and POMPEY.

sesame, herb (*Sesamum indicum*) of the family Pedaliaceae cultivated for its seeds since ancient times, found chiefly in the Old World tropics. Sesame seeds, or bennes, are black or white and yield an oil that resists turning rancid. The oil is used extensively in India for cooking, soap manufacture, food, and medicine, and as an adulterant in OLIVE oil. The seeds are used in baking and confectionery.

Sessions, Roger, 1896–1985, American composer and teacher; b. Brooklyn, N.Y. His early music is romantic and harmonic; later it became austere and complex. His works include music for ANDREYEV's *Black Maskers* (1923), eight SYMPHONIES (1927–68), and the *Concerto for Orchestra* (1982; Pulitzer).

set, in mathematics, collection of entities, called the elements or members of the set, that may be material objects or conceptual entities. Braces, { }, are commonly used to enclose the listed elements of a set, e.g., if A is the set of even numbers between 1 and 9, then $A = \{2,4,6,8\}$. The elements may also be described within braces, e.g., the set B of real numbers that are solutions to the equation $x^2 = 9$ can be written as $B = \{x{:}x^2 = 9\}$, which is read "the set of all x such that $x^2 = 9$." In fact, $B = \{3,-3\}$. There are three basic set operations: intersection, union, and complementation. The intersection of two sets, denoted by the symbol $\cap$, is the set containing the elements common to both. The union of two sets, denoted by $\cup$, is the set of all elements belonging to at least one of the original sets. Thus, if $C = \{1,2,3,4\}$ and $D = \{3,4,5\}$, then $C \cap D = \{3,4\}$ and $C \cup D = \{1,2,3,4,5\}$. In any discussion the set of all elements under consideration is the universal set U; the complement of A, written A', is the set of all elements of the universal set that are not in A; if $U = \{1,2,3,4,5\}$ and $A = \{1,2,3\}$, then $A' = \{4,5\}$. A set with no elements, e.g., the set of all foreign-born U.S. presidents, is called the null, or empty, set and is symbolized by $\varnothing$. Membership in a set is indicated by the symbol $\in$; thus, $x \in A$ means that x is a member of the set A. If the set B contains at least all the elements of the set A, then A is a subset of B, written $A \subset B$. Set theory is involved in many areas of mathematics and has important applications in such other fields as computer technology and atomic and nuclear physics.

SETI [*S*earch for *E*xtra*T*errestrial *I*ntelligence], name given to a series of independent programs to detect radio signals from civilizations beyond the solar system. In 1960 Project Ozma, the first such program, focused on the nearby stars Epsilon Eridani and Tau Ceti. Since then some 50 searches, mostly of limited duration and concentrating on stars similar to the sun, have been conducted without success. In 1992 the High Resolution Microwave Survey (HRMS) was initiated. Using radio telescopes around the world in a planned ten-year search, HRMS envisioned a two-pronged approach. One group is focusing on more than 800 solar-type stars within 100 LIGHT-YEARS of Earth; the other was to conduct an all-sky survey, but this was halted by a funding cutback in 1993. HRMS will monitor only microwave frequencies because there are few natural sources of emissions in that range and researchers hope that extraterrestrials would recognize that range as a quiet region of the electromagnetic spectrum suited to sending a message.

Seton, Saint Elizabeth Ann, 1774–1821, American Roman Catholic leader, also called Mother Seton; b. Elizabeth Ann Bayley, N.Y.C. Soon after she was widowed, she became (1805) a Roman Catholic. In 1808 she opened a school in Baltimore at the invitation of Bishop Carroll and later moved to Emmitsburg, Md., where she opened the first Catholic free school. She formed the first American congregation of the Daughters of Charity (Sisters of Charity) and served as its superior. Canonized in 1975, she was the first native-born U.S. saint. Feast: Jan. 4.

Seton, Ernest Thompson, 1860–1946, American writer and artist; b. England. He interpreted nature for children, as in *Wild Animals I Have Known* (1898, new ed. 1942), and organized the Woodcraft Indians, a precursor of the BOY SCOUTS.

setter: see SPORTING DOG.

Settlement, Act of, 1701, passed by the English Parliament to provide that if WILLIAM III and Princess (later Queen) ANNE died without heirs, succession should pass to Sophia, electress of Hanover, granddaughter of JAMES I, and to her Protestant heirs. Fear of the

JACOBITES partially prompted the measure, which also limited the power of the crown. The house of HANOVER, which became the British royal house in 1714, owed its claim to this act.

Seurat, Georges [sörä'], 1859–91, French neo-impressionist painter. He devised the pointillist technique of painting with tiny dots of pure color (see POSTIMPRESSIONISM). His works include *A Sunday Afternoon on the Island of La Grande Jatte* (Art Inst., Chicago).

Seuss, Dr., pseud. of **Theodor Seuss Geisel,** 1904–91, American author and illustrator of children's books; b. Springfield, Mass. His books blend whimsy, zany humor, catchy verse, and outlandish illustrations. His style is evidenced in *Horton Hears a Who* (1954), *The Cat in the Hat* (1957), *How the Grinch Stole Christmas* (1957), and *Green Eggs and Ham* (1960).

Sevan [syĭvän'], lake, c.540 sq mi (1,400 sq km), in Armenia, at an altitude of 6,280 ft (1,914 m), the largest lake of the Caucasus. The Razdan R. is its only outlet. An extensive hydroelectric system has been developed in the area.

Sevastopol, city (1989 pop. 355,000), S UKRAINE, on the Crimean peninsula and the Bay of Sevastopol, a BLACK SEA inlet. It is a port and major naval base. Among its industries are shipbuilding and lumber milling. It stands near the site of Chersonesus, a Greek colony founded in 421 B.C., which became part of the empire of ROME (1st cent. B.C.) and of the BYZANTINE EMPIRE (4th cent. A.D.). A medieval trade center, it was destroyed by the TATARS in 1399. When Russia annexed (1783) the CRIMEA, Sevastopol was refounded as the chief base of its Black Sea fleet. In the CRIMEAN WAR it was besieged for 349 days (1854–55). In WORLD WAR II it was virtually destroyed during an eight-month siege (1941–42) by German and Romanian forces, who occupied it until 1944. Control of the Black Sea fleet has become an important issue since Ukrainian independence (1991).

Seven against Thebes, in Greek legend, seven heroes. They made war on Eteocles when he refused to share the Theban throne with his brother Polynices, as agreed after the exile of their father, OEDIPUS. The brothers killed each other, and, of the Seven, only Adrastus survived. Their sons, the Epigoni, conquered Thebes 10 years later and gave the kingdom to Thersander, son of Polynices. AESCHYLUS and EURIPIDES dramatized the legend.

Seven Days battles, in the U.S. CIVIL WAR, the Confederate counteroffensive (June 26–July 2, 1862) that ended the Union drive to capture Richmond, Va., in the PENINSULAR CAMPAIGN. After the battle of Fair Oaks, Confederate Gen. R.E. LEE moved to cut off Union forces under G.B. MCCLELLAN from their base at White House Landing. The Confederates attacked the Union advance force under Fitz-John Porter at Mechanicsville but were repulsed (June 26). Porter fell back to Gaine's Mill, where his outnumbered corps was defeated (June 27). When McClellan tried to move his base to the James R. to add naval protection, Lee failed to stop him at Savage's Station (June 29) and Frayser's Farm (June 30). McClellan stood (July 1) at Malvern Hill and repeatedly repulsed Confederate attacks. But he declined to take the offensive and withdrew to the James R., allowing Lee, who suffered heavy losses, to save RICHMOND.

Seventh-Day Adventists: see ADVENTISTS.

Seven Weeks War: see AUSTRO-PRUSSIAN WAR.

Seven Wonders of the World, in ancient classifications, were the Great PYRAMID of Khufu, or all the pyramids, with or without the SPHINX; the Hanging Gardens of Babylon, with or without the walls; the mausoleum at Halicarnassus; the Artemision at EPHESUS; the COLOSSUS of Rhodes; the Olympian ZEUS statue by PHIDIAS; and the Pharos lighthouse at Alexandria, or, instead, the walls of Babylon.

Seven Years War, 1756–63, worldwide conflict fought in Europe, North America, and India between France, Austria, Russia, Saxony, Sweden, and (after 1762) Spain, on one side, and Great Britain, Prussia, and Hanover on the other. Two main issues were involved: French and English colonial rivalries in North America and India, and the struggle for supremacy in Europe of MARIA THERESA of Austria and FREDERICK II of Prussia. In the aftermath of the War of the AUSTRIAN SUCCESSION (1740–48) the European powers began maneuvering for alliances preparatory to a new show of strength. Hostilities began when Prussia invaded Saxony (1756) and BOHEMIA (1757). Despite Frederick's brilliant early victories at Rossbach (1757), Leuthen (1757), and Zorndorf (1758), by 1759 his situation had become nearly hopeless. In 1760 the Russians occupied Berlin briefly, but Frederick expelled them and went on to defeat the Austrians at Torgau. His final victory came only after the accession of PETER III of Russia, who made (1762) a separate peace with him. Sweden also left the war. Now fighting alone in the east, Frederick defeated the Austrians at Burkersdorf (1762). Meanwhile, England, after an inauspicious start, won victories at Krefeld (1758) and Minden (1759), in N Germany, and soundly defeated the French at Louisburg (1758) and Quebec (1759), in North America, and at Plassey (1757) and Pondichery (1761), in India. After protracted negotiations, peace was made at Hubertusburg and at Paris (see PARIS, TREATY OF, 1763). The war confirmed Prussia's new rank as a leading European power and made Britain the world's chief colonial power. France lost most of its overseas possessions.

Severus or **Septimius Severus** (Lucius Septimius Severus), 146–211, Roman emperor (193–211); b. Africa. He took the imperial throne by force, put down opponents, and pacified the empire in Mesopotamia, GAUL, and Britain. He died at York. Severus left the empire to his sons, but one son, CARACALLA, took power.

Sevier, John [səvēr'], 1745–1815, American political leader; b. near New Market, Va. A prominent frontiersman in the AMERICAN REVOLUTION, he was governor of the state of FRANKLIN (1785–88) and of TENNESSEE (1796–1801, 1803–9).

Seville, Span. *Sevilla,* city (1988 est. pop. 663,000), capital of Seville prov. and chief city of ANDALUSIA, SW Spain, on the Guadalquivir R. Seville is a major port connected with the Atlantic by a river and canal. Among its manufactures are tobacco products, armaments, and perfume. Important from Phoenician times, Seville fell to the MOORS in A.D. 712 and was the seat (1023–1091) of an independent emirate under the Abbadids. Taken (1248) by FERDINAND III of Castile, it later was a center for New World trade. One of the world's most beautiful cities, Seville contains many landmarks, e.g., the Moorish alcazar and the Gothic cathedral (1401–1519). The city was the site of the 1992 world's fair.

Sewall, Samuel, 1652–1730, American colonial jurist; b. England. He was one of the judges who tried the Salem witchcraft cases (1692) and shared responsibility for condemning 19 persons to death. He later (1697) publicly confessed the error of these convictions and thereafter observed an annual day of repentance.

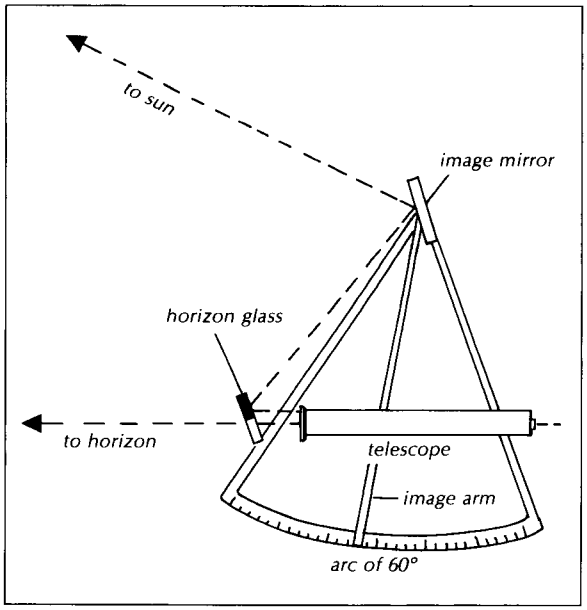
Seward, William Henry, 1801–72, American statesman; b. Orange co., N.Y. As senator from New York (1849–61), he was an antislavery advocate. He became secretary of state (1861) in Pres. LINCOLN's cabinet, where his efforts to dominate were overcome only by Lincoln's ingenuity. He was an able statesman, adept in handling diplomatic matters such as the TRENT AFFAIR. He continued in his post under Pres. Andrew JOHNSON and supported the RECONSTRUCTION policy. His most notable act was the farsighted purchase of ALASKA (1867), denounced at the time as "Seward's folly."

Sewell, Anna, 1820–78, English writer. Her only work, *Black Beauty* (1877), a novel about a horse, is a children's classic.

sewing machine, device that stitches cloth and other materials. The machine's invention is attributed primarily to Elias HOWE (1846) and Isaac M. SINGER (1850). In the typical home sewing machine, an eye-pointed needle, raised and lowered at great speed, pierces cloth lying on a steel plate, casting a loop of thread on the underside of the seam. A second thread, fed from a shuttle under the plate, passes through the loop and is interlocked with the upper thread as it is drawn up by the rising needle. Modern electric-powered machines, some controlled electronically, are capable of producing many types of stitches, and specialized machines have been devised for sewing particular items.

sextant, instrument (invented 1731) for measuring the altitude of a celestial body. The image of the body is reflected from the index mirror to the mirror half of the horizon glass and then into the telescope. If the movable index (or image) arm, to which the index mirror is attached, is then adjusted so that the horizon is seen (through the transparent half of the horizon glass) with the reflected image of the body lined up with it, the body's altitude can be read from the index-arm position on the graduated arc.

sex therapy, treatment of sexual disorders and dysfunction, including IMPOTENCE, orgasmic dysfunction, premature ejaculation, and lack of sexual responsiveness. Pioneered by MASTERS AND JOHNSON



Sextant

in the early 1970s, sex therapy is based on the premise that sexual behavior is learned and that problems can be alleviated through sex education, sensitization exercises, and improved communication between sexual partners. Treatment is generally short-term and focused on the sexual problem and is most successful when it includes the patient's sexual partner.

Sexton, Anne (Harvey), 1928–74, American poet; b. Newton, Mass. Collections of her lyrical, ironic, and confessional poetry include *To Bedlam and Part Way Back* (1960), *Live or Die* (1966; Pulitzer), and *The Complete Poems* (1981). She committed suicide at 46.

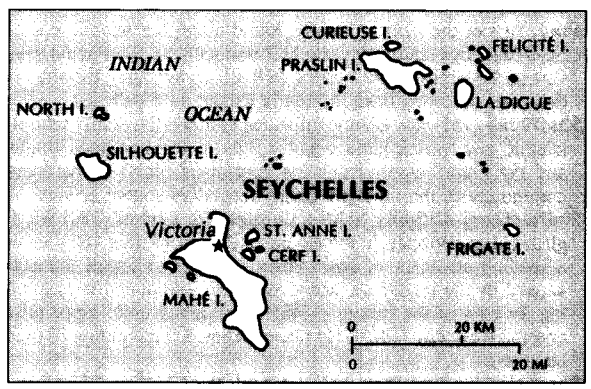
sexual harassment, sexual or sexist behavior that creates a hostile or offensive situation or environment. Sexual harassment can be verbal or physical in nature and ranges from sexist or sexually suggestive remarks and actions to pressure from an employer for a sexual relationship and sexual assault. Sexual harassment has been regarded as sex discrimination by federal courts since 1977 and by the Supreme Court since 1986. In 1991 it became a prominent political issue when, during hearings on Clarence Thomas's appointment to the Supreme Court, Anita Hill accused him of having sexually harassed her when she was his aide.

sexually transmitted disease (STD) or **venereal disease,** any of several infectious diseases almost always transmitted through sexual contact. These diseases include GONORRHEA, SYPHILIS, AIDS, CHLAMYDIA, HUMAN PAPILLOMAVIRUS, TRICHOMONIASIS, and genital HERPES SIMPLEX. The incidence of STDs has risen in recent years despite advances in diagnosis and treatment, possibly because of changes in sexual behavior (the SEXUAL REVOLUTION), the emergence of drug-resistant strains, symptomless carriers, lack of public education, and taboos that make patients reluctant to seek treatment.

sexual revolution, term denoting the sweeping changes in sexual mores in Western societies in the latter half of the 20th cent. It ranges from growing social tolerance of divorce, birth control, abortion, and premarital and extramarital sex, to movements for women's liberation and gay rights, to changing perceptions of men's and women's roles in the home and the workplace.

Seychelles [sāshĕlz'], officially Republic of Seychelles, republic (1992 est. pop. 69,500), 175 sq mi (453 sq km), comprising about 100 islands in the Indian Ocean, c.1,000 mi (1,600 km) E of Kenya. The capital and only urban center and port is Victoria, located on the largest island, Mahé (c.55 sq mi/140 sq km), where about 90% of the population lives. The other principal islands are Praslin, La Digue, Silhouette, and Curieuse. Most farming is of the subsistence type; copra, coconuts, and cinnamon are the principal export crops. Fishing is important—fish products are the largest export—but tourism is the principal economic activity. The people are mainly of European and African descent. Most are Roman Catholic and speak a creole patois, but English and French are the official languages.

History. The Seychelles were explored by Vasco da GAMA in 1502, but colonization, by French planters and their slaves, did not begin until 1768. Britain took possession of the islands in 1794 and administered them as part of MAURITIUS until they became a crown colony in 1903. After the first legislative elections (1948), gradual progress was made toward self-government, and Seychelles became independent in 1976. The coalition government was headed by a pro-Western president, James Mancham, and a leftist prime minister, France Albert René. In 1977 René assumed power in a bloodless coup and suspended the constitution. A presidential government and one-party state headed by René was established in 1979; he was reelected in 1984 and 1988. A 1981 attempt by a group of South African mercenaries to overthrow René failed. A multiparty democracy was reestablished in 1993, and René, running against Mancham, won reelection.



Seymour, Jane, 1509?–1537, third queen consort of HENRY VIII of England. Henry's resolve to marry Jane led to the trial and execution for treason of his second wife, Anne BOLEYN. Soon after, Jane and Henry were married (1536), and in 1537 their son, EDWARD VI, was born. Jane died 12 days later.

Seymour, Thomas, Baron Seymour of Sudeley, 1508?–49, lord high admiral of England; uncle of EDWARD VI. He married (1547) the dowager queen, Catherine PARR; tried to oust his brother, the duke of Somerset, as Edward's guardian; and tried to marry the future ELIZABETH I. He was convicted of treason and executed.

Sforza [sfôr'tsä], Italian family that ruled MILAN from 1450 to 1535. The first prominent member was **Muzio Attendolo Sforza,** 1369–1424, who became a noted condottiere leader of mercenary soldiers and took the surname Sforza [the forcer]. His illegitimate son, **Francesco I Sforza,** 1401–66, was also a famous soldier. He married (1441) Bianca Maria, the illegitimate daughter of Filippo Maria Visconti (see VISCONTI, family), duke of Milan, after whose death Francesco made himself duke (1450). His eldest son, **Galeazzo Maria Sforza,** 1444–76, duke 1466–76, was a patron of the arts but a dissolute and cruel ruler. He was assassinated by republicans. His son, **Gian Galeazzo Sforza,** 1469–94, became duke on his father's death. He was deprived (1480) of the duchy by his uncle, **Ludovico Sforza,** who held him prisoner until his death. Ludovico, 1451?–1508, duke 1494–99, was called *Il Moro* [the Moor] because of his swarthy complexion. His alliance with France helped start (1494) the ITALIAN WARS, but in 1495 he turned against the French. In 1499 LOUIS XII of France expelled him from Milan. Ludovico's attempt to retake the city failed (1500) at Novara, where he was captured, and he died in prison. He is especially remembered as a patron of LEONARDO DA VINCI and BRAMANTE. His son, **Massimiliano Sforza,** 1493–1530, recovered (1512) Milan with help from the HOLY LEAGUE, but surrendered it again to the French in 1515. His brother, **Francesco II Sforza,** 1495–1535, regained the duchy with aid from Holy Roman Emperor CHARLES V. He had no heirs, and Milan passed to Spain in 1559.

Shaba, formerly **Katanga,** region and province, (1984 pop. 3,874,019), c.200,000 sq mi (518,000 sq km), SE Zaïre. The capital is LUBUMBASHI. Eastern Shaba is an enormously rich mining area and supplies most of the world's cobalt as well as extensive quantities of copper and other minerals. Upon Zaïrian independence in 1960, the region seceded and proclaimed itself a republic; a civil war ensued that was ended in 1963 with the use of UN troops. The Belgian firm that controlled Shaba's mining interests was nationalized in 1966.

Shackleton, Sir Ernest Henry, 1874–1922, British explorer. After experience gained (1901–3) in the Robert F. SCOTT expedition, he commanded a south polar expedition (1907–9) during which Mt. Erebus was climbed, the south magnetic pole was located, and the plateau was crossed to within 100 mi (160 km) of the SOUTH POLE. Commanding a transantarctic expedition (1915), he led his party 180 mi (290 km) to safety on floes to Elephant Island after ice crushed his ship. From there he and a few others sailed c.800 mi (1,290 km) on wild seas, crossed South Georgia Island to a whaling station, and rescued the Elephant Island party and others. He died on a fourth voyage and was buried on South Georgia Island in the S Atlantic.

shad, FISH of the HERRING family, found along the Atlantic coast of North America and successfully introduced on the Pacific coast. One of the largest of the herring (6 lb/2.7 kg average), the shad has delicious but bony flesh. Its roe is valued as a delicacy.

Shafi'i, al-, 767–820, Islamic jurist. He founded the Shafi'i school of Islamic law, which gives equal weight to the traditions (hadith) and the Koran, emphasizing the consensus (ijma) of the Islamic community as the most important secondary source of law.

Shaftesbury, Anthony Ashley Cooper, 7th earl of, 1801–85, English social reformer. In the House of Commons after 1826, he was a leading advocate of government action to alleviate injustices caused by the INDUSTRIAL REVOLUTION. He introduced laws providing for care of the insane (1845) and limiting child labor (1842) and the work day (1847). He also promoted the building of model tenements.

Shagari, Alhaji Shehu, 1925–, president of Nigeria (1979–83). In 1978 he helped form the National party, and his subsequent election as president marked the end of 13 years of military rule in Nigeria. Continued economic problems and government corruption eventually led to his overthrow (1983).

Shah Jahan or **Shah Jehan,** 1592–1666, Mogul emperor of INDIA (1628–58). During his reign MOGUL ART AND ARCHITECTURE reached their height; the TAJ MAHAL is a leading example. He was deposed (1658) and imprisoned by his son AURANGZEB.

Shahn, Ben, 1898–1969, American painter and graphic artist; b. Lithuania; emigrated to the U.S. in 1906. Shahn frequently used powerful realism or lyrical abstraction to express social and political themes, e.g., his paintings on the SACCO-VANZETTI CASE. Shahn also painted important murals, worked in photography, and created striking posters.

Shaka, c.1787–1828, founder of the Zulu empire. He became (1816) chief of the Zulu clan. After strengthening the army and turning the Zulus into a powerful military nation, he was feared throughout SE Africa. His half-brothers, claiming that he was insane, murdered him.

Shakers, popular name for members of the United Society of Believers in Christ's Second Appearing. Their name derives from the trembling produced by religious emotions. Originating (1747) in England as Shaking Quakers, they grew under the leadership of Ann LEE (d. 1784). She and eight followers moved (1774) to New York. By 1826, 18 communities had been founded in the U.S. Shakers practiced celibacy, lived communally, and believed in a deity with male and female natures. The movement is all but extinct. Shaker furniture and handicrafts are noted for their fine design.

Shakespeare, William, 1564–1616, English dramatist and poet, considered the greatest of all playwrights; b. Stratford-upon-Avon. He was the son of a Stratford businessman and probably attended the local grammar school, acquiring a grounding in the classics. In 1582 he married Anne Hathaway. They had three children. Little else is known of his life before 1592, when he appeared as a playwright in London. He may have been a member of a traveling theater group, and some evidence in his early style suggests he may have been a schoolmaster. In 1594 he became an actor and playwright for the Lord Chamberlain's Men (the King's Men under James I). It is thought that he played supporting roles, e.g., the Ghost in *Hamlet.* In 1599 he became a part owner of the Globe Theatre, and in 1608 of the Blackfriars Theatre. He retired to Stratford in 1613.

The Plays. The chronology of the plays is uncertain, but style and content analysis give a reasonable approximation of their order (see table). They fall roughly into three periods. In the first are history plays, beginning with the three parts of *Henry VI,* and comedies. At this stage Shakespeare's historical tragedies (*Titus Andronicus*) lack depth of characterization and are somewhat bombastic. The comedies are essentially classical imitations, with strong elements of FARCE (*The Comedy of Errors*). The last play in this first period, *Romeo and Juliet* (c.1594), evidences Shakespeare's maturing talent. The versification is more complex, and rhythms reflect the speaker's state of mind, a technique he developed with increasing subtlety. In the second period, from *Richard II* (c.1595) through *Twelfth Night* (c.1599) Shakespeare produced histories and tragedies in which characterization and practical elements are successfully blended. In the COMEDIES of this period he moved away from farce toward idyllic ROMANCE (*As You Like It*). The third period, from 1600, saw the appearance of Shakespeare's major TRAGEDIES, beginning with *Hamlet,* and "problem plays." The tragedies, after *Othello,* present clear oppositions of order to chaos, and good to evil, on all levels. The style becomes increasingly compressed and symbolic. *Pericles, Cymbeline, The Winter's Tale,* and *The Tempest* are tragicomedies, with full tragic potential but a harmonious resolution through grace, a term with divine as well as artistic implications. Shakespeare has been criticized for failing to propound a philosophy, but the enduring appeal of his plays lies in his human vision, which recognizes the complexity of moral questions, and in the unparalleled richness of his language.

Sources and Editions. Eighteen of the plays appeared in print during Shakespeare's life, but the source for all except *Pericles* and *Two Noble Kinsmen* (of dubious authorship) is the First Folio of 1623. The plays were first published with act and scene divisions and stage directions by Nicholas ROWE (1709). Two major sources used by Shakespeare were Raphael HOLINSHED's *Chronicles of England, Scotland, and Ireland* (1577) for the English historical plays, and Sir Thomas North's translation (1579) of PLUTARCH's *Lives.* He altered many other source materials to suit his purposes.

The Poetry. Shakespeare would be well known for his poetry alone. His first published works were the narratives *Venus and Adonis* (1593) and *The Rape of Lucrece* (1594). The love poem *The Phoenix and the Turtle* appeared in 1601. But his major achievement is the *Sonnets* (1609, written in the 1590s). In them Shakespeare exercises his talent for compressing meaning, fully realized in his later work. Addressed (numbers 1–126) to the unidentified "W.H." and (numbers 127–152) to the mysterious "dark lady," the SONNETS treat the themes of time, mutability, and death, and their transcendence through love and art.

shale, sedimentary ROCK formed by the consolidation of mud or CLAY, having the property of splitting into thin layers parallel to its bedding planes. Shales comprise an estimated 55% of all sedimentary rocks and often contain large numbers of fossils. Oil shales are widely distributed in the W U.S. and may be a future source of petroleum.

Shalikashvili, John Malchase David [shälē"käshvē'lē], 1936–, U.S. army officer; b. Poland. Drafted into the army, he became a commissioned officer in 1959, served in Vietnam (1968–69) as an adviser, and rose (1989) to lieutenant general. He led the 9th Infantry (1987–89) and was deputy commander in chief of the U.S. Army in Europe (1989–91) and commander of NATO forces (1992–93). In 1993 he became the first foreign-born chairman of the Joint Chiefs of Staff.

shallot: see ONION.

Shalmaneser [shälmənē'zər], kings of Assyria. **Shalmaneser I,** d. 1290 B.C., moved the capital from Assur to Calah and established a royal residence at Nineveh. **Shalmaneser III** (r.859–824 B.C.) won an indecisive victory over Benhadad of Damascus and AHAB of Israel at Karkar, on the Orontes R. In Calah he built an enormous

ziggurat. **Shalmaneser V,** d. 722 B.C., attacked Hosea of Israel, but died in the siege of SAMARIA.

shaman, among tribal peoples, a magician, medium, or healer who owes his powers to mystical communion with the spirit world. Shamanism is based on ANIMISM; the shaman shields humans from destructive spirits by rendering the spirits harmless. He receives his power from a spirit who selects him and whom he cannot refuse. Characteristically, he goes into auto-hypnotic trances, during which he is said to be in contact with spirits. He occupies a position of great power and prestige in his tribe. Noted especially among Siberians, shamans are also found among the Eskimos, some Native American tribes, in SE Asia, and in Oceania.

Shamir, Yitzhak, 1915–, Israeli politician. Born in Poland, he emigrated (1935) to Palestine, where he joined the Zionist movement. Arrested (1946) by the British, he escaped to France. Returning to Palestine in 1948, he served in the Israeli secret service. He helped to found (1973) the conservative Likud party, becoming its leader and prime minister upon the retirement of Menachem BEGIN in 1983. In 1984 and 1988, Likud and Labor formed a government of national unity in which Shamir served as foreign minister (1984–86) and prime minister (1986–90). From 1990 to 1992 Shamir was prime minister of a Likud-led right-wing government.

Shammai, c.50 B.C.–A.D. c.30, Palestinian rabbi. A leader of the SANHEDRIN, Shammai adopted a rigorous style of interpretation of HALAKAH that opposed the teachings of HILLEL.

shamrock, plant with leaves composed of three leaflets. According to legend, it was used by St. PATRICK to explain the Trinity. The identity of the true shamrock has long been debated, but the plants most often designated as shamrocks are the white CLOVER, *Trifolium repens;* the small hop clover, *T. procumbens;* and the wood sorrel, *Oxalis acetosella* (see OXALIS). The shamrock is the emblem of Ireland.

Shang or **Yin,** dynasty: see CHINA.

Shanghai, city (1990 est. pop. 7,830,000), in, but independent of, Jiangsu prov., E China, on the Huangpu R. Administered directly by the central government, Shanghai is one of the world's great seaports, the largest city of China, and the country's most important foreign trade center. Shanghai is the leading industrial city of China, with steelworks, textile mills, shipyards, and oil refineries. Its factories produce various heavy and light industrial goods, such as machinery, chemicals, electronic equipment, aircraft, and precision tools. Since Shanghai was declared (1990) a special economic zone, the government has spent billions of dollares to modernize the city's transportation and other facilities. Shanghai comprises a commercial center (the former International Settlement), which is Western in appearance; an older quarter with crowded streets and wooden buildings; and industrial and residential sections ringing the city. Shanghai became a treaty port in the 19th cent. and there were extraterritorially administered British, American, and French concessions until World War II. The Chinese Communist party's first Congress was held there in 1921.

Shankara: see VEDANTA.

shape memory, property possessed by certain ALLOYS that allows them to return, when heated, to their original shape after having been deformed. This effect results because, as the alloy is deformed, it undergoes a martensitic (or athermal) transformation—a solid-state transition that rapidly changes the crystalline structure of the alloy without thermal activation—that is readily reversed once an appropriate amount of heat is applied. Among the alloys are copper-aluminum-nickel, copper-zinc-aluminum, nickel-titanium, and iron-manganese-silicon. Applications of shape memory include heat-activated fasteners, switches, eyeglass frames, orthopedic devices, teeth braces, and blood clot filters.

Shapiro, Karl, 1913–, American poet; b. Baltimore. As a soldier he wrote such volumes as *V-Letter and Other Poems* (1944; Pulitzer). Later books include *Poems of a Jew* (1958) and *Collected Poems* (1978). His critical essays appear in such collections as *Beyond Criticism* (1953) and *The Poetry Wreck* (1975).

Shapley, Harlow, 1885–1972, American astronomer; b. Nashville, Mo. He was a staff astronomer (1914–21) at Mt. Wilson Observatory and later director (1921–52) of Harvard Observatory. He established that CEPHEID VARIABLES are pulsating stars rather than eclipsing binaries. Through his study of Cepheids in globular STAR CLUSTERS he determined the size of the MILKY WAY galaxy as well as the position of its center and of the sun within the galaxy.

sharecropping, farm tenancy system once common in parts of the U.S. that arose from the cotton plantation system after the CIVIL WAR. Landlords provided land, seed, and credit; croppers—initially former slaves—contributed labor and received a share of the crop's value, minus their debt to the landlord. The system's abuses included emphasis on single cash crops, high interest charges, and cropper irresponsibility. Farm mechanization and reduced cotton acreage have virtually ended sharecropping.

shark, predatory cartilaginous FISH (order Selachii), found in all seas but most abundant in warm waters. About 250 species exist, ranging from the 2-ft (60-cm) pygmy shark to the 50-ft (15-m) whale shark. Sharks have pointed snouts and crescent-shaped mouths with several rows of sharp, triangular teeth. The most feared is the white shark, or man-eater (*Carcharodon carcharias*), reaching 20 ft (6 m) in length, which feeds on large fish and other animals and is known to attack swimmers and boats without provocation. Unlike other sharks, the whale shark and basking shark are harmless plankton feeders. Shark meat is nutritious, and shark oils are used in industry. Tanned sharkskin is a durable LEATHER.

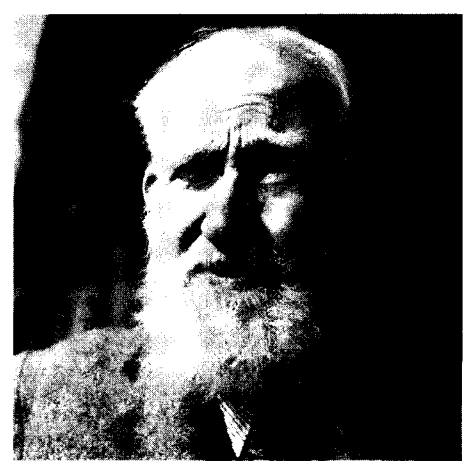
Sharon, Ariel, 1928–, Israeli soldier and politician. A brilliant military strategist, he took part in all of the ARAB-ISRAELI WARS. He served (1973–74, 1977–) in the Israeli parliament, helped to found the Likud coalition, and was minister of agriculture (1977–81) and of defense (1981–83). He was the chief architect of the 1982 Israeli invasion of Lebanon and was criticized for allowing Lebanese Christian forces into Palestinian refugee camps in West BEIRUT and the massacre of civilians that resulted. He also was minister of trade and industry (1984–90) and minister of housing (1990–92); in the latter post he worked to increase Jewish settlement in the occupied territories.

Shastri, Shri Lal Bahadur, 1904–66, Indian prime minister (1964–66). He held several governmental posts before succeeding Jawaharlal NEHRU.

Shatt al Arab, tidal river, 120 mi (193 km) long, formed by the confluence of the TIGRIS and EUPHRATES rivers in SE Iraq and flowing southeast along part of the Iran-Iraq border to the PERSIAN GULF. Iraq and Iran have disputed navigation rights on the Shatt al Arab since 1935, when an international commission awarded the rights to Iraq, leaving Iran with control of only the approaches to its ports of Abadan and Khorramshahr. The issue contributed to the outbreak of the IRAN-IRAQ WAR in 1980.

Shavuot: see under JEWISH HOLIDAYS.

Shaw, George Bernard, 1856–1950, Irish playwright and critic. His dramas of ideas revolutionized the Victorian stage, and his criticism is considered superb. In 1925 he was awarded the Nobel Prize in literature. A Fabian socialist, Shaw was a popular speaker and wrote five novels before becoming a music critic for London newspapers in 1888. After 1895, as drama critic for the *Saturday Review,* he won readers to IBSEN. His early plays were collected in



George Bernard Shaw

Plays Pleasant and Unpleasant (1898). Among the "unpleasant" plays was *Mrs. Warren's Profession* (1893), a jibe at Victorian attitudes on prostitution. The "pleasant" plays included *Arms and the Man* (1894), satirizing romantic attitudes toward love and war, and *Candida* (1893). In 1897 *The Devil's Disciple*, on the American Revolution, was a success in New York City. It was published along with *Caesar and Cleopatra* (1899) and *Captain Brassbound's Conversion* (1900). Shaw's major plays came in the next 15 years: *Man and Superman* (1905), on men, women, and marriage; *Major Barbara* (1905), arguing poverty as the root of all evil; and *Androcles and the Lion* (1912), satirizing Christianity. *Pygmalion* (1913) was his most successful play. A satire on English class attitudes, it was the basis for the 1956 musical *My Fair Lady*. Of Shaw's later plays, *Saint Joan* (1923), a dramatic consideration of JOAN OF ARC, is best known. His most notable nonfiction work is probably *The Intelligent Woman's Guide to Socialism and Capitalism* (1928).

Shaw, Henry Wheeler: see BILLINGS, JOSH.

Shawnee or **Shawano,** indigenous people of the Eastern Woodlands (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). By the mid-18th cent. they were concentrated in Ohio, where they fought in most wars of the Old Northwest. In 1795 they were forced to move into Indiana. There TECUMSEH and his brother Tenskwatawa, the Shawnee Prophet, established the tribe in a village on the Tippecanoe R., which William Henry HARRISON destroyed (1811). The Shawnee were then moved farther west, eventually to Oklahoma. In 1990 there were 6,179 Shawnees in the U.S.

Shays, Daniel [shāz], c.1747–1825, American soldier; b. probably Hopkinton, Mass. After fighting in the AMERICAN REVOLUTION, he led **Shays's Rebellion** (1786–87), an armed revolt in W Massachusetts. Economically depressed farmers demanding relief prevented the courts from sitting and attacked the Springfield arsenal. They were dispersed by state troops. Shays escaped and was pardoned in 1788.

shear: see STRENGTH OF MATERIALS.

Sheba, biblical name of a region of S Arabia, including Yemen and the Hadhramaut; it was also called Saba. Its inhabitants, Sabaeans or Sabeans, established an ancient culture there, as shown by inscriptions in a Semitic language. The biblical queen of Sheba (called Balkis in the Muslim tradition) visited Solomon in the 10th cent. B.C. With the rise of Islam (7th cent. A.D.), Sheba came under Muslim control.

Sheeler, Charles, 1883–1965, American painter; b. Philadelphia. His characteristic style is a cool simplification in planes and volumes of industrial forms and rural buildings, e.g., *Midwest, 1954* (Walker Art Center, Minneapolis). His photographs reflect a similar simplification and impersonality.

sheep, wild and domesticated ruminant MAMMALS (genus *Ovis*). Wild sheep, which include the BIGHORN, are agile rock climbers with large, spiraling horns. Present-day domesticated sheep are thought to be derived chiefly from the mouflon of SARDINIA and CORSICA and the urial of Asia. An adult male is called a ram; a female, a ewe; an infant, a lamb. Sheep are bred for their WOOL, meat (mutton or lamb, according to age), skins, and MILK (from which CHEESE is made). Important breeds include the Cotswold, Hampshire, Leicester, Lincoln, Merino, Rambouillet, and Suffolk.

sheepdog: see WORKING DOG.

Sheffield, city (1991 pop. 501,202), South Yorkshire, N England. One of the leading industrial cities of England, it is famous for its cutlery, especially the fused copper and silver metalware known as Sheffield plate.

Sheherazade: see THOUSAND AND ONE NIGHTS.

shellac, solution of lac, a RESIN exuded by a scale insect, in alcohol or acetone. The color ranges from light yellow to orange; the darker shellacs are the less pure. When bleached it is known as white shellac. Applied to surfaces, e.g., wood, shellac forms a hard coating when the solvent evaporates. Shellac is used as a spirit VARNISH, as a protective covering for drawings and plaster casts, for stiffening felt hats, and in electrical insulation.

Shelley, Percy Bysshe, 1792–1822, English poet. In 1810 he entered Oxford, where he read the philosophical writings of William GODWIN and others. In 1811 he and a friend published a pamphlet, *On the Necessity of Atheism*, and were expelled. Later that year he married Harriet Westbrook. His first major poem, *Queen Mab*, privately printed in 1813, advocated social and political reform through the abolition of various established institutions. In 1814 he went to France with Godwin's daughter, Mary. In 1816, after Harriet's suicide, he and Mary were married. *Alastor, or The Spirit of Solitude*, appeared in 1816; *The Revolt of Islam* in 1818. In that year the Shelleys settled in Italy, where his mature works were written, among them the poetic dramas *The Cenci* (1819) and *Prometheus Unbound* (1820); *Adonais* (1821), an elegy to John KEATS; and the lyrics "Ode to the West Wind" (1819) and "To a Skylark" (1820). In 1821 Shelley wrote "A Defence of Poetry" his most important prose work. He was drowned while sailing in 1822. Shelley's poetry reveals his belief in reason and the perfectability of humanity. His lyric poems are superb in their beauty and grandeur. His wife, **Mary Wollstonecraft Shelley,** 1797–1851, was the daughter of William Godwin and Mary WOLLSTONECRAFT. Her fame rests on the science-fiction novel *Frankenstein* (1818). Among her other novels is *The Last Man* (1826).

Shem: see NOAH.

Shenandoah National Park: see NATIONAL PARKS (table).

Shenandoah valley, scenic depression in the APPALACHIAN MTS., c.150 mi (240 km) long, between the Blue Ridge and Allegheny mountains, in N Va., occupied in part by the Shenandoah R. and by Shenandoah National Park (see NATIONAL PARKS, table). It was an important corridor in the early westward movement of pioneers and figured prominently in the "valley campaign" of Stonewall JACKSON (1862) and other events of the Civil War.

Shenchen: see SHENZHEN.

Shenyang, formerly Mukden, city (1990 est. pop. 4,540,000), capital of Liaoning prov., NE China, on the Hun R. It is one of China's leading industrial cities and the economic center of NE China. Industries include machinery, machine tools, metals, tractors, transformers, and chemicals. An important historical site, Shenyang was the capital of the MANCHUS in China and the site of the Japanese invasion of MANCHURIA in 1931 (the "Mukden Incident").

Shenzhen [shĕn'jŭn'], city (1991 est. pop. 2,385,000), S Guangdong prov., SE China, on the South China Sea, just N of Hong Kong. One of China's first designated special economic zones (1979), Shenzhen has experienced enormous economic growth. Manufactures include electronic and computer equipment, chemicals, processed foods, textiles, construction materials, and pharmaceuticals.

Shepard, Alan Bartlett, Jr., 1923–, American astronaut; b. East Derry, N.H. He was the first American to be launched into space. On May 5, 1961, Shepard in *Freedom 7* (*Mercury-Redstone 3*) made a 15-min suborbital flight down the Atlantic missile range. While commanding the *Apollo 14* lunar-landing mission (Jan. 31–Feb. 9, 1971), he became the fifth person to walk on the moon. He retired (1974) from NASA and the U.S. navy (as a rear admiral).

Shepard, Sam, 1943–, American playwright and actor; b. Fort Sheridan, Ill., as Samuel Shepard Rogers III. A product of the 1960s counterculture, Shepard combines wild humor, grotesque satire, myth, and haunting language evocative of Western movies to create a subversive POP-ART vision of America. His plays include *Curse of the Starving Class* (1977), *Buried Child* (1978; Pulitzer), *True West* (1980), and *States of Shock* (1991). He wrote the screenplay for and acted in *The Right Stuff* (1983), which made him a movie star.

Sheraton, Thomas, 1751–1806, English furniture designer. A Baptist preacher and writer, he published his designs in manuals such as the *Cabinet-Maker and Upholsterer's Drawing-Book* (1791–94). His style is marked by delicacy, simplicity, straight lines, classical motifs, and inlay decoration.

Sheridan, Philip Henry, 1831–88, Union general and outstanding cavalry officer in the U.S. CIVIL WAR; b. Albany, N.Y. His charge over Missionary Ridge (Nov. 1863) in the CHATTANOOGA CAMPAIGN contributed largely to the Union victory. In 1864, while leading the Army of the Shenandoah, he defeated the Confederates and laid waste the countryside. Surprised by a counterattack at Cedar Creek, Sheridan made a famous ride to the battlefield and turned a near defeat into a decisive victory. In April 1865 he cut off the Confederate retreat at APPOMATTOX and forced Gen. LEE to surrender.

Sheridan, Richard Brinsley, 1751–1816, English dramatist and

Sam Shepard

politician; b. Dublin. His masterpieces, *The Rivals* (1775) and *School for Scandal* (1777), COMEDIES of manners blending RESTORATION wit and 18th-cent. sensibility, are affectionate satires on fashionable society. Other works include *The Critic* (1779), a dramatic burlesque; *The Duenna* (1775), a comic opera; and *A Trip to Scarborough* (1777). He entered Parliament in 1780.

Sherman, William Tecumseh, 1820–91, Union general in the U.S. CIVIL WAR; b. Lancaster, Ohio. He distinguished himself in the VICKSBURG and CHATTANOOGA campaigns (1863). Appointed commander in the West (Mar. 1864), he embarked on the ATLANTA CAMPAIGN and took the city (Sept. 2). He burned Atlanta (Nov. 15) and set off, with a force of 60,000, on his famous march to the sea, devastating the country. After capturing Savannah (Dec. 21), he turned north through South Carolina, again wreaking havoc, and received the surrender of Gen. J.E. JOHNSTON (Apr. 26, 1865). Sherman, whose famous statement that "war is hell" expressed his belief in the need for ruthlessness in modern warfare, is considered one of the greatest Civil War generals. His brother, **John Sherman,** 1823–1900, was secretary of the treasury (1877–81) and secretary of state (1897–98). As a U.S. senator from Ohio (1861–77, 1881–97), he was associated with passage (1890) of the Sherman Antitrust Act and the SHERMAN SILVER PURCHASE ACT.

Sherman Antitrust Act: see under ANTITRUST LAWS.

Sherman Silver Purchase Act, 1890, passed by the U.S. Congress to supplant the BLAND-ALLISON ACT OF 1878. It required the U.S. government to double its purchase of silver and to increase money in circulation. When put into operation, it threatened to undermine the U.S. Treasury's gold reserves, and it was repealed in 1893.

Sherrington, Sir Charles Scott, 1857–1952, English neurophysiologist. He introduced the term and concept of synapse, described the motor functions of the spinal cord, and demonstrated that when one set of muscles is stimulated, an opposing set is simultaneously inhibited. His work on reflex integration was synthesized in his classic *The Integrative Action of the Nervous System* (1906). For his isolation and functional analysis of the neuron, he shared with Edgar Adrian the 1932 Nobel Prize in physiology or medicine.

sherry, naturally dry, fortified wine containing 15% to 23% alcohol; originally made from grapes of the Jérez de la Frontera region in Spain. The term now includes wines of S Spain, the U.S., Latin America, and South Africa. After fermentation, sherry is fortified with BRANDY and aged. Blending and, in some cases, sweetening produce a wide variety of sherries.

Sherwood, Robert Emmet, 1896–1955, American dramatist; b. New Rochelle, N.Y. His plays range from comedy—*Reunion in Vienna* (1931), to melodrama—*The Petrified Forest* (1935), to biography—*Abe Lincoln in Illinois* (1938; Pulitzer). He also wrote a memoir of his years in the F.D. ROOSEVELT administration, *Roosevelt and Hopkins* (1948; Pulitzer).

Shetland Islands, archipelago, 552 sq mi (1,427 sq km), off N Scotland. They consist of c.100 islands c.70 mi (110 km) long, about a fourth of which are inhabited. The largest are Mainland (where Lerwick, the main town, is located), Yell, Unst, Fetlar, Whalsey, and Bressay. Oil, produced offshore in the North Sea since the 1970s, supplements income from traditional sheep, cattle, and knitware industries. Tourism is also important. The hardy Shetland pony and the SHETLAND SHEEPDOG originated there. Occupied by Norsemen by the 9th cent., the islands were annexed to Scotland in 1472.

Shetland sheepdog, agile WORKING DOG; shoulder height, 13–16 in. (33–40.6 cm); weight, c.15 lb (7 kg). Its dense double coat is usually a mixture of black, blue, and sable, with white and tan markings. The sheltie was developed (19th cent.) to tend the small sheep of the Shetland Islands.

Shevardnadze, Eduard A(mvrosiyevich), 1927–, Soviet-Georgian political leader and diplomat, president of GEORGIA (1992–). Head of the Georgian Communist party (1972–85), he became (1985) Soviet foreign minister under GORBACHEV. He sought improved relations with the West and the end of the COLD WAR. During his tenure the USSR withdrew from Afghanistan, signed new arms-control agreements, and supported the U.S.-led coalition in the PERSIAN GULF WAR. In 1990 he resigned, warning of approaching dictatorship. He joined Boris YELTSIN in opposing the attempted coup (1991) against Gorbachev and again served as foreign minister (Nov.–Dec. 1991) as the USSR disintegrated. In 1992, after Georgian Pres. Zviad Gamsakhurdia's ouster, he became president of Georgia.

Shevchenko, Taras [shĭvchĕn'kō], 1814–61, Ukrainian poet and artist. Born a serf, he became a noted realist painter and published Ukrainian ballads in Russian. For opposing serfdom and autocracy in *The Heretic* (1845), he was sentenced to military service in Central Asia (1847–57), but he continued to produce lyric poetry and novels in exile. He died a week before the abolition of serfdom was proclaimed.

Shih Tzu, active TOY DOG; shoulder height, 8–11 in. (20.3–27.9 cm); weight, 9–18 lb (4.1–8.2 kg). Its long, soft double coat may be any color. Probably descended from the LHASA APSO, it originated in Tibet and was sent as a gift by Dalai Lamas to Chinese emperors as early as the 16th cent.

Shiites [Arab., = sectarians], members of one of the two great divisions of ISLAM, the other, much more numerous, being the SUNNI. There are important Shiite communities in Iran (where they predominate), Iraq, Yemen, Pakistan, Lebanon, and Oman. The schism arose over MUHAMMAD's successor, or caliph. The Shiites supported Ali, Muhammad's son-in-law. They believe that the divine line of descent from Muhammad will culminate in the twelfth IMAM, hidden from the usurpers, who will appear on the Last Day as the MAHDI. The Shiites also differ from the Sunni in matters of law and ceremony.

Shikoku, island (1990 pop. 4,240,265), Japan. The smallest (7,247 sq mi/18,770 sq km) of Japan's major islands, it is located in the south, separated from HONSHU and KYUSHU by the Inland Sea. The island is mostly mountainous, with little land suitable for farming, and has a warm, mild climate. Population is concentrated in the industrial belt along the northern coast, where Takamatsu and Matsuyama are the largest cities.

Shiloh [shī'lō], in the BIBLE, town, now Khirbet Seilun in the Israeli-occupied WEST BANK, NNE of Jerusalem. It was the home of the prophets Eli and Ahijah and the place where the ARK of the Covenant rested after the conquest of Judah.

Shiloh, battle of, Apr. 6–7, 1862, in the U.S. CIVIL WAR. On Apr. 6, the Confederates routed Union troops under U.S. GRANT in a surprise attack at Shiloh Church meetinghouse, Tenn. The next day Grant, with reinforcements from the Army of the Ohio, counterattacked, and the Confederates withdrew to Corinth, Miss. The battle,

one of the war's bloodiest, with losses of over 10,000 on each side, set the stage for later Union victories in the West.

shingles or **herpes zoster,** infection of a ganglion, or nerve center, with severe pain and a blisterlike eruption in the area of the nerve distribution, due to the same virus that causes CHICKEN POX. Most common in people past age 50, it often involves the area of the upper abdomen and lower chest, but may appear along other nerve pathways.

Shining Path, Span. *Sendero Luminoso,* Peruvian Communist guerrilla force, officially the Communist party of Peru. Founded (1970) by Abimael Guzmán Reynoso as an orthodox Marxist-Leninist offshoot of the Peruvian Communist party, the Shining Path turned to TERRORISM in 1980. By the mid-1980s it had several thousand guerrillas, largely in rural Peru; it began urban terrorism in the late 1980s. In 1992 Pres. Fujimori instituted martial law, and the subsequent capture of Guzmán set the guerrillas back.

Shinn, Everett, 1876–1953, American painter; b. Woodstown, N.J. The youngest member of the EIGHT, he is best known for his street and theater scenes, e.g., *Revue* (Whitney Mus., N.Y.C.). He was also an outstanding illustrator and muralist.

Shinto, ancient native religion of Japan still practiced in a form modified by the influence of Buddhism and Confucianism. In its present form it is characterized less by religious doctrine or belief than by the observance of traditional rituals and customs involving reverence of ancestors, the celebration of popular festivals, and pilgrimages to shrines believed to house a great host of mostly beneficent supernatural beings or deities called *kami.* Shinto beliefs and rituals were transmitted orally long before the introduction (5th cent.) of Chinese writing into Japan; much of the ancient belief is gathered in three later compilations of records, rituals, and prayers—the *Kojiki* (completed A.D. 712), the *Nihongi* (completed A.D. 720), and the *Yengishiki* (10th cent.). These accounts describe the development of early Japanese religion from the worship of the forces and forms of nature to a stage of polytheism in which spiritual conceptions had only a small place. The most exalted among the deities was the sun goddess, Amaterasu-o-mikami, held to be the ancestor of the line of emperors of Japan, each of whom was chief priest by divine right. In 1882 all Shinto organizations were divided into two groups, government-supervised state shrines and sectarian churches. A powerful tool in the hands of the militarists, state Shinto collapsed with the defeat of Japan in World War II and the disavowal (1946) by Emperor HIROHITO of his divinity. Sectarian Shinto still thrives; there is no dogmatic system and no formulated code of morals, but some newer sects stress world peace and brotherhood.

ship, large craft in which persons and goods can be conveyed on water. The term *boat* properly applies only to smaller craft, but some vessels may be called by either name. Ancient ships were propelled by oars, sails, or both; the trireme used by the Greeks and the Romans was the most famous warship of ancient times. In the Middle Ages, VIKING ships, propelled by both oars and sails, carried LEIF ERICSSON to America. The introduction of the mariner's COMPASS and the transoceanic voyages of the Portuguese and of COLUMBUS and other explorers of the New World gave impetus to the building and navigation of ships. With differences in the number and positions of masts, and sails either square-rigged or fore-and-aft, a number of different types of ships appeared. Building wooden ships became an important industry, especially in Britain and the U.S. Later, the STEAMSHIP replaced the sailing ship and steel replaced wood, making possible the construction of much larger ships. The steam engine was followed by the steam TURBINE and, early in the 20th cent., by the DIESEL ENGINE. In the 1950s nuclear marine engines were introduced. Today, some freight ships are equipped with cargo-handling machines that rival the power of any on the docks, and the latest generation of mammoth oil-carriers (supertankers) includes the largest ships that ever put to sea. Although the airplane has led to the virtual demise of the great ocean liner, luxurious cruise ships continue to be built. The pivotal vessels of modern warfare are the AIRCRAFT CARRIER and the SUBMARINE, but any sizable navy still includes destroyers, cruisers, and frigates.

shipworm or **teredo,** wormlike marine BIVALVE mollusk that bores in wood. It is a greatly elongated CLAM, with two ridged shells that function as boring tools enclosing only the front of the body. Shipworms burrow in submerged wood, feeding on wood particles and minute organisms; they do enormous damage to piers and ships.

Shirley, James, 1596–1666, English dramatist. His plays include *The Lady of Pleasure* (1635), a comedy realistically portraying London society; *The Traitor* (1631), a tragedy; and *The Triumph of Peace* (1633), a MASQUE.

Shiva, one of the major gods of HINDUISM; in the Hindu trinity he represents the force of destruction and cosmic dissolution (see also BRAHMA; VISHNU).

shock, condition in which the cardiovascular system is unable to provide adequate BLOOD circulation to body tissues. It may be due to inadequate pumping by the HEART (heart failure), hemorrhage, extensive BURNS, or low BLOOD PRESSURE. Symptoms include weakness, pallor, cold and moist skin, thirst, nausea, and, in severe cases, unconsciousness. Because shock can be fatal, emergency treatment, such as BLOOD TRANSFUSIONS and administration of fluids and oxygen, should be given while the cause is being diagnosed.

Shockley, William Bradford, 1910–89, American physicist; b. London. At Bell Laboratories, he, John Bardeen, and Walter H. Brattain produced (1947) the first TRANSISTOR, for which they shared the 1956 Nobel Prize in physics. Shockley later aroused controversy with his theory of black intellectual inferiority, which was rejected by most social scientists.

shock wave, wave formed of a zone of extremely high pressure within a fluid (see FLUID MECHANICS), especially one such as the atmosphere, that propagates through the fluid at supersonic speed, i.e., faster than the speed of SOUND. Shock waves are caused by the sudden, violent disturbance of a fluid, such as that created by a powerful explosion or by the supersonic flow of a fluid over a solid object (see SONIC BOOM).

Shoemaker, Bill (William Lee Shoemaker), 1931–, American jockey; b. Fabens, Tex. The most successful jockey in history, he won his first race at 18. By the time he retired in 1990 he had won 8,833 races, including four Kentucky Derbies, five Belmont Stakes, and three Preakness Stakes. He was the first jockey to win over $100 million.

shogun, title of the feudal military dictators who from the 12th to the 19th cent. were the actual rulers of Japan. The title dates back to 794 and originally meant commander of the imperial armies. It was established as a system of military government by Yoritomo after 1185. The shogunate was held in turn by the Minamoto family and their successors, with their capital at Kamakura (1192–1333); the Ashikaga, with their capital at Kyoto (1338–1597); and the TOKUGAWA, with their capital at Edo (Tokyo) after 1603. The overthrow (1867) of the Tokugawa shogunate in the MEIJI restoration marked the beginning of modern Japan.

Sholokhov, Mikhail Aleksandrovich [shô'ləkhôf], 1905–84, Russian novelist. His most famous work, *And Quiet Flows the Don* (1928–40), depicts the effects of World War I, the RUSSIAN REVOLUTION (1917), and the civil war on COSSACK life. *Virgin Soil Upturned* (1932–60) deals with agricultural collectivization. Sholokhov was awarded the 1965 Nobel Prize in literature.

Sholom Aleichem [shō'ləm älā'khəm] [Heb., = Peace be unto you], pseud. of **Shalom Rabinowitz,** 1859–1916, Russian Yiddish writer. Perhaps best known for his humorous novels and stories of life among poor and oppressed Russian Jews, Sholom Aleichem was influential in establishing Yiddish as a literary language. The sketches collected in *Tevye's Daughters* (1894) formed the basis for the successful Broadway musical *Fiddler on the Roof* (1964).

shooting, firing with rifle, shotgun, pistol, or revolver at fixed or moving targets. In the sport of small-bore rifle shooting, the targets range in distance from 50 ft to 200 yd (15.24–182.88 m); in pistol and revolver, from 50 ft to 50 yd (15.24–45.72 m); and in long-range rifle, from 200 to 1,000 yd (182.88–914.4 m). Competitors shoot from four positions with the rifle—prone, sitting, kneeling, and standing. In skeet or trapshooting marksmen fire shotguns at small disks ("clay pigeons") hurled into the air by a mechanical device (the trap). Major U.S. tournaments are sponsored by the National Rifle Association (formed 1871).

shorthand, any brief, rapid system of writing used in transcribing the spoken word. Such systems date from ancient times. Modern systems began with Timothy Bright's 500 symbols (1588). Many others followed. The phonetic system of Isaac Pitman (1837) is,

with improvements, still used in English-speaking countries. Employing geometric outlines with variations in shading, slope, and position to denote variations in meaning, it is difficult to learn but permits great speed. The business shorthand system of John Robert Gregg, published in 1888, is popular. Its curved outlines resemble ordinary script; the pen is rarely lifted, and variations in length indicate variations in meaning. Some systems, such as Speedwriting, employ shortened forms of longhand. Keyboard machines are also used to write shorthand, especially in law courts.

short story, brief prose fiction. The term embraces a variety of narratives, from stories focusing on events to character studies, from "short short" stories to long, complex narratives (sometimes called novellas) like Thomas Mann's (see MANN, family) *Death in Venice* (1912). Most often the short story concentrates on creating a single dynamic effect, and is limited in character and situation. Precursors of the short story can be found in the BIBLE, the medieval GESTA ROMANORUM, and the works of BOCCACCIO and CHAUCER. The modern short story dates from the 19th-cent. works of Nathaniel HAWTHORNE, E.A. POE, Herman MELVILLE, Nikolai GOGOL, Guy de MAUPASSANT, and Anton CHEKHOV. Twentieth-cent. masters of the form include Henry JAMES, Sherwood ANDERSON, Katherine MANSFIELD, Ernest HEMINGWAY, Katherine Anne PORTER, Flannery O'CONNOR, John CHEEVER, J.D. SALINGER, Donald BARTHELME, and Raymond CARVER.

short takeoff and landing aircraft (STOL), heavier-than-air craft capable of taking off or landing with only a short length of runway (1,000 ft/305 m), but incapable of taking off vertically (see VERTICAL TAKEOFF AND LANDING AIRCRAFT). STOL aircraft have large wings that are equipped with special aerodynamic devices, such as slotted flaps, drooped leading edges, and auxiliary spoilers that augment lift, increase stability, and improve the effect of control surfaces.

Shostakovich, Dmitri, 1906–75, Soviet composer. He scored his first successes with his First Symphony (1925), the opera *The Nose* (1930), and the ballet *The Golden Age* (1930). He sought official approval and survived the changing tides of opinion. His outstanding works include a piano concerto (1933), the Piano Quintet (1940), the Second String Quartet (1944), and the Ninth Symphony (1945).

Shreveport, city (1990 pop. 198,525), seat of Caddo parish, NW La., on the Red R. near the Ark. and Tex. lines; inc. 1839. It is an oil and natural gas center. Cotton and lumber are important products and its manufactures include machinery and chemicals. Oil was discovered in 1906, spurring the city's growth.

shrew, small, insectivorous MAMMAL of the family Soricidae, of Eurasia and the Americas. Related to MOLES, they include the smallest mammals (under 2 in./5.1 cm). Light-boned and fragile, with mouselike bodies, shrews are terrestrial and nocturnal and can produce a protective musky odor. They have the highest known metabolic rate of any animal and must eat incessantly to survive.

shrimp, small CRUSTACEAN with 10 jointed legs and a nearly cylindrical, translucent body. Unlike the closely related LOBSTERS and CRABS, which are crawlers, shrimp are primarily swimmers. Shrimp are widely distributed in temperate and tropical salt and fresh waters. Some grow to 9 in. (23 cm) long, but most are smaller. One of the most popular crustacean foods, shrimp are fished throughout the world.

shrub, any woody, perennial, bushy plant that branches into several stems or trunks at the base and is smaller than a TREE. Tree species may grow as shrubs under unfavorable conditions. In regions of extreme climatic conditions, e.g., the Arctic, where trees do not thrive, shrubs provide valuable food and wood. Common shrubs include the LILAC, mock orange, viburnum, FORSYTHIA, and AZALEA.

shuffleboard, sport in which players use cue sticks to push disks onto a triangular scoring diagram at either end of a concrete or terrazzo court (52 ft/15.85 m long and 6 ft/1.83 m wide). Each diagram is divided into 7-, 8-, and 10-point sections, and there is a penalty area of minus 10 points. Shuffleboard probably originated in 13th-cent. England. It has long been a popular recreation for the elderly.

Shula, Don(ald Francis), 1930–, American football coach, b. Grand River, Ohio. A college and National Football League (NFL) back, he began coaching (1959) at the Univ. of Virginia. After seasons with the Detroit Lions (1960–62) and Baltimore Colts (1963–69), he joined (1970) the Miami Dolphins and transformed the floundering team. Shula holds the NFL record for most wins as a coach.

Shultz, George Pratt, 1920-, U.S. public official; b. N.Y.C. An economist and educator, he was Pres. NIXON's secretary of labor (1969–70), director of the Office of Management and Budget (1970–72), and secretary of the treasury (1972–74). As Pres. REAGAN's secretary of state (1982–89), he was known for his ability to effect compromises. He was criticized for failing to oppose more strongly the operations that led to the IRAN-CONTRA AFFAIR.

Si, chemical symbol of the element SILICON.

Siamese cat: see under CAT.

Siamese language: see THAI LANGUAGE.

Siamese twins, congenitally united organisms that are complete or nearly complete individuals, developing from a single fertilized ovum that has divided imperfectly. Siamese twins are attached at the abdomen, chest, back, or top of the head, depending on where division of the fertilized ovum failed, and can often be separated surgically after birth.

Sian: see XI'AN.

Sibelius, Jean (Julius Christian) [sĭbā'lyōōs], 1865–1957, Finnish composer. A highly personal, romantic composer, he represents the culmination of nationalism in Finnish music. He is best known for orchestral works such as SYMPHONIC POEMS, e.g., *Finlandia* (1900), *Valse triste* (1903); a violin concerto (1903); and seven symphonies.

Siberia, vast geographical region with no precise boundaries, c.2.9 million sq mi (7.5 million sq km), mostly in Russia. As generally delineated, it extends east across N Asia from the URALS to the Pacific coast region known as the RUSSIAN FAR EAST, and south from the TUNDRA regions along the ARCTIC OCEAN margins, through the great TAIGA forest zone, to the STEPPES of Central Asia and Mongolia. Most of Siberia is sparsely populated, with NOVOSIBIRSK, OMSK, Tomsk, Novokuznetsk, and Irkutsk the principal cities. Russians and Ukrainians, migrating east from European Russia since the 13th cent., are now more numerous than indigenous ethnic groups. Transportation facilities are limited, the LENA, OB, and YENISEI rivers (and their tributaries) serving as the principal north-south routes and the Trans-Siberian RR (completed 1905) as the chief east-west route. Extreme cold in the north and scanty, irregular precipitation in the south limit the region's agricultural potential, and most development is based on Siberia's rich oil, natural gas, coal, iron ore, gold, timber, and other resources. Russia's conquest of Siberia was completed in 1598. From the early 17th cent. it has been notorious as the site of penal colonies and as a place of exile for political prisoners.

Siberian husky, muscular WORKING DOG; shoulder height, 20–23½ in. (50.8–59.7 cm); weight, 35–60 lb (15.9–27.2 kg). Its weather-resistant, dense coat is usually black, white, tan, gray, or combinations of these colors. Its origins date back thousands of years in N Siberia, where it was raised by the Chukchi people to pull sleds. The term *husky* is often used to designate any mixed-breed arctic sled dog.

sibyl, in classical mythology, a prophetess. There were said to be as many as 10 sibyls. The most famous was the Cumaean Sibyl, who sold TARQUIN the Sibylline Books, prophecies about Rome's destiny that were burned in 83 B.C.

Sicilian Vespers, 1282, a rebellion of the Sicilians against CHARLES I of Naples that broke out at the start of VESPERS on Easter Monday. Byzantine Emperor MICHAEL VIII and PETER III of Aragón were involved in the plot, and Peter accepted the crown of SICILY. A 20-year war between Aragón and Naples ensued. Sicily remained independent of Naples until 1442, when ALFONSO V of Aragón reunited the two areas.

Sicily, island (1990 pop. 5,172,785), S Italy, in the Mediterranean Sea, separated from the mainland by the Strait of Messina. Sicily gained limited autonomy in 1947 as part of the Sicilian region (9,925 sq mi/25,706 sq km), which also includes several smaller islands. PALERMO is the regional capital. Mainly mountainous, it reaches a high point of 10,700 ft (3,261 m) in volcanic Mt. ETNA. Though it has fertile soils and a mild climate, it has suffered chronic poverty, causing many Sicilians to emigrate. Wheat, olives, citrus, nuts, and wine are leading agricultural products, and there are oil and natural gas, textile, and chemical industries. Sicily

passed from Byzantine to Arab control in the 9th cent. It was conquered by Normans (1060–91) and came under Spanish rule following the SICILIAN VESPERS revolt (1282). In 1860 GARIBALDI conquered the island, which then voted to become part of the Kingdom of Sardinia and ultimately of a unified Italy.

Sickert, Walter Richard, 1860–1942, English painter. Apprenticed to WHISTLER and later working with DEGAS, he was a link between French and English turn-of-the-century painting. His preferred subjects were music halls and London demimonde scenes.

sickle-cell anemia, inherited disorder occurring mainly among Africans and people of African descent but also among people from the Mediterranean and India, in which the red blood cells (erythrocytes) assume distorted, sicklelike shapes. Because of a genetically transmitted chemical abnormality in the HEMOGLOBIN molecule, the red blood cells are fragile and subject to rupture, causing chronic ANEMIA, fever, abdominal and joint pains, and JAUNDICE. There is no cure, and many patients die young from complications.

Siddons, Sarah Kemble, 1755–1831, English actress, best-known member of the KEMBLE family. Famed for such Shakespearean roles as Desdemona in *Othello* and Volumnia in *Coriolanus,* she was unequaled as Lady Macbeth.

sidereal period: see SYNODIC PERIOD.

sidereal time, time measured relative to the fixed stars. The *sidereal day* is the period during which the earth completes one rotation on its axis, so that some chosen star reappears on the observer's celestial meridian; it is 4 min shorter than the solar day (see SOLAR TIME) because the earth moves in its orbit about the sun.

sidewinder, desert RATTLESNAKE (*Crotalus cerastes*) of the SW U.S. This 2-ft (60-cm) pale yellow and pink snake is named for its method of locomotion: It throws out successive loops at oblique angles so that it appears to move sideways. This form of movement allows it to traverse sand, which has little traction.

Sidney or **Sydney, Sir Philip,** 1554–86, English author. A diplomat and courtier at Queen ELIZABETH I's court, he was a model of Renaissance chivalry. As patron, critic, and exemplar he influenced English poetry. His works include the verse idylls of *Arcadia* (1590), the first renowned PASTORAL in English; his prose criticism known as *The Defense of Poesie,* or *An Apology for Poetry* (1595); and *Astrophel and Stella* (1591), one of the great SONNET sequences.

Sidon or **Saida,** city (1988 est. pop. 38,000), SW Lebanon, on the Mediterranean Sea. An ancient seaport of PHOENICIA, it remained important through Roman times and was famous for its purple dyes and glassware. Glassblowing is said to have begun at Sidon. During the 1982 Israeli invasion of S Lebanon, the city was captured from the PALESTINE LIBERATION ORGANIZATION by Israeli forces after heavy fighting (see ARAB-ISRAELI WARS).

Siegfried [sēg'frēd] or **Sigurd** [sig'ərd], folk hero of early and medieval Germanic mythology. His legend, important in several epics, recounts his killing of the dragon Fafnir, his marriage to GUDRUN (or Kriemhild), his love and betrayal of BRUNHILD, and his death. See VOLSUNGASAGA; NIBELUNGEN.

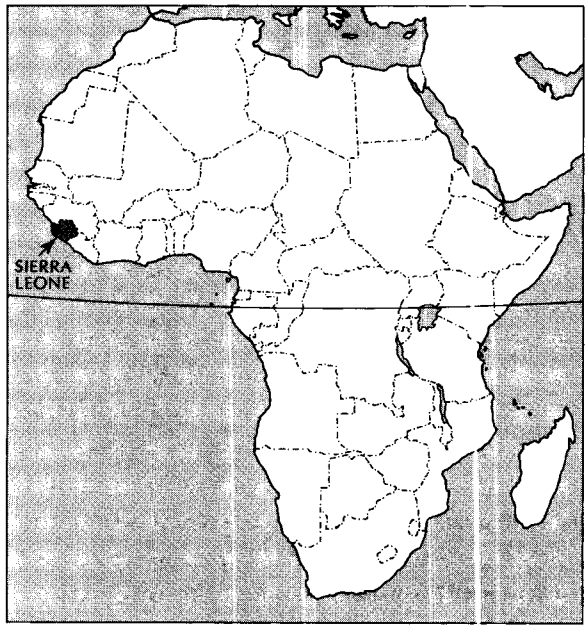
Siemens, Sir William, 1823–83, English electrical engineer; b. Germany. He went to Britain to introduce his and his brother Ernst's electroplating device and became a British citizen in 1859. He was head of the English branch of the Siemens firm, which made electrical apparatus. Siemens invented (1851) a water meter and developed, with his brother Frederick, a regenerative furnace that was the prototype for the open-hearth steelmaking process.

Siena, city (1990 pop. 58,278), in TUSCANY, central Italy. It is a tourist center and is known for its wine and marble. Of ancient origin, it was a free commune by the 12th cent. and grew into a wealthy republic. It fell to Emperor CHARLES V in 1555 and then passed to the MEDICI. Siena's artistic fame is tied to the work of the Sienese school (13th–14th cent.), represented by such painters as DUCCIO, Simone MARTINI, and the LORENZETTI brothers. Siena is noted for its medieval town square, the Piazza del Campo, and such buildings as the Gothic Palazzo Pubblico, the Mangia tower, and the Gothic cathedral.

Sienkiewicz, Henryk [shĕnkyĕ'vēch], 1846–1916, Polish novelist and short-story writer. His best-known historical novel, *Quo Vadis?,* concerns Christianity in NERO's time. His trilogy *With Fire and Sword* (1883), *The Deluge* (1886), and *Pan Michael* (1887–88) deals with the fight for Polish independence. He was awarded the 1905 Nobel Prize in literature.

Sierra Leone, officially Republic of Sierra Leone, republic (1992 est. pop. 4,457,000), 27,699 sq mi (71,740 sq km), W Africa, bordered by the Atlantic Ocean (W), Guinea (N and E), and Liberia (S). FREETOWN is the capital. The 350-mi (560-km) Atlantic coastline is made up of a belt of low-lying mangrove swamps, except for the mountainous Sierra Leone Peninsula (site of Freetown), and has some wide, sandy beaches. The eastern half of the country is mostly mountainous, rising to 6,390 ft (1,948 m). Sierra Leone's economy is predominantly agricultural; two thirds of the people are engaged in mostly subsistence farming. Palm kernels, cacao, ginger, and coffee are the leading cash crops, and large numbers of livestock and poultry are raised. Minerals are the main source of income; diamonds (which account for about half of export earnings), iron ore, gold, bauxite, and rutile are the most important. Manufactures are limited mainly to refined petroleum, agricultural processing, and consumer goods. The two main ethnic groups are the Mende and the Temne. Most people follow traditional beliefs; there are Muslim and Christian minorities. English is the official language, and Krio, a mixture of English and several indigenous languages, is the lingua franca.

History. The Temne were living along the coast when the Portuguese landed in 1460 on the Sierra Leone Peninsula, which, after c.1500, was the scene of European trading in ivory, timber, and small numbers of slaves. Mande-speaking people from present-day Liberia moved into the region in the mid–16th cent. and later established four Mende states. An attempt to resettle freed slaves on the peninsula failed in 1787, but in 1792 about 1,100 freed slaves from Nova Scotia founded Freetown. The new colony was controlled by a private company and had little contact with the interior. Britain took over Freetown in 1808, and during the next 50 years about 50,000 liberated slaves were settled there. To forestall French ambitions in the region, the British established a protectorate over the interior in 1896. After World War II, the African population was given some political power, but the Creoles, who were descendants of freed slaves living in Freetown, were largely excluded from the government. Independence came in 1961, with Milton Margai (a Mende) as prime minister. Siaka Stevens, leader of a Temne-based party, took office in 1967 but was immediately ousted in a military coup. He returned to power in 1968, after another army revolt. In 1971 Sierra Leone became a republic, with Stevens as president. The early 1970s were marked by considerable unrest,



and troops from Guinea were brought in to support the regime. Stevens succeeded in creating a one-party state under a new 1978 constitution, but student and labor protests continued into the 1980s. In 1985 Maj. Gen. Joseph Saidu Momoh, running unopposed, was elected president. Momoh was overthrown in 1992, and a junta established military rule; Capt. Valentine Strasser later became president.

Sierra Madre, rugged mountain system of Mexico, mostly between 6,000 and 12,000 ft (1,829 to 3,658 m) and rising to a high point of 18,700 ft (5,700 m) at the inactive volcano ORIZABA. The system includes the Sierra Madre Oriental (E), the Sierra Madre Occidental (W), and the Sierra Madre del Sur (S), which together form the dissected edges of the central Mexican plateau. The mountains are rich in silver, gold, and other minerals.

Sierra Nevada, mountain range, c.400 mi (640 km) long and up to 80 mi (130 km) wide, mostly in E California. It is known for its spectacular scenery, especially in the High Sierras and in Yosemite, Sequoia, and Kings Canyon NATIONAL PARKS (see table). The range reaches its highest point (14,491 ft/4,417 m) at Mt. WHITNEY.

Sieyès, Emmanuel Joseph [syāĕs'], 1748–1836, French statesman. Before the FRENCH REVOLUTION he was a clergyman known as Abbé Sieyès. Elected (1789) to the STATES-GENERAL, he helped to write the Declaration of the Rights of Man and Citizen and the constitution of 1791. By prudent silence, he lived through the REIGN OF TERROR, and in 1799 he entered the DIRECTORY, which he helped NAPOLEON to topple later that year. After the Bourbon restoration, he lived in exile (1816–30) in Brussels.

Sigismund, 1368–1437, Holy Roman emperor (1433–37), German king (1410–37), king of Hungary (1387–1437) and of Bohemia (1419–37). His election as German king was initially contested by his half brother, the former German king, WENCESLAUS. Sigismund backed Baldassarre COSSA (John XXIII), the strongest of the schismatic popes, in the Council of Constance that ended (1417) the Great SCHISM. After the conference, Sigismund secured the condemnation and burning of John HUSS, despite his promise to Huss of a safe conduct. As a result, his assuming the Bohemian crown in 1419 set off the Hussite Wars (see HUSSITES). His reign was one of constant turmoil, including recurring attacks by the Turks in Hungary. He was the last emperor of the LUXEMBOURG dynasty.

Sigismund, Polish kings. **Sigismund I,** 1467–1548, king of POLAND (1506–48), was the son of CASIMIR IV. He established a regular army and allied himself with Holy Roman Emperor MAXIMILIAN I as protection against Russia. By the double marriage of the children of his brother, Uladislaus II of Bohemia and Hungary, with the grandchildren of Maximilian, Bohemia and Hungary later passed (1526) to the Hapsburgs. His son, **Sigismund II** or **Sigismund Augustus,** 1520–72, king of Poland (1548–72), created (1569) a unified kingdom out of his Polish and Lithuanian fiefs, and acquired Courland and parts of Livonia. He halted the spread of Protestantism by peaceful means and by encouraging Catholic reform. **Sigismund III,** 1566–1632, king of Poland (1587–1632) and king of Sweden (1592–99), was the son of John III of Sweden and Catherine, sister of Sigismund II of Poland. A Roman Catholic, he was resented by the Protestant Swedes and was deposed by his uncle, who ruled as CHARLES IX. Between 1600 and 1629 Sigismund attempted to reclaim his Swedish claims. He intervened in Russia by supporting the pretender DMITRI, but his army was expelled from Russia in 1612.

Signac, Paul [sēnyäk'], 1863–1935, French painter. Associated with the divisionist technique, he painted with broader strokes than did SEURAT (see POSTIMPRESSIONISM). His works include *Port of St. Tropez* (1916; Brooklyn Mus., N.Y.C.).

sign language, substitute for speech, derived from gestures and facial expressions that accompany speech. It is used, e.g., where silence is a rule, as among Trappist monks; or to overcome language barriers, as among Plains tribes. Sign language for the deaf was systematized in 18th-cent. France and brought to the U.S. by T.H. GALLAUDET; it is usually taught along with the manual alphabet and lip reading.

Signorelli, Luca, 1441?–1523, Italian painter of the Umbrian school. MICHELANGELO was influenced by his powerful treatment of anatomy and his dramatic realism. His apocalyptic series decorating the Cappella Nuova in the Orvieto Cathedral includes *Story of the Anti-Christ, End of the World, Paradise,* and *Inferno.* The infernal scenes are remarkable for their evocation of fiends and the tortures of Hell.

Sigurd: see SIEGFRIED.

Sihanouk, Norodom: see NORODOM SIHANOUK.

Sikhs, religious community of some 16 million worldwide, centered on N India, mainly in the Punjab. Its founder, the mystic guru teacher Nanak (c.1469–c.1539), taught monotheism and opposed idolatry and the CASTE system. He believed in the fundamental identity of all religions and stressed religious exercises and MEDITATION. Gradually becoming united and developing military power under a series of gurus, the Sikhs were militarized to oppose Islam by Govind Singh (1666–1708), the tenth and last guru, who created a warrior fraternity and introduced the Sikh practices of wearing a turban and never cutting the hair. In the late 19th cent. conflict with the British led to the subjugation of the Sikh state in the Punjab (established earlier by Ranjit Singh). Following the partition (1947) of British India, the Sikhs fought the Muslims of the Punjab in a fierce holy war, after which some 2.5 million Sikhs moved from W Punjab (now part of Pakistan) to E Punjab, in India. In the early 1980s Indian Sikhs demanding an independent state resorted to terrorism, leading to turmoil in Punjab. In 1984 the Indian army stormed the Sikhs' Golden Temple, at Amritsar, which had been occupied by Sikh militants. Prime Min. Indira Gandhi was assassinated by her Sikh bodyguards in retaliation, after which mobs attacked Sikhs throughout India. Unrest in Punjab continued into the early 1990s.

Sikh Wars (1845–49), two conflicts preceding the British annexation of the PUNJAB. In 1845, fearing British intentions, the SIKHS crossed the Sutlej R. and attacked British troops south of the Punjab. They were defeated by the British and forced to cede KASHMIR, pay a large indemnity, and accept a British protectorate. In 1848, a Sikh uprising resulted in another full-scale war; at its end the victorious British annexed all Sikh territory.

Sikkim, state (1991 pop. 403,612), 2,745 sq mi (7,110 sq km), NE India, bordered by Nepal (W), Tibet (N), and Bhutan (E). The capital and only town is Gangtok. Located in the E HIMALAYAS, most of Sikkim is mountainous. Subsistence agriculture dominates the economy, rice, corn, and millet being the principal crops. Copper is mined, and cotton weaving is an important local craft. The people are predominantly of Nepalese extraction; Buddhism was the state religion, but the majority of the population is Hindu. Tibetans began to settle in Sikkim in the 16th cent., and in 1642 a Tibetan king started a hereditary line of Sikkimese rulers that lasted until 1975. The territory was a British protectorate from 1890 to 1947. In 1950 India assumed responsibility for Sikkim's defense, foreign relations, and communications, and Indian-built roads ended Sikkim's isolation from the outside world. In 1975 the Sikkimese voted to abolish the monarchy and became the 22d state of India.

Sikorsky, Igor Ivanovich, 1889–1972, American aeronautical engineer; b. Russia. He built and flew the first multimotored airplane (1913), but is best known for his work on the development of HELICOPTERS. In 1941 he established an endurance record for sustained flight in a helicopter of his own design.

silenus, in Greek mythology, part bestial, part human creature of forests and mountains. Followers of DIONYSUS, the sileni are usually represented as aged SATYRS. In some legends Silenus is the oldest satyr, the son of HERMES or PAN, and the companion, adviser, or tutor of Dionysus.

Silesia, region of E central Europe, extending along both banks of the Oder R. and bounded in the south by the Sudetes Mts. Most of Silesia is in Poland, a much smaller part in the Czech Republic, and a tiny area in Germany. WROCŁAW is among the chief cities. Silesia is largely agricultural and forested. The most important part is Upper Silesia, in Poland, one of the largest industrial concentrations in Europe, with extensive deposits of coal, lignite, and other resources. Austria ceded (1742) most of Silesia to Prussia during the war of the AUSTRIAN SUCCESSION. After WORLD WAR I the region was partitioned among Germany, Poland, and Czechoslovakia. The MUNICH PACT (1938) divided most of Czechoslovak Silesia between Germany and Poland, and during WORLD WAR II Germany occupied (1939–45) Polish

Silesia. After the war Poland annexed most of German Silesia and expelled the German residents.

silhouette, outline image, especially a solidly filled-in profile drawing or cutout pasted against a lighter background. Silhouette drawings were very popular in late-18th-cent. Europe, replacing miniatures at French and German courts. Profile portraits and silhouette illustrations abounded in 19th-cent. England and America. Silhouette drawings decreased in popularity after the invention of the daguerreotype (see DAGUERRE).

German silhouette of Napoleon, 19th cent.

silica or **silicon dioxide,** chemical compound (SiO_2). It is widely and abundantly distributed throughout the earth, both in the pure state (colorless to white) and in silicates (e.g., QUARTZ, OPAL, SAND, SANDSTONE, CLAY, GRANITE); in skeletal parts of various plants and animals, such as certain protozoa and DIATOMS; and in the stems and other tissue of higher plants. Because silica has a low thermal coefficient of expansion, it is used in objects subjected to wide ranges of heat and cold. It is the principal ingredient of common GLASS. **Silica gel** is a porous, colloidal form of silica that is used as a drying agent and as a catalyst and catalyst carrier.

silicon (Si), nonmetallic element, discovered by Jöns Jakob BERZELIUS in 1824. Silicon has brown amorphous and dark crystalline allotropic forms. The second most abundant element (28% by weight) of the earth's crust, it occurs in compound form as SILICA, SILICON CARBIDE, and silicates. Silicon adds strength to alloys, and is used in integrated circuits and other semiconductor devices. It is found in many plants and animals. See ELEMENT (table); PERIODIC TABLE.

silicon carbide, chemical compound (SiC) occurring as hard, dark iridescent crystals that are heat resistant, and insoluble in water and other common solvents. It is used as an ABRASIVE, in refractory materials, and in special parts for nuclear reactors. Silicon carbide fibers impart increased strength and stiffness to plastics and light metals.

silicon dioxide: see SILICA.

silicone, POLYMER in which atoms of SILICON and OXYGEN alternate in a chain; bound to the silicon atoms are various organic groups, e.g., the methyl group (CH_3). Silicones may be liquids, RUBBERS, RESINS, or greases. Water repellent, chemically inert, and stable at extreme temperatures, silicones are used as protective coatings and electrical insulators and in caulk. Implants consisting of silicone gel surrounded by hard silicone were used in reconstructive and cosmetic breast surgery. Questions about the long-term safety of the implants ended their use in 1992.

Silicon Valley, an industrial region, approximately 30 mi (32 km) long, between Palo Alto and San Jose in California, where many microchip manufacturing and design companies are located. The name derives from high purity silicon used in making these electronic devices.

silk, fiber produced by the SILKWORM in making its cocoon, or textiles woven from such fiber. Legend has it that sericulture (the raising of silkworms) began in China in 2640 B.C. Raw silk was exported, but the export of silkworm eggs was punishable by death. Silkworm eggs and seeds of the mulberry tree on which the worm feeds, were supposedly smuggled to Constantinople in A.D. c.550; thereafter Byzantium was famed for its silk textiles. In the 8th cent. the Moors brought sericulture and silk weaving to Spain and Sicily, where exquisite silk fabrics were being woven by the 12th cent. Italy developed great silk-weaving centers—Lucca, Florence, and Venice—in the 13th and 14th cent. The French city of Lyons became a weaving center in the 15th cent. In 1685 HUGUENOTS fleeing France after the revocation of the Edict of Nantes brought the art to England, where it became centered at Spitalfields, in London. In the American colonies, attempts to establish sericulture ultimately failed. The Asian *Bombyx mori,* which feeds on mulberry leaves, produces the finest silk and is thus the most widely raised silkworm. Wild silk is made by the tussah worm of India and China, which feeds on oak leaves. Silk manufacture begins with the reeling (unwinding) of the silk from the cocoons. In throwing, the raw silk is twisted and doubled to achieve various strengths and thicknesses. The silk is boiled in soap to remove the natural gum, then bleached or dyed. It is woven on delicate specialized looms to produce a wide variety of fabrics, e.g., taffeta, faille, velvet, crepe. Modern silk production is highly mechanized, but the finest fabrics are still handwoven.

silk-screen printing, multiple PRINTING technique, also called serigraphy, involving the use of stencils. Paint is applied to a fabric screen, penetrating areas not blocked by a stencil. Several stencils are used to produce a multicolored print. As a commercial medium, silk-screen printing has been used by such modern artists as Andy WARHOL.

silkworm, name for the larva of various species of MOTHS, indigenous to Asia and Africa but now domesticated and raised for SILK production throughout most of the temperate zone. After hatching, the larvae feed voraciously on MULBERRY leaves. When they mature, they attach themselves to a twig and spin a thick, strong cocoon from a single continuous filament of pale yellow silk about a half-mile long. After about a week, the cocoon is unwound and the silk processed. Only enough cocoons to ensure adequate reproduction are allowed to hatch. The most widely raised silkworm is the larva of *Bombyx mori.*

Sillanpää, Frans Eemil [sĭl'länpä"], 1888–1964, Finnish novelist, the foremost Finnish writer of his time. His works include *Meek Heritage* (1919), about the Finnish civil war, and *The Maid Silja* (1931), about the collapse of old values. He received the 1939 Nobel Prize in literature.

Sills, Beverly, 1929–, American operatic soprano; b. Brooklyn, N.Y., as Belle Silverman. She is famous for her light coloratura voice and her acting ability. After she retired from singing she was general director of the New York City Opera (1979–89) and chairwoman of Lincoln Center (1994–).

Silone, Ignazio [sēlō'nā], 1900–1978, Italian novelist and journalist; b. Secondo Tranquilli. An anti-Fascist, he lived in exile from 1931 to 1944 and devoted his writings to promoting socialism without sacrificing human or literary values. His novels include *Fontamara* (1933), *Bread and Wine* (1937), and *A Handful of Blackberries* (1952).

silt, mostly QUARTZ mineral particles that are between SAND and CLAY in size and are formed by WEATHERING and decomposition of preexisting rock. Hardened silt becomes a sedimentary rock called siltstone.

Silurian period: see GEOLOGIC ERA (table).

Silva, José Asunción [sĭl'vä], 1865–96, Colombian poet. One of the creators of MODERNISMO, he committed suicide at 31, despondent over his debts, the death of a sister, and the loss of a manuscript at sea just before its publication. His poems, collected after his death, include "Nocturne III," an elegy for his sister, and "Twilight."

silver (Ag), metallic element, one of the first metals used by humans. Pure silver is nearly white, lustrous, soft, very ductile, malleable, and an excellent conductor of heat and electricity. It is used in mirrors, coins, utensils, antiseptics, jewelry, and for electrolytic plating of tableware (see SILVERWORK). Silver nitrate is its most important compound. Silver reacts with hydrogen sulfide in air to form silver sulfide (tarnish). Photographic emulsions contain silver halides, which are sensitive to light. Silver alloys are used in dentistry and electrical contacts. Sterling silver contains 92.5% silver and 7.5% copper. Silver is obtained from the ores argentite, cerargyrite, pyrargyrite, stephanite, and proustite. See ELEMENT (table); PERIODIC TABLE.

silverfish, primitive wingless INSECT about ½ in. (1.27 cm) long, named for the tiny silvery scales on its body. Common indoors in cool, damp places, silverfish eat starch from bookbindings, wallpaper, and clothing.

silversides, small shore FISH (family Antherinidae) named for the silvery stripe on either side of its body, abundant in warmer waters of the Atlantic and Pacific. Related to mullets, silversides, also known as whitebait, feed on small CRUSTACEANS and insects. Included in the family are the top and jack smelts and the California grunion (5–8 in./12.5–20 cm), which rides in on high tides to lay its eggs in the sand and is often found beached.

silverwork, term encompassing ecclesiastical and domestic utensils, jewelry, buttons, weapons, horse trappings, boxes, and other articles. It involves embellishments such as chasing, repoussé, filigree, and inlaying. The art was highly developed in ancient times, as shown by Asian, Egyptian, Phoenician, Roman, and Byzantine examples. Much early Italian and French silverwork was melted down for reuse and thus lost. German, Swiss, Italian, Spanish, and English silverwork reached heights of ornamentation between the 15th and 18th cent. Much N European ecclesiastical silver work was destroyed during the Reformation, and little early English silver survived the Wars of the Roses. Sheffield plate, an innovation of the mid-18th cent., led to important silver plate industries in England and, later, the U.S. In colonial America silversmithing was an important trade, attracting several hundred silverworkers from Europe. Colonial silver was simple in design and is prized by collectors. Silverwork is a traditional art of the indigenous peoples of the Americas and is still practiced by them today.

Silvester: see SYLVESTER.

Simcoe, John Graves, 1752–1806, first British governor (1792–96) of Upper Canada (ONTARIO). To make the province a strong colony, he encouraged immigration of American Loyalists and fostered agricultural development.

Simenon, Georges, 1903–89, Belgian author. An extremely prolific writer, he is best known for his 84 detective novels featuring Inspector Maigret. He also wrote more than 100 psychological novels, including *The Stain on the Snow* (1938) and *The Cat* (1976), as well as many articles, short stories, and novellas.

Simeon I, c.863–927, ruler (893–927) and first czar (925–27) of Bulgaria. During his rule the first Bulgarian empire attained its greatest power. He ravaged the Byzantine Empire and conquered most of Serbia. He was a patron of culture.

Simeon: see ISRAEL, TRIBES OF.

Simi Valley city (1990 pop. 100,217), Ventura co., SW Calif.; laid out 1887, inc. 1969. A rapidly growing and highly residential Los Angeles suburb, it has many light manufactures, e.g., plastics, apparel, sewage units, and liquid oxygen. The Reagan Presidential Library is W of the city. The city achieved notoriety in 1992 when a jury there acquitted the police officers accused in the beating of Rodney King.

Simnel, Lambert, c.1475–1525, impostor and pretender to the English throne. In 1486, claiming to be Edward, earl of Warwick (who was then imprisoned in the TOWER OF LONDON), he rallied Yorkist support in Ireland and invaded England. He was defeated and captured at the battle of Stoke (1487) by the forces of HENRY VII. Simnel was later pardoned.

Simon, Saint, one of the Twelve APOSTLES. In the Gospels he is called the Canaanite or Cananaean or Zelotes, terms that may refer to an association with the zealots, a devout and strongly antiheathen Jewish sect.

Simon, in the BIBLE. **1** One of the MACCABEES. **2** Or Simon Peter: see PETER, SAINT. **3** Simon of Cyrene, bystander made to carry Jesus' cross. He was probably an African Jew. **4** Simon Magus, Samaritan sorcerer who attempted to buy spiritual power from the apostles. From this comes the term SIMONY.

Simon, Herbert Alexander, 1916–, American social scientist; b. Milwaukee, Wis. A professor at Carnegie-Mellon Univ., Simon was an early authority on uses of computers in business management. For his theories on decision making he won the 1978 Nobel Prize in economics. His *Scientific Discovery* was published in 1987.

Simon, (Marvin) Neil, 1927–, American playwright; b. N.Y.C. His popular comedies of middle-class life include *Barefoot in the Park* (1963), *The Odd Couple* (1965), and his autobiographical trilogy: *Brighton Beach Memoirs* (1984), *Biloxi Blues* (1985), and *Broadway Bound* (1986). *Lost in Yonkers* (1991; Pulitzer Prize) is distinguished from his other works by its more serious, sometimes anguished tone. He has also written screenplays.

Simone Martini: see MARTINI, SIMONE.

Simonides of Ceos, c.556–468? B.C., Greek lyric poet. After the PERSIAN WARS he was a rival of PINDAR at the court of Syracuse. He wrote epigrammatic verse of many kinds. Two of his finest epitaphs are on the fallen at MARATHON and THERMOPYLAE.

Simons, Menno: see MENNO SIMONS.

simony, in CANON LAW, buying or selling of any spiritual benefit for a temporal consideration. Because of the frequency of simony at times in the history of the Roman Catholic Church, the church now has strict laws against it; e.g., simony in a papal election invalidates the election, no priest may ask for a baptismal fee, and the sale of INDULGENCES is prohibited.

simple harmonic motion: see HARMONIC MOTION.

Simplon, pass, 6,590 ft (2,009 m) high, in the Swiss Alps near Brig, at the Swiss-Italian border. Its 12.3-mi (19.8-km) railroad tunnel system is Europe's longest.

Simpson, Sir George, 1792?–1860, governor of the HUDSON'S BAY COMPANY in CANADA (1821–56). He encouraged the company's expansion and the exploration of its vast territory. In 1841–42 he traveled overland around the world.

Simpson, George Gaylord, 1902–84, American paleontologist and zoologist; b. Chicago. His deductions, from studies of fossil material, that species reach adaptive peaks and suffer accidental dispersion contributed greatly to the study of evolution. He held several paleontology positions at the American Museum of Natural History (1927–59) and also taught at Columbia (1945–59) and Harvard (1959–70).

Simpson, Louis, 1923–, American poet; b. Jamaica. His finely crafted, witty poems are in *At the End of the Open Road* (1963; Pulitzer) and *People Live Here: Selected Poems 1949–1983* (1984).

Simpson, O(renthal) J(ames), 1947–, American football player; b. San Francisco. As a running back for the Univ. of Southern California, he won the 1968 Heisman Trophy as the best college player of the year. He played with the Buffalo Bills (1969–77) and San Francisco 49ers (1978–79) and gained 11,236 yards rushing during his career. Simpson set season records (now broken) for most yards gained (2,003; 1973) and most touchdowns (23; 1975) and still holds the season record for yards rushing per game (143; 1973). He later became a sportscaster and movie actor.

sin, in religion, unethical act in disobedience to a personal God. In ancient Israel, there were personal sin and national sin—usually idolatry. Some Christians hold that all acts are good, indifferent, or sinful; others that there are no indifferent acts. Roman Catholics are required to confess mortal sins, i.e., those committed with knowing and deliberate intent in a serious matter (see PENANCE); other sins are venial. The seven deadly sins are pride, covetousness, lust, anger, gluttony, envy, and sloth.

Sinai, triangular peninsula, c.23,000 sq mi (59,570 sq km), NE Egypt, between the SUEZ CANAL and Gulf of Suez (W) and the Gulf of AQABA and Strait of Tiran (W). The peninsula, which has a very hot and dry climate, rises to over 8,500 ft (2,590 m) in the south, where Moses is said to have received the Ten Commandments, and

is level and sandy in the north. Israeli troops occupied the Sinai briefly in 1956 and again from 1967 to 1980–82, when they withdrew over two years under the terms of the CAMP DAVID ACCORDS (1978) and Egyptian-Israeli peace treaty (1979).

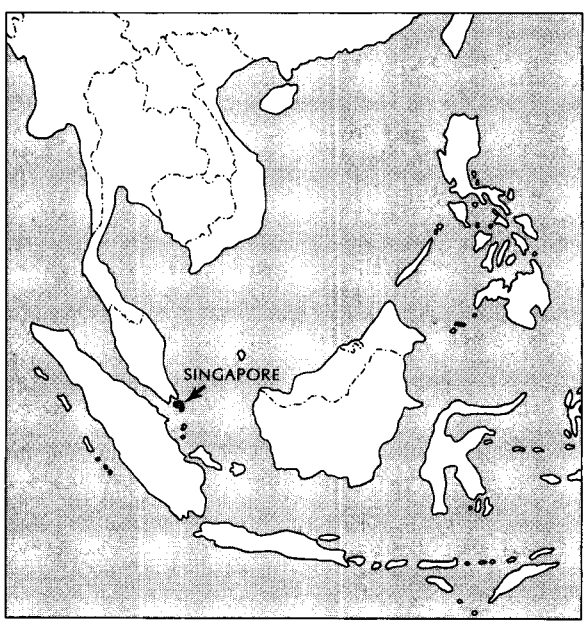
Sinanthropus: see HOMO ERECTUS.

Sinatra, Frank (Francis Albert Sinatra), 1915–, American singer and actor; b. Hoboken, N.J. He gained great popularity in the late 1930s with his romantic, casual renditions of songs such as "I'll Never Smile Again." He has appeared in many films, e.g., *From Here to Eternity* (1953).

Sinclair, Upton, 1878–1968, American novelist; b. Baltimore. An ardent Socialist, he was deeply involved in politics, and his interest in social and industrial reform underlies most of his over 80 books. Sinclair's novels include *The Jungle* (1906), a brutally graphic account of the Chicago stockyards; *King Coal* (1917); *Oil!* (1927); and *Little Steel* (1938). He also wrote a cycle of 11 novels dealing with world events from 1914 that feature Lanny Budd as hero; the third of these, *Dragon's Teeth* (1942), won the Pulitzer Prize.

Sindhi [sĭn'dē], language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See LANGUAGE (table).

Singapore, officially Republic of Singapore, republic (1992 est. pop. 2,792,000), c.240 sq mi (620 sq km), SE Asia, S of the Malay Peninsula, comprising Singapore Island and about 60 islets. There is no administrative distinction between the country and Singapore city, where the government and port is located. Singapore Island is largely low-lying and has a tropical climate. It is almost entirely urbanized and densely populated; there is a remnant rain forest in the Bukit Timah reserve. Singapore is one of the world's great commercial centers, and its citizens enjoy one of the highest standards of living in Asia. Its port, at Keppel Harbor, is one of the world's largest and busiest. The economy is supported primarily by manufacturing, service industries, and trade; shipbuilding is also important. Agriculture plays a minor role, and the country imports most of its food. The population is mainly Chinese; Malays and Indians constitute large minorities. Buddhism, Islam, Hinduism, and Christianity are the major religions. Malay, Chinese, Tamil, and English are the official languages.



History. Singapore was a sparsely populated island when the British East India Company purchased it in 1819 through the efforts of Sir T.S. RAFFLES. Ceded to Britain in 1824, it became (1826) part of the STRAITS SETTLEMENTS colony. After occupation by the Japanese in WORLD WAR II, Singapore became a British crown colony in 1946 and a self-governing state in 1959. Under Lee Kuan Yew, the first prime minister, Singapore underwent economic development and modernization. It joined Malaya, SARAWAK, and SABAH in the Federation of MALAYSIA in 1963 but withdrew in 1965. Continuing economic growth assured the political dominance of Lee and the People's Action party, despite growing opposition and governmental restrictions on personal and political freedoms. In 1990 Goh Chok Tong became prime minister, but Lee retained considerable governmental influence and remained party leader.

Singer, Isaac Bashevis, 1904–91, American Yiddish author; b. Poland. He came to the U.S. in 1935. Perhaps the greatest of the Yiddish writers based in New York City, he frequently treated the loneliness of old age and the Jewish sense of alienation. His characters are often tormented by demons, as in the novel *Satan in Goray* (1955). Singer wrote many novels, short stories, e.g., *The Collected Stories of Isaac Bashevis Singer* (1981), plays and children's books. He was awarded the 1978 Nobel Prize in literature. His brother, **Israel Joshua Singer,** 1893–1944, b. Poland, emigrated to the U.S. in 1934. He also wrote in Yiddish. His epic novel, *The Brothers Ashkenazi* (1936), is about Jewish industrialism.

Singer, Isaac Merritt, 1811–75, American inventor; b. Rensselaer co., N.Y. He patented a practical SEWING MACHINE (1851) that could do continuous stitching, and made 20 subsequent improvements (1851–65). Although he lost an infringement suit to Elias HOWE, his company was so well established that it took the lead in a subsequent combination of manufactures and pooling of patents.

Singhalese [sĭng'gəlēz], language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See LANGUAGE (table).

Sinkiang: see XINJIANG.

Sinn Féin [shĭn fān] [Irish, = we ourselves], Irish nationalistic movement that triumphed in the establishment of the Irish Free State (see IRELAND). Organized (1905) by Arthur GRIFFITH, an advocate of an economically and politically self-sufficient Ireland, it adopted passive resistance to the British, but gained little support before World War I. The British suppression of the Easter Rebellion (1916) greatly stimulated Sinn Féin's growth, and it was reorganized in 1917 under the leadership of Eamon DE VALERA. It set up an Irish assembly called the Dáil Éireann that declared Irish independence. The resulting disorders were countered violently by British military irregulars known as Black and Tans, but continued resistance led ultimately to the establishment (1922) of the Irish Free State. Sinn Féin virtually came to an end after De Valera withdrew (1927) and entered the Irish Dáil with the new FIANNA FÁIL party. A few intransigents merged with the IRISH REPUBLICAN ARMY, whose political arm is still known as the Sinn Féin. Gerry Adams has headed the latter group since 1983.

Sino-Japanese War, Second, 1937–45. Japan used the Manchurian Incident—the bombing (1931) of a Japanese railway in Manchuria—as a pretext for occupying Manchuria and establishing the puppet state of Manchukuo. In 1933 and 1935 the Japanese won further concessions, and full war erupted after a clash (July 1937) between Japanese and Chinese forces in Beijing. The Japanese soon occupied Beijing and Tianjin and, after a protracted struggle, took Shanghai and the national capital, Nanjing. In late 1938 Hankou and Guangzhou fell. The Nationalist government was driven back to a temporary capital at Chongqing, and despite vast and bloody fighting its cause continued to decline. The Japanese attack (1941) on PEARL HARBOR merged the Sino-Japanese War with WORLD WAR II. Allied aid and advisers provided some relief, but China's military position deteriorated until Apr. 1945. After Japan's capitulation, Japanese troops in China formally surrendered (Sept. 9, 1945). Manchuria was restored to China, as were Taiwan and the Pescadores, which Japan had received after the First Sino-Japanese War (1894–95).

Sino-Tibetan languages, family of languages spoken in central and SE Asia. See LANGUAGE (table).

sintering, process of forming objects by heating a metal powder. When the metal powder is chemically or mechanically produced, compacted into the desired shape, and heated, the powder particles join together to form a solid object.

sinus, cavity or hollow space in the body, usually filled with air or blood. In humans, the paranasal sinuses, mucous-lined cavities in the bones of the face, are connected by passageways to the nose

and probably help to warm and moisten inhaled air. In invertebrates, spaces through which blood returns to the heart are also called sinuses.

Sion: see ZION.

Siouan [sōō'ən], branch of Native American languages belonging to the Hokan-Siouan linguistic family of North and Central America (including Mexico). See NATIVE AMERICAN LANGUAGES (table).

Sioux or **Dakota,** confederation of seven Native American tribes, the dominant group of the Hokan-Siouan stock (see NATIVE AMERICAN LANGUAGES). They had a typical Plains culture (see NORTH AMERICA, INDIGENOUS PEOPLES OF), including buffalo hunts and the SUN DANCE. In the mid-18th cent. the Sioux inhabited the N Great Plains and the western prairies. Of 30,000 Sioux, some 15,000 were Teton, of whom 3,000 were Oglala. The Sioux sided with the British in the AMERICAN REVOLUTION and the WAR OF 1812. They later made treaties with the U.S., but some Sioux revolted (1862) and killed more than 800 settlers and soldiers. By a treaty of 1867 the Sioux agreed to retire to a Dakota reservation. When gold was found in the BLACK HILLS, an influx of prospectors precipitated Sioux resistance under such chiefs as SITTING BULL, RED CLOUD, and CRAZY HORSE. Gen. George CUSTER was defeated (1876) and his troops annihilated at the Battle of the LITTLE BIGHORN. In 1890, 200 Sioux were killed at WOUNDED KNEE. Sioux and other supporters of the AMERICAN INDIAN MOVEMENT occupied Wounded Knee in 1973 to protest U.S. neglect of Native American civil rights. In 1979 the Sioux were awarded $105 million for the taking of their lands, resolving a legal action begun in 1923. Now mostly farmers and ranchers, the Sioux numbered over 100,000 in 1990; over 40% live in South Dakota.

Sioux Falls, city (1990 pop. 100,814), seat of Minnehaha co., SE S.Dak., on the Big Sioux R.; settled 1856, inc. as a city 1883. The largest city in the state, it has huge stockyards and meat-packing plants, diversified manufactures, and commercial and financial institutions. The falls provide hydroelectric power; sandstone is quarried nearby.

Siqueiros, David Alfaro [sēkā'rōs], 1896–1974, eminent Mexican painter. His art was generally related to his socialist revolutionary activities. Siqueiros's paintings convey violent social protest through dynamic brushwork, dramatic contrasts in light and shade, and heroic themes. Among his best-known works are murals at the National Preparatory School (1922–24) and at the Polytechnic Institute (1952), both in Mexico City.

Siren, in Greek myth, one of three sea nymphs, whose song lured sailors to shipwreck on the rocky coast where they lived. ODYSSEUS escaped them by tying himself to a mast and stopping his men's ears; the Argonauts were saved by ORPHEUS' music.

sirenian or **sea cow,** large, aquatic MAMMAL of the order Sirenia. Living sirenians are the dugong and the manatee, both found in warm, sheltered waters, where they feed exclusively on sea vegetation. Their heavy, fishlike bodies end in a horizontally flattened fin; their skin is gray and virtually hairless. Sluggish and shy, they spend their entire lives in the water. Sirenians may reach 12 ft (3.6 m) in length and 600 lb (270 kg) in weight. The Florida manatee (*Trichechus manatus*) is protected.

sisal hemp, important cordage fiber obtained from the leaves of several species of agave, of the AMARYLLIS family, and from related genera. The fiber, used especially for twine and considered second in strength to MANILA HEMP, is obtained chiefly from the true sisal (*Agave sisalana*) and henequen (*A. fourcroydes*).

Sisley, Alfred, 1839–99, impressionist landscape painter; b. Paris, of British parents. He was influenced by MONET, but his use of the "rainbow palette" was less bold. His works include *Street in Moret* (Art Inst., Chicago).

Sistine Chapel [for Sixtus IV], private chapel of the popes in the VATICAN. Built (1473) for Pope SIXTUS IV, it is world famous for its decorations. Frescoes by PERUGINO, BOTTICELLI, GHIRLANDAIO, and others are on the side walls. The best known, however, are MICHELANGELO's paintings on the ceiling of scenes from the Bible. Below these are his figures of the prophets and sibyls, all prefiguring the salvation of Christianity. His awesome *Last Judgment* is on the altar wall. The chapel also has a notable collection of illuminated music manuscripts. Cleaning and restoration of the frescoes began in 1980 and was completed in 1994.

Sisyphus [sĭs'ĭfəs], in Greek mythology, founder and king of CORINTH. Angered by his disrespect, ZEUS condemned him to push a heavy rock up a steep hill eternally.

Sitka, city (1990 pop. 8,588), SE Alaska, in the Alexander Archipelago, on Baranof Island; inc. 1971. Fishing, canning, lumbering, and pulp-processing are its industries. Sitka was founded (1799) by Aleksander BARANOF; after 1802 it became the capital of Russian America. A decisive battle between the Russians and the TLINGIT occurred there in 1804, commemorated in the Sitka National Historical Park. In the city in 1867 the U.S. officially took possession of Alaska, and it remained the Alaskan capital until 1900.

Sitting Bull, c.1831–90, SIOUX chief and victor in the battle of LITTLE BIGHORN (1876) against George Armstrong CUSTER. He and his followers fled to Canada, were promised a pardon, and returned (1881) to settle on a reservation. He appeared (1885) in BUFFALO BILL'S Wild West Show but encouraged the Sioux to refuse to sell their land and advocated the Ghost Dance religion (see PAIUTE). He was killed while allegedly resisting arrest.

Sitwell, Dame Edith, 1887–1964, English poet and critic, **Sir Osbert Sitwell,** 1892–1969, English author, and **Sir Sacheverell Sitwell,** 1897–1988, English art critic. The Sitwells are probably the most famous English literary family of the 20th cent. All three were interested in contemporary movements in the arts and were noted for frivolity and precocity, although a somber note underlies their work. Edith Sitwell, a noted eccentric and wit, wrote critical essays, biographies, and poetry influenced by the French SYMBOLISTS, which appeared in many volumes, including *Collected Poems* (1954). Her *Façade,* an entertainment in abstract, rhythmic verse, with music by William WALTON, was first read in 1922. Osbert Sitwell wrote light satiric verse, novels, stories, and memoirs. His five-volume family reminiscence (1944–50) is a rich source of Edwardiana. Sacheverell Sitwell is known for his art studies, biographies, e.g., *Mozart* (1932), and travel books.

Sivaji, 1627–80, Indian ruler, leader of the MAHRATTAS. He spent his entire life fighting the MOGUL rulers and succeeded in carving out a considerable domain. In 1674 he crowned himself king of the Mahratta empire.

six, les, a group of young French composers—HONEGGER, MILHAUD, POULENC, Georges Auric, Louis Durey, and Germaine Tailleferre—who in 1918–19 joined Erik SATIE in reacting against the impressionism of DEBUSSY and RAVEL. They collaborated with Jean COCTEAU, their literary prophet.

Six-Day War: see ARAB-ISRAELI WARS.

Six Nations: see IROQUOIS CONFEDERACY.

Sixtus IV, 1414–84, pope (1471–84), an Italian named Francesco della Rovere, a Franciscan. He struggled with LOUIS XI of France over control of the French church and Louis's attempt to interfere in Naples. A quarrel with the MEDICI family of Florence became critical after Sixtus's nephew conspired to overthrow the Medici in the so-called Pazzi Conspiracy (1478). Sixtus waged war on Florence thereafter. Although a nepotist, he was a good administrator. He consented to the Spanish INQUISITION but welcomed Jews expelled from Spain. He founded the SISTINE CHAPEL.

Sixtus V, 1521–90, pope (1585–90), an Italian named Felice Peretti, a Franciscan. Sent (1565) to Spain to look into the alleged heresy of the Archbishop of Toledo, he fell out with his companion, the future GREGORY XIII, and they became lifelong enemies. As pope he lavished money on rebuilding Rome and left a huge surplus in the treasury, but in so doing he nearly ruined commerce in the Papal States. He set the maximum number of cardinals at 70 and authorized PHILIP II of Spain to send the Spanish ARMADA against England.

Skagerrak, strait, c.150 mi (240 km) long and 85 mi (140 km) wide, separating Denmark and Norway. It is one of the straits linking the North Sea and the Baltic Sea.

Skanderbeg: see SCANDERBEG.

skate: see RAY.

skating, gliding along an ice surface on keellike runners called ice skates. Originally a means of travel, skating became a well-established sport by the 17th cent. and has since developed into speed skating, figure skating, and ice dancing. Competition in these has become an important part of the Olympic winter games. Figure skating, one of the most beautiful and graceful events in all sport, was invented by an American, Jackson Haines, in the 1860s.

In the Olympics it is divided (since July 1990) into original program and free skating sections. Ice dancing, which increased in popularity during the 1980s, combines aspects of pair figure skating and ballroom dancing. The ice carnival, made popular by Sonja HENIE and other Olympic champions, has become a favorite American amusement. Skating is also integral part of ice HOCKEY. **Roller skating,** gliding over a smooth surface on skates with rollers or wheels, gained a large following after dance movements were adopted from ice skating. The development of skates suitable for use outside a rink, as well as of roller blades (skates with the wheels arranged in a single line), resulted in the growth of roller skating in the 1980s and 90s.

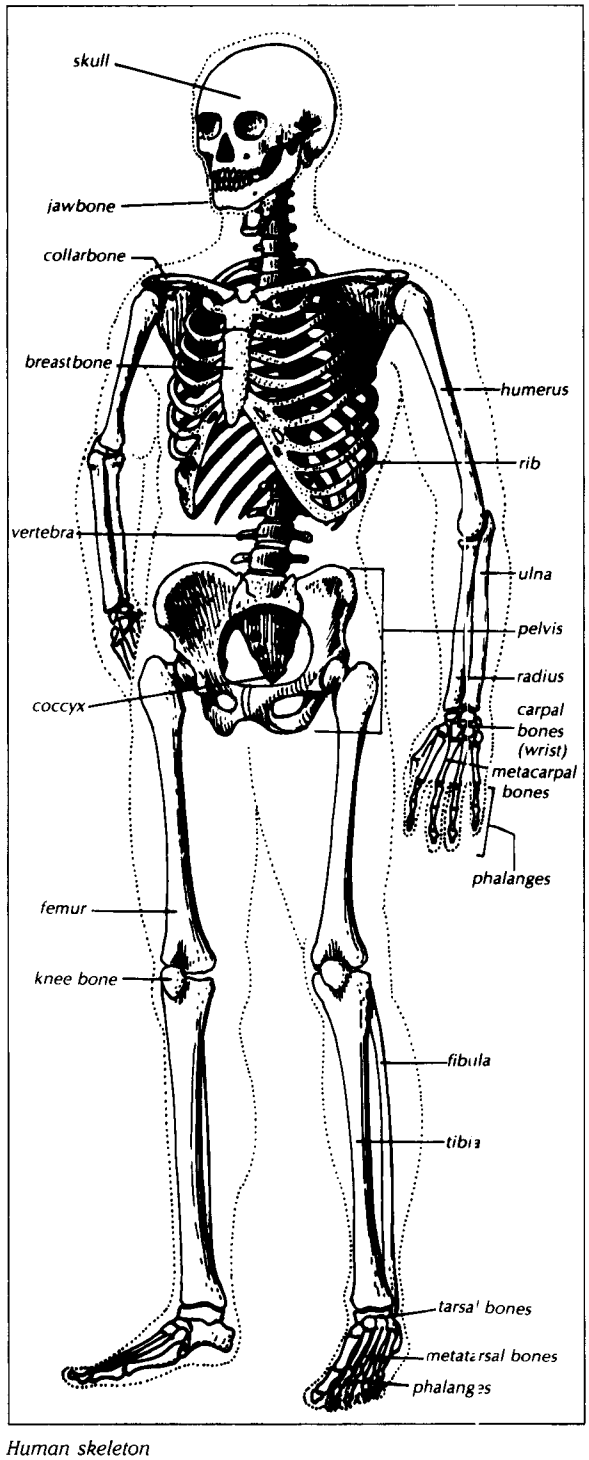
Skeat, Walter William, 1835–1912, English philologist. A professor of Anglo-Saxon at Cambridge (1878–1912), he translated many early English works and wrote *An Etymological Dictionary of the English Language* (1882), a standard reference work.

skeleton, stiff supportive framework of the body. The two basic types are the exoskeleton and the endoskeleton. The shell of the clam is an exoskeleton that provides formidable protection but is bulky and severely restricts movement. The firm, flexible insect skeleton combines protective armor and a framework for attachment of muscles used in rapid movement. Such exoskeletons must be shed periodically to allow for growth (all exoskeletons are nonliving) and thus tend to limit size. The endoskeleton, a framework of living material enclosed within the body of vertebrates, permits larger size and freedom of movement. The general arrangement of skeletal parts into skull, spinal column, and ribs is the same in all vertebrates. The human skeleton consists of 206 bones, held together by flexible tissue consisting of cartilage and ligaments. In addition to its supportive function, the skeleton provides sites for the attachment of MUSCLES and protects vital organs, such as the BRAIN, SPINAL CORD, HEART, and LUNGS.

Skelton, John, 1460–1529, English poet and humanist. Tutor to Prince Henry (later HENRY VIII), he is best remembered for his scathing SATIRES on the court and clergy—*The Bowge of Court* (1499), *Speke, Parrot* (1521), *Colin Clout* (1522)—and for the mock dirge *Phillip Sparrow.* His short lines, insistent rhymes, and alliteration are highly individual.

skepticism, philosophic position holding that the possibility of knowledge is limited, because of either the limitations of the mind or the inaccessibility of its object. The term is used more loosely to denote any questioning attitude. The earliest skeptics included the Greek Sophists (5th cent. B.C.) and PROTAGORAS. HUME is famous for his theoretical skepticism, but more closely linked to skepticism was the AGNOSTICISM of KANT, who demonstrated that certain problems are insoluble by reason. DESCARTES used skepticism as a methodology. The scientific method, which demands that all assumptions be questioned, is skeptical to a degree, although the POSITIVISM of scientists assumes that material effect is impossible without material cause.

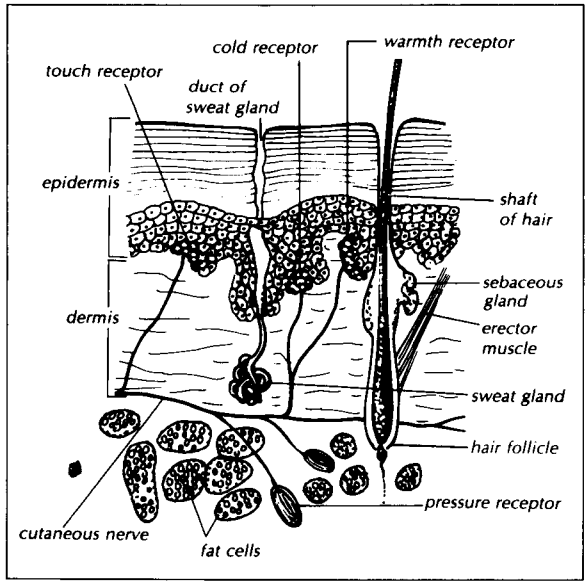
skiing, sport of sliding over snow on skis—long, narrow, flexible runners made of highly polished wood, metal, plastic, or other materials. Other equipment includes heavy boots, attached to the skis with safety-release bindings, and a pair of poles to aid in accelerating, turning, and balancing. Originally a vital means of travel, skiing began as an organized sport in Norway in the 19th cent. Since the 1930s the sport (mainly downhill) has enjoyed a tremendous boom, spurred by the development of ski tows and ski lifts, and the use of artificial snow. Traditional competitive skiing comprises four events: (1) downhill, a steep descent in a race against time; (2) slalom, raced on a sharply twisting course marked off by flags; (3) the ski jump, from specially prepared slopes and scored on distance and form; and (4) cross-country, a stamina test over a long course, ranging from 10 to 50 km (6 to 31 mi) in the Olympic games. The first two are known as Alpine events, the last two as Nordic events. Alpine competition now also includes giant slalom and supergiant slalom, which resemble the slalom but use longer, less twisted courses that permit faster speeds; speed skiing, raced on a straight, specially prepared, downhill track that permits speeds in excess of 125 mph (200 kph); and the freestyle events of mogul skiing (emphasizing jumps and turns), ballet skiing (somewhat like figure skating), and aerials (acrobatic twists, flips, and the like performed in the air). The



Human skeleton

Nordic biathlon combines cross-country skiing with target shooting. **Snowboarding** is a form of skiing that uses a single wide ski (snowboard) and no poles. It has similarities to surfing and skateboarding and originated in the 1970s.

skin, flexible tissue enclosing the body of a VERTEBRATE. In mammals, the skin is a complex organ of numerous structures serving vital protective and metabolic functions. It consists of two main cell layers: a thin outer layer (epidermis) and a thicker inner layer (dermis). The epidermis contains melanin, the pigment that gives the skin color. Evolutionary adaptations of epidermis include



Cross-section of skin

horns, hooves, HAIR, FEATHERS, and SCALES. The dermis consists of CONNECTIVE TISSUE containing BLOOD vessels, lymph channels, nerve endings, sweat glands, sebaceous glands, fat cells, hair follicles, and MUSCLES. The nerve endings, called receptors, perform an important sensory function, responding to various stimuli, including light touch, pressure, pain, heat, and cold. The skin provides a barrier against invasion from outside organisms and protects underlying tissues and organs from abrasion and other injury. Its pigment shields the body from dangerous ultraviolet rays in sunlight. Skin prevents excessive loss of bodily moisture and in humans also performs functions that help maintain normal body temperature.

skin diving: see DIVING, DEEP-SEA.

Skinner, B(urrhus) F(rederic), 1904–90, American psychologist; b. Susquehanna, Pa. A Harvard professor, Skinner was the leading exponent of BEHAVIORISM, a school of psychology that rejects the unobservable and focuses on patterns of responses to external rewards and stimuli. Skinner did extensive research with animals, using the reward technique, which he also applied to human learning in the teaching machine he invented. Such machines and accompanying programmed instruction have profoundly affected educational theories and methods in the U.S. Skinner's well-known works include *The Behavior of Organisms* (1938), *Walden Two* (1961), and *About Behaviorism* (1974).

Skinner, Otis, 1858–1942, American actor; b. Cambridge, Mass. He won lasting fame in *Kismet* (1911). His daughter, **Cornelia Otis Skinner,** 1901–79, American actress and author, b. Chicago, was noted for her original monologues.

skin patch, transdermal patch, or **transdermal delivery system,** adhesive patch used to deliver a controlled dose of a drug through the skin over a period of time. A skin patch uses a special membrane to control the rate at which the liquid drug contained in the reservoir within the patch can pass through the skin and into the bloodstream. Some drugs must be combined with substances, such as alcohol, that increase their ability to penetrate the skin in order to be used in a skin patch. Drugs administered through skin patches include scopolamine (for motion sickness), nicotine (for quitting smoking), estrogen (for MENOPAUSE and to prevent osteoporosis after menopause), and nitroglycerin (for angina).

Skopje [skôp'yə] or **Skoplje** [skôp'əlyə], city (1987 est. pop. 445,000), capital of MACEDONIA, on the Vardar R. in the northern part of the country. A transport and trade center, it produces chemicals, cement, and machinery. Dating from Roman times, it fell to Serbia (1282) and to the Turks (1392). Part of Yugoslavia after 1918, it became (1946) the capital of the new constituent republic of Macedonia, which gained independence in 1992. The city, which contains a Turkish citadel and two 15th-cent. mosques, was badly damaged (1963) by an earthquake.

skunk, several related New World MAMMALS of the WEASEL family, characterized by their striking black-and-white-striped fur and the strong, offensive odor they spray for defense. When severely provoked, the skunk squirts a mist from glands under the tail that causes choking and tearing of the eyes. Skunks are generally avoided by predators. They feed on rodents, insects, eggs, carrion, and vegetation, and live in one or more families in rock piles and abandoned burrows. Hunted for their fur, skunks range in size from 9 to 18 in. (23 to 46 cm), excluding the tail.

sky diving: see PARACHUTE.

Skye, island, 670 sq mi (1,735 sq km), largest of the Inner HEBRIDES, off W Scotland. Tourism, fishing, and farming are important; cattle and sheep are raised. "Bonny Prince Charlie" (see Charles Edward Stuart, under STUART, JAMES FRANCIS EDWARD) took refuge there in 1746.

Skylab: see SPACE EXPLORATION, table.

skylark: see LARK.

skyscraper, modern building of great height, constructed on a steel skeleton. The form originated in the U.S., and many late-19th-cent. technological developments contributed to its evolution. In 1887 the first elevator was installed, and with the eventual perfecting of high-speed electric elevators skyscrapers were free to attain any height. The early tall masonry buildings required very thick walls in the lower stories, which limited floor space. The use of cast iron to permit thinner walls was followed by cage construction, in which iron frames supported the floors, while the walls were self-supporting. The first fully steel-frame building was the Home Insurance Building in Chicago (1883), designed by William Jenney. Chicago subsequently became the center of skyscraper development. Early New York City examples include the Flatiron Building (1902) and Cass GILBERT's Woolworth Building (1913), which epitomized, with its Gothic ornamentation, the adaptation of earlier styles to modern construction. Louis SULLIVAN gave impetus to a new aesthetic, emphasizing underlying structure and fenestration, e.g., the Carson Pirie Scott Building (1899–1904), in Chicago. In 1916, New York established legal control over the height and plan of buildings; regulations regarding setting back walls above a determined height gave rise to the characteristic stepped profile. Skyscraper placement and design are a major concern of city planning. The tallest skyscraper is the SEARS TOWER, Chicago, 110 stories, 1454 ft (473 m). Major New York City skyscrapers are the twin towers of the WORLD TRADE CENTER, 110 stories, 1350 ft (442 m); the EMPIRE STATE BUILDING, 102 stories, 1250 ft (412 m); and the Chrysler Building, 77 stories, 1046 ft (349 m).

slander: see LIBEL AND SLANDER.

slate, fine-grained, characteristically gray-blue ROCK formed by the METAMORPHISM of SHALE. It splits into perfectly cleaved, broad, thin layers; this property is known as slaty cleavage. Better grades of slate are used for roofing.

Slatkin, Leonard, 1944–, American conductor; b. Los Angeles. Noted for his interpretations of 20-cent. American music, he has led the New Orleans Philharmonic (1977–79) and St. Louis Symphony Orchestra (1979–).

Slaughterhouse Cases, cases decided by the U.S. Supreme Court in 1873. In 1869 the Louisiana legislature granted a monopoly to a specific slaughterhouse to protect the people's health. Other operators claimed a violation of their rights under the 14th amendment. The Court decided against the operators, holding that their claims were beyond the scope of the amendment, whose original purpose was to guarantee the freedom of former slaves. Since then, the courts have expanded the interpretation of other guarantees in the amendment.

slavery, institution whereby one person owns another and can exact from that person labor or other services, found among both primitive and advanced peoples. Greek slaves had some legal protection, but in the Roman Empire agricultural (estate) slavery gave landowners nearly absolute power over slaves, though manumission (emancipation) gave freedmen status in Rome's social system. Early Christians did not oppose slavery, but economic changes replaced the agricultural slave with the semifree SERF in the Middle Ages. Islam also accepted slavery: eunuch slaves

guarded the harem. In the 15th and 16th cent., European exploration of the African coasts led to a lucrative, brutal slave trade carried out by the British, French, Dutch, Spanish, and Portuguese. African slaves, in demand in the Americas, were brought to Virginia in 1619. The slave trade developed a triangular pattern: goods were transported from British ports to the west coast of Africa, where they were exchanged for slaves, who were taken to the New World and traded for agricultural staples for the return to England. The movement to abolish slavery for economic and humanitarian reasons began in the 18th cent. Britain outlawed (1807) the slave trade and abolished (1833) slavery in the British Empire. In the U.S., slavery had disappeared in the North by the early 19th cent. but had become integral to the South's plantation system; the ABOLITIONISTS regarded it as an unmitigated evil. Attempts to compromise on permitting slavery in the western territories—the MISSOURI COMPROMISE, the COMPROMISE OF 1850, and the KANSAS-NEBRASKA ACT—failed to resolve the issue. Sectional opposition over STATES' RIGHTS and the FUGITIVE SLAVE LAWS, the UNDERGROUND RAILROAD, the DRED SCOTT CASE, the WILMOT PROVISO, and John BROWN's raid on Harpers Ferry, Va., heightened tensions. The formation of the Republican party with its antislavery platform and the election of Abraham LINCOLN (1860) led to the secession of Southern states and the CIVIL WAR. Northern victory ended U.S. slavery, and Lincoln's EMANCIPATION PROCLAMATION (1863) freeing the slaves in secessionist states was followed by the 13th amendment to the CONSTITUTION. In the late 19th cent. international action against the remaining slave trade (especially that of Muslim powers) began. The LEAGUE OF NATIONS and later the UNITED NATIONS have continued efforts to abolish slavery and similar systems of forced labor, but millions still live or work in such conditions worldwide.

Slavic languages, also called Slavonic, a subfamily of the Indo-European family of languages. See LANGUAGE (table).

Slavic religion, pre-Christian religious practices among the Slavs of Eastern Europe. Information about the myths and legends of the early pagan Slavs is fragmentary, but certain beliefs were common. Earliest rites were based on the principle that the natural world is inhabited and directed by beneficial and harmful spirits of nature. Later, these mysterious forces were anthropomorphized into divinities with special powers and functions. The supreme god of the East and South Slavs was Perun, god of lightning and thunder, who controlled the elements of nature. Svarog, known to most Slavs, was regarded as the father of the deities. Byelobog [the White God] and Chernobog [the Black God], representing the forces of good and evil, reflected the Slavic belief in the dualistic nature of the universe. The Baltic Slavs had a particularly rich tradition and many cults, including the powerful one of Radogost-Svarazic. With the coming of Christianity, the great divinities of the Slavs vanished in name, but many elements of pagan belief survived in popular tradition and in Christian Slavic religious ceremonies.

Slavonic: see SLAVIC LANGUAGES.

Slavs, Europe's largest ethnic and linguistic group, speakers of related Indo-European languages. They are divided into West Slavs (Poles, Czechs, Slovaks), South Slavs (Serbs, Croats, Slovenes, Macedonians, Bulgars), and East Slavs (Russians, Ukrainians, Belarussians). Religiously and culturally, the Slavs may be divided into two groups: those who are of the Eastern Orthodox faith and use the Cyrillic alphabet, and those who have been historically affiliated with the Roman Catholic Church and use the Roman alphabet. Slavs are believed to be descendants of Neolithic tribes of GALICIA; over the centuries they have intermixed with Turko-Tatars, Germans, Mongols, Greeks, and Illyrians. A sedentary agricultural people, they were probably dominated by the conquering Scythians, Sarmatians, Goths, Huns, and Avars. By the 6th cent. Slavs were in E Germany, and in 576 and 746 they invaded the BYZANTINE EMPIRE. The westernmost tribes adopted Christianity in the 9th cent. In the 12th cent. German expansion eastward pushed the Slavs east of the Elbe R. Most powerful of the early Slavic states was KIEVAN RUSSIA, which was destroyed by the MONGOLS in the 13th cent. From the 18th cent. through WORLD WAR I the West and South Slavs struggled for liberation from Turkish, German, and Magyar domination. Pan-Slavism was continually hampered by conflicting national aspirations, e.g., Polish vs. Russian, Croatian vs. Serbian.

sleep, resting state in which an individual becomes relatively quiescent and unaware of the environment. During sleep, most physiological functions, such as body temperature, blood pressure, and breathing rate, decrease. It is also a time of repair and growth, when some tissues proliferate more rapidly, and appears linked to the immune system. In healthy people, for example, lack of sleep causes an immune response resembling that to an infection. Humans cycle repeatedly through four stages of sleep, each 1½–2 hours long. Rapid eye movement (REM) sleep, associated with dreaming, occurs during Stage 1 sleep at the end of each cycle. It has been hypothesized that while deeper (non-REM) stages of sleep are physically restorative, REM sleep is psychically restorative. It is also believed to integrate new information into the brain (see also DREAMS). Dream or sleep deprivation results in changes in personality and in impairment of physical, perceptual, and intellectual processes.

sleeping pill, a pill containing medication that induces sleep. BENZODIAZEPINES such as temazepam (Restoril) and triazolam (Halcion) have for the most part replaced BARBITURATES as drugs of choice for insomnia.

sleeping sickness: see ENCEPHALITIS.

sleet, precipitation of small, partially melted grains of ice. As raindrops or melted snowflakes fall, they pass through layers of air having different temperatures. If they pass through a layer with a temperature below the freezing point, they become sleet. Sleet occurs only during the winter, whereas HAIL may fall at any time of the year.

Slick, Sam: see HALIBURTON, THOMAS CHANDLER.

Slidell, John [slīdĕl′, slī′dəl], 1793–1871, American politician and diplomat; b. N.Y.C. A U.S. senator from Louisiana (1853–61), he joined the Confederacy in 1861 and was Confederate commissioner to France, where he became one of the principals in the TRENT AFFAIR.

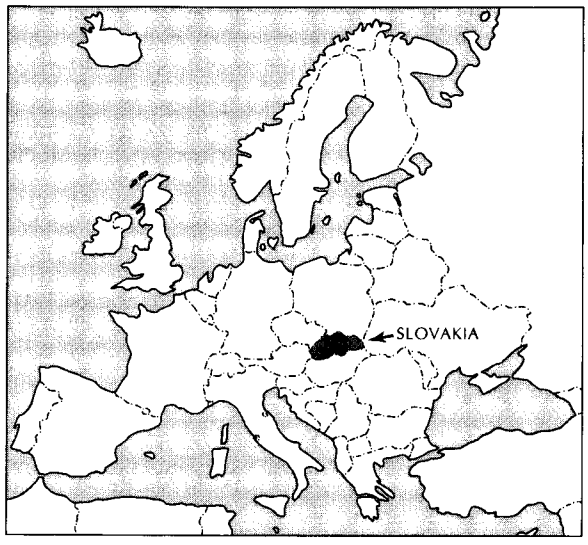
slime mold or **slime fungus,** organism usually classified with the PROTOZOANS but showing equal affinity to the fungi (see FUNGUS). Slime molds have complex life cycles with an animallike motile phase, in which feeding and growth occur, and a plantlike immotile reproductive phase. The motile phase, commonly found under rotting logs and damp leaves, consists of either solitary amebalike cells or a brightly colored multinucleate mass of protoplasm called a plasmodium, which creeps about and feeds by ameboid movement (see AMEBA). In the reproductive phase, slime molds are transformed into one or more reproductive structures, each consisting of a stalk topped by a spore-producing capsule. When the spores germinate they release amebalike cells; in plasmodium-forming species, the cells grow and the nucleus subdivides to form a plasmodium.

Sloan, Alfred Pritchard, 1875–1966, American businessman and philanthropist; b. New Haven, Conn. A draftsman for the Hyatt Roller Bearing Co., he rose to president (1901) before selling the company to General Motors (GM) in 1916. As president (1923–37) and chairman (1937–56) of GM, he helped lead the corporation to dominance in the U.S. auto industry. His philanthropic interests included the Sloan-Kettering Institute for Cancer Research (N.Y.C.).

Sloan, John, 1871–1951, American painter; b. Lock Haven, Pa. A member of the EIGHT, he is known for his nudes and city scenes painted with a directness that sometimes verges on satire. Characteristic paintings are *McSorley's Bar* (Detroit Inst. of Arts) and *Wake of the Ferry* (Phillips Coll., Wash., D.C.). Sloan was also a gifted illustrator and etcher.

sloth, tailless, arboreal MAMMAL found in tropical forests of Central and South America. The three-toed sloth (genus *Bradypus*), with three-toed front feet and five-toed hind feet, has a dense, gray-brown furry coat and is about the size of a house cat. Clinging to branches with powerful, curved claws, sloths eat, sleep, and travel upside down. Although sluggish, they can strike swiftly if attacked.

Slovakia, Slovak *Slovensko,* republic (1993 est. pop. 5,300,000), 18,917 sq mi (48,995 sq km), central Europe, formerly a constituent republic of Czechoslovakia. Slovakia is bordered by the Czech Republic (W), Austria (SW), Hungary (S), Ukraine (E), and Poland (N). The capital, BRATISLAVA, is a port on the Danube R., which forms part of Slovakia's southern borders. Other important cities include Košice, Trnava, Nitra, Komarno, and Nové Zámky. Most of Slovakia is traversed by the Carpathian Mts., with their vast forests,

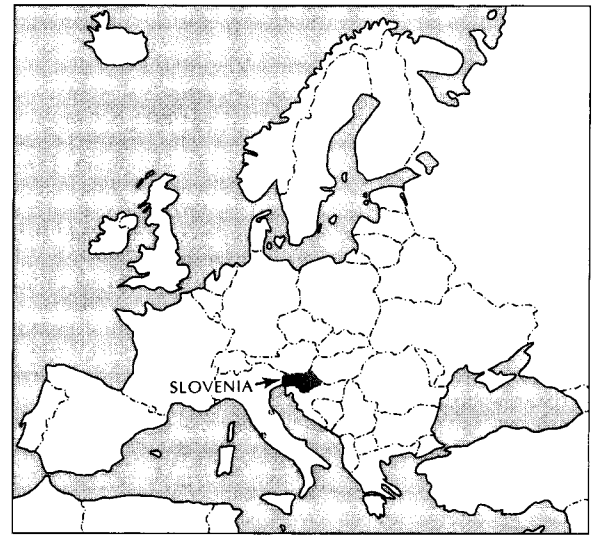


sheep pastures, and rich mineral resources, including iron, copper, and coal. The valleys are drained by the Váh R. and other Danube tributaries. Several rivers have been dammed for hydroelectric power, including the Danube at Cunovo in 1992. Much industrialization occurred under the Communists, including weapons manufacturing, shipbuilding, and metal processing; these state-owned enterprises contracted severely during the move toward a free market after 1990. S Slovakia is chiefly agricultural; crops include wheat, barley, and sugar beets. The majority of the people are Slovaks, who are ethnically and linguistically related to the Czechs; there are Hungarian, Gypsy, and other minorities. Roman Catholicism is the predominant faith, but there are also sizable Protestant (notably Lutheran), Eastern Orthodox, and Uniate groups.

History. The area, part of the 9th-cent. empire of MORAVIA, was primarily under Hungarian rule from the 10th cent. In 1526 Slovakia and W Hungary passed to the Hapsburgs after Louis II of Hungary was defeated by the Ottomans. In the 19th cent. there was a Slovak national revival, in part in reaction to the Germanization of Slovakia in the previous century. After WORLD WAR I, Slovakia became (1918) part of the new nation of CZECHOSLOVAKIA. The minority Slovaks, however, campaigned for greater autonomy from the Czech-dominated, centralized state. In 1938 Slovakia was made an autonomous unit by the MUNICH PACT and later (1939–45) was a German puppet state. The Czechoslovak state was reestablished in 1945, and after 1948 the Communist government curtailed Slovak autonomy until 1969, when Slovakia was granted autonomy over local affairs. With the end (1990) of Communist rule, Slovakia gained greater control over its affairs and budget, as well as some power-sharing with the national government. Discontent with depressed economic conditions resulting from free-market reforms brought nationalists led by Slovak Prime Min. Vladimír Mečiar to power in 1992, and Czech and Slovak leaders agreed to Slovakian independence and the dissolution of Czechoslovakia (Jan. 1, 1993). Slovakia's ethnic Hungarians, worried by Slovak nationalism, have sought special cultural protections in the new republic.

Slovenia, Slovenian *Slovenija,* officially Republic of Slovenia, republic (1992 est. pop. 1,963,000), 7,817 sq mi (20,246 sq km), S central Europe, formerly a constituent republic of Yugoslavia. Bordered by Croatia (S), the Gulf of Trieste and Italy (W), Austria (N), and Hungary (E), Slovenia is largely situated in the Karst plateau and Julian Alps. LJUBLJANA is the capital; other large cities are Maribor and Kranj. Slovenia was the wealthiest and most industrialized Yugoslav republic. Manufactures include steel, machinery, motor vehicles, electrical equipment, textiles and clothing, and pharmaceuticals, and mineral resources include oil, coal, and mercury. Farming and stock-raising are important occupations; grains, potatoes, and fruit are the major crops, and wine is produced. The vast majority of the population are Slovenes; there are Italian, Hungarian, Croatian, Serb, and Bosnian Muslim minorities. Slovenian, a South Slavic tongue, is the official language. Roman Catholicism is the predominant religion.

History. Ruled by Rome from the 1st cent. B.C., the region was settled by the South Slavs (6th cent. A.D.) and passed to the FRANKS (788), the dukes of BAVARIA (843), and the HAPSBURGS (1335), becoming part of Austria. In 1918 Slovenia was incorporated into YUGOSLAVIA. During WORLD WAR II it was divided (1941–45) among Germany, Italy, and Hungary. After the war a small part of Italy's Venezia Giulia region was added to Slovenia. In 1991 the republic proclaimed its independence after Serbia refused to agree to a looser Yugoslav confederation. Fighting broke out briefly when the Yugoslav army attempted to retake border posts seized by Slovenia, but a cease-fire led to the withdrawal of Yugoslav forces. Milan Kučan, first elected in 1990, is president of Slovenia.



slow virus, virus, such as a lentivirus, that causes symptoms in an infected host long after the original infection. Slow viruses are believed by some to cause a group of slowly developing diseases that includes Creutzfeld-Jacob disease and scrapie. See also PRION.

slug, terrestrial GASTROPOD mollusk, a form of SNAIL, with a rudimentary shell and a lung for breathing air. Feeding at night, slugs devour both the roots and aerial portions of plants; some species are serious garden pests.

Sm, chemical symbol of the element SAMARIUM.

small arms, firearms designed primarily to be carried and fired by one person, as distinguished from heavy arms, or ARTILLERY, from which such weapons developed in the late 1300s. At first, small arms were nothing more than small, hand-held cannon fired by placing a small flame at the touchhole. In the matchlock—the first real handgun—a trigger moved the flame to the touchhole; in its successors, the wheel lock and flintlock, a spark-producing mechanism ignited the GUNPOWDER. Among early weapons of this kind were the musket, fired from the shoulder, and the pistol, held and fired with one hand. The rifle, invented in the 15th cent., is a firearm with a rifled bore (that is, with spiral grooves that impart a spinning motion to the bullet, giving it greater accuracy). Rifles first came into widespread use in the American colonies. Two major innovations of the early 19th cent. were the percussion cap, a small capsule filled with fulminate of mercury that exploded when struck and fired the gun instantly; and the gas-expanding bullet, which, after being dropped down the barrel of a rifle, would expand when fired to fit the barrel's rifling. Both sides in the U.S. CIVIL WAR used a rifled musket. Thereafter, all guns became rifled with the exception of the shotgun, a smooth-bored, short-range gun firing a single slug or several small shot. Practical breech-loading, or rear-loading, firearms came into general use about 1870; by the 1880s magazine loading, smokeless powder, and bolt action had

been introduced. Although a crude "revolving pistol" existed in the late 16th cent., the modern revolver was introduced c.1835 by Samuel COLT. Colt's revolving cylinder permitted his gun to be fired six times without reloading. The revolver and the magazine-loading rifle were the standard small arms of the later 19th cent., but around 1900 a host of new automatic weapons were developed. The heavy Gatling gun, used in the U.S. Civil War, was the forerunner of the modern, rapid-firing machine gun, which achieved its full potential during the trench warfare of World War I and remains an important military firearm. The 1920s saw the development of submachine guns, notably the Thompson submachine gun (or "tommy gun"), an easily portable automatic weapon that fired 450–600 cartridges per minute. During World War II the bolt-action rifle was supplanted by the semiautomatic Garand rifle—a lightweight, self-loading, clip-fed shoulder weapon; it was used by U.S. forces through the KOREAN WAR. The American M-16 rifle, still widely used, can fire accurately up to 500 yd (460 m) when hand-held and up to 800 yd (730 m) when mounted. Other effective weapons include the Russian AK-47 Kalashnikov automatic rifle and the Israeli Uzi submachine gun.

smallpox, acute, highly contagious, sometimes fatal, disease causing a high fever and successive stages of severe skin eruptions. Caused by a virus that may be airborne or spread by direct contact, smallpox has occurred in epidemics throughout history. Edward JENNER, at the end of the 18th cent., demonstrated that cowpox virus was an effective vaccine against the disease. By the end of the 1970s, VACCINATION programs, such as those by the World Health Organization, had eliminated the disease worldwide.

smart card, small device that resembles a credit card but contains electronic circuitry that stores encoded information. The card and the computerized system with which it is used are designed to provide and record information about the user or the user's account. A smart card may be used to authorize payments or purchases without the need for telephone links to the card-issuer or to maintain computerized individual medical records without the need for a centralized database or computer system.

smart weapon, missile or steerable bomb equipped with a LASER or TELEVISION guidance system. In the case of a smart bomb with a laser guidance system, an aircraft pilot aims a laser beam at the target, a COMPUTER keeps the beam locked on the target, and the bomb has a sensor programmed to find the reflection of the laser's light. A guidance computer adjusts the path of the bomb after it is released, using movable fins to steer. A television guidance system uses a television camera in the nose of the weapon to lock onto the image of the target identified by the pilot.

smell: see NOSE.

smelt, small, slender FISH of the family Osmeridae, allied to the grayling of the SALMON family. Most species are marine, but some spawn in fresh water and some are landlocked in lakes. The American smelt, or icefish (*Osmerus mordax*), averages 10 in. (25 cm) in length and is valued as a food fish.

smelting, any process of melting or fusion, especially to extract a metal from its ORE. Processes vary depending on the ore and metal involved, but they are typified by the use of the BLAST FURNACE and the reverberatory furnace.

Smetana, Bedřich [smĕ'tänä], 1824–84, Czech composer. The creator of a national style in Czech music, he is best known for the opera *The Bartered Bride* (1866). Almost all his music is programmatic, including the SYMPHONIC POEM *My Fatherland* (1879) with its famous section, *The Moldau,* and his two string quartets, *From My Life* (1876, 1882).

Smith, Adam, 1723–90, Scottish economist, founder of the classical school of ECONOMICS. While professor of moral philosophy at the Univ. of Glasgow, he wrote his *Theory of Moral Sentiments* (1759), which attracted international interest. In the 1760s he traveled in France, met some of the PHYSIOCRATS, and started to write his masterpiece, *An Inquiry into the Nature and Causes of the Wealth of Nations,* published in 1776. Smith postulated the theory of the division of labor and emphasized that value arises from the labor used in production. He believed that in a LAISSEZ FAIRE economy the impulse of self-interest would bring about the public welfare. Although opposed to monopoly and the concepts of MERCANTILISM, he admitted that restrictions on free trade (such as the NAVIGATION ACTS) were sometimes necessary. Although some of Smith's theories were voided by the experience of the INDUSTRIAL REVOLUTION, his influence on later economists has never been surpassed.

Smith, Alfred Emanuel, 1873–1944, American politician; b. N.Y.C. As four-time governor of New York (1919–20, 1923–28), he was forceful and well-liked, and he achieved many reforms. In 1928 he ran on the Democratic ticket as the first Roman Catholic candidate for president, but he was defeated by Herbert HOOVER.

Smith, Bessie, 1898?–1937, African-American singer; b. Chattanooga, Tenn. In the 1920s she became the favorite singer of the JAZZ public. The power and beauty of her voice earned her the title "Empress of the Blues."

Smith, David, 1906–65, American sculptor; b. Decatur, Ind. His mature works, in wrought iron and cut steel, exhibit totemlike forms and a use of space that recalls CONSTRUCTIVISM, e.g., *Hudson River Landscape* (Ogunquit Mus., Maine).

Smith, Donald Alexander: see STRATHCONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH, 1ST BARON.

Smith, Ian Douglas, 1919–, Rhodesian politician. As a member of the white supremacist Rhodesian Front party, he became (1964) prime minister and in 1965 unilaterally declared Rhodesia independent from Britain. He maintained minority white rule until the election of a black prime minister, Abel Muzorewa, in 1979. He continued to lead the white minority in parliament after the country was proclaimed the Republic of ZIMBABWE and after the election of Robert MUGABI as prime minister (1980). In 1987, however, he was suspended from his position due to conflict with Mugabi.

Smith, Jedediah Strong, 1799–1831, American explorer and one of the greatest MOUNTAIN MEN; b. near Binghamton, N.Y. His western travels opened the rich fur-trapping country and showed the way for pioneers who came later. Arriving in St. Louis (1822), he joined William Ashley's expedition. In 1824 he helped lead a party through South Pass, in Wyoming, beginning use of that route. In 1826–27 he traveled southwest from Great Salt Lake, crossed the Colorado R. and the Mojave Desert, arrived at the San Gabriel (Calif.) mission, and then with two men made the first recorded crossing of the Sierra Nevada and the Great Salt Desert from west to east. Smith later traveled from California to Ft. Vancouver, surviving Native American attacks that killed 26 of his party, but he himself was killed along the Cimarron R. by Comanches.

Smith, John, c.1580–1631, English colonist in America. A member of the JAMESTOWN council, the resourceful and tactful Smith carried the colony through periods of hardship (1607–9). The celebrated story of his capture by Powhatan (see POWHATAN CONFEDERACY) and rescue by POCAHONTAS is probably true.

Smith, John, 1938–, British Labour politician. A Scottish lawyer, he was first elected to Parliament in 1970 and held several junior ministerial posts (1974–78) before serving as secretary of state for trade (1978–79). He succeeded Neil KINNOCK as party leader in 1992. A member of Labour's right wing, Smith has played a major role in moderating the party's leftist policies and reducing union influence.

Smith, Joseph, 1805–44, American MORMON leader, founder of the Church of Jesus Christ of Latter-Day Saints; b. Sharon, Vt. After moving to Palmyra, N.Y., he claimed that visions revealed (1823) to him the existence of secret records, which he said he had unearthed in 1827 in the form of golden tablets and translated as the Book of Mormon. As prophet and seer, he founded (1830) a church in Fayette, N.Y. The hostility of neighbors led him to move to Kirtland, Ohio, to Missouri, and finally to Nauvoo, Ill. Disaffection grew within the sect, and more trouble with non-Mormons led to his arrest, along with that of his brother Hyrum, on charges of treason. On June 27, 1844, both brothers were murdered by a mob at Carthage, Ill. Smith's revelations, including one on plural marriage (made public eight years after his death), were accepted as doctrine by the Mormons, who increased greatly after his death.

Smith, Sydney, 1771–1845, English clergyman and writer. A founder of the *Edinburgh Review* (1802), he championed the rights of the oppressed, as in the "Peter Plymley" letters (1807–8) urging CATHOLIC EMANCIPATION.

Smith, Tony, 1912–80, American sculptor; b. South Orange, N.J. Also an architect, Smith was allied with the MINIMALISM art move-

ment. He is known for monumental modular sculptures that employ geometric forms in monochromatic plywood or metal.

Smith, W. Eugene, 1918–78, American photojournalist; b. Wichita, Kans. Among the foremost modern documentarians, Smith recorded World War II in the Pacific and produced a wide range of powerful photo-essays, including "Country Doctor" (1948), "Pittsburgh" (1956), and *Minamata* (1975).

Smithsonian Institution, research and educational center, largely in Washington, D.C.; est. 1846 under terms of the will of James Smithson, of London, who in 1829 bequeathed his fortune to the U.S. Today, it is a vast complex that includes the National Air and Space Museum, the National Gallery of Art, the National Museum of American History, the National Museum of Natural History, the National Portrait Gallery, the Joseph H. Hirshhorn Museum and Sculpture Garden, the National Postal Museum, the National Zoological Park, museums of African and Asian art, and other institutions. The John F. Kennedy Center for the Performing Arts is an independent bureau within the institution. The National Museum of the American Indian, containing the collections of the former Museum of the American Indian, Heye Foundation (N.Y.C.), includes the George Gustav Heye Center in New York City and a planned main museum in Washington, D.C. The Cooper-Hewitt Museum of Decorative Arts and Design, in New York City, is also part of the Smithsonian.

smog, dense, visible air POLLUTION, commonly of two types. The gray smog of older industrial cities like London and New York comes from the massive combustion of coal and fuel oil in or near the city, releasing ashes, soot, and sulfur compounds into the air. The brown smog characteristic of Los Angeles and Denver is caused by automobile emissions. Smog, which usually results in reduced visibility and can irritate the eyes and respiratory system, may be dangerous to people with respiratory ailments. It can also damage metal, rubber, and other materials.

Smollett, Tobias George, 1721–71, Scottish novelist. A ship's surgeon and later an editor, he wrote *Roderick Random* (1748), *Peregrine Pickle* (1751), *Ferdinand Count Fathom* (1753), and *Humphrey Clinker* (1771), his major success, all adventure novels drawn largely from experience. Rich in character, plots, and satire, they influenced many, including DICKENS.

Smoot, Reed, 1862–1941, U.S. senator from Utah (1903–33); b. Salt Lake City. The first Mormon elected to the U.S. Senate, he helped write the HAWLEY-SMOOT TARIFF ACT (1930).

smut, name for plant diseases caused by a FUNGUS of the order Ustilaginales. Smut produces sootlike masses of spores on the host, lowers its vitality, and often causes deformities. Serious threats to grain crops, smuts do not alternate hosts as do the RUSTS. Severe annual crop losses are caused by the corn smut, oat smut, and loose smut of wheat. Bunt, the most serious smut, attacks young wheat seedlings and destroys the GRAIN.

Smuts, Jan Christiaan, 1870–1950, South African statesman and soldier. Of Boer stock, he fought against the British in the SOUTH AFRICAN WAR. After concluding that British-Boer cooperation was essential in South Africa, he was instrumental in the creation (1910) of the Union of South Africa. Smuts held office continuously (1910–19) in Louis BOTHA's cabinet and was a signer of the treaty of VERSAILLES. He was prime minister (1919–24, 1939–48). During WORLD WAR II Smuts was made a field marshal and held a high place on British war councils. He was active in organizing the UN.

Smyrna, Turkey: see IZMIR.

Sn, chemical symbol of the element TIN.

snail, GASTROPOD mollusk with a spirally coiled shell; there are thousands of species on land and in water. In aquatic species, respiration is carried on by gills; terrestrial forms often have lungs. Snails secrete a slimy substance over which they move by contractions of their muscular foot. Many species are eaten.

Snake, river, NW U.S., flowing c.1,038 mi (1,670 km) from Yellowstone National Park (NW Wyoming) to become the chief tributary of the Columbia R., which it joins near Pasco, Wash. A scenic river with spectacular gorges, notably Hell's Canyon (c.125 mi/200 km long and up to 7,900 ft/2,400 m deep), it is also an important source of hydroelectricity and irrigation.

snake, limbless REPTILE of the order Squamata, which also includes the LIZARDS. The snake's extremely long, narrow body has many vertebrae, and paired internal organs are arranged linearly rather than side by side; all snakes are deaf. Some snakes—constrictors—crush their prey by wrapping their bodies around it and squeezing; others—venomous snakes—inject a toxic substance into their victims. The approximately 2,700 snake species, of which about four fifths are nonvenomous, are distributed throughout most temperate and tropical zones of the world. About two thirds of all species, most of them nonvenomous, belong to the family Colubridae, including garter and grass snakes. Most poisonous New World snakes belong to the PIT VIPER family, while venomous Old World snakes are the true VIPERS. The family Boidea includes the largest snakes, e.g., BOAS and PYTHONS, and the family Elapidae (snakes with inflatable neck hoods) includes the COBRA.

snapdragon, cultivated garden and greenhouse plant (*Antirrhinum majus*) of the figwort family, native to the Mediterranean area. Its showy blossoms, resembling a dragon's snout, display a wide range of colors and varieties.

snapper, carnivorous, spiny-finned FISH of the family Lutianidae, chiefly of tropical coastal waters. Snappers are active and voracious, with large mouths and sharp teeth. Best known is the red snapper, an important food fish. Found from the Gulf of Mexico N to LONG ISLAND, it grows up to 3 ft (90 cm) long and weighs up to 35 lb (16 kg).

snare drum: see DRUM.

Snead, Sam(uel Jackson), 1912–, American golfer; b. Hot Springs, Va. He won his first major title, the Professional Golfers' Association (PGA) championship, in 1942 and again in 1949 and 1951. He also captured the Masters three times (1949, 1952, 1954) and the British Open once (1946). A master of long-iron play, "Slamming Sammy" won over 80 PGA tournaments, far more than any other golfer in history.

Snell's law: see REFRACTION.

snipe, shore BIRD of the SANDPIPER family, native to the Old and New World. The common, or Wilson's, snipe (*Capella gallinago*) is a game bird of marshes and meadows. The mud snipe, or woodcock (*Scolopax rusticola*), is a nocturnal woodland bird.

SNOBOL: see PROGRAMMING LANGUAGE.

Snorri Sturluson [snôr'rē stür'lüsôn] or **Sturleson** [–lēsôn], 1178–1241, Icelandic chieftain and historian, the leading figure in medieval Norse literature. He is the author of the *Prose Edda* (see EDDA) and of the *Heimskringla,* a SAGA of great literary merit that recounts Norwegian history to 1177. One of the most influential people of his day, he became involved in political intrigues and was assassinated.

Snow, C(harles) P(ercy) (Baron Snow of Leicester), 1905–80, English author. A physicist, he also held important positions in the British government. His 11-volume novel series, *Strangers and Brothers* (1940–70), which analyzes power and the relation between science and the community, also delineates the changes in English life in the 20th cent.

snow, precipitation formed by the sublimation of water vapor into solid crystals at temperatures below freezing. A snowflake, like a raindrop (see RAIN), forms around a dust particle. Snowflakes form symmetrical (hexagonal) crystals, sometimes matted together if they fall through air warmer than that of the cloud in which they originated. Apparently, no two snow crystals are alike; they differ from each other in size, lacy structure, and surface markings. Snowfall has been produced artificially by introducing dry-ice pellets into clouds that contain unfrozen water droplets at temperatures below the freezing point. Melted, 10 in. (25 cm) of snow is approximately equal to 1 in. (2.5 cm) of rainfall. See also GLACIER.

snowboarding: see SKIING.

snow plant: see INDIAN PIPE.

Snyder, Gary, 1930–, American poet; b. San Francisco. Associated with the BEAT GENERATION of the 1950s, he lived in Japan from 1956 to 1968. His poetry, influenced by ZEN BUDDHISM and Native American culture, celebrates the peace found in nature and decries its destruction; volumes include *Myths and Texts* (1960) and *Turtle Island* (1974; Pulitzer).

Snyders, Frans, 1579–1657, most celebrated Flemish still-life and animal painter. Influenced by RUBENS, he often collaborated with Rubens and JORDAENS, sometimes painting the animals in their pictures. He is best known for his spirited scenes of the hunt and of

animal struggles, e.g., *Stag Hunt* (The Hague) and *Lions Chasing a Deer* (Metropolitan Mus.).

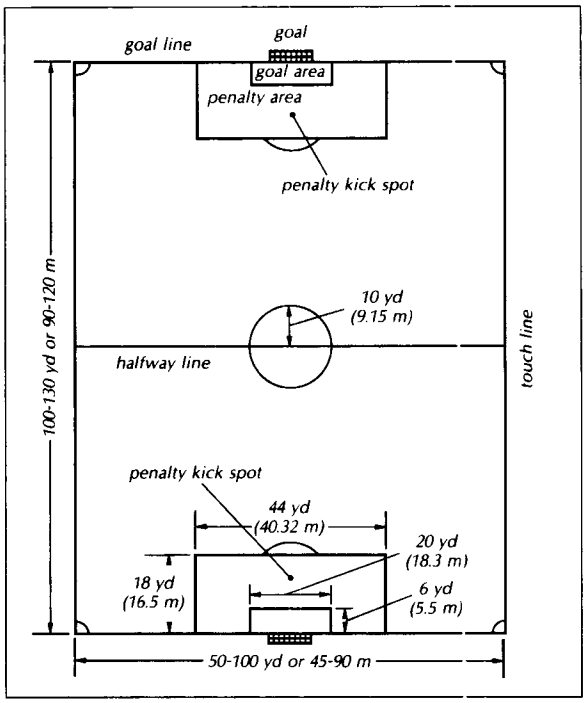
soap, any of a group of organic compounds that are metallic salts of fatty acids. A soap of tallow and wood ashes was used as early as the 1st cent. A.D. by Germanic tribes. In the American colonies it was made from waste fats and lye, which is a strong alkali leached from wood ashes. The resulting chemical reaction, called saponification, remains the basis of soap manufacture today. FATS AND OILS are heated with an alkali, e.g., sodium hydroxide (which gives hard soaps) or potassium hydroxide (which gives soft soaps). Sodium or potassium may be replaced in the alkali by other metals, e.g., aluminum, calcium, or magnesium, to make soaps used in industry as paint driers, ointments, and lubricating greases, and in waterproofing. After the alkali and fats have reacted, salt is added to form a curd of the soap. Glycerol (glycerin), a valuable by-product used as a solvent and sweetener, can then be removed by DISTILLATION. Varying the composition or method of processing affects the lathering, cleansing, and water-softening properties. Soap can be formed as bars, chips, flakes, beads, or powders and may contain perfumes, dyes, germicides, or so-called builders, which assist in rough cleaning. Like modern soapless detergents (usually sulfonated alcohols), soaps cleanse by lowering the surface tension of water, by emulsifying grease, and by absorbing dirt into the foam. Soap is less effective than detergent in hard water because the salts that make the water hard react with the soap to form insoluble curds (e.g., the "ring" left in bathtubs).

soapstone or **steatite,** metamorphic ROCK (see METAMORPHISM) in which the characteristic mineral is TALC. It is gray to green, has a soapy feel, and resists acids and heat. Soft and easily carved, it is a popular sculpture medium. Soapstone is also used to make sinks and laundry tubs. The chief deposits are in the U.S., Canada, and Norway.

soccer, ball and goal game usually played outdoors, also called association football or simply football. Played in more than 140 countries, it is by far the most popular international sport. Two opposing teams of 11 players each compete on a field preferably measuring 120 yd by 75 yd (110 m by 70 m). A goal 8 yd (7.3 m) wide and 8 ft (2.4 m) high, backed with netting, is centered on each end line. The object of the game is to advance an inflated leather ball into the opponent's goal (worth one point). The ball is kicked (often dribbled with short kicks) or advanced by the head or other parts of the body, but only the goalkeeper may use the hands. Rules infractions result in free kicks for the opposing team. The first recorded soccer (football) game took place in England in 217 A.D., and by the 12th cent. the annual Shrove Tuesday contest was a regular event. In the 19th cent. the game was refined to emphasize only the kicking aspects. It gained tremendous popularity after spreading from Britain to the Continent. The highlight of international play is the quadrennial World Cup competition; soccer has been an Olympic sport since 1900. In the U.S., where soccer has been overshadowed by American FOOTBALL, the game was a fast-growing sport in the 1970s and 80s at many levels, from little league to collegiate. Professional American soccer leagues, however, have not succeeded. The North American Soccer League, formed in 1968, folded in 1985.

social contract, agreement by which human beings are said to have abandoned the "state of nature" in order to form the society in which they now live. HOBBES, LOCKE, and J.J. ROUSSEAU each developed differing versions of the social contract, but all agreed that certain freedoms had been surrendered for society's protection and that the government has definite responsibilities to its citizens. Similar ideas were used in the 18th cent. as justification for both the American and the French revolutions. The concept has generally been discarded as a theoretical basis of political life but was revived in the 20th cent. by U.S. philosopher John Rawls.

Social Credit, economic plan in Canada. It was based on the theories of Clifford Hugh Douglas, who held that the basic cause of economic depression was unequal distribution resulting from lack of purchasing power, and proposed issuing "social dividends" to every citizen. This scheme proved unworkable, and other measures were blocked by the federal government and the courts. The Social Credit party has held power in ALBERTA (1935–71) and British Columbia (1952–72, 1975–91).



A soccer (association football) field. The opening of the goal is 24 ft (7.3 m) wide and 8 ft (2.44 m) high.

Social Darwinism, belief that societies and individual human beings develop in a manner consistent with the principles of biological EVOLUTION proposed by Charles DARWIN, i.e., that "survival of the fittest" enables only superior people to gain wealth and power. Social Darwinism has been used to justify IMPERIALISM, and although popular in the late 19th cent., it has been widely attacked in modern times.

Social Democratic party (SDP), British political party founded (1981) to offer a centrist alternative to the more extreme positions of the ruling Conservatives on the right and Labour on the left. The SDP began with the defection of 12 Labour members of Parliament who opposed their party's leftward drift. The party joined with the LIBERAL PARTY in 1982 in a statement of common principles and merged with the Liberals in 1988. Some members re-formed the SDP in 1988, but they disbanded in 1990.

Social Gospel, liberal movement within American Protestantism that attempted to apply biblical teachings to problems associated with industrialization. It grew in the late 19th cent. under the leadership of Washington Gladden and Walter Rauschenbusch, who believed in social progress and the essential goodness of human beings. New Deal legislation in the 1930s embodied many Social Gospel ideals.

socialism, general term for the political and economic theory that advocates collective or government ownership and management of the means of production and distribution of goods. It arose in the late 18th and early 19th cent. as a reaction to the hardships caused by CAPITALISM and the INDUSTRIAL REVOLUTION. F.N. BABEUF, the first theorist who may properly be called socialist, propounded the doctrine of class war later seen in MARXISM. Utopian socialists such as Charles FOURIER, Robert OWEN, and the comte de SAINT-SIMON rejected the notion of class struggle. Louis BLANC and P.J. PROUDHON were among other leading socialists. The *Communist Manifesto* (1848), by Karl MARX and Friedrich ENGELS, argued the inevitability of a proletarian-led international revolution. Ferdinand LASSALLE founded (1863) the first workers' party in Germany, and by the 1870s there were socialist parties in most European countries. Doctrinal disputes between gradualists and revolutionists culminated in the split of Russian socialism into BOLSHEVISM AND MENSHEVISM. After the 1917 RUSSIAN REVOLUTION international socialism and COMMUNISM split irrevocably. Present-day socialist parties play an im-

portant role in Western European electoral politics. Usually called democratic socialist parties, they have favored a variable economic mix of capitalism and state control. In the THIRD WORLD, socialist programs have stressed land reform and centralized economic planning, often through a one-party state, but since the 1980s there has been a movement toward reduced state control of the economy.

Socialist Labor party, in the U.S., formed in 1877 by New York City socialists. In the 1880s it concentrated unsuccessfully on electoral politics; in the 1890s, led by Daniel De Leon, it shifted its emphasis to militant labor activities. It declined when De Leon's opponents withdrew (1899) to join the less militant Socialist Democratic party.

socialist realism, Soviet artistic and literary doctrine prescribing the optimistic depiction of socialist society in conventionally realistic terms. Proclaimed by the Union of Soviet Writers as compulsory practice in 1932, the doctrine was less stringently enforced after STALIN's death, although it remained official policy in the USSR until the country's demise. It has remained a dominant, state-sponsored mode of art and literature in China.

Socialist Revolutionary party, Russian populist party founded 1901. It called for an end to autocracy, a classless society, distribution of land to peasants, and self-determination of minorities. The party carried out political assassinations. It participated in the 1917 RUSSIAN REVOLUTION but by 1922 was suppressed by the Soviet government.

social security, public program providing for economic security and welfare. While programs vary from one country to another, all provide some cash payment to defray income loss or deficiency due to sickness, old age, or unemployment. (In socialist nations the insured person makes no direct contribution toward the coverage.) Germany adopted a social security program in the 1880s and Great Britain's program, begun in 1911, was expanded after World War II. The U.S. Social Security Act (1935) established unemployment compensation, retirement insurance, and federal assistance for state welfare programs. The HEALTH INSURANCE plans Medicare and Medicaid and supplemental security income (SSI) for the disabled were added later. Administered principally by the Social Security Administration of the Dept. of HEALTH AND HUMAN SERVICES, the U.S. system is threatened by economic factors and by changing patterns in DEMOGRAPHY—most significantly, the increasing number of older persons receiving benefits as compared to those persons working and contributing to the program through taxes. Most developed countries face similar problems in funding their social security systems.

social welfare or **public charity,** organized assistance to the needy. England's poor law (1601) was the first extensive state effort to aid the needy; it required work of the able-bodied and provided apprenticeships for children. Modern SOCIAL SECURITY programs for broad groups of people, not just the poor, began in Germany in the 1880s with health insurance for workers; they were instituted in Britain in 1911 and the U.S. in 1935 (see SOCIAL SECURITY). Great Britain and the Scandinavian countries, often termed "welfare states," have wide-ranging social welfare programs, including comprehensive HEALTH INSURANCE providing free or low-cost medical services for all. In the U.S. the term "welfare" is usually limited to the Aid to Families with Dependent Children (AFDC) program, which has its origins in the NEW DEAL. Proposals for changes to or elimination of AFDC have been a fixture of U.S. politics since the late 1960s. Private charities, international relief bodies (e.g., the RED CROSS), and UN agencies (e.g., UNICEF) also provide various social services.

social work, organized efforts to help individuals and families adjust to the community and to adapt the community to their needs. Early charitable activities were aimed at alleviating maladjustments piecemeal. The French sociologist and economist P.G.F. Le Play was the first to apply (1850s) scientific methods to the solution of the problem of poverty. Later in the 1800s, the English investigator Charles Booth developed the social survey method, providing a basis for determining the extent of social maladjustment. In the 1930s, to deal with economic DEPRESSION, the U.S. government joined private, state, and local social work efforts. Modern methods of social work include casework (helping individuals and families with physical, mental, and such social problems as child neglect, alcoholism, drug abuse), group work (e.g., social settlement), and community organization (coordinating community efforts and funding). Social work has been steadily professionalized, and special graduate schools have been established to train social workers.

Society of Friends: see FRIENDS, RELIGIOUS SOCIETY OF.

sociobiology, study of the effect of biological processes on animal and human behavior. Sociobiologists hold that behavior patterns are genetically determined and are governed by the process of natural selection. The theory has contributed to the understanding of certain evolutionary traits in the animal world, such as how the helpfulness of nonreproducing animals in a group is determined in part by the need to insure survival of the group's offspring. It is controversial, however, when applied to human behavior in such areas as aggressiveness, sex differences, mate selection, and parenting behavior. Edward O. WILSON's *Sociobiology* (1975) was instrumental in defining the field.

sociolinguistics, study of language as it affects and is affected by social relations. It encompasses such concerns as bilingualism, lingua franca, and other ways that language use is influenced by contact among people of different language communities. Sociolinguists also examine dialects, accents, and diction as they affect varying social contexts and distinctions, status within a society, and such areas as class, ethnic, and regional differences.

sociology, the scientific study of collective human behavior. The term was coined (1838) by Auguste COMTE, who attempted to identify the unifying principles of society at different stages of human social development. Major contributions to 19th-cent. sociology were made by Karl MARX, who emphasized the economic basis of the organization of society and saw in class struggle the main agent of social progress, and by Herbert SPENCER, who applied Darwinian principles to the study of human society. The founders of modern sociology are Émile DURKHEIM, who pioneered the scientific use of comparative empirical evidence and statistical data, and Max WEBER, who developed historical and theoretical models as a tool of sociological analysis. Theorists in the 20th cent. have focused on conflict (drawing on Marx's work), structural-functionalism (developed by Talcott PARSONS and advanced by Robert K. MERTON), and symbolic interaction (developed by George Herbert Mead and Herbert Blumer).

Socotra, mountainous island (1,383 sq mi/3,582 sq km) of Yemen, at the mouth of the Gulf of ADEN, c.150 mi (250 km) E of the African mainland. The islanders fish, farm, and herd; the main exports are dried fish and pearls. Under British control from 1834, Socotra was a refueling station before being ceded (1967) to Southern Yemen, which merged with Yemen in 1990.

Socrates, 469–399 B.C., Greek philosopher of Athens, generally regarded as one of the wisest people of all time. It is not known who his teachers were, but he seems to have been acquainted with the doctrines of PARMENIDES, HERACLITUS, and ANAXAGORAS. Socrates himself left no writings, and most of our knowledge of him and his teachings comes from the dialogues of his most famous pupil, PLATO, and from the memoirs of XENOPHON. Socrates is described as having neglected his own affairs, instead spending his time discussing virtue, justice, and piety wherever his fellow citizens congregated, seeking wisdom about right conduct so that he might guide the moral and intellectual improvement of Athens. Using a method now known as the Socratic dialogue, or dialectic, he drew forth knowledge from his students by pursuing a series of questions and examining the implications of their answers. Socrates equated virtue with the knowledge of one's true self, holding that no one knowingly does wrong. He looked upon the soul as the seat of both waking consciousness and moral character, and held the universe to be purposively mind-ordered. His criticism of the Sophists and of Athenian political and religious institutions made him many enemies, and his position was burlesqued by ARISTOPHANES. In 399 B.C. Socrates was tried for corrupting the morals of Athenian youth and for religious heresies; it is now believed that his arrest stemmed in particular from his influence on Alcibiades and Critias, who had betrayed Athens. He was convicted and, resisting all efforts to save his life, willingly drank the cup of poison hemlock given him. The trial and death of Socrates are described by Plato in the *Apology*, *Crito*, and *Phaedo*.

sodium (Na), metallic element, discovered in 1807 by Sir Humphry DAVY; its compounds have been known since antiquity. A silver-white, very reactive ALKALI METAL, it must be stored out of contact with air and water. The metal is used in arc-lamp lighting and as a heat-transfer liquid in nuclear reactors. Widely used compounds include SODIUM CHLORIDE (common salt), SODIUM BICARBONATE (baking soda), SODIUM CARBONATE (soda ash), hydroxide (lye), nitrate, phosphates, and BORAX. SOAP is made with sodium hydroxide. Sodium compounds are widely distributed in rocks, soil, oceans, salt lakes, mineral waters, and salt deposits, and are found in the tissues of plants and animals. Sodium is an essential element of the diet. See ELEMENT (table); PERIODIC TABLE.

sodium bicarbonate or **sodium hydrogen carbonate,** chemical compound ($NaHCO_3$), a white crystalline or granular powder, commonly known as bicarbonate of soda or baking soda. It is soluble in water and very slightly soluble in alcohol. Because it evolves carbon dioxide gas when heated above 50°C (122°F), it is used in baking powder. It is sometimes used medically to correct excess stomach acidity.

sodium carbonate, chemical compound (Na_2CO_3) soluble in water and very slightly soluble in alcohol. Pure sodium carbonate is a white, odorless powder that absorbs moisture from the air and forms a strongly alkaline water solution. One of the most basic industrial chemicals, it is usually produced by the Solvay process. The chief uses of sodium carbonate are in glassmaking and the production of chemicals.

sodium chloride (NaCl), common salt. It is a chemical compound containing equal numbers of positively charged sodium and negatively charged chlorine IONS. The colorless-to-white crystals have no odor but a characteristic taste. When dissolved in water, the ions move about freely and conduct electricity (see ELECTROLYSIS). Salt is essential in the diet of humans and animals, and is a part of blood, sweat, and tears. Salt is widely used for the seasoning, curing, and preserving of foods. Its major use is in the production of CHLORINE, SODIUM, and sodium hydroxide. Salt makes up nearly 80% of the dissolved material in seawater and is also widely distributed in solid deposits. Manufacture and use of salt is one of the oldest chemical industries.

sodium hydroxide: see ALKALI.

Sodom and Gomorrah [gəmôr'ə], in the BIBLE, two of the Cities of the Plain (the others being Admah, Zeboiim, and Zoar, which was spared) destroyed by fire from heaven because of their unnatural carnal wickedness. They were probably located near the southern end of the Dead Sea and may have been destroyed by an earthquake c.1900 B.C.

Soeharto: see SUHARTO.

Sofia [sōfē'a], city (1990 est. pop. 1,221,000), capital of Bulgaria, W central Bulgaria, on a high plain surrounded by the Balkan Mts. It is Bulgaria's industrial center, with such manufactures as machinery, metal products, foodstuffs, and textiles. Settled by the Thracians, it was held (1st–14th cent.) by Rome, Byzantium, and the first and second Bulgarian kingdoms. It passed to Turkey in 1382 and to Russia in 1878. After 1879 it was the capital of independent Bulgaria. During World War II the Germans occupied Sofia until 1944, when it fell to Soviet forces. Landmarks include many old churches, mosques, and synagogues, the parliament building, and the former royal palace.

softball, a variant of baseball, played with a larger ball on a smaller field. The ball is about 12 in. (30 cm) in circumference, about 3 in (8 cm) larger than a baseball; the infield is 60 sq ft (5.6 sq m), about 30 sq ft (2.8 sq m) smaller than a baseball infield. Two teams of nine players each compete (until 1946, 10 players). Major differences from baseball are that the ball must be pitched underhand and a regulation game is seven innings. The game, invented in Chicago in 1888, is played by both men's and women's teams in the U.S., with annual sectional and world series championships. An international federation regulates the game.

software: see COMPUTER PROGRAM.

soil, surface layer of earth containing organic matter and capable of supporting vegetation. A few inches to several feet thick, soil consists of fine rock material, HUMUS, air, and water. The arrangement of soil particles—soil structure—together with organic matter (including microorganisms and living roots) determines the soil's capacity to retain gases, water, and plant nutrients. Soil varies with the type of vegetation, climate, and parent rock material. Soil fertility—determined in part by texture, chemical composition, water supply, and temperature—can be maintained or improved by FERTILIZERS or by cultivation practices.

Soka Gakkai [sō'kä gäk'kī] [Value Creation Society], Japan-based lay Buddhist group, founded (1930) by Makiguchi Tsunesaburo. Soka Gakkai seeks to apply the teachings of Nichiren, a 13th-cent. Japanese Buddhist who emphasized the importance of the *Lotus Sutra,* to the modern world and particularly stresses the need for world peace. An evangelistic movement, it flourished in the postwar years and now has members worldwide. In 1964 Soka Gakkai leaders founded the Komeito, or Clean Government, political party in Japan.

Sokolova, Lydia [sukəlu'və], 1896–1974, English ballerina; b. as Hilda Munnings. She joined (1913) DIAGHILEV's Ballets Russes and was the principal character dancer until it disbanded in 1929. She retired to teach and coach in England.

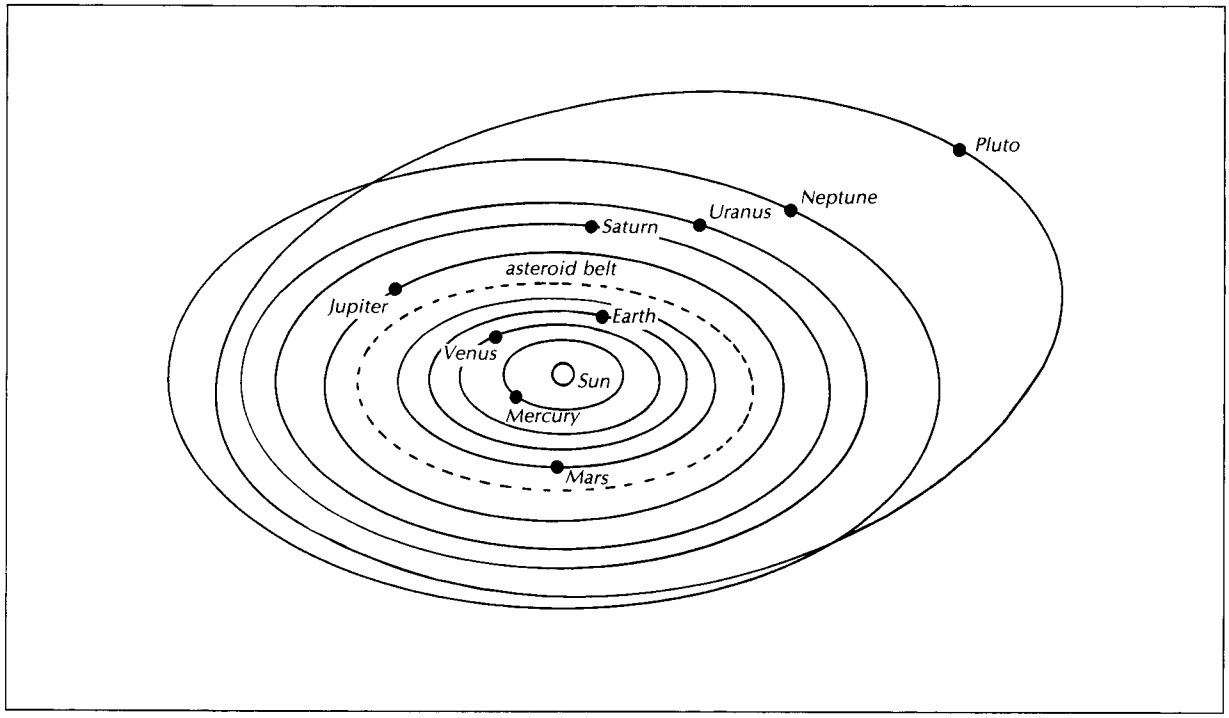
solar cell: see PHOTOVOLTAIC CELL.

solar energy, any form of ENERGY radiated by the SUN, including light, radio waves, and X rays. Solar energy is needed by green plants for the process of PHOTOSYNTHESIS, which is the ultimate source of all food. The energy in fossil fuels (e.g., COAL and PETROLEUM) and other organic fuels (e.g., WOOD) is derived from solar energy. Difficulties with these fuels have led to the invention of devices that directly convert solar energy into usable forms of energy, such as electricity. Solar batteries, which operate on the principle that light falling on photosensitive substances causes a flow of electricity, play an important part in astronautics but are presently too expensive to be in common use on the earth (see PHOTOVOLTAIC CELL). Thermoelectric generators convert the heat generated by solar energy directly into electricity. Heat from the sun is used in air-drying a variety of materials and in producing salt by the evaporation of sea water (see DESALINATION). Experimental solar heating systems can supply heat and hot water for domestic use; heat collected in special plates on the roof of a house is stored in rocks or water held in a large container. Such systems, however, usually require a conventional heater to supplement them. Solar stoves, which focus the sun's heat directly, are employed in regions where there is perennial sunlight.

solar system, the SUN and the family of PLANETS, natural SATELLITES, ASTEROIDS, METEORS, and COMETS that are its captives. The principal members of the sun's retinue are the nine major planets; in order of increasing distance from the sun, they are MERCURY, VENUS, EARTH, MARS, JUPITER, SATURN, URANUS, NEPTUNE, and PLUTO. All the planets orbit the sun in approximately the same plane (that of the ECLIPTIC) and move in the same direction (from west to east). Current theories suggest that the solar system was formed from a NEBULA consisting of a dense nucleus, or protosun, surrounded by a thin shell of gaseous matter extending to the present edges of the solar sytem. Because of gravitational instabilities, the nebula eventually broke up into whirlpools of gas, called protoplanets, within the rotating mass. In time the protoplanets condensed to form the planets.

solar time, time defined by the position of the sun. The observer's **local solar time** is 0 hr (noon) when the center of the sun is on the observer's meridian. The *solar day* is the time it takes for the sun to return to the same meridian in the sky. The length of the solar day varies throughout the year because the earth moves with varying speed in its orbit and because the equatorial plane is inclined to the orbital plane. It is thus more convenient to define time in terms of the **mean solar time,** or average of local solar time; hence every mean solar day is of equal length. The *equation of time* is the difference between the local solar time and the mean solar time at a given location. **Civil time** is mean solar time plus 12 hr; the civil day begins at midnight, whereas the mean solar day begins at noon. **Greenwich mean time** (GMT) is the local civil time at the former site of the Royal Observatory in Greenwich, England, which is located on the PRIME MERIDIAN (0° longitude). **Standard time** is the civil time within one of the 24 time zones into which the earth's surface is divided. Within a zone all locations keep the same time, namely, the mean solar time of the central meridian (except when DAYLIGHT SAVING TIME is in effect).

The key to pronunciation appears on page xiii.



Solar system

Zone times generally differ by a whole number of hours from GMT. See also SIDEREAL TIME.

solar wind, stream of ionized hydrogen and helium that radiates outward from the sun, carrying away about 1 million tons of gas per sec. Near the earth the solar wind normally has a velocity of 450 mi/sec (700 km/sec). The wind is believed to extend to between 100 and 200 ASTRONOMICAL UNITS from the sun. COMET tails always point away from the sun because of the pressure exerted by the solar wind. The interaction of the solar wind with the earth's magnetic field is also responsible in part for such phenomena as the AURORAS and geomagnetic storms.

solder, metal ALLOY used in the molten state as a metallic binder. The type of solder to be used is determined by the metals to be united. Soft solders are commonly composed of lead and tin and have low melting points. Hard solders (i.e., silver solders) have high melting points. When brass is used in the solder or when brass surfaces are to be joined, the process is known as brazing, although the name is sometimes applied also to other hard soldering.

sole: see FLATFISH.

solenoid, device made of a long wire wound many times into a tightly packed cylindrical coil. If current is sent through a solenoid made of insulated wire and having a length much greater than its diameter, a uniform magnetic field will be created inside the solenoid. The magnetic field can be intensified by inserting a ferromagnetic core into the solenoid.

Soleri, Paolo, 1919–, Italian-American architect. His functional, organic style is seen in his designs for self-sufficient desert communities, which he terms arcalogies, notably one at Arcosanti, near Scottsdale, Ariz.

solfeggio, in music, systems of vocal exercises employing a series of syllables originally devised by the Benedictine monk Guido d'Arezzo (c.990–1080) for the purpose of vocalization and for practice in sightsinging. These "solmization" syllables are now commonly known in the form *do, re, mi, fa, sol, la, si* (or *ti*), *do.*

solid: see STATES OF MATTER.

Solidarity, Polish trade union federation formed in September 1980. Led by Lech WALESA, it grew rapidly in size and political power and soon posed a threat to Poland's Communist government by its sponsorship of labor strikes and other forms of public protest. On Dec. 13, 1981, however, the Polish government launched a crackdown by declaring martial law, suspending Solidarity, and imprisoning most of its leaders. Despite these actions, and the formal abolition of the union in 1982, demonstrations in support of Solidarity continued in Poland. In 1989 Solidarity was reinstated, limited free elections were held, and candidates supported by the union won a resounding victory. In 1990 Walesa became president of Poland and resigned his union post. Solidarity has since placed greater emphasis on traditional trade union matters.

solid-state physics, the study of properties exhibited by atoms because of their association and regular, periodic arrangement in CRYSTALS. Besides mechanical and thermal properties, electric conductivity (see CONDUCTION) is one of the most important properties of solids. METALS are highly conductive and offer little resistance to electric currents. Most solid nonmetals are insulators; they offer virtually infinite resistance to electric currents. SEMICONDUCTORS, which possess electrical conductivity that is neither very high nor very low, are used in TRANSISTORS.

solid waste: see WASTE DISPOSAL.

Soliman. For Ottoman sultans thus named, see SULAYMAN.

Solomon, d. 922 B.C., king of the ancient Hebrews, son and successor of DAVID. His mother was BATH-SHEBA. The reign of Solomon was eminently peaceful, marked by foreign alliances, notably with Egypt and with Phoenicia (he was on especially good terms with Hiram of Tyre). He developed trade and commerce. As he grew older, his despotism became worse and finally led to the revolt of JEROBOAM I. Solomon's wisdom is proverbial. He built the first Hebrew temple at Jerusalem. PROVERBS and ECCLESIASTES were ascribed to him, and the SONG OF SOLOMON bears his name.

Solomon Islands, independent Commonwealth nation (1992 est. pop. 360,000), land area c.11,600 sq mi (29,785 sq km), comprising GUADALCANAL and other islands and atolls stretching in a 900-mi (1,450-km) chain across the SW Pacific Ocean E of New Guinea; the extreme northwestern islands in the chain, Bougainville and Buka, are part of PAPUA NEW GUINEA. The capital is Honiara, on Guadalcanal. The mountainous islands are sparsely populated and largely covered with rain forest. Subsistence farming and fishing are mainstays of the economy, with small exports of timber, fish, copra, cocoa, and palm oil. The inhabitants are largely Melanesians; there are Polynesians on some outlying atolls. Over a hun-

dred languages are spoken, and a Melanesian pidgin is the lingua franca. Most Solomon Islanders are Christian.

History. Visited in 1568 by the Spaniard Álvaro de Mendeña de Neira, the Solomons were colonized by Europeans and missionaries in the 18th and 19th cent. Germany took possession of the N Solomons in 1885 but relinquished (1900) all except Buka and Bougainville to Britain, which had created (1893) a protectorate in the S Solomons. During WORLD WAR II the islands were invaded (1942) by Japan and liberated (1943–44) by U.S. forces after heavy fighting. They became self-governing in 1976 and independent in 1978. Support by Solomon Islanders for secessionists on Bougainville has strained relations with Papua New Guinea. Francis Billy Hilly became prime minister in 1993. See PACIFIC OCEAN map.

Solomon R. Guggenheim Museum, N.Y.C.; founded 1939. A major gallery of modern art, it is known for its circular building designed by Frank Lloyd WRIGHT (completed 1959); a 10-story addition was completed in 1992. Its collection includes works by BRANCUSI and KANDINSKY. The museum is part of the Solomon R. Guggenheim Foundation, which also operates the Peggy Guggenheim Collection in Venice, Italy.

Solon [sō'lən], c.639–c.559 B.C., Athenian statesman. Elected leader in 594, he instituted sweeping economic and social reforms, and made important constitutional changes. Although bitterly opposed at first, Solon's reforms became the basis of the Athenian state. He also introduced a more humane law code to replace the code of DRACO.

solstice, either of two points on the ECLIPTIC where the sun's apparent position on the celestial sphere (see ASTRONOMICAL COORDINATE SYSTEMS) reaches the greatest angular distance (about 23½°) above or below the celestial equator. At the time of the summer solstice, about June 22, the sun is directly overhead at the TROPIC OF CANCER; at the time of the winter solstice, about December 22, it is directly overhead at noon at the TROPIC OF CAPRICORN. In the Northern Hemisphere these dates mark the beginnings of summer and winter and the days of the longest and shortest hours of daylight.

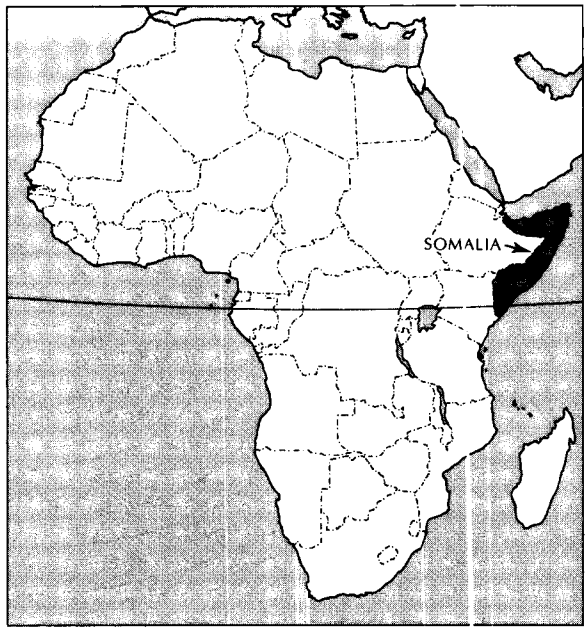
Solti, Sir Georg [shôl'tē], 1912–, English conductor; b. Hungary. He made his conducting debut in Budapest in 1933 and subsequently led orchestras in Switzerland, Germany, and France. Solti was music director (1969–91) of the Chicago Symphony Orchestra and principal conductor and artistic director (1979–83) of the London Philharmonic.

solution, in chemistry, homogeneous mixture of two or more substances. The dissolving medium is called the solvent, and the dissolved material is called the solute. In most common solutions, the solvent is a liquid, often water, and the solute may be a solid, gas, or liquid. Syrups are solutions of sugar, a solid, dissolved in water. Household AMMONIA is a solution of ammonia gas in water, and VINEGAR is a solution of acetic acid, a liquid, in water. Some ALLOYS are solutions of one solid in another. A solution is said to be saturated when it contains the maximum amount of solute that can be dissolved. See also COLLOID; COMPOUND; CONCENTRATION; ELECTROLYSIS; SUSPENSION.

Solyman. For Ottoman sultans thus named, see SULAYMAN.

Solzhenitsyn, Aleksandr Isayevich [sôl"zhənēt'sĭn], 1918–, Russian writer. After army service in World War II, he was imprisoned (1945–53) and exiled in Siberia (1953–56). His novel *One Day in the Life of Ivan Denisovich* (1962), based on his labor-camp experiences, was published with KHRUSHCHEV's help, but a 1966 story was his last work published in the USSR. His novels *The First Circle* and *Cancer Ward,* both highly critical studies of life under STALIN, were published abroad in 1968. In 1970 he was awarded the Nobel Prize in literature. *August 1914* (1971), a novel, and *The Gulag Archipelago* (1973–75), a documentary study, were also published abroad. In 1974 Solzhenitsyn was arrested and deported to West Germany. He settled in Switzerland and after 1976 lived in the U.S. Also a critic of Western democracy, he has called for a paternal, autocratic government for Russia that would be rooted in the Orthodox Church and Russian nationalism.

Somalia, country (1992 est. pop. 7,235,000), 246,200 sq mi (637,657 sq km), E Africa, directly south of the Arabian Peninsula across the Gulf of Aden, also bordered by Ethiopia and Kenya (W), Djibouti (NW), and the Indian Ocean (E). MOGADISHU is the capital; other



large cities are Harghessa, Berbera, and Kismayu. The country is arid and semidesert, with a barren coastal lowland rising to the great interior plateau (generally c.3,000 ft/910 m high), which stretches to the northern and western highlands. Pastoralism is the dominant mode of life, and herding (both nomadic and sedentary) of camel, sheep, goats, and cattle is the principal occupation. Live animals, hides, skins, and clarified butter (ghee) make up the majority of exports. The major cash crops are bananas, citrus fruits, and sugarcane; subsistence crops include sorghum and corn. Processing of raw materials constitutes the bulk of the small but growing industry. The most valuable mineral resource is uranium; many other minerals are largely unexploited. Petroleum deposits have been found, and a refinery was built in 1979. The Somali, who are the vast majority of the population, are divided into many clans and subclans. There are Italian, Indian, and Pakistan minorities. Islam is the state religion. Somali is the official language, but Arabic, English, and Italian are in wide use.

History. Muslim Arabs and Persians established trading posts along Somalia's coasts from the 7th to 10th cent., and Somali warriors joined Muslim sultanates in their battles with Christian Ethiopia in the 15th and 16th cent. Britain, France and Italy began to dominate the region in the 19th cent. Britain established a protectorate in 1887 and concluded an agreement with France in 1888 defining their Somali possessions. Italy created a small protectorate in 1889, added territory in the south, and in 1925 detached Jubaland from KENYA. Somali-speaking districts of ETHIOPIA were combined with Italian Somaliland in 1936 to form ITALIAN EAST AFRICA. Britain conquered Italian Somaliland in WORLD WAR II, and the former colony, renamed Somalia, gained internal autonomy in 1956 and independence in 1960. The presence of some 350,000 Somalis in neighboring countries stirred demands for a "Greater Somalia," and fighting erupted with Ethiopia in 1964 over the OGADEN region, which Somalia claims. In 1969 a coup led by Maj. Gen. Muhammad Siyad Barre resulted in a socialist state. In 1977 the corrupt and repressive regime broke with the USSR over Soviet aid to Ethiopia and received aid during the 1980s from the U.S. The Somali army invaded the Ogaden region in 1978 but was defeated (1979) by Ethiopian forces; skirmishes continued into the early 1980s. Barre was ousted (1991) by rebels after intense and bloody fighting. The Somali National Movement gained control of the north, the old British Somaliland, and proclaimed it the Somaliland Republic. In Mogadishu and most of the south the United Somali Congress achieved control, but savage warfare erupted between rival subclans. Almost a quarter of the population faced starvation because of the fighting. Troops from the U.S. and other nations

entered Somalia in late 1992 to assure distribution of food aid; control of the operation passed to the UN in 1993. A national cease-fire was signed, but no central government was formed. Fighting again erupted (1993) in Mogadishu as the UN unsuccessfully attempted to arrest Gen. Mohammed Farah Aidid, and clan-based fighting increased in 1994 as the U.S. and other nations began withdrawing their troops.

somatotropin: see HUMAN GROWTH HORMONE.

Somerset, Edward Seymour, duke of, 1506?–1552, protector of England; brother of Jane SEYMOUR. He gained custody of his nephew, the young EDWARD VI, after the death (1537) of HENRY VIII, and was named protector. He wielded almost royal authority in effecting Protestant reforms and with Thomas CRANMER introduced (1549) the first Book of Common Prayer. Somerset defeated the Scots at Pinkie (1547), but his failure to halt INCLOSURE caused unrest. After the execution of his brother Thomas SEYMOUR, Somerset was deprived of the protectorate (1549) by John Dudley (later duke of Northumberland) and was beheaded.

Somoza, Anastasio [sōmō'sä], 1896–1956, president of NICARAGUA (1937–47, 1950–56). As head of the national guard, he seized power by a coup (1937) and ruled as dictator for nearly 20 years. He was assassinated. His older son, **Luis Somoza Debayle,** 1922–67, succeeded him as president (1957–63) and somewhat liberalized the regime. His younger brother, **Anastasio Somoza Debayle,** 1925–80, also ruled as dictator and president (1967–72, 1974–79) until his regime was overthrown (1979) by the SANDINISTAS. He fled to Paraguay, where he was assassinated.

sonar, device for the location of submerged objects and for submarine detection and communication at sea. Capable of rotation, it can scan a surrounding area. The device projects subsurface sound waves and, as a HYDROPHONE, listens for returning echoes, determining the range and bearing of submerged targets. Returning signals may be audibly sounded through a loudspeaker and/or visually displayed by a CATHODE-RAY TUBE. Simpler sonar devices are used as depth finders and to locate schools of fish.

sonata, in music, type of instrumental composition that arose in Italy in the 17th cent., at first merely designating an instrumental piece as contrasted to a piece with voice, called a CANTATA. The BAROQUE sonata, later called trio sonata, most commonly featured two melody instruments, usually violins or flutes, with a bass instrument and a keyboard instrument playing the thorough bass (see FIGURED BASS). In the later 18th cent. sonatas for groups of instruments were designated as string quartets or SYMPHONIES, and the term *sonata* was limited to pieces for one keyboard instrument or for one solo instrument (e.g., violin) with keyboard accompaniment. The keyboard sonata, developed by such composers as G.B. Sammartini and featuring one outstanding melodic line with harmony provided by a bass instrument, influenced the classical sonata perfected by HAYDN, MOZART, and BEETHOVEN. The first movement of the classical sonata (and sometimes other movements as well) observes a pattern called **sonata form,** consisting of two parts, a musical statement of several contrasting themes, followed by the development of those themes and a recapitulation of the original statement. This form is employed in string quartets, symphonies, and concertos as well. After the classical era LISZT developed the use of one thematic idea in all movements.

Sondheim, Stephen, 1930–, American composer and lyricist; b. N.Y.C. He wrote lyrics for Leonard BERNSTEIN's *West Side Story* (1957) and Jule Styne's *Gypsy* (1959) and to his own music in such MUSICALS as *Company* (1970), *A Little Night Music* (1973), *Sweeney Todd* (1979), *Sunday in the Park with George* (1984; Pulitzer), and *Into the Woods* (1987). He is noted for his sophisticated, cynical lyrics and his ability to make his songs further plot development.

Songhai or **Songhay,** largest ancient empire of W Africa, in the region that is now MALI. It was founded c.700 by Berbers, and its rulers accepted Islam c.1000. Gao was its capital. Its greatest rulers were Sonni Ali (1464–92), who took TIMBUKTU, the former capital of the MALI empire; and Askia Muhammad I (c.1493–1528), whose death began the empire's decline, accelerated by a Moroccan invasion (1590).

Song of Solomon, Song of Songs, or **Canticles,** book of the OLD TESTAMENT, 22nd in the Authorized Version, traditionally ascribed to King SOLOMON, but possibly as late as the 3d cent. B.C. It is a collection of love poems, generally accepted as an allegory or PARABLE of God's love for Israel.

Song Qingling: see under SOONG, family.

sonic boom, SHOCK WAVE produced by an object moving through the air at supersonic speed, i.e., faster than the speed of sound. An object, such as an airplane, moving through the air generates sound. When the speed of the object exceeds the speed of sound, the object forces the sound ahead of itself faster than the speed at which the sound would ordinarily travel. The piled-up sound takes the form of a violent shock wave propagating behind the object.

sonnet, poem of 14 lines, usually in iambic PENTAMETER, restricted to a definite rhyme scheme. There are two prominent types: the Petrarchan, composed of an octave and a sestet (rhyming *abbaabba cdecde*); and the Shakespearean, consisting of three quatrains and a couplet (rhyming *abab cdcd efef gg*). Sonnets were highly popular in RENAISSANCE Italy, and thereafter in Spain, Portugal, France, and England. German and English romantics (see ROMANTICISM) revived the form, which remains popular. Notable sonneteers include, besides PETRARCH and SHAKESPEARE, DANTE, Edmund SPENSER, Philip SIDNEY, John KEATS, Elizabeth Barrett BROWNING, George MEREDITH, Edna St. Vincent MILLAY, and W.H. AUDEN.

sonography: see ULTRASOUND.

Sons of Liberty, secret organizations formed in the American colonies to protest the STAMP ACT (1765). They were organized by merchants, businessmen, lawyers, journalists, and others most affected by the act.

Sontag, Susan, 1933–, American writer; b. N.Y.C. A brilliant and original thinker, she is known for her analyses of contemporary culture. Her essay collections include *Against Interpretation* (1966), *About Photography* (1977), *Illness as Metaphor* (1978), and *Under the Sign of Saturn* (1980). Sontag has also written short stories and novels, including *The Volcano Lover: A Romance* (1992), and written and directed films.

Soong [sōōng], Chinese family, prominent in public affairs. **Soong Yao-ju,** or **Charles Jones Soong,** 1866–1918, graduated from Vanderbilt Univ. and was a Methodist missionary in Shanghai. His son **T.V. Soong,** 1894–1971, served in the KUOMINTANG government as finance minister (1928–31, 1932–33), foreign minister (1942–45), and president of the Executive Yuan (1945–47). After 1949 he lived in the U.S. Among his sisters, **Soong Ch'ing-ling** or **Song Qingling,** 1892–1981, married (1914) SUN YAT-SEN. Following his death (1925) she broke with the Kuomintang after its expulsion (1927) of the Communists. She was reconciled (1937) with the Kuomintang but again left in 1946 and after 1949 served as vice chairman of the government of the People's Republic of China. Another sister, **Soong Mei-ling,** c.1897–, married (1927) Chiang Kai-Shek and campaigned to enlist U.S. support for the Nationalist Chinese struggle against the Communists. After the Nationalists lost, she joined (1950) her husband in Taiwan. In 1978 their son, Chiang Ching-Kuo, (see under CHIANG KAI-SHEK) became president of Nationalist China (Taiwan).

Sophia, 1630–1714, electress of Hanover, daughter of FREDERICK THE WINTER KING and granddaughter of JAMES I of England. In 1701 the British Parliament settled on Sophia, a Protestant, and her issue the succession to the British crown. Thus her son GEORGE I became (1714) the first English king of the Hanoverian dynasty.

Sophists, originally, itinerant teachers in 5th-cent. Greece who received fees for their lectures. PROTAGORAS was an early, respected Sophist. Others who followed him, less interested in the pursuit of truth than in the political use of rhetoric, were burlesqued by ARISTOPHANES and criticized by PLATO and ARISTOTLE, judgments that gave the term its present, derogatory meaning.

Sophocles, c.496–406 B.C., Greek tragic poet, younger contemporary of AESCHYLUS and older contemporary of EURIPIDES. A respected public figure, a general and a priest, he won many dramatic prizes from 468 on, composing in all about 123 dramas. An innovator, he added a third actor, increased the size of the CHORUS, abandoned the trilogy for the self-contained tragedy, and introduced scene painting. Seven complete plays and over 1,000 fragments survive. His best-known works are *Antigone* (c.441); *Oedipus Rex* or *Oedipus Tyrannus* (c.429), the apex of Greek dramatic irony; *Electra; Trachiniae; Philoctetes* (409); and *Oedipus at Colonus* (401).

Sophocles' characters are dramatically interesting in that their fates are determined more by their own faults than by the Aeschylean gods; as such they have profoundly influenced Western TRAGEDY.

Sophonias: see ZEPHANIAH.

soprano: see VOICE.

Sorbonne: see PARIS, UNIVERSITY OF.

Sorel, Agnès [sôrĕl], c.1422–1450, mistress (1444–50) of CHARLES VII of France. She was the first officially recognized royal mistress in France and wielded much influence. The financier Jacques CŒUR was rumored to have had her poisoned.

sorghum, tall, coarse annual (*Sorghum vulgare*) of the GRASS family, similar in appearance to CORN and probably indigenous to Africa. Valued for their drought resistance, its varieties include the sweet sorghums, which yield molasses from the cane juice; the broomcorns, which yield a fiber used for brooms; the grass sorghums, used for pasture and hay; and the grain sorghums, used primarily for stock and poultry feed and, in the Old World, for human food.

sorority: see FRATERNITY AND SORORITY.

sorrel, name for several plants, particularly species of dock (see BUCKWHEAT) and OXALIS.

Soto, Hernando de: see DE SOTO, HERNANDO.

Soufrière, volcano, 4,048 ft (1,234 m) high, on the island of St. Vincent, West Indies. Its great eruption of 1902 killed more than 1,000 people and devastated a third of the island.

soul, the vital, immaterial life principle, generally conceived as existing within human beings and sometimes within all living things, inanimate objects, and the universe as a whole. In more primitive religions (forms of ANIMISM and SPIRITISM), the soul is thought to control both motor and mental processes; death, the cessation of these processes, is thus viewed as caused by the departure of the soul. PANTHEISM denies the individuation of human souls, and MATERIALISM declares the soul nonexistent. A widespread concept in religion is that of immortality, which usually postulates the existence of a soul that lives apart from the body after death. Dualistic concepts posit a God-given soul distinct from, and antagonistic to, an inferior, earth-bound body. For many Western philosophers the term *soul* is indefinable. Others consider *soul* synonymous with *mind.*

sound, pressure WAVES that propagate through air or other media. Sounds are generally audible to the human ear if their frequency lies between 20 and 20,000 vibrations per second. Sound waves with frequencies below the audible range are called subsonic, and those with frequencies higher than the audible range are called ultrasonic (see ULTRASONICS). When a body, such as a violin string, vibrates, or moves back and forth, its movement in one direction pushes the molecules of the air before it, crowding them together. When it moves back again past its original position and on to the other side, it leaves behind it a nearly empty space. Alternately the body thus causes in a given space a crowding together of the air molecules (a condensation) and a thinning out of the molecules (a rarefaction). The condensation and rarefaction make up a sound wave; such a wave is called longitudinal, or compressional, because the vibratory motion is forward and backward along the direction that the wave is following. Because such a wave consists of a disturbance of particles of a material medium, sound waves cannot travel through a vacuum. The velocity of sound in air at 32°F (0°C) is 1,089 ft/sec (331.9 m/sec), but at 68°F (20°C) it is increased to about 1,130 ft/sec (344.4 m/sec). Sound travels more slowly in gases than in liquids, and more slowly in liquids than in solids. The pitch of a sound depends upon the frequency of vibration; the higher the frequency, the higher the pitch. Loudness, or intensity of sound, is measured in units called DECIBELS. See also ACOUSTICS; DOPPLER EFFECT; ECHO; INTERFERENCE.

sound barrier: see AERODYNAMICS.

sour gum: see BLACK GUM.

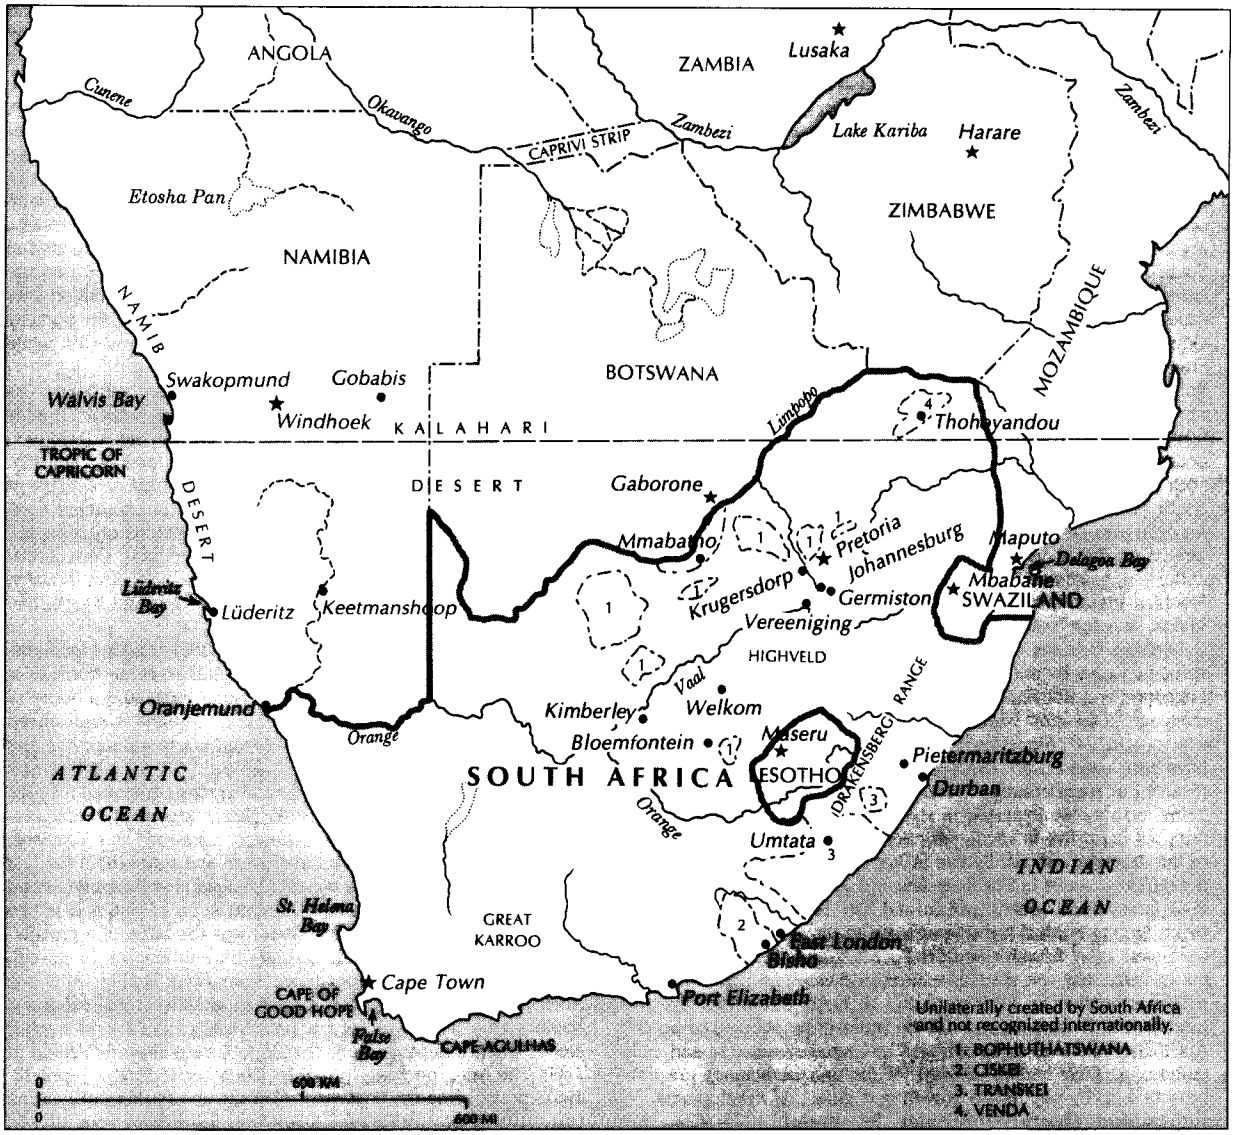
Sousa, John Philip [sōō'zə], 1854–1932, American bandmaster and composer; b. Washington, D.C. He improved the instrumentation and quality of band music. From 1880 to 1892 he led the U.S. Marine Band and in 1892 formed his own band and successfully toured the world. He wrote some 100 marches, many immensely popular, e.g., "Semper fidelis" (1888) and "The Stars and Stripes Forever" (1897).

Souter, David Hackett: see SUPREME COURT, UNITED STATES (table 1).

South, the, region of the U.S., variously defined but including at most 14 states—MARYLAND, VIRGINIA, NORTH CAROLINA, SOUTH CAROLINA, GEORGIA, FLORIDA, KENTUCKY, TENNESSEE, ALABAMA, MISSISSIPPI, ARKANSAS, LOUISIANA, OKLAHOMA, and TEXAS. The basic agricultural economy of the Old South, determined by the warm climate and fertile soil, led to the development of twin institutions—the plantation system and SLAVERY—that made the South a section apart. Its doctrine of STATES' RIGHTS brought on secession, the CIVIL WAR, and, ultimately, the death of the Old South during RECONSTRUCTION. After World War II the South experienced profound economic, social, and political changes—including the development of diversified industry, the emergence of a genuine two-party system, and INTEGRATION—that brought the region closer to the rest of the nation.

South Africa, Afrik. *Suid-Afrika,* officially Republic of South Africa, republic (1992 est. pop. 41,688,000), 471,442 sq mi (1,221,037 sq km), S Africa, bordered by the Atlantic Ocean (W), Namibia (NW), Botswana and Zimbabwe (N), Mozambique and Swaziland (NE), and the Indian Ocean (E and S). LESOTHO is an independent enclave in E South Africa. PRETORIA is the administrative capital, CAPE TOWN the legislative capital, and BLOEMFONTEIN the judicial capital. Other major cities include JOHANNESBURG and DURBAN. Under the policy of racial separation called apartheid about 14% of the land was set aside for black South Africans in ten "homelands" (originally called BANTUSTANS). Four such territories (TRANSKEI, BOPHUTHATSWANA, VENDA, and CISKEI) were declared independent, but no other nation recognized them. The homelands were reabsorbed into South Africa under the new constitution. The economy of South Africa—almost entirely white-controlled but with a work force that is largely nonwhite (over 75%)—is highly advanced and diversified. Mining, the foundation of the country's wealth, has been surpassed by industry as the chief economic sector. Manufactures include processed food, beverages (including wine), textiles, clothing, forest products, chemicals, iron and steel, metal products, machinery, and motor vehicles. Gold, the chief mineral extracted, accounts for two thirds of mining revenue. South Africa also ranks as a leading producer of diamonds, chromite, platinum, vanadium, manganese, and fluorspar, and there are large deposits of copper, coal, uranium, antimony, iron ore, and other minerals. Agriculture, stock-raising, forestry, fishing, and tourism are also important. Crops include corn and other grains, vegetables, peanuts, deciduous and citrus fruit, cotton, tobacco, and sugarcane. The population consists of black South Africans (about 74% of the total); whites, mostly Afrikaners (Boers) and those of English descent (14%); persons of mixed descent (9%); and Asians, largely of Indian descent (3%). English and Afrikaans are the official languages, but there are 10 main African languages, including Zulu and Xhosa, and a lingua franca called Fangalo that was developed in the mines. Most South Africans are Christian (Dutch Reformed, independent black Christian, Anglican, Methodist, Roman Catholic, and Lutheran); there are also Hindus, Muslims, traditional Africans, and Jews.

History. Bantu-speaking peoples moved into the region from E central Africa about 1500. The first permanent European settlement, a Dutch EAST INDIA COMPANY station, was set up in 1652. By 1707 there were about 1,780 freeholders of European descent in South Africa, with about 1,100 slaves. The first of a long series of wars broke out (1779) between the Xhosa people and white farmers, known as Boers, who had moved inland. Britain replaced the Dutch at the Cape in 1795 and was awarded the territory by the Congress of VIENNA in 1814. Disturbed by British rule, which accorded legal rights to free blacks and Coloureds and abolished slavery, some 12,000 Boers left the Cape in what is known as the Great TREK (1835–43) into the interior and Natal. Britain annexed Natal (1843), but the Boer republics of Orange Free State and the Transvaal were established (1850s). The discovery of diamonds (1867) and especially of gold (1886) spurred great economic development. Following increasing tension between the non-Afrikaner whites (Uitlanders) and the dominant Afrikaners, the two Boer republics declared war on Britain. The SOUTH AFRICAN WAR (Boer War; 1899–1902) was won by the British, who established



(1910) the Union of South Africa, with dominion status. South Africa joined the Allies in World War I and afterward received a mandate over South West Africa (Namibia). Under Prime Minister J.B.M. HERTZOG (1924–39) South Africa gained final British recognition of independence (1931), prospered economically, and further suppressed nonwhites. J.C. SMUTS brought South Africa into World War II on the Allied side. Through the policy of APARTHEID (complete segregation), white supremacy was strengthened during the regimes of H.F. VERWOERD (1958–66), B.J. Vorster (1966–78), and P.W. BOTHA (1978–89), leaders of the National party, which ruled from 1948 to 1993. F.W. DE KLERK, who became president in 1989, removed the ban on the AFRICAN NATIONAL CONGRESS (ANC) and other antiapartheid parties and released Nelson MANDELA and other political prisoners. All remaining apartheid laws were repealed (1991), and an interim constitution ending white rule was completed in 1993. A multiparty transitional government council was formed, and the first elections open to all races were held in April 1994. The ANC won over 60% of the vote, and Mandela was elected president.

South African War or **Boer War,** 1899–1902, war of the South African Republic (Transvaal) and the Orange Free State against Great Britain. Beginning with the acquisition (1814) of the Cape of Good Hope, the British had gradually increased their territorial possessions in South Africa. The Boers (Dutch) already settled in some of these areas resented the British advance; their hostility was inflamed after the discovery (1886) of gold brought an influx of British prospectors into the Transvaal. The Boers denied these newcomers citizenship and taxed them heavily, despite British protests. The situation was aggravated in 1895 by the Jameson raid (see JAMESON, SIR LEANDER STARR), which was interpreted as a British plot to seize the Transvaal. A military alliance (1896) of the TRANSVAAL and the Orange Free State followed. The British dispatched troops to defend what they considered their commercial rights, and the Boer states declared war (Oct. 12, 1899). The large and well-equipped Boer forces won early victories, capturing Mafeking (now MAFIKENG) and besieging Kimberley and Ladysmith. But the tide turned in 1900 with the landing of heavy British reinforcements. Under the leadership of F.S. Roberts and Lord KITCHENER, the British occupied all the major cities and formally annexed the Boer states; Kitchener remained only for mopping up. The Boers, however, began guerrilla attacks, led by such people as Louis BOTHA and J.C. SMUTS. Kitchener gained victory by interning Boer women and children and by building blockhouses to cut off large areas. His troops then combed the country, section by section. The Treaty of Vereeniging (May 31, 1902) ended hostilities. The Boers accepted the British sovereign in return for a promise of responsible government in the near future; amnesty was granted to

all who had not broken the rules of war. Bitterness caused by the war continued to affect political life in South Africa.

South America, fourth largest continent, c.6,880,000 sq mi (17,819,000 sq km), extending c.4,750 mi (7,640 km) north to south and up to 3,300 mi (5,300 km) east to west. It is connected with North America by the Isthmus of Panama. The great chain of the ANDES Mts., running nearly the length of the continent and reaching a high point of 22,835 ft (6,960 m) in Mt. ACONCAGUA (in Argentina), is the dominant landform. Major lowlands include the LLANOS, along the ORINOCO R.; the basin of the AMAZON R., containing the world's largest rain forest; the GRAN CHACO; and the PAMPAS. South America is rich in iron ore, copper, tin, and hydroelectric potential, and has significant oil deposits. The countries of South America are Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Guyana, Paraguay, Peru, Suriname, Uruguay, and Venezuela; the French overseas department of French Guiana is also on the continent (see separate articles). The fast-growing population, approaching 300 million in the early 1990s, is becoming increasingly urbanized. Half of it is concentrated in the nation of Brazil, which occupies more than a third of the continental landmass.

South America, indigenous peoples of, aboriginal peoples of South America, from the Isthmus of Panama to Tierra del Fuego. An estimated 30 million people were living there when Europeans arrived. In the Andean region extensive remains show developed cultures at CHAVÍN DE HUÁNTAR and among the PARACAS in Peru. The Mochica, CHIMU, and NAZCA in Peru, the Chibcha and AYMARA of the Andes, and the ARAUCANIANS of Chile had socially complex pre-Columbian cultures (see PRE-COLUMBIAN ART AND ARCHITECTURE), surpassed only by the INCA. Descendants of these peoples live in Ecuador, Peru, Bolivia, NW Argentina, and Chile. QUECHUA, the Inca language, is the most widespread linguistic stock (see NATIVE AMERICAN LANGUAGES). Since the Spanish conquest indigenous peoples have been used as laborers, poorly paid and lacking political representation; these conditions of semiservitude are changing slowly. Some, notably the Inca, play a significant role in the national culture; but many live in small, peripheral groups. A few descendants of the Arawaks and Caribs live in Venezuela, the Guianas, and N Brazil. The GUARANÍ in Brazil are few and scattered, but in Paraguay their language is widely spoken and they form a significant element. Among tropical forest groups are the JÍVARO of Ecuador. The Colorados of W Ecuador and the Puelches and Tehuelches, hunters of Patagonia, are virtually extinct. A dwindling number of Fuegians, so called for their campsites at Tierra del Fuego, live by hunting and fishing. In general the indigenous peoples of South America continue to be assimilated into white-dominated national cultures as their traditional ways of life and homelands are encroached on by population growth and industrial development.

Southampton, Henry Wriothesley, 3d earl of, 1573–1624, English nobleman and patron of letters. Best known as a patron of SHAKESPEARE, some thought the sonnets were dedicated to him. He took part in the rebellion (1601) of the earl of Essex and was sentenced to life imprisonment. JAMES I restored him to favor and he became (1619) a privy councilor. He died of fever while leading an expedition against the Spanish in the Netherlands.

South Australia, state (1992 est. pop. 1,458,000), 380,070 sq mi (984,381 sq km), S central Australia. Most people live in metropolitan ADELAIDE, the capital. Grains, meat, and wine grapes are important agricultural products, with farming largely confined to the irrigated MURRAY R. valley. Much of the land is desert and other areas unsuitable for agriculture. Iron ore, mined at Whyalla, is the chief mineral. Metals, vehicles, and electrical equipment are among the manufactures. South Australia was settled in 1836 as a free (i.e., nonpenal) colony. It became a federated state of Australia in 1901 and transferred its northern areas, now known as the NORTHERN TERRITORY, to the federal government in 1911.

South Bend, city (1990 pop. 105,511), seat of St. Joseph co., N Ind., on the St. Joseph R.; inc. as a city 1865. An industrial city in a farming region, it produces paint, machinery, plastics, and other manufactures. The Studebaker corporation was founded there in 1852. The city was settled c.1820 as a fur-trading post. The Univ. of Notre Dame is nearby.

South Carolina, state of the SE U.S.; bordered by North Carolina (N), the Atlantic Ocean (E), and Georgia (SW).

Area, 31,055 sq mi (80,432 sq km). *Pop.* (1990) 3,486,703, an 11.8% increase over 1980 pop. *Capital,* Columbia. *Statehood,* May 23, 1788 (8th of original 13 states to ratify the Constitution). *Highest pt.,* Sassafras Mt., 3,560 ft (1,086 m); *lowest pt.,* sea level. *Nickname,* Palmetto State. *Mottos, Dum Spiro Spero* [While I Breathe, I Hope] and *Animis Opibusque Parati* [Prepared in Mind and Resources]. *State bird,* Carolina wren. *State flower,* Carolina jessamine. *State tree,* palmetto. *Abbr.,* S.C.; SC.

Land and People. The partly marshy coast gives way to a plain, separated from the rolling hills of the Piedmont plateau by the FALL LINE. The BLUE RIDGE Mts. are in the extreme northwest. The coastal climate is humid and subtropical; inland temperatures become cooler as the altitude increases. Almost 55% of the population lives in urban areas, principally in COLUMBIA, the largest city, the port city of CHARLESTON, and GREENVILLE. In 1990 the state was 69% white and 30% African American.

Economy. The major agricultural products are soybeans, tobacco, cattle, eggs, corn, peaches, and cotton (which formerly dominated the entire economy). The 12.2 million acres (5 million hectares) of woods support a valuable forestry industry. Manufacturing—the sector that employs the highest percentage of South Carolinians—is heavily based on the state's primary commodities. Textiles, chemicals, nonelectrical machinery, apparel, and paper and pulp are the most important products. Commercial fishing is important offshore. Tourism is now a leading industry, with many visitors attracted to the SEA ISLANDS, Myrtle Beach, and Charleston.

Government. The constitution (adopted 1895) provides for a governor elected to a four-year term. The general assembly consists of a senate whose 46 members serve four-year terms and a house of 124 members elected for two years. South Carolina is represented in the U.S. Congress by two senators and six representatives and has eight electoral votes.

History. When explorers for Spain and France penetrated the area during the 16th cent., the principal Native American peoples inhabiting the region were the CHEROKEE, Catawba, and Yamasee. England subsequently claimed the region and sent (1670) the first Europeans to establish a permanent settlement at Albemarle Point (near present-day Charleston). The cultivation of rice and indigo on large plantations using slave labor was the basis of a prosperous economy. In 1776 South Carolina became one of the 13 colonies to declare its independence from Great Britain. After the American Revolution, cotton began to dominate the economy. South Carolina was already a prominent proponent of STATES' RIGHTS when it became the first state to secede from the Union in 1860. The firing on FORT SUMTER by Confederate troops (April 12, 1861) precipitated the CIVIL WAR. After the RECONSTRUCTION era the vast majority of African Americans lost the right to vote, and in 1895 segregationist "Jim Crow" laws were enacted. It was not until 1947 that African Americans were permitted to vote in Democratic primaries and not until 1970 that they were elected to the state legislature. Cotton farming declined during the 1920s because of destruction of crops by the boll weevil and erosion of the land, and industry has since dominated the economy.

South China Sea, western arm of the Pacific Ocean, c.1,000,000 sq mi (2,590,000 sq km), bordering S China, Vietnam, Malaysia, the Philippines, and Taiwan. It covers the shallow Sunda Platform (less than 200 ft/61 m deep) in the southwest and depths of up to c.18,000 ft (5,490 m) in the northeast. The Gulfs of Tonkin (N) and Siam (S) are its chief embayments. Many islands dot the sea, which is subject to violent typhoons.

South Dakota, state in N central U.S.; bordered by North Dakota (N), Minnesota and Iowa (E), Nebraska (S), and Wyoming and Montana (W).

Area, 77,047 sq mi (199,552 sq km). *Pop.* (1990) 696 004, a 0.8% increase over 1980 pop. *Capital,* Pierre. *Statehood,* Nov. 2, 1889 (40th state). *Highest pt.,* Harney Peak, 7,242 ft (2,209 m); *lowest pt.,* Big Stone Lake, 962 ft (293 m). *Nickname,* Coyote State. *Motto,* Under God the People Rule. *State bird,* ring-necked pheasant. *State flower,* pasque flower. *State tree,* Black Hills spruce. *Abbr.,* S.D.; SD.

Land and People. The MISSOURI R. cuts a wide path southward through the center of the state, dividing it into two regions. The

east consists of broad prairies of fertile chernozem soils. The rough, high terrain of the west includes the mineral-rich BLACK HILLS and the Badlands, an area of startling, eroded sand-and-clay formations. The usually dry climate is marked by hot summer days and winter blizzards. The population is evenly divided between rural and urban areas. The leading cities, in order of size, are SIOUX FALLS, Rapid City, and Aberdeen. In 1990 over 91% of the population was white and over 7% were Native Americans.

Economy. Primary industries, including agriculture, are very important. The arid west is the site of many cattle and sheep ranches. Principal crops, mostly from irrigated land in the east, include corn, oats, wheat, sunflowers, soybeans, and sorghum. The largest U.S. gold mine is in the Black Hills. The leading manufactures are processed foods, nonelectrical machinery, electrical and electronic equipment, and lumber. Both service and tourist sectors have been growing rapidly. Mount Rushmore, as well as Badlands and Wind Cave national parks (see NATIONAL PARKS, table), and gambling (legalized in 1989) draw many visitors to the state.

Government. The constitution of 1889 provides for a governor elected to a four-year term. The legislature consists of 35 senators

and 70 representatives who serve for two years. South Dakota sends two senators and one representative to the U.S. Congress and has three electoral votes.

History. When the region was explored (1742–43) by the sons of the Pierre Galtier, sieur de la VÉRENDRYE, it was inhabited by the sedentary Arikara and nomadic SIOUX, who lived by hunting the abundant buffalo. The U.S. acquired (1803) the area as part of the LOUISIANA PURCHASE. Although fur-traders were subsequently active, little settlement took place until Gen. George CUSTER confirmed (1874) that there was gold in the Black Hills. A huge influx of prospectors occurred. The Sioux, who had been granted the land in 1868 and refused to sell it, were gradually and brutally subdued, infamously in the massacre at WOUNDED KNEE (1890). The arrival of railroads stimulated both ranching and farming, despite recurrent droughts. South Dakota was a center (c.1900) of the POPULIST party. Four dams in the Missouri basin were constructed after World War II to control flood waters. Many Indians on South Dakota's reservations were leaders of the activist Native American movement in the 1970s and early 80s. During the 1980s the state became a center of U.S. credit card operations, as service, finance, and trade industries assumed added importance in its economy.

Southeast Asia, region (1990 est. pop. 442,500,000), c.1,740,000 sq mi (4,506,600 sq km). As usually defined, it includes BRUNEI, CAMBODIA, INDONESIA, LAOS, MALAYSIA, MYANMAR, the PHILIPPINES, SINGAPORE, THAILAND, and VIETNAM. A tropical rainy climate with seasonal monsoon winds predominates over most of the area. The chief crop is rice. Population is unevenly distributed, with very high densities in many lowland areas, and there is great diversity of culture, history, ethnic composition, language, and religion. Southeast Asia was once the site of several great Eastern civilizations, notably that of the KHMER EMPIRE, in what is now Cambodia and Laos. In the 16th cent. Europeans began the conquest of the entire area, with the exception of Thailand (Siam). Southeast Asia was the scene of heavy fighting during WORLD WAR II. After the war most of the countries achieved independence.

Southeast Asian languages, family of languages, sometimes called Austroasiatic, spoken in SE Asia. According to one school of thought, it has three subfamilies: the MON-KHMER LANGUAGES, the MUNDA LANGUAGES, and the Annamese-Muong subfamily. There is considerable evidence, but no definite proof, that all these groups are derived from a single ancestor. See LANGUAGE (table).

Southeast Asia Treaty Organization (SEATO), formed (1954) by Australia, France, Great Britain, New Zealand, Pakistan, the Philippines, Thailand, and the U.S. in response to the French defeat in Indochina. Designed to oppose Communist advances in that area, SEATO lacked substantial support and was dissolved in 1977.

Southern Christian Leadership Conference (SCLC), civil-rights organization founded in 1957 by Martin Luther KING, Jr., and headed by him until his assassination in 1968. Composed largely of African-American clergymen from the South, it advocated nonviolent passive resistance as the means of securing equality for African Americans. It sponsored the massive march on Washington in 1963. Ralph Abernathy headed (1968–77) the SCLC after King's death, but its influence has declined.

southern lights: see AURORA.

Southey, Robert, 1774–1843, English writer. A poet, historian, biographer, and translator, he became poet laureate in 1813. He is remembered for his friendships with COLERIDGE and WORDSWORTH; his epic poem *A Vision of Judgment* (1821); and such short poems as "The Battle of Blenheim."

South India, Church of, merger of six major Protestant denominations in India. It was formed (1947) from Anglican, Methodist, Presbyterian, Reformed, Congregational, and Lutheran bodies. The union, especially in its reconciliation of the Anglican view of apostolic succession with the views of the other groups, is cited as a landmark in the ECUMENICAL MOVEMENT.

South Pole, southern end of the earth's axis, lat. 90°S and long. 0°, distinguished from the south MAGNETIC POLE. It was first reached by Roald AMUNDSEN in 1911.

South Sea Bubble, popular name in England for speculation in the South Sea Co. formed (1711) by Robert Harley. The company assumed the national debt in return for an annual payment by the government plus a monopoly of British trade with the islands of the South Seas and South America. Fraudulent schemes resulted and the bubble burst (1720). Robert WALPOLE was made first lord of the treasury and chancellor of the exchequer and moved to restore the company's credit.

Southwestern Indians: see NORTH AMERICA, INDIGENOUS PEOPLES OF.

Soutine, Chaïm, 1894–1943, French expressionist painter; b. Lithuania. In 1913 he joined the bohemian society of the SCHOOL OF PARIS. His turbulent, visceral works often depict human corrosion and depravity. Characteristic is his *Page Boy at Maxim's* (Albright-Knox Gall., Buffalo).

Sovern, Michael Ira, 1931–, American lawyer and educator, president of Columbia Univ. (1980–93); b. N.Y.C. He graduated from the Columbia Univ. Law School in 1955 and after 1957 he was on its faculty. Dean of the law school from 1970 to 1979, he was named president of Columbia in 1980.

soviet [Rus., = council], primary unit in the political organization of the Soviet Union. The first soviets were revolutionary committees organized by socialists among striking workers during the 1905 RUSSIAN REVOLUTION. When the 1917 Revolution broke out, workers', peasants', and soldiers' soviets were formed throughout Russia. Their central executive committees included adherents of BOLSHEVISM AND MENSHEVISM, and members of the SOCIALIST REVOLUTIONARY PARTY. When the Bolsheviks under V.I. LENIN took control of the soviets in Petrograd and other cities, their success was assured. Soviets (1918–20) in Bavaria, Hungary (see KUN, BÉLA), and the Baltic republics, however, were short-lived. The soviets, elected by universal suffrage, became the basic political unit in the USSR, forming a hierarchy culminating in the Supreme Soviet. In reality, they were dominated by the Communist party and the POLITBURO. In Russia the soviets survived the disintegration (1991) of the USSR, but in 1993 YELTSIN called for them to dissolve and reorganize as smaller *dumas* [assemblies]. Although some resisted, many complied.

Soviet Far East: see RUSSIAN FAR EAST.

Soweto, collective name for a group of townships inhabited by Africans, located 10 mi (16 km) SW of JOHANNESBURG, South Africa. In 1976 Soweto was the scene of severe violence that began as a African student protest against the use of the Afrikaans language in schools. The rioting spread to other black urban centers, and more than 600 people were killed when the army quashed the riots.

soybean, soya bean, or **soy pea,** plant (*Glycine max*) of the PULSE family, native to tropical and warm temperate regions of E Asia, where it has been a principal crop for at least 5,000 years. There are over 2,500 varieties in cultivation, producing high-PROTEIN beans of many sizes, shapes, and colors. Soybeans are used in many forms, e.g., oil, soybean meal, soy sauce, soy milk, and bean curd, and as a COFFEE substitute. Soybean oil is also valuable for its use in the manufacture of other products, e.g., glycerin, soaps, and plastics. The green crop is used for forage and hay.

Soyer, three brothers, American painters; b. Russia; emigrated to the U.S. in 1912. **Raphael Soyer,** 1899–1987, and **Moses Soyer,** 1899–1974, twins. They used New York City residents as their main subjects. Raphael's subdued, realistic style expresses an intimate sympathy with people, as in *Office Workers* (Whitney Mus., N.Y.C.). Moses' figures are usually in higher-keyed colors or sharper black-and-white contrasts, as in *Old Worker* (Phillips Coll., Wash., D.C.). **Isaac Soyer,** 1907–81, also specialized in scenes of everyday life, e.g., *Employment Agency* (Whitney Mus., N.Y.C.).

Soyinka, Wole, 1934–, Nigerian playwright, poet, and novelist; b. Akinwande Oluwole Soyinka. Written in English, his works fuse Western and YORUBA traditions. His play *The Invention* (1955) brought him notice in London. Other works include the plays *A Dance of the Forests* (1962) and *A Play of Giants* (1984); the novel *The Interpreters* (1965); and the autobiography *Aké: Years of Childhood* (1982). A champion of Nigerian democracy, Soyinka has been jailed and exiled at various times. In 1986 he was awarded the Nobel Prize for literature.

Soyuz: see SPACE EXPLORATION, table.

Spaak, Paul Henri, 1899–1972, Belgian statesman and Socialist leader. He was Belgium's foreign minister almost continuously from 1938 to 1966, premier (1938–39, 1946, 1947–49), first president of the UN General Assembly (1946), chairman of the Council for Economic Recovery (1948–49), secretary general of NATO

MANNED SPACE PROGRAMS

Program	*Country*	*Years of Launchings*	*Number of Crew*	*Missions and Major Accomplishments*
Apollo: Command and Service Modules	U.S.	1968–73	3	First manned flight to moon (Frank Borman, James Lovell, and William Anders, *Apollo 8*; Dec. 21–27, 1968); used to take Lunar Excursion Module to lunar orbit (*Apollos 10–17; 1969–72*); ferried astronauts to *Skylab*.
Apollo: Lunar Excursion Module (LEM)	U.S.	1969–72	2	First manned lunar landing (Neil Armstrong and Buzz Aldrin in *Apollo 11*, July 20, 1969); five other successful manned lunar landings (*Apollos 12* and *14–17*; 1969–72).
Apollo: Lunar Rover	U.S.	1971–72	2	Motorized lunar surface rover used on *Apollos 15-17*.
Apollo-Soyuz Test Project (ASTP)	U.S., USSR	1975	3 (Apollo) 2 (Soyuz)	First international docking in space (Thomas Stafford, Deke Slayton, and Vance Brand in *Apollo 18*; Aleksei Leonov and Valery Kubasov in *Soyuz 19* ; July 16–18, 1975).
Gemini	U.S.	1965–66	2	First U.S. extravehicular activity (Edward White in *Gemini 4*; June 3,1965); first close rendezvous of two spacecraft (Walter Schirra and Thomas Stafford in *Gemini 6* with *Gemini 7*; Dec. 15, 1965); first manned docking of two spacecraft (Neil Armstrong and David Scott in *Gemini 8* with an Agena rocket stage; Mar. 16, 1966).
Mercury	U.S.	1961–63	1	First U.S. manned (suborbital) flight (Alan Shepard, *Mercury-Redstone 3* or *Liberty Bell 7*; May 5, 1961); first U.S. manned orbital flight (John Glenn, *Mercury-Atlas 6* or *Friendship 7*; Feb. 20, 1962).
Mir	USSR/Russia	1986	2+	Earth-orbit space station; enlarged using Kvant science modules. Space endurance record of nearly 366 days (Vladimir Titov and Musa Maranov, Dec. 21, 1987–Dec. 21, 1988).
Salyut	USSR	1971–86	2+	Earth-orbit space stations (seven launched). Mir is improved version.
Skylab	U.S.	1973–74	3	Earth-orbit space station; three 3-person crews visited for 28, 59, and 84 days, the last a U.S. space-endurance record.
Soyuz	USSR	1967–81	1,2, or 3	First extravehicular transfer of crew members from one spacecraft to another (Yevgeny Khrunov and Aleksei Yeliseyev from *Soyuz 5* to *Soyuz 4*; Jan. 16, 1969); ferried cosmonauts to Salyut.
Soyuz T	USSR	1979–86	2 or 3	Improved version of Soyuz; ferried cosmonauts to Salyut.
Soyuz TM	USSR/Russia	1987–	2 or 3	Improved version of Soyuz T; used to ferry cosmonauts to Mir.
Spacelab	European Space Agency		2 payload specialists	Orbital workshop (with open pallets for scientific instruments) to be carried into space by space shuttle.
Space Shuttle	U.S.	1981–	2–7	First reusable space vehicle (see article).
Voskhod	USSR	1964–65	2 or 3	First extravehicular activity (Aleksei Leonov in *Voskhod 2*; Mar. 18, 1965).
Vostok	USSR	1961–63	1	First manned spaceflight (Yuri Gargarin in *Vostok 1*; Apr. 12, 1961); first simultaneous spaceflights (Andrian Nikolayev in *Vostok 3* and Pavel Popovich in *Vostok 4*; Aug. 1962); first woman in space (Valentina Tereshkova in *Vostok 6*; June 16–19, 1963).

(1957–61), and a founder of the Common Market (see EUROPEAN UNION).

space exploration, the investigation of physical conditions in space and on stars, planets, and natural satellites through the use of artificial SATELLITES, SPACE PROBES, and manned spacecraft. Although studies from earth using optical and radio TELESCOPES had accumulated much data on the nature of celestial bodies, it was not until after World War II that the development of powerful ROCKETS made direct space exploration a technological possibility. Manned spaceflight progressed from the simple to the complex, starting with suborbital and orbital flights by a single ASTRONAUT or cosmonaut (Mercury and Vostok); subsequent highlights include the launching of several crew members in a single capsule (beginning with Gemini and Voskhod), rendezvous and docking of two spacecraft (beginning with Gemini and performed internationally in the *Apollo-Soyuz Test Program*), lunar orbit and landing (Apollo), the launching of space stations (Salyut, Skylab, and Mir), and the launching of a reusable space vehicle, the SPACE SHUTTLE. In 1992 the U.S. and Russia agreed to cooperate on space exploration projects.

Spacelab: see SPACE EXPLORATION, table.

space law, principles of law governing the exploration and use of outer space. The 1967 Outer Space Treaty, signed by most nations, states that INTERNATIONAL LAW applies to outer space and that while

SPACE PROBE PROGRAMS

Program	*Country*	*Years of Launchings*	*Missions and Major Accomplishments*
Galileo	U.S.	1989	Orbiter/probe mission to Jupiter; returned images of Antarctica (1991), first close photographs of asteroids (Gaspra, 1991; Ida, 1993).
Giotto	European Space Agency	1985	Flyby mission to Halley's comet. (Japan and the USSR conducted similar missions.)
Helios	U.S.; West Germany	1974, 1976	Two probes passed within 30 million mi (48 million km) of sun; studied solar wind and surface, interplanetary magnetic field, and cosmic rays.
Luna	USSR	1959, 1963–66, 1968–76	First probes to enter solar orbit, impact the moon, and photograph far side of moon (*Lunas 1, 2,* and *3;* all 1959); first probes to achieve soft lunar landing and lunar orbit (*Lunas 9* and *10;* both 1966); first automated lunar-soil sample return and lunar-surface rover (*Lunas 16* and *17;* both 1970).
Lunar Orbiter	U.S.	1966–67	Five spacecraft inserted into lunar orbit photographed 95% of lunar surface, focusing particularly on potential Apollo landing sites.
Magellan	U.S.	1989	Radar map of Venus's surface (1990–92); measurements of Venus's gravity (1993–).
Mariner	U.S.	1962, 1964, 1967, 1969, 1971, 1973	First successful flybys of Venus (*Mariner 2;* 1962) and Mars (*Mariner 4;* 1964); first probe (*Mariner 9;* 1971) to orbit another planet (Mars); first flyby of Mercury and first dual planet probe (*Mariner 10;* 1973).
Mars	USSR	1960, 1962, 1969, 1971, 1973	First probe to enter Martian atmosphere (*Mars 6;* 1973).
Pioneer	U.S.	1958–60, 1965–69, 1972–73, 1978	First deep-space probe (*Pioneer 5;* 1960); first successful flybys of Jupiter (*Pioneer 10;* 1973) and Saturn (*Pioneer 11;* 1979); first radar probe of cloud-covered surface of Venus (*Pioneer-Venus 1;* 1978). Early missions (*Pioneers 1* to *4;* 1958–59) were unsuccessful lunar-orbit or -flyby attempts.
Ranger	U.S.	1961–62, 1964–65	First probe to return thousands of high-resolution pictures before lunar impact (*Ranger 7;* 1964).
Surveyor	U.S.	1966–68	First probe to return thousands of pictures from lunar surface (*Surveyor 1;* 1966); first chemical analysis of lunar soil (*Surveyor 5;* 1967).
Ulysses	U.S., European Space Agency	1990	Study of sun from polar orbit planned in 1994 and 1995. Examined Jupiter's magnetic field in flyby (Feb. 1992).
Venera	USSR	1961–62, 1965, 1967, 1969–70, 1972, 1975, 1978, 1981	First successful Venus atmospheric entry (*Venera 4,* 1967); first probe to survive to Venusian surface (*Venera 7,* 1970); first probe to return television pictures from Venusian surface (*Venera 9,* 1975).
Viking	U.S.	1975	First successful Mars landers (*Vikings 1* and *2,* 1976), which conducted search-for-life experiments and returned first television pictures from Martian surface; surface also photographed extensively by orbiters.
Voyager	U.S.	1977	Jupiter, and Saturn, Uranus, and Neptune flybys discovered Jupiter's rings, volcanoes on Jovian Satellite Io, new satellites of Jupiter, Saturn, Uranus, and Neptune, and complex structure of Saturn's ring system (*Voyagers 1* and *2,* 1981–89).
Zond	USSR	1964–65, 1967–70	First probe to achieve circumlunar flyby and return to earth (*Zond 5,* 1968).

all states may freely explore and use outer space, territorial claims in space are prohibited. Other treaties dealing with rescue and return of astronauts, liability for damage caused by space objects, and registration of space objects became effective, respectively, in 1968, 1972, and 1976. A treaty on the potential use of the moon's resources, drafted by the UN in 1979, has been signed by several nations; the U.S. has not yet signed it.

space medicine, study of the medical and biological effects of space travel on living organisms. The principal aim is to discover how well and for how long humans can withstand conditions encountered in space and to study their ability to readapt to the earth's environment after travel in space. Medically significant aspects of space travel include WEIGHTLESSNESS, inertial forces experienced during liftoff, radiation exposure, the absence of day-night cycle (see BIORHYTHM), and heat produced within the spacecraft. Participants in SPACE EXPLORATION initially suffered from symptoms such as nausea, sensory disorientation, and poor muscular coordination. Longer flights, having longer periods of weightlessness, have shown that physical adaptations specifically developed in gravity-bound earth organisms (e.g., weight-bearing muscles, gravity-sensing portions of the inner ear, and BLOOD PRESSURE) are especially affected. Shielding and protective clothing prevent exposure to radiation from space and from nuclear reactors on board and regular schedules help mimic day-night cycles.

space probe, unmanned space vehicle, usually carrying sophisticated instrumentation, designed to explore various aspects of the

The key to pronunciation appears on page xiii.

RULERS OF SPAIN SINCE 1474 *(including dates of reign)*

Union of Castile and Aragón

Isabella I (of Castile), ruled jointly with Ferdinand II (of Aragón), 1474–1504
Ferdinand II, ruled jointly with Isabella I as Ferdinand V of Castile, 1474–1504; ruled Aragón only, 1504–16; ruled Castile as regent, 1506–16

Hapsburg Dynasty

Joanna (the Mad), daughter of Ferdinand and Isabella, ruled Castile only (jointly with Philip I in 1506), 1504–6
Philip I (the Handsome), son of Holy Roman Emperor Maximilian I; ruled Castile jointly with Joanna, 1506
Charles I (Holy Roman Emperor Charles V), son of Joanna and Philip, 1516–56
Philip II, son of Charles I, 1556–98
Philip III, son of Philip II, 1598–1621
Philip IV, son of Philip III, 1621–65
Charles II, son of Philip IV, 1665–1770

Bourbon Dynasty

Philip V, great-grandson of Philip IV, 1700–1746
Ferdinand VI, son of Philip V, 1746–59
Charles III, younger son of Philip V, 1759–88
Charles IV, second son of Charles III, 1788–1808
Ferdinand VII, son of Charles IV, 1808

French Intrusion

Joseph Bonaparte, 1808–13

Bourbon Restoration

Ferdinand VII, restored, 1813–33
Isabella II, daughter of Ferdinand VII, 1833–68

Elective Monarchy

Francisco Serrano y Domínguez, regent, 1869–70
Amadeus, elected by a constituent assembly, 1870–73

First Republic

Estanislao Figueras, president, 1873
Francisco Pi y Margall, president, 1873
Nicholás Salmerón y Alonso, president, 1873
Emilio Castelar y Ripoll, prime minister, 1873–74

Bourbon Restoration

Alfonso XII, son of Isabella II, 1874–85
Alfonso XIII, son of Alfonso XII, 1886–1931

Second Republic

Niceta Alcalá Zamora, president, 1931–36
Manuel Azaña, president, 1936–39

Nationalist Government

Francisco Franco, chief of state, 1939–75

Constitutional Monarchy

Juan Carlos I, grandson of Alfonso XIII, 1975–

SOLAR SYSTEM. Unlike an artificial SATELLITE, which is placed in more or less permanent orbit around the earth, a space probe is launched with enough energy to escape the gravitational field of the earth (see ESCAPE VELOCITY) and navigate between planets. Radio contact between the control station on earth and the space probe provides a channel for transmitting data recorded by onboard instruments back to earth. A probe may be directed to orbit a planet, to soft-land instrument packages on a planetary surface, or to fly by one or more planets and/or natural satellites, approaching within a few thousand miles. See table of space probe programs.

space shuttle, reusable U.S. space vehicle. It consists of a winged orbiter, two solid-rocket boosters, and an external tank. Lift-off thrust is derived from the orbiter's three main liquid-propellant engines and the boosters. After 2 min the latter use up their fuel, are separated from the spacecraft, and—after deployment of parachutes—are recovered following splashdown. After about 8 min of flight, the orbiter main engines shut down; the external tank is then jettisoned and burns up as it reenters the atmosphere. The orbiter meanwhile enters orbit after a short burn of its two small Orbiting Maneuvering System (OMS) engines. To return to earth, the orbiter turns around, fires its OMS engines to reduce speed, and, after descending through the atmosphere, lands like an airplane. Following four orbital test flights (1981–82) of the space shuttle *Columbia*, operational flights began in Nov. 1982. The 25th shuttle flight ended in disaster on Jan. 28, 1986, when *Challenger*, on its 10th flight, exploded shortly after liftoff, killing all seven crew members. Shuttle flights were suspended until Sept. 1988 and then resumed on a more conservative schedule. The shuttle program has resulted in several notable achievements, including the rescue and repair of disabled satellites (including the HUBBLE SPACE TELESCOPE) and the first three-person spacewalk (1992). It has also conducted experiments designed to test the ability of astronauts to assemble and maintain a SPACE STATION. NASA was forced, however, to reemphasize expendable rockets to reduce the cost of placing payloads in space.

space station or **space platform,** artificial earth satellite, usually manned, that is placed in a fixed orbit and can serve as a base for astronomical observations, zero-gravity materials processing, satellite repair, or (possibly) weapons, or as a staging area for constructing large communications satellites to be placed in geosynchronous orbit. Early examples of space stations are the American *Skylab* and the Soviet Salyut and Russian Mir spacecraft (see SPACE EXPLORATION, table). NASA, in conjunction with Japan, Canada, and the European Space Agency, is developing a space station that would be assembled in space beginning in the late 1990s. Russia joined the project in 1993. The American physicist Gerard O'Neill proposed the construction of space colonies—very large space stations built from lunar or asteroidal material and inhabited by several thousand people.

space telescope: see HUBBLE SPACE TELESCOPE.

space-time, central concept in the theory of RELATIVITY that replaces the earlier concepts of space and time as separate absolute entities. In space-time, events in the universe are described in terms of a four-dimensional continuum in which each observer locates an event by three spacelike coordinates and a timelike coordinate. The choice of the last is not unique; hence, time is not absolute but is relative to the observer.

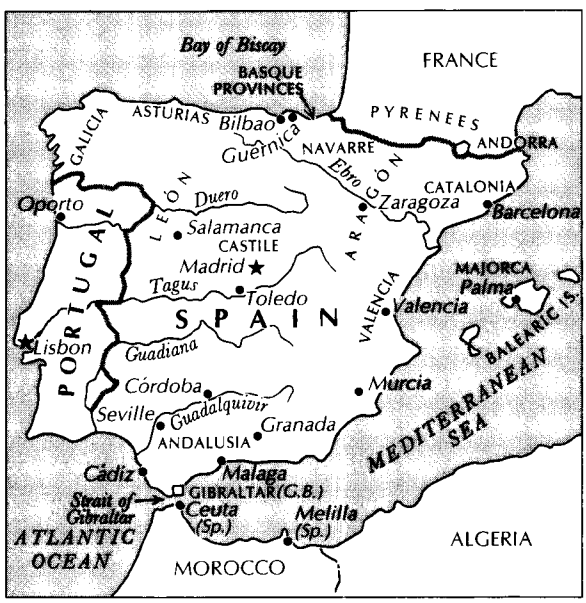
Spahn, Warren Edward, 1921–, American baseball player; b. Buffalo. He pitched for the Boston (later, Milwaukee) Braves from 1942 to 1964. Before retiring at age 44, he won 363 games, a record for left-handers and the fifth best ever.

Spain, Span. *España*, officially Kingdom of Spain, country (1992 est. pop. 39,118,000), 194,884 sq mi (504,750 sq km), SW Europe, on the IBERIAN PENINSULA and including the BALEARIC ISLANDS, CANARY ISLANDS, and five enclaves in Morocco. Spain is bordered by the Bay of Biscay and France (N), the Mediterranean Sea (E and SE), and Portugal and the Atlantic Ocean (W). The small principality of ANDORRA is wedged between Spain and France in the PYRENEES. The Strait of Gibraltar separates Spain from North Africa. (GIBRALTAR itself is a British possession.) Spain has 17 geographic and historic regions, now constituted as autonomous communities (regions), that generally correspond to the old Christian and Moorish kingdoms. MADRID is the capital; other major cities include BARCELONA, VALENCIA, and SEVILLE. The center of Spain forms a vast plateau extending from the Cantabrian Mts. in the north to the Sierra Morena in the south, and from the Portuguese border in the west to low ranges in the east. The plateau is generally arid and thinly populated. It is cut from west to east by mountain chains and the valleys of the Douro (Duero), Tagus, and Guadiana rivers. To the northeast of the plateau is the broad valley of the Ebro R. The southernmost section, ANDALUSIA, is crossed by the fertile valley of

the Guadalquivir R. The highest peak in continental Spain is Mulhacén (11,411 ft/3,478 m), in the Sierra Nevada.

People. The Spanish people display great regional diversity; a desire for political independence remains particularly strong among the Catalans and the BASQUES. The Castilian dialect is the standard language, but Catalan, Galician, and Basque are spoken. Roman Catholicism is the predominant religion.

Economy. Spain is primarily an agricultural country, with wheat, olive oil, potatoes, sugar beets, and citrus fruits among the leading crops. It is also a leading producer of cork and wine. Spanish industry produces textiles, iron and steel products, ships, automobiles, processed foods, chemicals, and various consumer goods. Rich deposits of iron, coal, and zinc are mined in the Cantabrian Mts.; petroleum and copper are also produced. Tourism and fishing are important sources of income.



Government. Spain is a constitutional monarchy. Since 1975 the reigning monarch has been King JUAN CARLOS I. The parliament (CORTES) consists of a chamber of deputies, with 350 members, and senate, with 208 members. The leading political groups are the Socialist party and the conservative People's party. A new constitution was approved by national referendum in 1978.

Early History. Spain was known to early Mediterranean peoples as far back as the Stone Age. The Phoenicians established colonies c.1100 B.C. and were followed by the Carthaginians and the Greeks. The Romans conquered Spain in the 2d cent. B.C. and made the region a colony. Christianity was introduced in the 1st cent. A.D. In 409 Spain was overrun by Germanic invaders, and in 419 a Visigothic kingdom was set up. After Spain was invaded (711) from N Africa by Muslim BERBERS, the last Visigothic kingdom collapsed. The MOORS, as the Muslim invaders were known, soon conquered the entire peninsula except for ASTURIAS and the Basque country. Under the Moors, Spanish cities, industry, and agriculture prospered and a distinctive architecture (exemplified by the Alhambra in GRANADA) flourished. But the Moors never controlled N Spain, and over the centuries the northern Christian kingdoms expanded (see ARAGÓN and CASTILE) while the Moors became divided. The fall of Granada (1492) made the Spanish monarchs FERDINAND V and ISABELLA I rulers of all Spain. Catholic leaders expelled the Jews in 1492 and attempted to convert the Muslims by force. America was discovered (1492) by Columbus, and the beginnings of a huge colonial empire in the New World were established.

The Golden Age and Decline. Gold and silver from the Americas flowed into Spain in great quantities, and by the 16th cent. Spain was the most powerful country in the world. Under its first HAPSBURG king, Charles I (r.1516–56; Holy Roman emperor after 1519 as CHARLES V), Spain entered its Golden Age, when a brilliant artistic, cultural, and intellectual life flourished. During this period the church's dominance grew, reaching its peak in the INQUISITION. But Spanish power in Europe began its long decline during the reign of Charles's son, PHILIP II (r.1556–98). The Spanish ARMADA was defeated (1588) by England, and continuous wars in Europe sapped the country's strength. The accession (1700) of the BOURBON dynasty in Spain provoked the War of the SPANISH SUCCESSION. Drawn into the Napoleonic Wars, Spain was occupied by French troops and given (1808) a French king, Joseph Bonaparte (see BONAPARTE, family), but by 1814 Spanish resistance forces and the British had expelled the French (see PENINSULAR WAR). In the mid-19th cent. Spain was torn by internal struggles (see CARLISTS). On the abdication (1868) of ISABELLA II, a constitutional monarchy was established, followed by a short-lived republic (1873–74). The last remnant of Spain's colonial empire in America was lost (1898) during the SPANISH-AMERICAN WAR.

Modern Spain. In 1923 a military dictatorship was established under PRIMO DE RIVERA. King ALFONSO XIII was deposed (1931) and a second republic was created. But opposition from both the left and the right, as well as from Catalan separatists, eventually undermined the republic. The election of a leftist coalition in 1936 precipitated the SPANISH CIVIL WAR (1936–39). The Insurgents, under Francisco FRANCO, embraced most conservative groups, notably monarchists, the army, the church, and the fascists. After a savage conflict the pro-republican forces (Loyalists) were defeated and a dictatorship under Franco was set up. During WORLD WAR II Spain aided the AXIS but did not enter the war. The 1950s and 60s were marked by growing prosperity and by agitation for political freedom. In 1969 Franco appointed Prince Juan Carlos, grandson of Alfonso XIII, as his successor. Following Franco's death in 1975, King JUAN CARLOS and his premier, Adolfo SUÁREZ GONZÁLEZ, steered Spain toward parliamentary democracy. With all political parties, including the Communists, legalized by 1977, the first parliamentary election was held that year, and Suárez's Democratic Center received a plurality. In 1981 Leopoldo CALVO SOTELO became premier following Suárez's resignation. The following year the Socialist party won a sweeping victory in nationwide elections, bringing into power the first left-wing government since before the civil war, with Socialist leader Felipe GONZÁLEZ MÁRQUEZ as premier. Violence associated with Basque and Catalan separatism remained a problem in the 1980s. Rightist civil guards seeking greater centralization seized the Spanish parliament in 1981. Lacking support, however, the coup was quickly put down. Spain joined the European Community in 1986, and despite widespread opposition to Spain's membership in NATO, Spaniards voted (1987) to remain in the alliance. Voters returned the Socialists to office in 1986, 1989, and, as a minority government, 1993. In the early 1990s the country slipped into a deep recession.

spaniel: see SPORTING DOG.

Spanish-American War, 1898, conflict between Spain and the U.S. Demands by Cuban patriots for independence from Spain were supported by large numbers of Americans. Pro-rebel sentiment was inflamed by the biased reporting of the U.S. "yellow press," heavy losses of American investment caused by guerrilla warfare, and an appreciation of Cuba's strategic importance to a projected Central American canal. The publication of a Spanish letter disparaging Pres. MCKINLEY, and the sinking (Feb. 15) of the U.S. battleship MAINE in Havana harbor, intensified U.S. feeling against Spain. The U.S. demanded Spanish withdrawal from Cuba. On Apr. 24 Spain declared war on the U.S. On May 1 a U.S. naval squadron under George DEWEY thoroughly defeated the Spanish fleet in Manila harbor, in the Philippines. On May 28 the U.S. established a blockade of Santiago de Cuba; when the Spanish fleet attempted to escape (June 1), it was destroyed. Meanwhile, U.S. troops, including the famed ROUGH RIDERS, engaged in some heavy fighting (July 1) at El Canay and San Juan Hill. On July 17 Santiago was captured, effectively ending the war. An armistice was signed Aug. 12, and peace was arranged by the Treaty of Paris (Dec. 10). The Spanish empire was practically dissolved; Cuba was freed, but under U.S. tutelage; Puerto Rico and Guam were ceded to the U.S.; and the Philippines were surrendered to the U.S. for $20 million. The U.S. emerged from the war with new international power.

The key to pronunciation appears on page xiii.

Spanish civil war, 1936–39, conflict in which conservative forces in Spain overthrew the second Spanish republic. The war pitted the Nationalists, led by the landed aristocracy, Roman Catholic Church, military leaders, and the fascist FALANGE party, against the Loyalists, consisting of liberals, anarchists, socialists, and Communists. In July 1936, Gen. FRANCO led an army revolt in Morocco and invaded Spain to support right-wing rebels. The Nationalist army overran conservative areas in N Spain, while the Loyalists remained strong in CATALONIA and the BASQUE PROVINCES. Volunteers abroad formed International Brigades to fight for the Loyalists, who received supplies from the Soviet Union. Fascist Italy and Nazi Germany aided the Nationalists with modern arms and some 60,000 troops. The Loyalist side was riven by factional strife that was exacerbated by the Communists' suppression of anarchists and Trotskyites. Nationalist forces, unified under Franco, gradually wore down republican strength, conquering Barcelona and Madrid in early 1939. For Italy and Germany the war was a testing ground for modern armaments and techniques to be used in WORLD WAR II. For the youth of the 1930s, saving the Spanish republic was the idealistic cause of the era. But the civil war's huge death toll, human suffering, and material devastation were unparalleled in Spanish history. The war also ushered in a long era of right-wing dictatorship, that ended only with Franco's death in 1975.

Spanish colonial art and architecture, fl. 16th–early 19th cent. The art of the Spanish colonies followed the development of styles in Spain, but had original features in different regions, with the main centers in Peru and Mexico. The earliest colonial buildings have disappeared, but by the end of the 16th cent. a durable monumental architecture had been achieved. Intricate ornamentation was often used, as in the plateresque decorations on the earliest cathedral in the New World, in Santo Domingo, Dominican Republic (1512–41). However, most of the buildings of the colonial period are massive and simple, e.g., the Spanish missions of California. In 16th-cent. Mexico the great builders were the Augustinian, Franciscan, and Dominican orders, which introduced the open chapel. During most of the 17th and 18th cent. the baroque style held sway, but contrasts between plain and decorated surfaces were maintained. A more conservative trend was manifested in the simple, severe buildings of Colombia. The colonial ultrabaroque reached a climax in the cathedral in Mexico City, with its strong light-and-shade patterns, rich carvings, and violent alternations of curves and angles. Central American buildings were generally provincial versions of the Mexican. Meanwhile, Peru evolved a rich architecture, more massive than the Mexican, with wall surfaces divided into large compartments rather than covered with shallow carving as in Mexico. A fine example of Peruvian architecture is the Church of San Agustín in Lima (1720). The great days of Spanish colonial architecture ended with the rise of neoclassicism in the late 18th cent. The fine artists of the Spanish colonies, many of them indigenous people who gave colonial art its unique flavor, mainly portrayed religious subjects from the New Testament. Indigenous sculptors, notably in Mexico, Guatemala, Paraguay, and Peru, developed a powerful folk art, employing polychrome wood, terra cotta, and architectural bas-reliefs. In painting, the conceptions were frequently original and charged with remarkable intensity and piety. Native strains were also noticeable in the broadsides of so-called folk-lithography, often political in nature, common in 18th- and 19th-cent. Mexico and Venezuela. See also MEXICAN ART AND ARCHITECTURE.

Spanish language, member of the Romance group of the Italic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Spanish Main, the coast of NW South America, particularly the section between Panama and the ORINOCO R., from which Spanish treasure fleets carried gold back to Spain in colonial times. Buccaneers preying on the vessels as they passed through the CARIBBEAN SEA made the term a symbol of piratical romance.

Spanish moss, fibrous grayish-green EPIPHYTE (*Tillandsia usneoides*) of the BROMELIAD family, found in tropical America and the Southern U.S. Spanish moss, also called Florida, long, or southern moss, grows hanging from trees and has inconspicuous flowers. It is not a true MOSS.

Spanish Succession, War of the, 1701–14, general European war fought for the succession to the Spanish empire. CHARLES II, the Hapsburg king of Spain, was childless, and negotiations over his eventual successor began long before his death. The chief claimants were Philip, son of Louis XIV of France; Archduke Charles (later Holy Roman Emperor CHARLES VI), son of Emperor Leopold I; and Joseph Ferdinand, electoral prince of Bavaria. England and Holland, opposed to the extension of either French Bourbon or Austrian Hapsburg power into Spain, favored Joseph Ferdinand. In 1698 all the powers agreed to the complicated First Partition Treaty. By its terms, Joseph Ferdinand was to get the crown; in return, Spanish territories were to go to Austria and France. Joseph Ferdinand died before Charles, however, and the treaty went into jeopardy. In 1700 the duke of Anjou, grandson of Louis, named by the dying Charles as his successor, ascended the throne as PHILIP V. England, Holland, Austria, and most of the German states then went to war against France. Bavaria sided with France, as did Portugal and Savoy until 1703, when they switched sides. Military operations began in the Low Countries and became general in 1703. The great allied commanders, the English duke of MARLBOROUGH and the imperial general Prince EUGENE OF SAVOY, won such major victories as Blenheim and Gibraltar (1704), Ramillies (1706), Oudenarde (1708), and Malplaquet (1709). The campaigns in Spain were indecisive, however, and in 1711 England quit the war. Charles VI had become emperor, and he represented as great a threat to the English as did the Bourbons. In 1713 England, Holland, and France signed the Peace of Utrecht. Charles continued the war until 1714. Although Philip remained on the Spanish throne, the principle of BALANCE OF POWER had been established in European dynastic affairs.

Spark, Muriel, 1918–, Scottish novelist. Her witty novels expose both the petty foibles of her characters and the dark side of human experience. They include *Memento Mori* (1958), *The Girls of Slender Means* (1963), and *Loitering with Intent* (1981). *The Prime of Miss Jean Brodie* (1961) became an acclaimed stage, film, and television production.

spark chamber: see PARTICLE DETECTOR.

sparrow, small, perching, New World BIRD (genus *Passer*) of the FINCH family. Field and hedge birds inconspicuously colored in dull grays and browns, sparrows have stout, conical beaks adapted to seed eating, and are valuable to farmers in destroying weed seeds.

Sparta, city of ancient Greece, capital of Laconia, on the Eurotas R. in the S PELOPONNESUS. The CITY-STATE of Sparta was founded by Dorian Greeks who conquered Laconia and Messenia (c.735–715 B.C.). It was a center of wealth and culture. However, after 600 B.C. Sparta cultivated only the military arts, and the city became an armed camp. The ruling class, the Spartiates, gave themselves wholly to war. Only Spartiates were citizens with legal and civil rights. Below this warrior class were the perioeci (freemen permitted to carry on commerce and handicrafts) and helots (serfs bound to the land). The Spartan government was headed by two hereditary kings, and there were a council of elders and a general assembly of citizens. But the real rulers were the board of five ephors (overseers), elected annually, who conducted the business of the state secretly. By the 6th cent. B.C. Sparta was the strongest city in Greece. In the PERSIAN WARS Sparta fought beside Athens at THERMOPYLAE and Salamis (480), and at Platea (479). Afterward, Sparta's rivalry with Athens intensified, leading to the PELOPONNESIAN WAR (431–404), which wrecked the Athenian empire. Sparta emerged triumphant but was decisively defeated by Thebes at Leuctra (371). Sparta subsequently fell an easy prey to Macedon and declined. It prospered under the Romans but was devastated by the Goths in A.D. 395.

Spartacus, d. 71 B.C., Roman gladiator, leader of a slave revolt that was the last and most important of the SERVILE WARS. He escaped from the gladiators' school at Capua, gathered many runaway slaves about him, and in 72 B.C. dominated much of S Italy. He was killed in battle when Marcus Licinius Crassus (see CRASSUS, family) and POMPEY put down the revolt. They crucified some 6,000 captured slaves.

Spartacus party or **Spartacists,** German radical socialist party, the precursor of the German Communist party. Among its founders in 1916 were Karl Liebknecht (1871–1919) and Rosa Luxemburg. In

Jan. 1919 the Spartacists, newly transformed as the German Communist party, led a general strike and revolt in Berlin that was put down by the army within a week. Liebknecht and Luxemburg were brutally murdered by the soldiers.

spearmint: see MINT.

Special Drawing Rights (SDRs), type of international monetary reserves established (1968) by the International Monetary Fund (IMF). Created in response to concern over the limitations of gold and dollars as the sole means of settling international accounts, SDRs were designed to augment international liquidity. Also known as "paper gold," SDRs are assigned to the accounts of IMF members in proportion to their contributions to the fund. Each member agrees to accept them as exchangeable for gold or reserve currencies, and deficit countries can use them to purchase stronger currencies. In 1976 the IMF increased the share of the less-developed countries and moved to make SDRs the primary reserve asset of the INTERNATIONAL MONETARY SYSTEM, supplanting gold and dollars.

special prosecutor: see INDEPENDENT COUNSEL.

species: see CLASSIFICATION.

specific gravity, the ratio of the WEIGHT of a given volume of a substance to the weight of an equal volume of a reference substance, usually water. See DENSITY.

specific heat, ratio of the HEAT CAPACITY of a substance to the heat capacity of a reference substance, usually water. Because the heat capacity of water is 1 Btu/lb per degree Fahrenheit or 1 cal/g per degree Celsius, the specific heat of a substance relative to water will be numerically equal to its heat capacity.

spectral class, a classification of stars by their SPECTRUM and LUMINOSITY. The stars were originally divided into seven main classes designated by the letters O, B, A, F, G, K, and M; since 1924 four other classes (R, N, S, and W) have been added. R, N, and S are similar to the K and M types but have somewhat different characteristics; W indicates a Wolf-Rayet star, the hottest type of star that shines with a steady light. Each of the letter classes has subdivisions indicated by the numerals 0 through 9; 0 signifies the hottest type and 9 the coolest within a class. A Roman numeral—ranging from I (supergiant) to V (normal dwarf or main sequence)—is added to the spectral class to specify the luminosity, or intrinsic intensity, of a star.

SPECTRAL CLASSES: CHARACTERISTICS

Type	*Color*	*Temperature*	*Strong Lines*
O	blue-white	35,000°C	ionized helium
B	blue-white	21,000°C	helium
A	white	10,000°C	hydrogen
F	creamy	7,000°C	ionized calcium
G	yellow	6,000°C	calcium
K	orange	4,500°C	titanium oxide
M	red	3,000°C	titanium oxide

spectroscope, optical instrument for producing spectral lines and measuring their wavelengths and intensities, used in spectral analysis (see SPECTRUM). In the simple prism spectroscope, a collimator, with a slit at the outer end and a lens at the inner end, transforms the light entering the slit into a beam of parallel rays. A prism or diffraction grating disperses the light coming from the collimator, and the spectrum formed is observed with a small telescope. A **spectrograph** uses a camera or a photomultiplier tube instead of a telescope; the photomultiplier tube allows real-time spectrographic analysis and greater accuracy. Such analysis (spectroscopy) is used to analyze the composition of unknown materials in many disparate fields.

speech: see LANGUAGE.

speed: see MOTION.

Speer, Albert [shpār], 1905–81, German architect and NAZI leader. He was HITLER's official architect and was Nazi minister of armaments (1942–45). He served 20 years in prison after being sentenced as a war criminal (1946) by the Nuremberg tribunal. His memoirs, *Inside the Third Reich* (tr. 1972), were widely read.

Speke, John Hanning [spēk], 1827–64, English explorer in Africa. In 1858 he and Sir Richard BURTON discovered Lake TANGANYIKA. Speke also discovered Lake VICTORIA. In 1862 he proved that the Victoria NILE R. issues from the north end over Ripon Falls.

speleology, systematic exploration of CAVES, popularly called spelunking. It includes the measuring and mapping of caves and reporting on the flora and fauna found in them.

Spencer, Herbert, 1820–1903, English philosopher. Together with Charles DARWIN and Thomas Henry HUXLEY he was responsible for the acceptance of the theory of evolution, and he coined the phrase "survival of the fittest," later attributed to Darwin. He projected a vast work, *Synthetic Philosophy,* that would apply the principle of evolutionary progress to all branches of knowledge; the numerous volumes published between 1855 and 1893 covered such subjects as biology, psychology, sociology, and ethics. He is credited with the establishment of sociology as a discipline in the U.S.

Spender, Stephen, 1909–, English poet and critic. In the 1930s he was an associate of AUDEN and MACNEICE; his autobiography, *World within World* (1951), records the period. His poems are collected in many volumes, e.g., *The Still Centre* (1939) and *Generous Days* (1971), and he has written social and literary criticism and fiction.

Spener, Phillip Jakob [shpā'nər], 1635–1705, German theologian, founder of the devotional movement in LUTHERANISM known as Pietism. As a Lutheran pastor in Frankfurt, he instituted (1670) meetings for fellowship and Bible study to counteract the barren intellectualism in the church. These *Collegia Pietatis* led to a religious revival in Germany and in other parts of Europe despite the opposition of the orthodox clergy. He helped found (1694) the Univ. of Halle.

Spengler, Oswald, 1880–1936, German historian and philosopher. His major work, *The Decline of the West* (2 vol., 1918–22), reflects his view that every culture passes through a life cycle from youth through maturity and old age to death, and that Western culture had entered the period of decline.

Spenser, Edmund, 1552?–1599, English poet. A friend of many eminent court and literary figures, he was appointed to a secretaryship in Ireland in 1580, and lived in County Cork thereafter. Patterning his literary career on VERGIL, he first published 12 pastoral eclogues of *The Shepheardes Calendar* (1579). *Complaints* and the elegy *Daphnaida* appeared in 1591. In 1595 *Colin Clouts Come Home Againe,* a PASTORAL allegory dealing with a journey to London and the vices of court life, appeared, as did the ELEGY *Astrophel,* the SONNET sequence *Amoretti,* and the complex wedding poem *Epithalamion* in honor of his marriage. *Fowre Hymnes,* explaining his Platonic and Christian views on love and beauty, and *Prothalamion* came in 1596. In the same year the second three books of his unfinished masterpiece, *The Faerie Queene,* were published (the first three had been published in 1590). The poem is an EPIC that treats moral virtues allegorically. Its excellence lies in the depth of Spenser's moral vision, and in the Spenserian nine-line stanza he invented for it. Spenser was recognized by contemporaries as the foremost poet of the time.

sperm or **spermatozoon,** specialized male sex cell. It is smaller than the female sex cell (OVUM) and has a flagellum which provides motility. The formation of sperm, like that of the ovum, requires MEIOSIS, which reduces the chromosome number by half. An ovum fertilized by a sperm (called a zygote) has the full number of chromosomes restored to it. See also REPRODUCTION; REPRODUCTIVE SYSTEM.

sphagnum or **peat moss,** economically valuable MOSS (genus *Sphagnum*) typically growing as a floating mat in freshwater bogs. Sphagnums are the principal constituent of PEAT. They are highly absorbent and are commercially important as packing material and absorbent dressings.

sphalerite, zinc sulfide mineral (ZnS), occurring worldwide, sometimes in crystals but more often in massive form, in a variety of colors. Often found in association with GALENA, it is the most important source of ZINC.

sphere, in geometry, a solid whose surface consists of points all at the same distance r (the radius) from a certain fixed point (the center). The term *sphere* refers both to the surface and to the space it encloses. The area of the surface of a sphere is given by the

formula $S = 4\pi r^2$ and the volume of a sphere is given by $V = \frac{4}{3}\pi r^3$.

sphinx, mythical beast of ancient Egypt, usually represented in art as having a human head and the body of a lion. It frequently symbolized the pharaoh as an incarnation of the sun god RA. The most famous one is the Great Sphinx, a colossal stone figure at Al Jizah. Sphinxes were also depicted throughout the ancient Middle East and Greece.

spider, mostly terrestrial ARACHNID, with a two-part body, four pairs of legs, and four pairs of eyes. Spinnerets (specialized organs under the abdomen) produce silk thread for binding prey or making webs, cocoons, and lines for floating. Spiders live chiefly on insects and other arthropods; some large species prey on small snakes, mammals, and birds. All spiders paralyze their prey with venom produced in poison glands under the head; several species, such as the BLACK WIDOW, have bites that are painful or even dangerous to humans. See also TARANTULA.

Spielberg, Steven, 1946–, American film director; b. Cincinnati. His technically polished films include *Jaws* (1975), *Close Encounters of the Third Kind* (1977), *Raiders of the Lost Ark* (1981), *E.T.: The Extra-Terrestrial* (1982), *The Color Purple* (1985), *Jurassic Park* (1993), and *Schindler's List* (1993).

spinach, annual plant (*Spinacia oleracea*) of the goosefoot family, probably Persian in origin. The leaves are high in VITAMINS and iron, and numerous varieties are cultivated.

spinal cord, length of nerve-fiber bundles carrying information (electrical and chemical signals) through the NERVOUS SYSTEM. The spinal cord carries sensory impulses from the trunk and limbs to the brain; it returns commands from the brain to the muscles and glands. Anatomically, the spinal cord runs nearly the length of the trunk and merges with the brainstem. The spinal cord is housed within the **spinal column,** a bony column that also forms the main structural support of the SKELETON. The spinal column consists of segments (vertebrae) linked by flexible joints and held together by gelatinous disks of cartilage and by ligaments. Each vertebra has a roughly cylindrical body, winglike projections, and a bony arch. The arches, positioned next to one another, create the tunnellike space that houses the spinal cord.

spinal meningitis: see MENINGITIS.

spindle: see SPINNING.

spinet: see PIANO.

Spingarn, Joel Elias, 1875–1939, American educator and critic; b. N.Y.C. A professor of literature at Columbia (1899–1911), he wrote such studies as *A History of Literary Criticism in the Renaissance* (1899) and *The New Criticism* (1911). Spingarn was also a prominent officer of the NAACP.

spinning, the drawing out, twisting, and winding of FIBERS into a continuous thread or yarn. From antiquity until the INDUSTRIAL REVOLUTION, spinning was a household industry. The earliest tools were the distaff, a hand-held stick on which the cotton, flax, or wool fiber was wrapped; and the spindle, a shorter stick, held in the other hand, notched at one end and weighted at the other. The twirling of the spindle twisted the fiber into thread. In Europe from the 14th to 16th cent. the distaff and spindle were replaced by the spinning wheel, a spindle set in a frame and turned by a belt passing over a wheel. The great wheel, also called the wool or walking wheel, was turned by hand; the more elaborate flax, or Saxony, wheel was operated by a foot treadle. In 18th-cent. England, improvements in the loom, increasing the demand for yarn, stimulated such inventions as James HARGREAVES's spinning jenny (c.1765), which spun 8 to 11 threads at once; Richard ARKWRIGHT's spinning frame (1769), which made more tightly twisted, stronger threads; and Samuel CROMPTON's mule spinning frame (1779), which combined the best features of the two earlier machines. Using water power and, later, steam, spinning became a factory enterprise.

Spinoza, Baruch or **Benedict,** 1632–77, Dutch philosopher. A member of the Sephardic Jewish community of Amsterdam, Spinoza received a thorough education in the tradition of medieval philosophical texts as well as in the works of DESCARTES, HOBBES, and other writers of the period. After charges of heretical thought and practice led to his excommunication from the Jewish community in Amsterdam in 1656, he Latinized his name to Benedict. He was by trade a lens grinder, modestly rejecting offers of an academic career, but he nevertheless became celebrated in his own day and was regularly visited by other philosophers. Spinoza's system is monist, deductive, and rationalistic. Politically he posited the idea of the SOCIAL CONTRACT, but unlike Hobbes he visualized a community in which human beings derive most advantage from the rational renunciation of personal desire. He rejected the concept of FREE WILL, holding human action to be motivated by one's conception of self-preservation. A powerful, or virtuous, person acts out of understanding; thus freedom consists in being guided by the law of one's own nature, and evil is the result of inadequate understanding. He saw the supreme ambition of the virtuous person as the "intellectual love of God." Spinoza shared with Descartes an intensely mathematical appreciation of the universe: truth, like geometry, follows from first principles, and is accessible to the logical mind. Unlike Descartes, however, he regarded mind and body (or ideas and the physical universe) as merely different aspects of a single substance, which he called alternately God and Nature, God being Nature in its fullness. This pantheism was considered blasphemous by the religious and political authorities of his day. Of his works, only *A Treatise on Religious and Political Philosophy* (1670) was published during his lifetime. His *Ethics, Political Treatise,* and *Hebrew Grammar* are included in his posthumous works (1677).

spiritism or **spiritualism,** belief that the human personality survives death and can communicate with the living through a medium sensitive to its vibrations. The communication may be psychic, as in clairvoyance or trance speaking, or physical, as in automatic writing or ectoplasmic materializations. Modern U.S. spiritism dates from the activities (1848) of medium Margaret Fox and her sisters, later admitted to be fraudulent. Spiritualistic phenomena are now under scientific investigation (see PARAPSYCHOLOGY).

spiritual, a deeply emotional, often profoundly melancholy, religious FOLK SONG, characterized by syncopation, polyrhythmic structure, and the pentatonic scale of five whole tones. The text is often biblical. Spirituals were long thought to be the spontaneous creation of African-American slaves and the only original folk music of the U.S. In the 1920s G.P. Jackson proposed the theory that these spirituals were in fact adapted from or inspired by 19th-cent. camp-meeting revival songs of the Southern white population. Spirituals are now considered to be an amalgamation of African musical traditions and religious songs of the 19th-cent. white South, which produced a form of folk music distinctly African-American in character. Spirituals are related to the sorrow songs that are the source of the blues (see JAZZ).

Spitsbergen, formerly **Vestspitsbergen,** largest island (15,075 sq mi/39,044 sq km) of SVALBARD, a Norwegian possession in the Arctic Ocean. Coal mining is a major industry.

Spitz, Mark Andrew, 1950–, American swimmer; b. Modesto, Calif. Known as a great freestyle swimmer, he won four individual events in the 1972 Olympics, setting world records in the 100- and 200-meter freestyle races. He also won two gold medals in 1968 and three in 1972 for team relays.

spleen, soft, purplish-red organ that lies on the left side of the abdominal cavity, under the diaphragm. The spleen filters foreign organisms and old red blood cells from the bloodstream by means of phagocytic cells that engulf and destroy them. Certain white blood cells are formed in the spleen. The spleen also manufactures red blood cells in the fetus toward the end of pregnancy and takes over again after birth if the bone marrow fails to perform that function.

Spock, Benjamin McLane, 1903–, American author and pediatrician; b. New Haven, Conn. His *Common Sense Book of Baby and Child Care* (1946; later *Baby and Child Care*) has sold more copies than almost any other book published in the U.S. He wrote widely on child-rearing, and became (1955) professor of child development at Western Reserve Univ. In 1967 he resigned to devote his full time to the peace and antinuclear movements. He was the 1972 presidential candidate for the People's party.

Spode, English family of potters. **Josiah Spode I,** 1733–97, founded a pottery firm in 1770 at Stoke-on-Trent. He developed a transparent but durable bone china that is still made. After 1797,

under his son **Josiah Spode II,** 1754–1827, the firm was known for blue-and-white ware with novel designs, such as hunting scenes.

spoils system, in U.S. history, the practice of giving appointive offices to loyal members of the party in power. Used by the earliest presidents, particularly Thomas JEFFERSON, the spoils system became extensive during the administration of Andrew JACKSON. The corruption and inefficiency bred by the system reached staggering proportions under U.S. GRANT; reaction led to the creation of the CIVIL SERVICE Commission in 1871. The spoils system has, however, continued for some federal and many state offices.

Spokane, city (1990 pop. 177,196), seat of Spokane co., E Wash., at the falls of the Spokane R.; inc. 1881. It is a port of entry, and the commercial, transportation, and industrial center of the "Inland Empire," a productive grain, fruit, and livestock region. Its manufactures are diversified. Spokane's business and cultural life were reinvigorated by development for the fair "Expo '74." A cultural and educational center, the city has a noted museum of Native American culture.

sponge, aquatic invertebrate animal of the phylum Porifera. All but one family are marine. Colonies of adult sponges, often brilliantly colored, live attached to rocks, corals, or shells, exhibiting so little movement that 18th-cent. naturalists considered them plants. The sponge's body is like a sac. Water is drawn into a central cavity through many tiny holes in the body wall and expelled through a large opening at the top. Hard materials embedded in the body wall form a skeleton. The dried skeletons of colonial sponges have been used to hold liquid since ancient times. Natural sponges are light gray or brown when dried and irregular in shape.

spontaneous combustion, phenomenon in which a substance unexpectedly bursts into flame without apparent cause. Spontaneous combustion occurs when a substance undergoes a slow oxidation that releases heat in such a way that it cannot escape the substance; the temperature of the substance consequently rises until ignition takes place.

spore, term applied both to a resistant or resting stage occurring among unicellular organisms such as bacteria and to an asexual reproductive cell of multicellular plants that gives rise to a new organism without FERTILIZATION. A spore is typically a cell surrounded by a cell wall that may be tough and waterproof, permitting the cell to survive unfavorable circumstances.

sporophyte: see GAMETOPHYTE.

sporozoan: see APICOCOMPLEXA.

sporting dog, class of dogs bred for pointing, flushing, and retrieving game. They hunt by air scent (as opposed to most HOUNDS, which are ground scenters), and their quarry is mainly game birds. Pointers stand rigidly, with nose and body pointing at their quarry, directing hunters to its location. Setters, originally trained to crouch in front of game, were later taught to point. Retrievers find and return killed game to the hunter. See individual breeds, e.g., COCKER SPANIEL, ENGLISH SPRINGER SPANIEL, GOLDEN RETRIEVER, IRISH SETTER, LABRADOR RETRIEVER, POINTER, WEIMARANER.

sports medicine, branch of medicine concerned with prevention, treatment, and study of injuries received during participation in sports. "Tennis elbow"; shoulder, knee, back, and leg injuries; stiffness and pain in joints; and tendinitis are some of the conditions involved. Treatments and prevention techniques include mechanical supports, exercise programs for strengthening and improving flexibility, PHYSICAL THERAPY, and—in severe cases—surgery. Sports medicine is also concerned with the abuse of so-called performance-enhancing drugs, such as ANABOLIC STEROIDS. Sports medicine was initially practiced primarily by physicians associated with professional sports teams, but with increased interest in amateur sports and physical fitness programs in the 1970s and 80s, it grew rapidly.

Spotsylvania, rural county, NE Virginia, formerly part of the estate of Gov. Alexander Spotswood. In the CIVIL WAR it was the scene of the battles of FREDERICKSBURG and CHANCELLORSVILLE, and of the battles of the Wilderness and Spotsylvania Courthouse in the WILDERNESS CAMPAIGN.

Spratly Islands, group of low islands and coral reefs in the central SOUTH CHINA SEA, claimed by China, Taiwan, and Vietnam, and in part by Malaysia, the Philippines, and Brunei. Valued primarily for the petroleum and gas potential of the surrounding waters, various islands in the Spratlys are occupied by the claimants, except for Brunei.

spring, in geology, natural flow of water from the ground or from rocks, representing an outlet for the water that has accumulated in permeable rock strata underground. Mineral springs have a high mineral content. See also ARTESIAN WELL; GEYSER; HOT SPRING.

springer spaniel: see ENGLISH SPRINGER SPANIEL.

Springfield. **1** City (1990 pop. 105,227), state capital and seat of Sangamon co., central Ill., on the Sangamon R.; settled 1818, inc. as a city 1840. In a rich coal and farm area, it is a governmental, commercial, medical, insurance, and business center, with varied industries. Abraham LINCOLN, a longtime resident, is buried nearby, and there are numerous sites associated with him. Vachel LINDSAY's birthplace is now a museum. **2** Industrial city (1990 pop. 156,983), seat of Hampden co., SW Mass., a port on the Connecticut R.; inc. 1641. It has chemical, plastics, machinery, paper, and printing and publishing industries. Settled (1636) by Puritans, Springfield was a scene of Shays's Rebellion (1786–87; see under SHAYS, DANIEL), and a station on the UNDERGROUND RAILROAD. A U.S. armory there (1794–1966) developed the Springfield army rifles. Dr. James Naismith invented (1891) basketball at Springfield College, which houses a hall of fame for the sport. **3** City (1990 pop. 140,494), seat of Greene co., SW Mo., in a resort area of the OZARKS; inc. 1838. It is the trade and shipping center for an area producing livestock, grains, and corn. Food processing and diverse manufactures are important. A Civil War battlefield and the Mark Twain National Forest are nearby.

spruce, evergreen tree or shrub (genus *Picea*) of the PINE family, widely distributed in the Northern Hemisphere. The needles are angular in cross section, not flattened as in the related HEMLOCKS and FIRS. Spruces are a major source of pulpwood for PAPER manufacture; the light, straight-grained wood is also used in construction. Common North American spruces include the red spruce (*P. rubens*), white spruce (*P. glauca*), and black spruce (*P. mariana*) of the East; the Engelmann spruce (*P. engelmanii*) of the Rockies; and the Sitka spruce (*P. sitchensis*) of the Pacific forest belt. The Siberian spruce (*P. obovata*) grows in the huge coniferous forests (see TAIGA) of Russia.

spurge, common name for the family Euphorbiaceae, herbs, shrubs, and trees of greatly varied structure and almost cosmopolitan distribution, although most species are tropical. The spurges are of great economic importance; the sap of most species is a milky latex, and that of the PARÁ RUBBER TREE is the source of much of the world's natural RUBBER. The genus *Manihot* includes CASSAVA, the source of tapioca and the most important tropical root crop after the SWEET POTATO. The cactuslike euphorbias (genus *Euphorbia*) are among the most common Old World desert SUCCULENTS and comprise most of the species commonly called spurge. Many are cultivated for their often colorful foliage and the showy bracts enclosing their "naked flowers" (i.e., FLOWERS lacking petals and sometimes sepals). The poinsettia, native to Central America and sometimes classed in a separate genus (*Poinsettia*), is a popular Christmas plant with large rosettes of usually bright-red bracts.

Spyri, Johanna [shpē'rē], 1827–1901, Swiss author. She is best known for *Heidi* (1880) and other popular children's stories set in the Swiss Alps.

squash: see GOURD; PUMPKIN.

squash, game played on four-walled court with a small, hollow hard-rubber ball and a round-headed, gut-strung racket. A serve must hit the front wall above a service line 6½ ft (1.98 m) high, with subsequent caroms off the sidewalls permitted. The ball may be returned before it hits the floor, and a point is scored when either player fails to return the ball before it touches the floor twice. The game may be played by partners. Squash probably originated in the late 19th cent. and has become a popular game in U.S. colleges. National championships are conducted for men and women.

squatter sovereignty, in U.S. history, doctrine under which SLAVERY was permitted in territories, the final question of its legal status being left to territorial settlers when they applied for statehood.

First proposed in 1847, it was incorporated into the COMPROMISE OF 1850 and the KANSAS-NEBRASKA ACT. Its chief exponent, Stephen A. DOUGLAS, called it "popular sovereignty," but opponents of slavery contemptuously called it "squatter sovereignty."

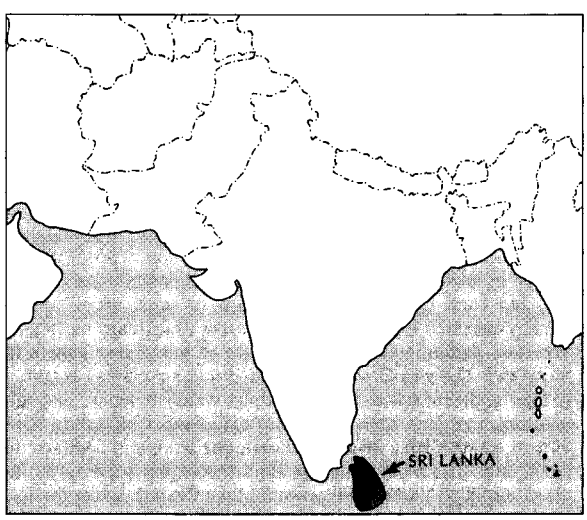
squid, carnivorous marine mollusk with 10 sucker-bearing arms; a CEPHALOPOD. Among the most highly developed invertebrates, the squid has eyes similar to those of humans, relatively sophisticated nervous and circulatory systems, and no external shell. Squids prey on fish, which they seize in their tentacles; when in danger, they emit a cloud of ink from a special sac. Squids range in size from 2 in. (5 cm) to the 50-ft (15.2-m) giant squid, the largest of all invertebrates. Squid is a favorite food in the Mediterranean region and E Asia.

squill, low, usually spring-blooming bulbous herb (genus *Scilla*) of the LILY family. The flowers, commonly deep blue but also white, rose, or purplish, are borne along a leafless stem; the leaves are usually narrow. Species of *Scilla* are used in rock gardens and borders.

squirrel, small or medium-sized RODENT of the family Sciuridae, found worldwide except in Australia, Madagascar, and polar regions. Typical tree squirrels (genus *Sciurus*), including the Eurasian red squirrel (*S. vulgaris*) and the North American gray squirrels, are day-active animals with slender bodies, thick fur, and bushy tails. In addition to tree squirrels the family includes the CHIPMUNK, WOODCHUCK, PRAIRIE DOG, and FLYING SQUIRREL.

Sr, chemical symbol of the element STRONTIUM.

Sri Lanka [srē läng'kə], officially Democratic Socialist Republic of Sri Lanka, island republic (1992 est. pop. 17,632,000), S Asia, 25,332 sq mi (65,610 sq km), in the Indian Ocean, SE of India. The capital is COLOMBO. The island is mainly flat or gently rolling; among the mountains in the south central area is Adam's Peak (7,360 ft/2,243 m), sacred to Buddhists. Plantation crops, principally tea, rubber, and coconuts, dominate the agricultural sector of the economy and are important exports. Manufactures include textiles (the most important export), processed agricultural products, and consumer goods. Sri Lanka is also a leading producer of high-grade graphite. The population is composed mainly of Sinhalese, who are Theravada Buddhists. Hindu Tamils make up a large minority, and there are smaller Muslim, European, and Eurasian minorities. The national languages are Sinhala (the official language) and Tamil. English is also spoken.



History. The aboriginal inhabitants were conquered in the 6th cent. B.C. by the Sinhalese, from N India, who established their capital at Anuradhapura. With the introduction of Buddhism in the 3d cent. B.C. the island became one of the world centers of that religion. Europeans were drawn by the spice trade, and the island came under the Portuguese (16th cent.), the Dutch (17th cent.), and the British, who made it the crown colony of Ceylon in 1798. A nationalist movement arose during World War I, and the island was granted independence in 1948. The new nation was challenged by rapid population growth, economic difficulties, and separatist demands by the Tamil minority. After the assassination of Prime Minister S.W.R.D. Bandaranaike in 1959 his widow, Sirimavo BANDARANAIKE, served as prime minister (1960–65, 1970–77), implementing such policies as nationalization of Western-owned businesses. A new constitution in 1972 adopted the Sinhalese name Sri Lanka and declared the country a republic. Economic crises and social unrest continued to plague the nation, and Mrs. Bandaranaike's party was overwhelmingly defeated by the conservatives in 1977, who consitutionally changed the government to a presidential one. Western-style capitalism was promoted by Pres. J.R. Jayewardene, who was reelected in 1982; in 1989 Ranasinghe Premadasa became president. Hostility among Sri Lanka's ethnic groups continued to be a serious problem into the 1990s. Tamil forces, allegedly supplied by the government of India, kept the nation in civil war through much of the 1980s and seized control of the Jaffna peninsula in the north. India's attempt to mediate the conflict, including stationing (1987–90) its troops in Tamil areas, was unsuccessful, and fighting resumed in 1990. In 1993 Premadasa was assassinated; he was succeeded as president by Prime Min. Dingiri Banda Wijetunga.

Ssu-ma Ch'ien [sōō'mä chyĕn], 145?–90? B.C., Chinese historian of the Han dynasty, called the Father of Chinese history. He wrote *Shih chi* [records of the historian], a history in 130 chapters of China and all regions and peoples known at that time. It became a model for later dynastic histories.

Staël, Germaine de [stäl], 1766–1817, French-Swiss woman of letters; daughter of Suzanne and Jacques NECKER. Her Paris salon was a powerful political and cultural center until 1803, when her spirited opposition to NAPOLEON I caused her exile. She retired to her estate at Coppet, on Lake Geneva, where she again attracted a brilliant circle. Her principal work, *On Germany* (1810), with its enthusiasm for German ROMANTICISM, tremendously influenced European thought and letters. Her other works include a sociological study of literature (1800); the novels *Delphine* (1802) and *Corinne* (1807); and a memoir, *Ten Years of Exile* (1818).

Stafford, Jean, 1915–79, American writer; b. Covina, Calif. Her finely wrought, gently ironic work includes the novels *Boston Adventure* (1944) and *The Catherine Wheel* (1952), and her widely acclaimed *Collected Stories* (1969; Pulitzer).

stained glass, windows made of colored glass. An art form of great antiquity in E Asia, used by Muslim designers in their intricate windows, it became one of the most beautiful achievements of medieval art. Christian churches had colored glass windows as early as the 5th cent., but the art of stained glass reached its height in the Middle Ages, particularly 1150–1250. As the massive Romanesque wall was eliminated, the use of glass expanded. Integrated with the lofty verticals of Gothic architecture (see GOTHIC ARCHITECTURE AND ART), large windows provided greater illumination that was regarded as symbolic of divine light. Early glaziers followed a CARTOON to cut the glass and fired the painted pieces in a kiln. Metallic oxides fused with the glass in the melting pot to produce the jewel-like colors of small pieces whose irregular surfaces created scintillating refractions of light. The pieces were fitted into channeled lead strips, the leads were soldered together, and the glass was installed in an iron framework. Outstanding examples of 12th-cent. stained glass can be found in the windows of such churches as Saint-Denis, in Paris, and CANTERBURY, in England. Among the finest 13th-cent. works are the windows at CHARTRES and the SAINTE-CHAPELLE in Paris. With improved glassmaking many medieval qualities vanished, and by the 16th cent. a lesser art was produced with larger, smoother pieces and sophisticated painting techniques. In the 19th cent., ROMANTICISM and the GOTHIC REVIVAL caused renewed interest in stained glass. Important contributions to the art were made by William MORRIS, in England, and John LA FARGE and Louis Comfort TIFFANY, in the U.S. In modern art the medium has been used by ROUAULT, MATISSE, and CHAGALL.

stainless steel: see STEEL.

stalactite and stalagmite, mineral forms found in CAVES; sometimes collectively called dripstone. A stalactite is an icicle-shaped

mass of CALCITE that hangs from the roof of a cave, formed by the precipitation of calcite from groundwater. A stalagmite is a cone of calcite rising from the floor of a cave, formed by the same process. Stalactites and stalagmites often meet to form solid pillars. The many colors often seen in these formations are caused by impurities.

Stalin, Joseph Vissarionovich, 1879–1953, Russian revolutionary, head of the USSR (1924–53). A Georgian cobbler's son named Dzhugashvili, he joined the Social-Democratic party while a seminarian and soon became a professional revolutionary. In the 1903 party split (see BOLSHEVISM AND MENSHEVISM) he sided with LENIN. Stalin attended party congresses abroad and worked in the Georgian party press. In 1912 he went to St. Petersburg, where he was elected to the party's central committee. About this time he took the name Stalin ("man of steel"). His sixth arrest (1913) led to four years of Siberian exile. After the RUSSIAN REVOLUTION of March 1917, he joined the editorial board of the party paper *Pravda.* When the Bolsheviks took power (Nov. 1917) he became people's commissar of nationalities. He also played an important administrative role in the civil war (1918–20). In 1922 Stalin was made general secretary of the party. Lenin, before he died in 1924, wrote a "testament" urging Stalin's removal from the post because of his arbitrary conduct; but in the struggle to succeed Lenin, Stalin was victorious. By 1927 he had discarded his erstwhile allies BUKHARIN, KAMENEV, and ZINOVIEV; in 1929 TROTSKY, his major rival for the succession, was exiled from the USSR. Forcible agricultural collectivization and breakneck industrialization began in 1928. The state, instead of "withering away," as Marx had foreseen, was glorified. Nationalism was revived as "socialism in one country." The military was reorganized along czarist lines. Conservatism permeated official policy on art, education, and the family. Political repression and terror reached a height in the 1930s. In a public trial Bukharin, Kamenev, Zinoviev, and others were charged with conspiring to overthrow the regime; they confessed and were executed. Enormous numbers of ordinary citizens also fell victim. Stalin's foreign policy in the 1930s focused on efforts to form alliances with Britain and France against NAZI Germany; the 1939 Russo-German nonaggression pact marked the failure of these efforts. In 1941 Stalin took over the premiership from MOLOTOV. The German invasion (June 22) found him unprepared; at war's end (1945) 20 million Russians were dead (see UNION OF SOVIET SOCIALIST REPUBLICS). At the TEHERAN CONFERENCE and the YALTA CONFERENCE Stalin gained Western recognition of a Soviet sphere of influence in Eastern Europe. The paranoia of his last years led to a period of terror reminiscent of the 1930s. On his death (1953) his body was placed next to Lenin's. In 1956, at the 20th Party Congress, KHRUSHCHEV denounced Stalin's tyranny, but "destalinization" has never been thoroughgoing.

Stalingrad: see VOLGOGRAD.

stamen: see FLOWER.

Stamford, city (1990 pop. 108,056), SW Conn., on Long Island Sound; settled 1641, inc. as a city 1893. It is a residential suburb of New York City, and the headquarters site for a large number of major U.S. corporations. Office equipment, bearings, and chemicals are manufactured.

Stamp Act, 1765, revenue law passed by the British Parliament requiring publications and legal documents in the American colonies to bear a tax stamp. The act was vehemently denounced, and organizations formed to resist it (see SONS OF LIBERTY). The **Stamp Act Congress,** Oct. 1765, adopted the Declaration of Rights and Grievances, which declared the tax unconstitutional because the colonists were not represented in Parliament. The Stamp Act was repealed in 1766.

standard deviation: see STATISTICS.

standard of living, level of consumption of goods and services to which an individual or group is accustomed, usually thought of in national terms. Although an evaluation of a standard of living is relative, the use of GROSS NATIONAL PRODUCT or per capita income provides a more objective yardstick for comparing the living standards of two or more countries. The elements that make up a standard of living include not only the goods consumed but also the number of dependents in a family, educational opportunities, and the amount spent for health and recreation. In the U.S. the standard of living has been climbing steadily, but in periods when prices rise faster than does per capita income, as in the late 1970s, the living standard may actually decline.

standard time: see SOLAR TIME.

Standish, Miles or **Myles,** c.1584–1650, American colonist; b. England. Accompanying the PILGRIMS to America (1620), he became the military leader of PLYMOUTH COLONY and a founder of Duxbury, Mass. He is familiar as the disappointed suitor in LONGFELLOW's poem *The Courtship of Miles Standish.*

Stanhope, Philip Dormer: see CHESTERFIELD, PHILIP DORMER STANHOPE, 4TH EARL OF.

Stanislaus, Polish kings. **Stanislaus I,** 1677–1766, king of POLAND (1704–9, 1733–35) and duke of Lorraine (1735–66), was born Stanislaus Leszczynski. Early in the NORTHERN WAR, CHARLES XII of Sweden deposed AUGUSTUS II of Poland and installed Leszczynski, a Polish nobleman. In 1709, however, Stanislaus was forced to yield the crown to Augustus and retire to France. There his daughter, Marie Leszczynska, married LOUIS XV, with whose help Stanislaus attempted (1733) to wrest the crown from Augustus, thus precipitating the War of the POLISH SUCCESSION. At its conclusion, he retained his royal title but renounced his actual rights in return for the duchy of Lorraine. **Stanislaus II,** 1732–98, was the last king of Poland (1764–95). With the support of Frederick II of Prussia and Catherine II of Russia (his former mistress), he was elected (1764) to succeed AUGUSTUS III. He was a virtual puppet of Russia, and during his reign Poland was dismembered (see POLAND, PARTITIONS OF).

Stanislavsky, Constantin, 1863–1938, Russian theatrical director, teacher, and actor, cofounder of the Moscow Art Theatre (see THEATER, table); b. Constantin Sergeyevich Alekseyev. His innovative technique for actors, emphasizing emotional truth and inner motivation and known today as the Stanislavsky Method, revolutionized modern acting. He was the first to produce many of CHEKHOV's plays.

Stanley, Sir Henry Morton, 1841–1904, British explorer and journalist. In 1871 he was sent by the New York *Herald* to find David LIVINGSTONE in Africa, where he delivered his famous greeting, "Dr. Livingstone, I presume?" On another expedition (1874–79) he explored the length of the Congo R., and on a third journey (1879–84), under Belgian auspices, he helped to organize the future Independent State of the Congo (see ZAÏRE).

Stanton, Elizabeth Cady, 1815–1902, American reformer and feminist; b. Johnstown, N.Y. With Lucretia MOTT she organized (1848) the first U.S. women's rights convention, and from 1852 she led the women's movement with Susan B. ANTHONY. An able journalist, gifted orator, and persuasive promoter of FEMINISM, Stanton was president (1869–90) of the National Woman Suffrage Association and editor (1868–70) of *Revolution,* a militant women's rights magazine.

star, hot, incandescent sphere of gas (usually more than 90% hydrogen) that is held together by its own gravitation and emits light and other forms of electromagnetic radiation whose ultimate source is nuclear energy. The universe contains billions of galaxies, and each GALAXY contains billions of stars, which are frequently bunched together in STAR CLUSTERS of as many as 100,000. The stars visible to the unaided eye are all in our own galaxy, the MILKY WAY. The visible stars are divided into six classes according to their apparent MAGNITUDE. Stars differ widely in mass, size, temperature, age (see STELLAR POPULATIONS), and LUMINOSITY. About 90% of all stars have masses between one tenth and 50 times that of the sun. The most luminous stars (excluding supernovas) are about a million times more powerful than the sun, while the least luminous are only a hundredth as powerful. VARIABLE STARS fluctuate in luminosity. Red giants, the largest stars, are hundreds of times greater in size than the sun. At the opposite extreme, WHITE DWARFS are no larger than the earth, and NEUTRON STARS are only a few kilometers in radius. The central region, or core, has a temperature of millions of degrees. At this temperature nuclear energy is released by the fusion of hydrogen to form helium. By the time nuclear energy reaches the surface of the star, it has been largely converted into visible light with a spectrum characteristic of a very

hot body. The theory of STELLAR EVOLUTION states that a star must change as it consumes its hydrogen in the nuclear reactions that power it. When all its nuclear fuel is exhausted, the star dies, possibly in a SUPERNOVA explosion.

starch, white, odorless, tasteless CARBOHYDRATE powder. It plays a vital role in the BIOCHEMISTRY of both plants and animals. Made in green plants by PHOTOSYNTHESIS, it is one of the main forms in which plants store food. Animals obtain starch from plants and store it as GLYCOGEN. Both plants and animals convert starch to GLUCOSE when energy is needed. Commercially, starch is made chiefly from CORN and POTATOES. Corn syrup and corn sugar made from cornstarch are widely used to sweeten food products. Starch is also used to stiffen laundered fabrics and to size paper and textiles.

Star Chamber, ancient meeting place of the king's councilors in WESTMINSTER PALACE, London, named for the stars painted on the ceiling. From the 15th cent. the role of the council as an equity and prerogative court increased and it extended its jurisdiction over criminal matters, especially under the TUDORS. Abuses of its power under JAMES I and CHARLES I led to its abolition in 1641.

star cluster, group of neighboring stars that resemble each other in certain characteristics that suggest a common origin. Galactic, or open, clusters typically contain from a few dozen to about a thousand loosely scattered stars and exist in regions rich in gas and dust, such as the spiral arms of the galaxy. More than 1,000 galactic clusters, including the Hyades and Pleiades in the constellation Taurus, have been catalogued in the Milky Way. Globular clusters are spherical aggregates of thousands or millions of densely concentrated stars and exist in the outer halo of the galaxy. The brightest of the more than 100 globular clusters so far detected in the galaxy are Omega Centauri and 47 Tucanae, both seen with the unaided eye in the southern skies. X-ray sources have been detected in some globular clusters.

starfish or **sea star,** star-shaped carnivorous marine invertebrate animal (an ECHINODERM), found worldwide in shallow waters. The spiny body has five or more tapering arms radiating from a central area. Usually dull yellow or orange but occasionally brightly colored, starfish vary in size from under ½ in. (1.3 cm) to over 3 ft (90 cm).

Stark, John, 1728–1822, American Revolutionary soldier; b. Londonderry, N.H. As commander of the New Hampshire militia in the SARATOGA CAMPAIGN, he repulsed the British in the battle of Bennington (1777).

starling, any of a group of originally Old World BIRDS of the family Sturnidae, now distributed worldwide. The common starling (*Sturnus vulgaris*) is found throughout North America. Insect eaters, starlings have iridescent black plumage and a long bill. They mimic bird songs and other sounds, and are considered pests since they collect in large, noisy flocks and drive away smaller, more desirable birds.

Star of Bethlehem, name of the luminous celestial object in the eastern sky that, as related in the New Testament, led the Wise Men to Bethlehem. The phenomenon may have been caused by the conjunction of the planets Jupiter, Saturn, and Mars, or by the appearance of a nova or a comet.

Starr, Belle, 1848?–89, American outlaw; b. near Carthage, Mo., as Myra Belle Shirley. Her home in Oklahoma was a retreat for outlaws. Imprisoned briefly for horse theft in 1883, she was later shot to death by an unknown person.

Star-spangled Banner, The, U.S. national anthem, beginning, "O say can you see." The words were written by Francis Scott KEY, a Washington, D.C., lawyer who watched the bombardment of Fort McHenry by the British in Sept. 1814. The fort withstood the attack, and the sight of the American flag at dawn inspired Key's verses, set to a popular English tune. Its designation as national anthem by executive order in 1916 was confirmed by an act of Congress in 1931.

START (Strategic Arms Reduction Talks): see DISARMAMENT, NUCLEAR.

Star Wars: see STRATEGIC DEFENSE INITIATIVE.

State, United States Department of, federal executive department responsible for the implementation of American foreign policy. Created in 1789, it is the oldest federal department, and its head, the secretary of state, is the ranking member of the cabinet. While some of its original functions (such as supervision of the U.S. Mint) have been transferred to other departments, it has expanded with the growth of the U.S. as a world power. The Dept. of State is in charge of the Foreign Service and maintains delegations (embassies, consulates, and special missions) in other countries. Such secretaries of state as George C. MARSHALL (1947–49), John Foster DULLES (1953–59), and Henry KISSINGER (1973–76) have played important roles in making U.S. foreign policy.

States-General or **Estates-General,** French national assembly in which the three chief states (clergy, nobles, and commons) were represented as separate bodies. Like the English PARLIAMENT, it originated in the king's council, but it never gained the financial control that made the English Parliament powerful. The first States-General was summoned (1302) by PHILIP IV to obtain national approval for his anticlerical policy. Later meetings often opposed the king or even won temporary concessions, but the continuous consolidation of royal power prevented its growth. After the States-General of 1614, the estates were not convoked again until 1789. In that year LOUIS XVI assembled the estates as a last resort to solve France's financial crisis. In June 1789 the third estate (commons), joined by some of the clergy, declared itself the National Assembly, an act that began the FRENCH REVOLUTION.

states of matter, forms of matter differing in several properties because of differences in the motions of and the forces between the molecules (or atoms or ions) of which they are composed. There are three common states of matter: solid, liquid, and gas. The molecules of a solid are limited to vibrations about a fixed position, giving a solid both a definite volume and a definite shape. When heat is applied to a solid, its molecules begin to vibrate more rapidly until, at a temperature called the MELTING POINT, they break out of their fixed positions and the solid becomes a liquid. Because the molecules of a liquid are free to move throughout the liquid but are held from escaping by intermolecular forces (see ADHESION AND COHESION), a liquid has a definite volume but no definite shape. As more heat is added to the liquid, some molecules near the surface gain enough energy to evaporate, or break away completely from the liquid, and change to a gaseous state. Finally, at a temperature called the BOILING POINT, molecules throughout the liquid become energetic enough to escape, forming bubbles of vapor that rise to the surface; the liquid thus changes completely to a gas. Because its molecules are free to move in every possible way, a gas has neither a definite shape nor a definite volume but expands to fill any container in which it is placed. The reverse processes of melting and boiling are, respectively, freezing and condensation. See also CRYSTAL; GAS LAWS; KINETIC-MOLECULAR THEORY OF GASES; PLASMA.

states' rights, in U.S. history, a doctrine based on the 10th amendment to the CONSTITUTION, which states: "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." Controversy over interpretation of this clause arose immediately. The Federalists, led by Alexander HAMILTON, favored a broad interpretation. Thomas JEFFERSON and the "strict constructionists" insisted that all powers not specifically granted the federal government be reserved to the states; the KENTUCKY AND VIRGINIA RESOLUTIONS were the first formulations of this doctrine. The issue was central to the HARTFORD CONVENTION (1814–15), called by New Englanders to express officially their hostility to the federal government. The fight over the constitutionality of the Bank of the U.S. provided a major setback for states' rights; the Supreme Court's decision in MCCULLOCH V. MARYLAND (1819) greatly expanded the scope of federal power. An extreme expression of states' rights was the ordinance of NULLIFICATION, led by Sen. John C. CALHOUN and passed (1832) by South Carolina in response to the tariff acts of 1828 and 1832. Ultimately, states' rights was used by the proslavery states to justify secession. In the 20th cent., states' rights was revived by Southern opponents of the federal civil-rights program. But states' rights is not exclusive to any section or party, and the vast increase in the powers of the federal government has led to renewed interest in the doctrine.

statics, branch of MECHANICS concerned with the maintenance of equilibrium in bodies by the interaction of FORCES upon them. In a

state of equilibrium the resultant of all outside forces acting on a body is zero, thus keeping the body at rest.

statistical mechanics, quantitative study of systems that consist of a large number of interacting elements, such as the molecules of a gas or the PHOTONS of visible light. The nature of an individual molecule and the interactions between any pair of molecules may be well understood, but understanding the behavior of a system consisting of a large number of molecules with many possible interactions can present an almost overwhelming challenge. Statistical mechanics provides a mathematical framework upon which an understanding of such a system can be built, usually on a microscopic or atomic scale. Modern statistical mechanics recognizes three types of systems: those that obey Maxwell-Boltzmann statistics, those that obey Bose-Einstein statistics, and those that obey Fermi-Dirac statistics. Maxwell-Boltzmann statistics apply to systems of classical particles, such as the atmosphere. The other two types deal with systems in which the effects decribed by QUANTUM MECHANICS cannot be ignored. Bose-Einstein statistics apply to systems of subatomic particles called BOSONS, and Fermi-Dirac statistics to those called FERMIONS. Statistical mechanics has yielded insights into the nature of MAGNETISM, PHASE TRANSITIONS, and SUPERCONDUCTIVITY.

statistics, branch of applied mathematics dealing with the collection and classification of data by numerical characteristics and the use of these data to make inferences and predictions in uncertain situations. Generally, measurements taken from a small group, the sample, are used to infer the behavior of a larger group, the population, as in television ratings and election predictions. The theory of PROBABILITY is necessary to determine how well the sample represents the population. The most widely used tools are the (arithmetic) mean and the median. The mean of a set of numbers is their sum divided by the number of elements in the set, e.g., for the five numbers 7, 7, 8, 10, and 11, the mean is $(7 + 7 + 8 + 10 + 11)/5 = 43/5 = 8.6$. The median of a set is the number that divides the set in half, so that as many numbers are larger than the median as are smaller. The median of 7, 7, 8, 10, and 11 is 8. (If the set has an even number of elements, the median is the number halfway between the middle pair.) Another important statistical measure is the standard deviation, which indicates how closely the data are clustered about the mean. Statistics is used in scientific and social research, insurance, and many other fields.

stator: see GENERATOR; MOTOR, ELECTRIC.

STD: see SEXUALLY TRANSMITTED DISEASE.

Stead, Christina, 1902–83, Australian novelist. She wrote unsentimentally about human obsession and the problem of evil, as in *The Man Who Loved Children* (1940), *A Little Tea, A Little Chat* (1948), and *The Little Hotel* (1975).

steady-state theory: see COSMOLOGY.

stealth technology, materials and techniques used in the construction of mobile military systems, such as aircraft, tanks, and ships, to significantly reduce their detection by an enemy, primarily by enemy radar. Among the techniques used in the U.S. F-117A fighter and B-2 bomber, for example, are a low profile with no surfaces that reflect radar directly back, the intensive substitution of radar-opaque composites for metals, and an overall coating of a radar-absorbing material.

steam engine, machine for converting heat energy into mechanical energy, using steam as the conversion medium. When water is boiled into steam its volume increases about 1,600 times, producing a force that can be used to move a piston back and forth in a cylinder. The piston is attached to a crankshaft that converts the piston's back-and-forth motion into rotary motion for driving machinery. From the Greek inventor HERO OF ALEXANDRIA to the Englishman Thomas NEWCOMEN, many persons contributed to the work of harnessing steam. However, James WATT's steam engine (patented 1769) offered the first practical solution by providing a separate chamber for condensing the steam and by using steam pressure to move the piston in both directions. These and other improvements by Watt prepared the steam engine for a major role in manufacturing and transportation during the INDUSTRIAL REVOLUTION. Today steam engines have been largely replaced by more efficient devices, e.g., the steam TURBINE, the electric MOTOR, the INTERNAL-COMBUSTION ENGINE, and the DIESEL ENGINE.

steamship, watercraft propelled by a STEAM ENGINE or a steam TURBINE. A number of experimental steam-powered vessels were built in the late 18th cent., and in 1807 Robert FULTON's *C'ermont* made the 150-mi (240-km) trip from New York City to Albany in 32 hr. The *Savannah,* a full-rigged sailing ship fitted with engines and paddlewheels, made the first Atlantic Ocean crossing by a steam-propelled vessel in 1819. Two British SHIPS made the first crossing under steam power alone in 1838. By the late 1850s the screw propeller was replacing paddlewheels, and the steamship began to supplant the sailing ship. Great liners were plying the Atlantic on regular schedules by the end of the century. The sea-going leviathans of the 20th cent., such as the *Queen Mary* (1934), the *Queen Elizabeth* (1938), and the *United States* (1951), were turbine-powered steamships. Ships using fission-generated heat to produce steam proved uneconomical for commerce, but most large naval vessels use nuclear-powered steam plants. Today commercial steamships have given way to more fuel-efficient diesel-powered ships.

steatite: see SOAPSTONE.

steel, ALLOY of IRON, CARBON, and small proportions of other elements. Steelmaking involves the removal of iron's impurities and the addition of desirable alloying elements. Steel was first made by cementation, a process of heating bars of iron with charcoal so that the surface of the iron acquired a high carbon content. The bars were then fused together, yielding a metal harder and stronger than the individual bars but lacking uniformity in these properties. The crucible method, consisting of melting iron together with other substances in a crucible, is one of the costlier steelmaking processes, employed only for making special steels (e.g., the famous blades of Damascus). The OPEN-HEARTH PROCESS, BASIC OXYGEN PROCESS and ELECTRIC ARC PROCESS are the methods most commonly used in modern steelmaking; the BESSEMER PROCESS is a historically important method that has been superseded. Steel is often classified by its carbon content: a high-carbon steel is hard and brittle; low- or medium-carbon steel can be welded and tooled. Alloy steels, now the most widely used, contain one or more elements that give them special properties. Aluminum steel is smooth and has a high tensile strength. Chromium steel is used in automobile and airplane parts because of its hardness, strength, and elasticity. Nickel steel is the most widely used of the alloys; it is nonmagnetic and has the tensile properties of high-carbon steel without the brittleness. Stainless steel has a high tensile strength and resists abrasion and corrosion because of its high chromium content; it is used in kitchen utensils and plumbing fixtures. See also CASEHARDENING; GALVANIZING.

Steele, Sir Richard, 1672–1729, English essayist and playwright; b. Dublin. His first play, *The Funeral,* appeared in 1701 and was followed by three more comedies: *The Lying Lover* (1703), *The Tender Husband* (1705), and *The Conscious Lovers* (1722). Steele held various minor governmental posts before starting his periodical the *Tatler* (1709–11), on which he was soon joined by Joseph ADDISON. Their partnership led to the founding of the *Spectator* (1711–12), *Guardian* (1713), and lesser periodicals, all graced by Steele's spontaneous, witty ESSAYS. A Whig partisan and member of Parliament from 1713, Steele wrote the pamphlet *Crisis* (1713) in opposition to SWIFT. He also founded (1720) the first theatrical paper.

Steen, Jan [stān], 1626–79, Dutch genre painter. Steen's nearly 900 paintings show the influence of the major Dutch masters except REMBRANDT. His humorous and moralistic works offer a picture of life in his day. He was a superb draftsman and portraitist, and his favorite themes were revelry and feasting, e.g., *The Prince's Birthday* (Rijks Mus., Amsterdam) and *Skittle Players* (National Gall., London).

Steffens, (Joseph) Lincoln, 1866–1936, American author; b. San Francisco. A magazine editor (1902–11) and a MUCKRAKER, he wrote articles exposing municipal corruption, collected in such volumes as *The Shame of the Cities* (1904) and *Upbuilders* (1909). His famous autobiography (1931) casts light on his era.

Stegner, Wallace, 1909–93, American writer; b. Lake Mills, Iowa. He wrote perceptively of the American West in short stories, e.g.,

The Woman on the Wall (1950); novellas, e.g., *On a Darkling Plain* (1940); and novels, e.g., *The Big Rock Candy Mountain* (1943), *Angle of Repose* (1971; Pulitzer), and *Crossing to Safety* (1987).

Steichen, Edward [stī'kən], 1879–1973, American photographer; b. Luxembourg. In Paris Steichen was renowned for his painterly photographs. With Alfred STIEGLITZ he established photography as an art. He helped develop aerial photography in World War I and directed U.S. naval combat photography in World War II. As head of the Museum of Modern Art's photography department (1947–62) he organized the *Family of Man* exhibition (1955).

Stein, Gertrude, 1874–1946, American author; b. Allegheny, Pa. She went abroad in 1902 and from 1903 until her death lived mainly in Paris. During the 1920s she led a cultural salon, acting as a patron for such artists as PICASSO and MATISSE and influencing such writers as HEMINGWAY, Sherwood ANDERSON, and F. Scott FITZGERALD. Stein's own innovative writing emphasized the sounds and rhythms rather than the sense of words. Her works include short stories, e.g., *Three Lives* (1909); a long narrative, *The Making of Americans* (1925); autobiographical works, notably the *Autobiography of Alice B. Toklas* (1933); critical essays, e.g., *How to Write* (1931) and *Lectures in America* (1935); "cubist" poetry, e.g., *Tender Buttons* (1914); and operas, notably *Four Saints in Three Acts* (1934), with music by Virgil THOMSON.

Gertrude Stein

Steinbeck, John, 1902–68, American writer; b. Salinas, Calif. His works are marked by a compassionate understanding of the world's disinherited. His best-known novel, *The Grapes of Wrath* (1939; Pulitzer), treats the plight of 1930s Dust Bowl farmers turned migrant laborers while presenting a universal picture of victims of disaster. Among Steinbeck's other novels are *Tortilla Flat* (1935), *Cannery Row* (1945), *East of Eden* (1952), and *The Winter of Our Discontent* (1961). His other books include the novella *Of Mice and Men* (1937; later made into a play); short stories, notably the exquisite "The Red Pony" in *The Long Valley* (1938); nonfiction works, e.g., *A Russian Journal* (1948), *America and Americans* (1966); and screenplays. Steinbeck was awarded the 1962 Nobel Prize in literature.

Steinem, Gloria, 1934–, American journalist and feminist; b. Clarklake, Mich. A journalist during the 1960s, she became a spokeswoman for FEMINISM, helping organize (1971) the Women's Political Caucus, and was founding editor of *Ms.* magazine (1971–87). Her books include *Outrageous Acts and Everyday Rebellions* (1983) and *Revolution from Within* (1992).

Steiner, Rudolf, 1861–1925, German occultist and social philosopher. Originally an adherent of THEOSOPHY, he founded (1912) his own system, which he called anthroposophy. It attempted to explain the world in terms of human spiritual nature, or a level of thinking independent of the senses. More than 170 private schools throughout the world are based on his pedagogical and philosophic teachings.

Steinmetz, Charles Proteus, 1865–1923, American electrical engineer; b. Germany; came to U.S., 1889. He joined the General Electric Co. in 1892. His discovery of the law of hysteresis made it possible to reduce the loss of efficiency in electrical apparatus resulting from alternating magnetism. His method for calculating alternating current revolutionized electrical engineering.

stele, stone or terra-cotta slab, usually oblong, set upright. Used as votives or memorials, they were commonly carved with inscriptions and designs. Stelae were often used as commemorative stones in ancient Egypt and as boundary markers in Mesopotamia. Greek marble funerary stelae, with painted reliefs of the dead, are monuments of classical art. Ancient stelae are also found in China and in Mayan ruins.

Stella, Frank, 1936–, American painter; b. Malden, Mass. His earlier paintings are generally large, often with precise, concentric angular stripes or curved motifs that emphasize the frequently irregular shape of his canvases. In more recent work, he has favored a more improvised, dynamic idiom in mixed media.

Stella, Joseph, 1877–1946, American painter; b. Italy. He is best known for his cubist- and futurist-inspired works, done c.1920, expressing the dynamism of New York City.

stellar evolution, life history of a STAR. The initial phase of stellar evolution is contraction of the protostar from the interstellar gas (see INTERSTELLAR MATTER). In this stage, which typically lasts millions of years, half the gravitational potential energy released by the collapsing protostar is radiated away and half goes into increasing the temperature of the forming star. Eventually the temperature becomes high enough for the fusion of hydrogen to form helium. The star then enters its longest period in stellar evolution. Because most stars are in this stage and fall along a diagonal line in the HERTZSPRUNG-RUSSELL DIAGRAM, they are called main-sequence stars. As the star's helium content builds up, the core contracts and releases gravitational energy, which heats up the core and increases the rate of hydrogen consumption. The increased reaction rates cause the stellar envelope to expand and cool, and the star becomes a red giant. Eventually, the contracting stellar core will reach temperatures in excess of 100,000,000K. At this point, helium burning sets in, and the star starts shrinking in size. In the further course of evolution, the star may become unstable, possibly ejecting some of its mass and becoming an exploding nova or SUPERNOVA or a pulsating VARIABLE STAR. The end phase of a star depends on its mass. A low-mass star may become a WHITE DWARF; an intermediate-mass star may become a NEUTRON STAR; and a high-mass star may undergo complete GRAVITATIONAL COLLAPSE and become a black hole.

stellar populations, two distributions of star types. Population I stars are recently formed stars (see STELLAR EVOLUTION) that lie mostly on the main sequence of the HERTZSPRUNG-RUSSELL DIAGRAM. They are located mainly in the interstellar dust of the arms of spiral galaxies, in galactic, or open, STAR CLUSTERS, and in irregular galaxies. The older and highly evolved population II stars are formed early in the history of a galaxy from pure hydrogen with a possible admixture of primordial helium. Population II stars are found mainly in the arms, central nucleus, and halo of spiral galaxies and in elliptical galaxies.

stem, supporting structure of a plant, serving also to conduct and store food materials. Stems of herbaceous and woody plants differ: herbaceous plants usually have pliant, green stems with relatively more pith and an almost inactive CAMBIUM; woody stems are covered by BARK and increase in height and diameter because of an active cambium. Tendrils, thorns, and runners (stolons) are specialized aerial stems; BULBS, corms, RHIZOMES, and TUBERS are specialized underground stems. The stems of dicotyledons (see ANGIOSPERM) and GYMNOSPERMS consist of upward-conducting xylem (see WOOD) on the inside and downward-conducting phloem arranged on either side of the cambium. In monocotyledons, which generally lack cambium, bundles of xylem and phloem are scattered throughout the stem.

Stendhal [stäNdäl'], pseud. of **Marie Henri Beyle,** 1783–1842,

French author. He was an officer in Napoleon's army and later served as consul in Italy. His amorous involvements are reflected in *On Love* (1822), a psychological analysis of love that predates FREUD. Although largely unappreciated during his lifetime, his *The Red and the Black* (1831) and *The Charterhouse of Parma* (1839), noted for their character analysis, rank among the world's great novels. The Stendhalian hero has an egoism that derives its energy from passion, has its own moral code, and unswervingly pursues happiness in the form of love or power.

Stengel, Casey (Charles Dillon Stengel), 1891?–1975, American baseball player and manager; b. Kansas City, Mo. He played (1912–25) major-league baseball with five teams and then managed in the minor leagues. The colorful Stengel achieved greatness with the New York Yankees, managing them to 10 pennants and 7 world championships (5 in a row) in 12 seasons (1949–60). He managed the New York Mets from 1962 to 1965.

Stenmark, Ingemar, 1956–, Swedish skier. Nicknamed the "Silent Swede," he won 86 World Cup races in 16 years, including two Olympic gold medals (1980), and was World Cup champion three times (1976–78).

stenography: see SHORTHAND.

Stephen, Saint or **Stephen I,** 975–1038, duke (977–1001) and first king (1001–38) of Hungary. Because of his Christianizing and pro-German policy he had to put down revolts by pagan nobles. His crown remains a sacred symbol of Hungarian national identity. Feast: Aug. 16 (in Hungary, Aug. 20).

Stephen, 1097?–1154, king of England (1135–54); grandson of WILLIAM I. He swore fealty to HENRY I's daughter, MATILDA, but on Henry's death was proclaimed king. He constantly struggled to maintain his throne, and he quarreled repeatedly with the English clergy. Matilda, aided by her half brother Robert, earl of Gloucester, captured Stephen in 1141 and reigned briefly before Stephen was released and regained the throne. When his son Eustace died, Stephen was forced to name (1153) Matilda's son Henry, later HENRY II, as heir.

Stephen I, king of Hungary: see STEPHEN, SAINT (975–1038).

Stephen, Sir Leslie, 1832–1904, English writer and critic. He edited the *Cornhill Magazine* (1871–82) and was the first editor of *The Dictionary of National Biography* (1882–91). His books include *History of English Thought in the Eighteenth Century* (1876) and biographies of Samuel JOHNSON, POPE, SWIFT, George ELIOT, and HOBBES. Virginia WOOLF was his youngest daughter.

Stephen Báthory, 1533–86, king of POLAND (1575–86), prince of Transylvania (1571–75). Elected king, he married the daughter of SIGISMUND II, the last Jagiello king. He fought several successful campaigns against Russia, particularly for control of Livonia, but failed in efforts to crusade against the Turks and to make Russia a vassal state.

Stephen Dušan or **Dushan,** c.1308–1355, king (1331–46) and czar (1346–55) of SERBIA. After usurping his father's crown, he conquered Bulgaria, Macedonia, Thessaly, and Epirus. He brought Serbia to its greatest power, but his empire disintegrated after his death.

Stephens, Alexander Hamilton, 1812–83, American politician; b. Taliaferro co., Ga. He was U.S. congressman from Georgia (1843–59). Opposed to secession, he remained loyal to Georgia when the state seceded. Elected vice president (1861–65) of the CONFEDERACY, he consistently opposed the policies of Pres. DAVIS. After the war he was interned for several months.

Stephens, James, 1882–1950, Irish poet and fiction writer. A leading figure in the Irish literary renaissance, he is best known for his fanciful prose, e.g., in *The Crock of Gold* (1912), *The Demi-Gods* (1914), and *Deirdre* (1923).

Stephenson, George, 1781–1848, English engineer and locomotive builder. He created a traveling engine to haul coal (1814) and the first LOCOMOTIVE using the steam blast (1815). His locomotive *Rocket* won an 1829 contest and was used on the Liverpool-Manchester Railway. He became engineer for several of the new railroads. His son **Robert Stephenson,** 1803–59, and a nephew, **George Robert Stephenson,** 1819–1905, were railroad engineers and bridge designers.

steppe, temperate grassland of Eurasia, consisting of level, generally treeless plains. The term is sometimes applied to the PRAIRIES of the U.S., the PAMPAS of South America, and the high VELD of South Africa. There are three vegetation zones: the wooded steppe (having deciduous trees and the highest rainfall), the tillable steppe (consisting of productive agricultural lands), and the non-tillable steppe (a semidesert).

stereochemistry, study of the three-dimensional configuration of the atoms that make up a MOLECULE and of the ways in which this arrangement affects the physical and chemical properties of the molecule. Central to stereochemistry is the concept of isomerism. ISOMERS are sets of chemical compounds having identical atomic composition but different structural properties. Stereochemistry is particularly important in BIOCHEMISTRY and molecular biology.

stereoisomer: see ISOMER.

stereophonic sound, sound recorded simultaneously by two or more MICROPHONES placed in different positions relative to the sound source. The recorded sound is played back through LOUDSPEAKERS placed more or less as the recording microphones were placed. The voices or instruments composing the sound thus seem to be spread out as they would be naturally in the recording hall. Quadrophonic reproduction utilized four microphones and four loudspeakers to further enhance the effect, but it was not commercially successful. Surround Sound uses special encoding and processing to enhance the effect and also requires additional loudspeakers. It is used in movie theaters and more expensive home entertainment systems.

sterility, inability to reproduce (see REPRODUCTIVE SYSTEM); also called infertility. In the male, malfunctioning of the sex glands, or testes, usually results in the production of defective sperm or a decreased number of sperm, causing sterility. In the female, malfunctioning of the sex glands, or ovaries, disturbs ovulation (production of the egg cell). Structural deformity (e.g., blockage of a tube), metabolic and infectious diseases, and psychological factors may also cause sterility. Voluntary sterilization is a form of BIRTH CONTROL.

sterilization: see BIRTH CONTROL.

Sterling Heights, city (1990 pop. 117,810), SE Mich., a growing suburb of DETROIT, 19 mi (31 km) NE of the city.

Stern, Isaac, 1920–, American violinist; b. USSR. He came to the U.S. as an infant. A child prodigy and a leading contemporary virtuoso, he has made many successful world tours since 1937.

Sterne, Laurence, 1713–68, English author; b. Ireland. A country churchman, he went to London in 1760 and published the first volume of his masterpiece *Tristram Shandy.* Although Dr. JOHNSON and others denounced it on moral and literary grounds, it was a great success. Eight more volumes followed (1761–67). A mixture of character sketches, digressions, and dramatic action into which the author constantly obtrudes himself, *Tristram Shandy* is based on LOCKE's association of ideas. By recording internal impressions, Sterne greatly expanded the scope of the NOVEL. His other books are *Journal to Eliza* (1767) and *A Sentimental Journey* (1768).

steroid, any of class of LIPIDS having a molecular structure based on four joined carbon rings with hydrogen molecules attached. Steroids differ from one another only in the additional atoms attached to the central structure. Many steroids are biologically active HORMONES. The class includes the sex hormones TESTOSTERONE, ESTROGEN, and PROGESTERONE, corticosteroids such as CORTISONE, several forms of vitamin D, CHOLESTEROL, and the BILE acids. Steroids are used in oral contraceptives and in the treatment of ARTHRITIS, ADDISON'S DISEASE, and certain skin ailments. ANABOLIC STEROIDS have been abused by bodybuilders and athletes in an attempt to increase muscle mass and strength. Steroids are found in plants and invertebrates as well as in vertebrates.

Stesichorus, fl. c.600 B.C., Greek LYRIC poet. Legend says he invented the choral "heroic hymn" and added the epode to the strophe and antistrophe, much used thereafter, e.g., by the tragedians and PINDAR.

Stettin: see SZCZECIN.

Steuben, Friedrich Wilhelm, Baron von [styōō'bən], 1730–94, Prussian army officer, general in the AMERICAN REVOLUTION. He helped to train the Continental army and to mold it into a powerful striking force.

Stevens, John, 1749–1838, American inventor; b. N.Y.C. After serving as state treasurer (1776–77) and surveyor general (1782–83) of

New Jersey and playing a leading role in the establishment of the first U.S. patent laws, he procured patents for various steam boilers and auxiliary devices and built (1806–8) the *Phoenix*, a seagoing steamboat (see STEAMSHIP). He later pioneered in railroad development, building an early locomotive.

Stevens, John Paul: see SUPREME COURT, UNITED STATES (table 1).

Stevens, Thaddeus, 1792–1868, U.S. representative from Pennsylvania (1849–53, 1859–68); b. Danville, Vt. A leader of the radical Republicans' RECONSTRUCTION program after the Civil War, he viewed the defeated Southern states as "conquered provinces." Sincerely desiring African-American betterment but eager to maintain the Republican party in power, he proposed the Fourteenth Amendment, guaranteeing civil rights. He was a leader in the impeachment of Andrew JOHNSON.

Stevens, Wallace, 1879–1955, American poet; b. Reading, Pa. While pursuing a career as an insurance executive, Stevens wrote elegant, philosophic verse often concerned with creating order from chaos. His books of poetry include *Harmonium* (1923), *The Man with the Blue Guitar* (1937), *Transport to Summer* (1947), and *Collected Poems* (1954; Pulitzer). His ideas are elaborated in the essays of *The Necessary Angel* (1951), and the poems, plays, essays, and epigrams of *Opus Posthumous* (1957).

Stevenson, Adlai Ewing, 1835–1914, U.S. vice president (1893–97); b. Christian co., Ky. His grandson, **Adlai Ewing Stevenson** (1900–65), b. Los Angeles, was governor of Illinois (1949–53). The unsuccessful Democratic presidential candidate in 1952 and 1956, he nonetheless gained enormous respect as a spokesman for liberal reform and internationalism. His son, **Adlai Ewing Stevenson, 3d,** 1930–, b. Chicago, served as U.S. senator from Illinois (1970–81). He ran unsuccessfully for governor of Illinois in 1982 and 1986.

Stevenson, Robert Louis, 1850–94, Scottish novelist, poet, and essayist. His first books, *An Inland Voyage* (1878) and *Travels with a Donkey in the Cévennes* (1879), were accounts of his wanderings on the Continent. In 1880 he went to the U.S., where he married Frances Osbourne. Four plays written with W.E. HENLEY had little success, but the adventure novel *Treasure Island* (1883) and *A Child's Garden of Verses* (1885) were very popular. In 1886 came two of his best-known works, *Kidnapped*, an adventure tale set in Scotland, and *The Strange Case of Dr. Jekyll and Mr. Hyde*, a science fiction thriller with moral overtones. *The Master of Ballantrae* (1889) was begun at Saranac Lake, N.Y., where Stevenson, a tuberculosis sufferer, had gone in search of a congenial climate. In 1889 he settled in Samoa, where he wrote three novels with Lloyd Osbourne, his stepson. He died there, leaving *Weir of Hermiston* (1896) and *St. Ives* (1897) unfinished.

Stewart, James, 1908–, American film actor; b. Indiana, Pa. Famous for his slow drawl and homespun charm, he starred in such films as *Mr. Smith Goes to Washington* (1939), *The Philadelphia Story* (1940; Academy Award), *Harvey* (1950), and *Vertigo* (1958).

stibnite, antimony sulfide mineral (Sb_2S_3), the most important ore of ANTIMONY. It is found in many parts of the world, often in association with arsenic, calcite, gold, quartz, and silver. Silvery gray in color, stibnite was used in ancient times by women to darken eyebrows and eyelashes. It is now used in alloys, in explosives, in vulcanizing rubber, and as an emetic.

stick insect: see WALKING STICK.

Stieglitz, Alfred [stēg'lĭts], 1864–1946, American photographer, editor, and art exhibitor; b. Hoboken, N.J. In his magazines, e.g., the seminal *Camera Work* (1902–17), and his galleries, including "291" and "An American Place," he sought to establish photography as an art while promoting modern French and American painting. Chief among his photographs are the series of portraits of his wife, Georgia O'KEEFFE; and studies of New York City.

Stijl, de [də stīl] [Dutch, = the style], Dutch nonfigurative art movement (1917–1931), also called neoplasticism. Its leaders were the artists Theo van Doesburg and Piet MONDRIAN. They advocated purifying art, eliminating subject matter in favor of abstract elements and primary colors. Their austerity of expression influenced architects Gerrit RIETVELD and J.J.P. Oud.

Stiles, Ezra, 1727–95, American theologian and educator; b. North Haven, Conn. He was a pastor at Newport, R.I., and Portsmouth, N.H., before serving (1778–95) as president of Yale. At Yale he taught church history and encouraged the sciences.

Stieglitz photo of Georgia O'Keefe, 1919

Stilicho, Flavius, d. 408, Roman statesman and general. He was the chief general of THEODOSIUS I and regent for HONORIUS in the West (395–408). His rival RUFINUS influenced ARCADIUS against him. Honorius had him arrested for high treason; although there was no evidence to support the charge, Stilicho did not resist execution.

Stilwell, Joseph Warren, 1883–1946, American general; b. Palatka, Fla. In WORLD WAR II he was commander in the China-Myanmar-India area. Defeated by the Japanese in Myanmar (1942), he retreated to India, then successfully counterattacked (1943–44) in Myanmar. An astute but frequently tactless general, he was known as "Vinegar Joe."

Stimson, Henry Lewis, 1867–1950, American statesman; b. N.Y.C. He was twice secretary of war (1911–13, 1940–45). As secretary of state (1929–33) he denounced the Japanese invasion of MANCHURIA in a declaration of policy that came to be known as the Stimson Doctrine.

stimulant: see DRUG.

stoat: see ERMINE.

Stockdale, James B(ond), 1923–, U.S. naval officer; b. Abingdon, Ill. A fighter pilot and highly decorated career naval officer (1946–79), he was the highest ranking U.S. prisoner of war (1965–73) in North Vietnam. He rose to the rank of vice admiral and was (1976–79) president of the Naval War College. Stockdale was H. Ross PEROT's vice-presidential running mate in 1992.

stock exchange, organized market for the trading of stocks and bonds. In Europe a stock exchange is called a bourse. Stock exchanges exist in all important financial centers of the world. Members of an exchange buy and sell for themselves or for others, charging commissions. A stock may be traded only if it is listed on an exchange after having met certain requirements. In the U.S., regulations are set by the governing board of each exchange and by the SECURITIES AND EXCHANGE COMMISSION. The New York Stock Exchange (founded 1790) is the largest in the U.S., handling more than 70% (in market value) of all transactions. The American Stock Exchange (Amex), also in New York City, and regional exchanges account for the remainder. Unlisted shares, often of smaller companies, are traded in the growing OVER-THE-COUNTER market. The NASDAQ (National Association of Securities Dealers Automated Quotations) system, an over-the-counter U.S. organization, accounts for the fifth largest stock trade in the world. Increasing computerization of stock trading may eventually render trading on a stock exchange floor obsolete.

Stockhausen, Karlheinz, 1928–, German composer and music theorist. He often uses TWELVE-TONE MUSIC techniques and is a major proponent of ELECTRONIC MUSIC. His compositions, e.g., *Gruppen* (1959), are characterized by complex COUNTERPOINT, free RHYTHMS, dissonance, percussive effects, and the use of improvisation by performers.

Stockholm, city (1989 pop. 671,742), capital of Sweden, E Sweden. It is the nation's largest city and its economic and administrative hub, with an important shipbuilding industry and diverse manufactures. A cultural center, the city has a noted opera house (1898), the Royal Dramatic Theatre (1908), and many museums. Founded

in the mid-13th cent., it became the official capital (1634) under Queen CHRISTINA. Built on several peninsulas and islands, modern Stockholm is famed for its striking design, e.g., the new city hall (1911–1923) and the residential districts. The Great Square was the site of a massacre (1520) instigated by CHRISTIAN II of Denmark. Most of the NOBEL PRIZES are awarded in Stockholm.

Stockton, Frank R(ichard), 1834–1902, American writer; b. Philadelphia. Among his humorous novels are *Rudder Grange* (1879) and its sequels. He is also known for his short stories, e.g., *The Lady or the Tiger?* (1884), and his children's books.

Stockton, city (1990 pop. 210,943), seat of San Joaquin co., central Calif., on the San Joaquin R.; inc. 1850. Located at the head of the river's delta, its harbor can accommodate seagoing trade. Processing and distribution of the San Joaquin Valley's farm products is important. Its manufactures include farm machinery, building materials, and boats.

Stoicism, school of philosophy founded by Zeno of Citium c.300 B.C. Influenced by Socratic ideals and by the thought of HERACLITUS, ARISTOTLE, and PLATO, the Stoics held that all reality is material but is shaped by a universal working force (God) that pervades everything. Only by putting aside passion, unjust thoughts, and indulgence, and by performing one's duty with the right disposition can a person live consistently with nature and thus achieve true freedom. The school was especially well received in the Roman world; CICERO, SENECA, EPICTETUS, and MARCUS AURELIUS were all Stoics.

Stoker, Bram, 1847–1912, English novelist. He is best known for *Dracula* (1897), a horror novel about the vampire Count Dracula. He was manager to the actor Sir Henry IRVING.

Stokowski, Leopold, 1882–1977, American conductor; b. England. As the highly dramatic conductor of the Philadelphia Orchestra (1912–36), he introduced many unknown contemporary works. He later conducted other famous orchestras for brief periods, and in 1962 he founded the American Symphony Orchestra.

STOL aircraft: see SHORT TAKEOFF AND LANDING AIRCRAFT.

Stolypin, Piotr Arkadevich [stəlĭ'pĭn], 1862–1911, Russian premier and interior minister (1906–11) for NICHOLAS II. His regime of courts-martial executed hundreds for revolutionary activities (1906–7). By reforming the land distribution system created in 1861 (see EMANCIPATION, EDICT OF), which gave land to the community (Mir) rather than to individuals, he tried to create a loyal class of peasant landowners. His secret police carried out repression, but he allowed reactionary groups to go on committing anti-Jewish outrages. He was assassinated by a revolutionary who was also a police agent.

stomach, saclike organ of the DIGESTIVE SYSTEM located between the esophagus and the INTESTINES. The human stomach is a muscular, elastic, pear-shaped bag lying crosswise in the abdominal cavity, beneath the diaphragm. Food enters the stomach from the esophagus, and is converted into a semiliquid state by muscular action and by the digestive enzymes in the gastric juice secreted by the glands. The pyloric sphincter, which separates the stomach from the small intestine, remains closed until the food has been appropriately modified and is ready to be emptied into the duodenum, the first section of the small intestine.

Stone, Edward Durell, 1902–78, American architect; b. Fayetteville, Ark. With Philip L. Goodwin, he designed the Museum of Modern Art, N.Y.C. (1937–39). He won renown for his U.S. Embassy, New Delhi (1958), in which he used Muslim motifs including lacy grillwork. His later buildings include the Kennedy Center for the Performing Arts (1971), Washington, D.C.

Stone, Harlan Fiske, 1872–1946, associate justice (1925–41) and 12th chief justice (1941–46) of the U.S. SUPREME COURT; b. Chesterfield, N.H.; LL.B., Columbia Univ. (1898). As U.S. attorney general (1924–25), he helped restore faith in the Department of Justice after the TEAPOT DOME scandal. On the Court he was noted for his vigorous minority opinions, many upholding NEW DEAL legislation.

Stone, Lucy, 1818–93, American leader in the women's movement (see FEMINISM); b. near West Brookfield, Mass. In 1870 she founded the *Woman's Journal,* which became the official organ of the National American Woman Suffrage Association. After her marriage to **Henry Brown Blackwell** (1825–1909) in 1855, she called herself Mrs. Stone as a matter of principle. *Woman's Journal* was edited by Stone and Blackwell. On Stone's death, their daughter, **Alice Stone Blackwell** (1857–1950), became coeditor. The Lucy Stone League was formed in 1921 to work for women's rights.

Stone Age, period beginning with the earliest human development, c.2 million years ago. It is divided into three periods. The **Paleolithic period,** or **Old Stone Age,** was the longest phase of human history, roughly coextensive with the Pleistocene Epoch (see GEOLOGIC ERA, table). Its most outstanding feature was the development of *Homo sapiens* (see HUMAN EVOLUTION). Paleolithic peoples were generally nomadic hunters and gatherers who sheltered in caves, used fire, and fashioned stone tools. Their cultures are identified by distinctive stone-tool industries: Pre-Chellean, Abbevillian (or Chellean), and Acheulian in the Lower Paleolithic; Mousterian in the Middle Paleolithic, associated with NEANDERTHAL MAN; and Aurignacian, Solutrean, and Magdalenian in the Upper Paleolithic. By the Upper Paleolithic there is evidence of communal hunting, constructed shelters, and belief systems centering on MAGIC and the supernatural. ROCK CARVINGS AND PAINTINGS reached their peak in the Magdalenian culture of CRO-MAGNON MAN. The **Mesolithic period,** or **Middle Stone Age,** began at the end of the last glacial era, over 10,000 years ago. Cultures included gradual domestication of plants and animals, formation of settled communities, use of the bow, and development of delicate stone microliths and pottery. Notable Mesolithic cultures were the early Azilian and Tardenoisian, over most of Europe; the middle Mesolithic Maglemosian, in the Baltic and N England; the late Ertebolle, or kitchen-midden culture; and the Natufian, in the Middle East. The time periods and cultural content of the **Neolithic period,** or **New Stone Age,** vary with geographic location. The earliest known Neolithic culture developed from the Natufian in SW Asia between 8000 and 6000 B.C. People lived in settled villages, cultivated grains and domesticated animals, developed pottery and weaving, and evolved into the urban civilizations of the BRONZE AGE. In SE Asia a distinct type of Neolithic culture cultivated rice before 2000 B.C. New World peoples independently domesticated plants and animals, and by 1500 B.C. Neolithic cultures existed in Mexico and South America that led to the AZTEC and INCA civilizations.

Stonehenge, group of standing stones on Salisbury Plain, Wiltshire, S England. Preeminent among MEGALITHIC MONUMENTS in the British Isles, Stonehenge is enclosed by a circular ditch 300 ft (91 m) in diameter. The stones are arranged in four series: the two outermost form circles; the third is a horseshoe shape; the fourth is an ovoid form. Within the ovoid lies the Altar Stone. Most archaeologists agree that Stonehenge served some sort of religious function. In 1963 the British astronomer Gerald Hawkins theorized that Stonehenge was used as a huge astronomical instrument.

Stonehenge

Stone Mountain Memorial, memorial to the CONFEDERACY carved on Stone Mt., NW Georgia, near Atlanta. It represents, in bas-relief, the equestrian figures of Robert E. Lee, Stonewall Jackson, and Jefferson Davis. Commissioned in 1916, it was begun by Gutzon

BORGLUM, the sculptor of Mt. Rushmore, but was not completed until 1969, by Walter K. Hancock.

stoneware, hard pottery made of siliceous paste fired at high temperature to make it glassy (vitrified). Stoneware is heavier and more opaque than PORCELAIN, and differs from TERRA COTTA in being nonporous. Fired stoneware is usually grayish, but colors may vary widely with the clay used. Produced in China since ancient times, it was the forerunner of Chinese porcelain. Stoneware was made in Germany in the 12th cent. and elsewhere in Europe by the 14th. The English potter Josiah WEDGWOOD developed two important types. Today stoneware remains one of the most common types of pottery.

Stoppard, Tom, 1937–, English playwright; b. Czechoslovakia. He became prominent with the comic and pathetic play *Rosencrantz and Guildenstern Are Dead* (1966), about characters in Shakespeare's *Hamlet.* In later works, e.g., *The Real Inspector Hound* (1968), *The Real Thing* (1982), and *Hapgood* (1988), he continued to find significance in wordplay and bizarre juxtapositions of language and character.

Storey, David (Malcolm), 1933–, English novelist and playwright. His northern working-class upbringing and professional rugby career contributed to his novel *This Sporting Life* (1960). Later novels include *Saville* (1976) and *Present Times* (1984). Storey is probably better known for his plays, e.g., *The Restoration of Arnold Middleton* (1967), *Home* (1970), and *The Changing Room* (1971).

stork, mute, long-legged wading BIRD of the family Ciconiidae. Found in most of the warmer parts of the world, it has long, broad, powerful wings. The American wood stork, a white bird c.4 ft (122 cm) tall with a greenish-black tail, is found in temperate and tropical regions.

Storm, Theodor [shtôrm], 1817–88, German poet and novelist. Nostalgic lyricism marks his early works, such as the story *Immensee* (1852). His later writings, notably the novel *The Rider of the White Horse* (1888), show a sense of tragedy. *Aquis Submersus* (1877) is a historical novella.

storm, disturbance of the ordinary atmospheric conditions marked by strong winds and (usually) precipitation. Types of storms include the extratropical CYCLONE, the tropical cyclone (HURRICANE), the TORNADO, and the THUNDERSTORM. The term is also applied to blizzards, dust storms, and sandstorms in which high wind is the dominant meteorological element.

Storm and Stress: see STURM UND DRANG.

Story, Joseph, 1779–1845, American jurist, associate justice of the SUPREME COURT (1811–45); b. Marblehead, Mass. His decision in *Martin v. Hunter's Lessee* (1816) established the power of the court to review constitutional issues raised in state cases. His legal writings rank among the foremost influences on American jurisprudence.

stout, alcoholic beverage: see BEER.

Stowe, Harriet Beecher, 1811–96, American writer; b. Litchfield, Conn.; daughter of Lyman BEECHER; sister of Henry Ward BEECHER. Her antislavery novel *Uncle Tom's Cabin* (1852) was very influential in spreading abolitionist sentiment, as was the dramatization of the book that followed. Notable among the 16 volumes she wrote are a second novel of slavery, *Dred* (1856), and novels of New England life, e.g., *The Minister's Wooing* (1859), *Old Town Folks* (1869). Stowe was also dedicated to such other reform movements as temperance and woman suffrage.

Strabo [strā'bō], b. c.63 B.C., d. after A.D. 21, Greek geographer, historian, and philosopher. He studied and traveled widely and wrote historical sketches (47 books), quoted by later authorities but almost all lost. His *Geographia,* based on his observations and on works of predecessors, contains historical data and descriptions of people and places; it is a rich source of ancient knowledge. Almost all extant, its 17 books include two defining the scope of geography, eight on Europe, six on Asia, and one on Africa.

Strachey, (Giles) Lytton, 1880–1932, English biographer and critic. A member of the BLOOMSBURY GROUP, he revolutionized the art of biography, writing selective, critical, witty works, e.g., *Eminent Victorians* (1918) and *Queen Victoria* (1921).

Stradivari, Antonio [strädēvä'rē] or **Antonius Stradivarius,** 1644–1737, Italian violinmaker of Cremona. Recognized in his time, Stradivari produced over 1,000 instruments; his workmanship brought the violin to perfection. Two of his sons continued the craft after his death.

Strafford, Thomas Wentworth, 1st **earl of,** 1593–1641, English statesman. As lord deputy of Ireland (1632–40), he enforced the rule of CHARLES I. After the English humiliation by the Scots in the first BISHOPS' WAR, he was recalled (1639) to become the king's adviser. Strafford led the English to disaster in the second Bishops' War, and was beheaded after Parliament accused him of plotting to use Irish troops against England.

strain: see STRENGTH OF MATERIALS.

Straits Settlements, collective name for certain former British colonies in Southeast Asia. They originally consisted (1826–58) of the British EAST INDIA COMPANY territories of Pinang, SINGAPORE, and Malacca. In 1867 they became a crown colony, to which several dependencies of Singapore were later added. The Straits Settlements crown colony was dissolved in 1946. Singapore became a separate crown colony; Labuan became part of British N Borneo (see SABAH); Pinang and Malacca were incorporated into the Malayan Union (see MALAYSIA).

Strand, Paul, 1890–1976, American photographer; b. N.Y.C. His elegant images of Manhattan life and 20th-cent. machines were promoted by STIEGLITZ. Strand also made landscape and nature photographs and documentary films.

Strasberg, Lee, 1901–82, American acting teacher and director, cofounder (1931) of the Group Theatre. An initiator of the STANISLAVSKY acting method in the U.S., he headed New York City's Actors' Studio from 1948. His first film appearance was in *The Godfather, Part II* (1974).

Strasbourg, city (1982 pop. 252,264), capital of Bas-Rhin dept., NE France. The city is a port on the RHINE. It is heavily industrialized (e.g., metal casting, machinery, oil refining), and its goose-liver pâté is famous. It became an important city in Roman times. Destroyed (5th cent.) by the HUNS and rebuilt, it became (923) part of the HOLY ROMAN EMPIRE. It emerged as a free imperial city in the 13th cent. The city and its university were Protestant centers in the 16th cent. Seized (1681) by Louis XIV, Strasbourg increasingly adopted French customs and speech. Ceded to Germany (1871), it was regained by France in 1919. Its cathedral (1015–1439) is a masterpiece of Rhenish architecture.

Strategic Arms Limitation Talks and **Strategic Arms Reduction Talks:** see DISARMAMENT, NUCLEAR.

Strategic Defense Initiative (SDI), U.S. defense program to develop a "shield" against ballistic missile attack, announced in 1983 by Pres. REAGAN. The SDI proposal envisioned developing a number of defensive weapons systems, primarily based in space, to destroy incoming nuclear missile warheads while they were still in space. A space-based SDI system was criticized as destabilizing, impractical, and a probable violation of the 1972 Antiballistic Missile Treaty. The end of the COLD WAR led to criticism that SDI was unnecessary, and in 1991 Pres. BUSH called for a more limited version using rocket-launched interceptors based on the ground at a single site; deployment of this system is scheduled for 1998. Emphasis was also placed on developing missile defenses for the battlefield. In 1993 SDI was renamed the Ballistic Missile Defense program, and it was revealed that the only successful test (1984) of a ground-launched interceptor in the 1980s had been rigged for propaganda purposes. In 1987 the USSR revealed it had a similar program.

strategy and tactics: see MILITARY SCIENCE.

Stratford-upon-Avon, town (1991 pop. 117,788), Warwickshire, central England, on the Avon R. A market town with light industries, it is famous as the birthplace of William SHAKESPEARE. Annual Shakespeare festivals are held there.

Strathclyde, one of the early Celtic or Welsh kingdoms of Britain. It was in SW Scotland, and Dumbarton was the principal town. Little is known of its history. In 945 King Edmund of Wessex defeated Strathclyde and awarded it to King Malcolm of Scotland. It was permanently absorbed by Scotland in the 11th cent.

Strathcona and Mount Royal, Donald Alexander Smith, 1st **Baron,** 1820–1914, Canadian financier. He emigrated (1838) from Scotland and worked for the HUDSON'S BAY COMPANY, of which he was governor (1889–1914). He and his associates gained control

(1878) of the Great Northern lines and completed (1885) the Canadian Pacific Railway. He was Canadian high commissioner (1896–1914) in England.

stratigraphy: see GEOLOGY.

stratosphere: see ATMOSPHERE.

Straus, family of American merchants, public officials, and philanthropists. **Isidor Straus,** 1845–1912, b. Rhenish Bavaria, emigrated to the U.S. in 1854. In New York City he and his brother Nathan became associated (1874) with R.H. Macy & Co., acquiring ownership of the firm in 1896. He served (1894–95) in the U.S. Congress. His brother **Nathan Straus,** 1848–1931, b. Rhenish Bavaria, was an outstanding philanthropist, particularly in child health, and a prominent Zionist leader. Another brother, **Oscar Solomon Straus,** 1850–1926, b. Rhenish Bavaria, was minister (1887–89, 1898–1900) and ambassador (1909–10) to Turkey, and secretary of commerce and labor (1906–9). A son of Isidor Straus, **Jesse Isidor Straus,** 1872–1936, b. N.Y.C., became president (1919) of R.H. Macy & Co. and served (1933–36) as ambassador to France. **Nathan Straus,** 1889–1961, b. N.Y.C., son of the elder Nathan Straus, served (1921–26) in the New York state legislature and headed (1937–42) the U.S. Housing Authority.

Strauss, Richard, 1864–1949, German composer and conductor. His romantic SYMPHONIC POEMS, e.g., *Death and Transfiguration* (1889), *Till Eulenspiegel's Merry Pranks* (1895), *Thus Spake Zarathustra* (1895), are evocative and richly orchestrated. His highly dramatic operas, which develop Richard WAGNER's leitmotif concept, include *Salomé* (1905) and, with librettos by HOFMANNSTHAL, *Electra* (1909), *Der Rosenkavalier* (1911), and *Ariadne auf Naxos* (1912).

Stravinsky, Igor (Fedorovich), 1882–1971, Russian-American composer, widely considered the greatest and most versatile composer of the 20th cent. In Russia he was a student of RIMSKY-KORSAKOV. His first strikingly original compositions, *The Firebird* (1910) and *Petrouchka* (1911), were written for DIAGHILEV's Ballets Russes. In the ballet *The Rite of Spring* (1913), a masterpiece of modern music, Stravinsky used radically irregular RHYTHMS and harsh dissonances. He later employed an austere, neoclassical style, as in *The Soldier's Tale* (1918) and *Oedipus Rex* (1927). After becoming a U.S. citizen (1945), he experimented with TWELVE-TONE MUSIC, e.g., *Cantata* (1952), *Septuor* (1953), and the ballet *Agon* (1957). Stravinsky's fresh, meticulously crafted, innovative music revitalized European musical expression and achieved new sonorities and orchestral colors.

strawberry, low, herbaceous perennial (genus *Fragaria*) of the ROSE family, native to temperate regions. It is grown for its edible red fruits, which are used fresh, frozen, in preserves and confectionery, and for flavoring. The common strawberry (*F. chiloensis*) is believed native to Chile and W North America; it has probably hybridized to some extent with the wild strawberry (*F. virginiana*) of E North America. Most species propagate by runners, or stolons, slender horizontal stems.

stream of consciousness, literary technique for recording the thoughts and feelings of a character without regard to their logical association or narrative sequence. The writer attempts to reflect all the forces affecting the psychology of a character at a single moment. Introduced by the French writer Edouard Dujardin in *We'll to the Woods No More* (1888), the technique was used notably by James JOYCE, Virginia WOOLF, and William FAULKNER.

Streicher, Julius, 1885–1946, German NAZI leader. An early member of the Nazi party, he published *Der Stürmer,* a periodical known for its sadistic and anti-Semitic mania. He was convicted at the Nuremberg trials and hanged as a war criminal.

strength of materials, the capacity of materials to withstand stress (the internal force exerted by one part of an elastic body upon an adjoining part) and strain (the deformation or change in dimension occasioned by stress). When a body is subjected to a pull, it is said to be under tension, or tensional stress; when it is compressed, it is under compression, or compressive stress. Shear, or shearing stress, results when a force tends to make part of a body slide past the other part. Torsion, or torsional stress, occurs when external forces tend to twist a body around an axis. The elastic limit is the maximum stress that a material can sustain and still return to its original form. The ratio of tensile stress to strain for a given material is called its Young's modulus. Hooke's law states that, within the elastic limit, strain is proportional to stress.

Stresemann, Gustav [shtrā'zəmän], 1878–1929, German statesman. A founder (1918) of the conservative German People's party, he served briefly (1923) as chancellor and then as foreign minister (1923–29). His primary aim was to reestablish Germany as a respected nation following World War I. He accepted the Dawes Plan (1924) and the Young Plan (1924) for Germany's reparations payments. He also was a principal architect of the LOCARNO PACT (1925) and signed the KELLOGG-BRIAND PACT (1928). He shared the 1926 Nobel Peace Prize with Aristide BRIAND.

stress: see STRENGTH OF MATERIALS.

stress test or **exercise electrocardiography,** in medicine, a test that evaluates the performance of the heart by subjecting it to controlled amounts of physical stress. Such tests, which include walking on a treadmill, measure the heart's reaction to an increased demand for oxygen. The test ends when the patient reaches a predetermined heart rate or experiences chest pain or fatigue.

Streuvels, Stijn [strö'vəls], pseud. of **Frank Lateur,** 1871–1969, Flemish novelist and short-story writer. Streuvels wrote moving portraits of everyday life, of which *The Flax Field* (1907) is his masterpiece.

strike, concerted work stoppage by a group of employees to achieve economic or other goals. It is the chief weapon of organized labor. Work stoppages in North America date from colonial times, but the first nationwide strike (by railroad workers) occurred in 1877. Strikes became more frequent in the late 19th cent. with the development of strong labor organizations such as the KNIGHTS OF LABOR. The use by the employer of armed guards or of police, either to harass pickets or to protect strikebreakers, often resulted in violence. The 1960s and 70s witnessed a growing number of strikes by public employees, notably teachers, municipal workers, policemen, and firemen. A suspension of work on the employer's part is called a lockout. Strikes over jurisdictional disputes, to determine which union should be the bargaining agent for employees, were outlawed in 1947. The general strike, involving workers in all industries of a locality or nation, is common in Europe.

Strindberg, (Johan) August [strĭnd'bĕr"yə], 1849–1912, Swedish author whose novels, plays, stories, histories, and poems reveal him as the greatest master of the Swedish language and an influential innovator in dramatic and literary form. His personal life was tumultuous, marked by three disastrous marriages and periods of persecution mania. Among his 70-odd plays are the naturalistic free-verse dramas *The Father* (1887), which vividly expresses his derogatory view of women, and the psychological *Miss Julie* (1888). Later plays, e.g., *A Dream Play* (1902) and *The Ghost Sonata* (1907), reflect his adoption of Swedenborgian mysticism (see SWEDENBORG) and employ experimental, expressionistic techniques that have greatly influenced modern theater. Other works include the novels *The Red Room* (1879) and *Inferno* (1897), the stories in *Married* (1884–85), and his bitter autobiography, *Son of a Servant* (1886).

stringed instrument, musical instrument whose tone is produced by vibrating strings. Those instruments played with a bow are principally of the VIOL and VIOLIN families. Those whose strings are plucked, either by finger or with a pick (plectrum), include the lyre, any of various ancient instruments with arms projecting from the sound box and having from 3 to 12 strings; the HARP; and a number of fretted instruments, in which narrow strips of wood or metal, called frets, mark the places on the keyboard where the player's fingertips should be applied to stop the strings and produce various notes. Fretted instruments include the balalaika a Russian instrument having a triangular body, a long fretted neck, and usually three strings; the banjo, often used in COUNTRY AND WESTERN MUSIC, having four to nine strings and a round body resembling a tambourine; and the lute, popular in the Middle Ages and Renaissance, and the mandolin, both having a pear-shaped body and rounded back. Related to the lute is the guitar, which has six strings, a flat back, and a body curved inward to form a waist; it appeared in Spain as early as the 12th cent. and is used in both classical and folk music. Much smaller and more limited than the guitar, but developed from it, is the ukulele, which has four strings. The dulcimer, psaltery, and zither are stringed instruments con-

structed of a variable number of strings stretched over a flat sound box. The dulcimer is struck with small mallets; the psaltery and zither are plucked. The psaltery flourished in Europe from the 12th cent. until the late Middle Ages. The dulcimer, which originated in the Middle East, was adopted in Europe in the Middle Ages. The zither is derived from the psaltery and dulcimer. Stringed instruments operated by a keyboard include the PIANO and its predecessor, the clavichord, whose strings are struck by mallets or hammers. Keyboard instruments whose strings are plucked by means of quills or jacks include the spinet and virginal, small, legless instruments similar to the clavichord, and the harpsichord. See also ORCHESTRA.

string theory, theoretical description of ELEMENTARY PARTICLES that treats them as one-dimensional curves, or "strings." Traditional models of interactions between elementary particles are based on quantum field theory (see QUANTUM MECHANICS), which treats the particles as dimensionless points. Although quantum theories have been formulated for three of the four fundamental FORCES—the STRONG INTERACTION, WEAK INTERACTION, and ELECTROMAGNETISM—theoretical physicists have not developed a workable theory of GRAVITATION that is consistent with the principles of quantum mechanics. Treating elementary particles as strings, however, permits the derivation of a quantum theory that encompasses all four forces. **Superstring theory,** a combination of string theory and SUPERSYMMETRY, treats particles as very short (10^{-33} cm along its single dimension, which is 10^{20} smaller than the diameter of a proton) closed strings, or string loops. All of the masses, charges, and other properties of elementary particles result from the vibration of these superstrings at different frequencies. The complex mathematical basis of superstrings involves 10 dimensions: 9 spatial dimensions, 6 of which are hidden from view, and time. Because superstring theory provides a unified description of all elementary particles and fundamental forces, it is sometimes called "the theory of everything."

strip mining, process of extracting coal (or certain metallic ores) in which the surface material is removed to expose a coal seam or bed. The coal is then usually removed in a separate operation. The environment can be protected by respreading soil and by seeding or planting grass or trees on the fertilized, restored surface. Sometimes the terms *open-pit, open-cast,* or *surface mining* are used in the same sense as *strip mining.*

Stroessner, Alfredo [shtrös'nər], 1912–, president of PARAGUAY (1954–89). He commanded the armed forces and took power in a 1954 military coup. His totalitarian rule brought order and monetary stability. He was "reelected" to his eighth successive term as president in 1988 but was overthrown in a coup in Feb. 1989.

stroke or **cerebrovascular accident** (CVA), destruction of brain tissue due to impaired blood supply caused by intracerebral hemorrhage, THROMBOSIS (clotting), or embolism (obstruction caused by clotted blood or other foreign matter circulating in the bloodstream). It is a leading cause of death worldwide. Stroke is most common in the elderly, but may occur at any age; predisposing conditions include ARTERIOSCLEROSIS, DIABETES, and HYPERTENSION. Symptoms develop suddenly and can range from almost unnoticed clumsiness or headache to severe paralysis, speech and mental disturbances, and coma. Treatment depends on the cause of the stroke and may include ANTICOAGULANTS, surgery, and PHYSICAL THERAPY.

strong interaction or **strong nuclear force,** force responsible for the binding of the protons and neutrons in an ATOM's nucleus and of the ELEMENTARY PARTICLES called QUARKS in protons and neutrons. The strong interaction is mediated, or carried, by gluons. It is one of four fundamental FORCES of nature; the others are GRAVITATION, electromagnetism, and the WEAK INTERACTION.

strontium (Sr), metallic element, first recognized as distinct from barium by A. Crawford in 1790. A soft, silver-yellow ALKALINE-EARTH METAL, it is stored away from air and water. Strontium-90 from nuclear fallout is absorbed in plants and animals, and may induce bone cancer and leukemia. See ELEMENT (table); PERIODIC TABLE.

Strozzi, Bernardo [strôt'sē], 1581–1644, Italian painter. One of the greatest of the 17th-cent. Italian painters who made the transition from MANNERISM to the BAROQUE style, he was influenced by RUBENS. His early work, e.g., *St. Augustine Washing Christ's Feet* (Genoa), shows strong high-contrast effects, but later his palette lightened.

structuralism, general term for the analysis of aspects of culture as culturally interconnected signs that can be studied to reconstruct the underlying systems of relationships (e.g., the formal units and rules of a language, or the elements of myths and how they enable a society to frame an understanding of the world, as in the work of Claude LÉVI-STRAUSS). No single item in such a system has meaning except as an integral part of a set of structural connections. These interconnections are said to be binary in nature and are viewed as the permanent, organizational categories of experience. Structuralism's modern origins are in the semiology (see SEMIOTICS) of Ferdinand de SAUSSURE. In France after 1968 this search for the deep structure of the mind was criticized by DERRIDA and other "post-structuralists," who abandoned the goal of reconstructing reality scientifically in favor of "deconstructing" (see DECONSTRUCTION) the illusions of METAPHYSICS.

structural linguistics: see LINGUISTICS.

Strutt, John William: see RAYLEIGH.

Struve [shtrōō'və], family of astronomers. **Friedrich Georg Wilhelm von Struve,** 1793–1864, b. Germany, directed the Dorpat Observatory (1817–34) and later the Pulkovo Observatory (1834–64) near St. Petersburg. He discovered numerous previously undetected double stars and was, with Friedrich BESSEL and Thomas Henderson, one of the first to make a reliable determination of stellar parallax. His son, **Otto Wilhelm von Struve,** 1819–1905, succeeded him as director of the Pulkovo Observatory. He discovered about 500 double stars and a satellite of Uranus, and he estimated the sun's velocity. Otto Wilhelm's grandson, **Otto Struve,** 1897–1963, b. Russia, came to the U.S. in 1921. He was director of the Yerkes and McDonald observatories (1932–47), the Leuschner Observatory (1950–59) of the Univ. of California, Berkeley, and the National Radio Astronomy Observatory (1959–62). He made notable studies in stellar spectroscopy and of stellar rotation, interstellar matter, and stellar evolution.

strychnine, bitter ALKALOID drug derived from the seeds of a tree (*Strychnos nux-vomica*) native to Sri Lanka, Australia, and India. A potent stimulant, the drug has been used as a rat poison for five centuries. Strychnine poisoning is characterized by violent convulsions and is fatal unless promptly treated with barbiturate sedatives and ARTIFICIAL RESPIRATION.

Stuart or **Stewart,** royal family that ruled Scotland and England. It began (c.1160) as a family of hereditary stewards of Scotland, and gained the Scottish crown with the accession of ROBERT II in 1371. The marriage of James IV of Scotland to MARGARET TUDOR, daughter of Henry VII of England, eventually made Henry's granddaughter MARY QUEEN OF SCOTS a claimant to the English throne. This claim was recognized when her son, James VI of Scotland, became JAMES I of England in 1603. After the execution of CHARLES I and the period of the Commonwealth and the Protectorate, CHARLES II was restored to the throne. With the deposition of JAMES II, the crown passed to MARY II and her husband, WILLIAM III. ANNE, the last Stuart to rule England, saw the crowns of Scotland and England permanently joined by the Act of UNION (1707). On Anne's death (1714) the crown passed to the Hanoverian GEORGE I by the Act of Settlement. The Hanoverian claim was through a granddaughter of James I. Parliamentary rule of succession was adopted to thwart the claim (upheld by the JACOBITES) to the throne by the Roman Catholic James II and his descendants. After 1807 this claim ceased to be politically important.

Stuart or **Stewart, Alexander, duke of Albany,** 1454?–1485, second son of JAMES II of Scotland. Imprisoned (1479) by his brother JAMES III, who suspected him of plotting against the throne, he escaped to England. To gain English support, Albany agreed to rule Scotland as England's vassal. He returned (1482) to Scotland with an English army, but was reconciled briefly with his brother. Sentenced (1483) to death by the Scots, he again fled and died in exile.

Stuart or **Stewart, Arabella,** 1575–1615, cousin of JAMES I of England. Her descent from MARGARET TUDOR had placed her next after James in the succession to ELIZABETH I, and many thought her title preferable. Her marriage (1610) to William Seymour (later marquess of Hertford), who was also of royal descent, was viewed as

threatening by James, who imprisoned them. They escaped, but Arabella was recaptured and died in prison.

Stuart, Gilbert, 1755–1828, foremost American portrait painter of his day; b. North Kingstown, R.I. A protégé of Benjamin WEST, he first achieved success in London. He returned to America and settled in Boston. Stuart's brilliant, elegant style of portraiture was partially modeled after REYNOLDS and GAINSBOROUGH. Among his many celebrated portraits are three famous ones of George Washington: the Vaughan type (1795), a bust; the Lansdowne type (1796), a full-length study; and the unfinished Athenaeum Head (Mus. Fine Arts, Boston), commissioned c.1796 by Martha Washington and immortalized on the U.S. one-dollar bill. There are many replicas of these works.

Stuart, Henry: see DARNLEY, HENRY STUART, LORD.

Stuart, James Ewell Brown (Jeb Stuart), 1833–64, Confederate cavalry commander in the U.S. CIVIL WAR. He was known for bold raids of reconnaissance; his circuit of Gen. MCCLELLAN's Union army (June 1862) and his foray to the rear of John Pope's forces (Aug. 1862) provided Gen. LEE with invaluable information. He fought at the battles of BULL RUN (1861) and FREDERICKSBURG (1862) and commanded at CHANCELLORSVILLE. His greatest cavalry battle was at Brandy Station (1863). He was mortally wounded (1864) at Yellow Tavern.

Stuart or **Stewart, James Francis Edward,** 1688–1766, claimant to the English throne; son of JAMES II and Mary of Modena; called the Old Pretender. After the GLORIOUS REVOLUTION (1688), he was taken to France, where he was recognized as James III of England after the death (1701) of his father. In England the Act of SETTLEMENT excluded the male STUART line from succession, and James's hopes of succeeding Queen ANNE were dashed by the peaceful succession of GEORGE I in 1714. James's supporters, called JACOBITES, hatched many unsuccessful plots to restore him as king, including the rising of the earl of Mar (1715), which brought James to Scotland. He later retired to Rome. His son **Charles Edward Stuart,** 1720–88, was known as Bonnie Prince Charlie and as the Young Pretender. He led the rising of 1745, which ended in defeat at Culloden Moor in Scotland. Charles escaped, finally settling in Rome. He is the subject of much romantic literature. His brother **Henry Benedict Maria Clement Stuart,** known as **Cardinal York,** 1725–1807, was the last of the direct male Stuart line to claim the English throne (as Henry IX). He became (1747) a Roman Catholic cardinal and at his death bequeathed to GEORGE IV (then prince of Wales) the Stuart crown jewels.

Stuart, Mary: see MARY QUEEN OF SCOTS.

Stubbs, William, 1825–1901, English historian, the bishop of Chester (from 1884). His critical studies of source materials transformed the study of medieval history. He wrote *The Constitutional History of England* (3 vol., 1874–78).

stupa [Sanskrit, = mound], Buddhist monument of tumulus, or mound, form, containing relics. The stupa is probably derived from pre-Buddhist burial mounds. The oldest known prototypes are enormous earth mounds (c.700 B.C.) at Lauriya Nandangarh, NE India. They were the burial places of royalty. At Sanchi and Bharnut are the earliest proper stupas, hemispherical earth masses faced with brick or stone. Processional paths surrounded the structures, the whole enclosed with a stone railing and topped by a balcony. Stupas are found in all countries where BUDDHISM was practiced.

sturgeon, primitive marine and freshwater FISH of N Eurasia and North America. It has reduced scalation, a mostly cartilaginous skeleton, upturned tail fins, and a toothless mouth set far back under its jaw. It sucks up its food—CRAYFISH, SNAILS, larvae, and small fish—from the water bottom. The largest is the Russian sturgeon, or beluga (*Acipenser huso*), reaching a length of 13 ft (396 cm) and a weight of 1 ton (908 kg). Smoked sturgeon and sturgeon caviar are valued as food. The North American pallid sturgeon (*Scaphirhynchus albus*) is an endangered species.

Sturluson or **Sturleson, Snorri:** see SNORRI STURLUSON.

Sturm und Drang or **Storm and Stress,** movement in German literature, fl. c.1770–84. The name derives from a play (1776) by Friedrich von Klinger. Under the influence of J.J. ROUSSEAU, HERDER, and LESSING, German authors stressed with great intensity both subjectivity and the revolt of youthful genius against accepted standards. GOETHE's *Götz von Berlichingen* (1773) and *Sorrows of Young Werther* (1774) and SCHILLER's *Robbers* (1781) are representative works.

Stuttgart, city (1989 est. pop. 563,000), capital of Baden-Württemberg, SW Germany, on the Neckar R. It is an industrial center with such manufactures as electrical and photographic equipment, textiles, and pianos, and is the home of the renowned Stuttgart Ballet. Chartered in the 13th cent., it became (15th cent.) the capital of Württemberg. The city's historic center was almost entirely destroyed during WORLD WAR II and has since been restored. Historic buildings include the 12th-cent. Stiftskirche and the rococo Solitude Palace (1763–67). The city also contains such striking modern structures as the city hall and the concert hall.

Stuttgart Ballet, the first major German ballet company. It became prominent in the 1960s under the direction of John Cranko. It focuses on full-length story productions, e.g., *Romeo and Juliet* and *Eugene Onegin*.

Stuyvesant, Peter [stī'vəsənt], c.1610–1672, Dutch director-general of the North American colony of New Netherland (1647–64). The one-legged Stuyvesant was a harsh, autocratic ruler, intolerant of religious dissenters. He expanded the colony by conquering NEW SWEDEN (1655). Overwhelmed by a surprise English attack, he surrendered (1664) New Netherland to England.

Styron, William, 1925–, American novelist; b. Newport News, Va. His powerful, deeply felt, and often poetic novels include *Lie Down in Darkness* (1951), *The Confessions of Nat Turner* (1967; Pulitzer), and *Sophie's Choice* (1979), which was made into a movie (1982). He also wrote the autobiographical *Darkness Visible* (1990).

Styx [stĭks], in Greek mythology, sacred river in HADES crossed by the souls of the dead, who were ferried by Charon.

Suárez, Francisco, 1548–1617, Spanish Jesuit theologian and philosopher. His works include a commentary on THOMAS AQUINAS's *Summa Theologica;* the metaphysical study *Disputationes Metaphysicae;* and *Tractatus de Legibus,* on international law.

Suárez Gonzáles, Adolfo, 1932–, Spanish political leader. He became secretary-general of the reformed Falange movement after FRANCO's death (1975). In 1976 King JUAN CARLOS appointed him premier, and in 1977 he led his Democratic Center Union to victory in SPAIN's first free elections in 41 years. His centrist government instituted democratic procedures, and his coalition again won the 1979 elections under the new constitution. He resigned in 1981. In 1982 he founded the Democratic and Social Center Party.

subduction zone: see PLATE TECTONICS.

submarine, naval craft capable of operating underwater for an extended period of time. Cornelis DREBBEL built (c.1620) a leather-covered rowboat that could remain under water as long as 15 hr. The first submarine used in combat was invented by the American David Bushnell in 1776; many of its principles were adopted by Robert FULTON in his *Nautilus,* a submarine successfully operated (1800–1801) on the Seine R., in France. Although the Confederates used several submersible craft in the Civil War, it was the work of John Holland and Simon Lake that advanced considerably the development of the modern submarine in the U.S. A Holland submarine became the first for the U.S. navy in 1900; Lake's *Argonaut* was (1898) the first submarine to navigate extensively in the open sea. E-boats, the first U.S. diesel-engine submarines, appeared in 1912 and were the first to cross the Atlantic Ocean. Both sides used submarines extensively in WORLD WAR I, especially Germany, whose 200-ton U-boats inflicted heavy damage on Allied shipping. Larger and improved submarines played a major role in WORLD WAR II, in which the Allies and neutrals lost some 4,770 ships to these raiders. The advent of nuclear energy brought about major changes in submarine propulsion and striking power. The first nuclear submarine, the U.S.S. *Nautilus,* was completed in 1954. Nuclear submarines can remain submerged for almost unlimited periods of time and can fire cruise or ballistic missiles at enemy land targets from a submerged position. Nuclear attack submarines for deployment against other submarines and shipping, have also been built. See also SUBMERSIBLE.

submersible, small, mobile undersea research vessel capable of functioning at great depths. Submersibles have a crew compartment within a pressure hull, life-support and power systems, sensors (cameras, sonar hydrophones, and other equipment), and

usually external mechanical arms that are used to collect samples and perform other tasks. Among the better-known submersibles are the *Alvin,* which was used to explore the wreck of the *Titanic* and is capable of diving to 13,000 ft (3,960 m) with a crew of three, and the *Aluminaut,* which is constructed of high-strength aluminum alloys and is able to operate at 15,000 ft (4,570 m) with a crew of six.

succory: see CHICORY.

succulent, any fleshy plant, typically with reduced leaves and an outer surface covered with a waxy substance (cutin) that reduces evaporation from the inner, water-storing tissue. Many are indigenous to dry regions. Species of CACTUS, ALOE, and YUCCA are succulents.

Suckling, Sir John, 1609–42, English Cavalier poet, gallant at the court of CHARLES I, wit, and gamester, said by John AUBREY to have invented cribbage. *Fragmenta Aurea* (1646) collected his poems, plays, letters, and tracts. He is best known for the lyric "Why so pale and wan, fond lover?"

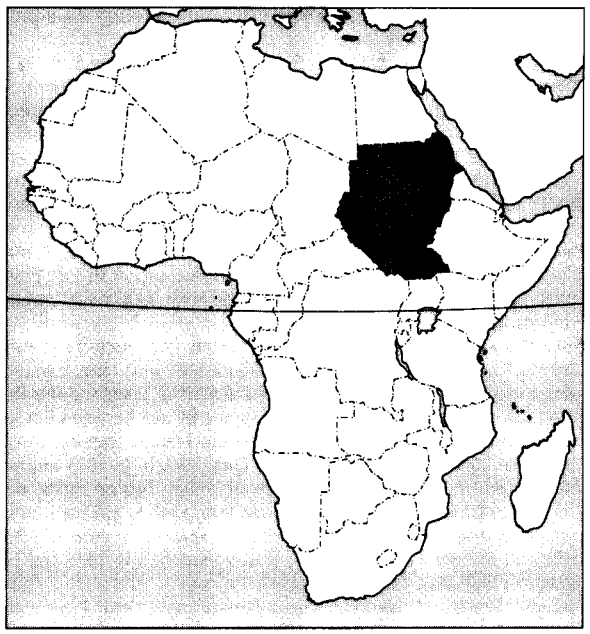
Sucre, Antonio José de [sōō'krā], 1795–1830, South American revolutionary leader. He joined (1811) the revolution against Spain and became the chief lieutenant of Simón BOLÍVAR. A military genius, Sucre won victories at Pichincha (in ECUADOR; 1822) and at Junín and AYACUCHO (in PERU; 1824); the latter battle assured South America's independence. He served (1825–28) as president of the new state of BOLIVIA and repelled (1828) a Peruvian invasion of Ecuador.

Sucre, city (1985 est. pop. 86,700), S central Bolivia, capital of Chuquisaca dept. and constitutional capital of Bolivia. (The administrative capital, since 1898, has been LA PAZ, but the supreme court is in Sucre.) It was founded as La Plata in 1538 and was also called Chuquisaca and Carcas before being renamed for Antonio José de SUCRE in 1839. A major agricultural center, it supplies the mining towns of the barren ALTIPLANO. It is also the seat of the national university, San Francisco Xavier (est. c.1625).

sucrose (empirical formula: $C_{12}H_{22}O_{11}$), common table sugar, a white, crystalline solid with a sweet taste. Common names, which indicate the natural source, include cane sugar, beet sugar, and maple sugar. A disaccharide (see CARBOHYDRATE), sucrose can be hydrolized to yield invert sugar, a mixture of unequal amounts of FRUCTOSE and GLUCOSE. Sucrose is obtained from the "juice" of sugar cane or sugar beets and from the sap of the sugar maple. It is evaporated to give first a brownish liquid, called molasses; further evaporation yields a brownish sugar. The color, due to impurities, is removed by charcoal used in the refining process.

Sudan, officially Republic of Sudan, republic (1992 est. pop. 28,305,000), 967,494 sq mi (2,505,813 sq km), the largest country in Africa, bordered by Egypt (N), the Red Sea (NE), Eritrea and Ethiopia (E), Kenya, Uganda, and Zaïre (S), the Central African Republic and Chad (W), and Libya (NW). The principal cities are KHARTOUM (the capital) and OMDURMAN. The most notable geographical feature is the NILE R., which, with its tributaries, flows through eastern Sudan from south to north. Rainfall in Sudan, more plentiful in the south, diminishes as one moves north; thus the southern part of the country is characterized by swampland and rain forest, the central region by savanna and grassland, and the north by desert and semidesert. There are mountains in the northeast, south, center, and west; the highest point is Kinyetti (10,456 ft/3,187 m), in the southeast. Agriculture, mostly of a subsistence nature, dominates the economy. Long-staple cotton, the principal cash crop, is raised in the irrigated Gezira region. Other crops include sorghum, millet, peanuts, sesame, dates, and sugarcane. Cotton, gum arabic (about 80% of world production), sesame, and peanuts are exported. The small mining industry extracts chromite, copper and manganese ores, gypsum, and gold. Manufacturing is largely devoted to consumer goods. The population is divided into three main groups: northerners, who are Muslim and speak Arabic (the official language); westerners, largely Muslim and originally (20th cent.) from W Africa; and southerners, who follow traditional beliefs mostly and speak Nilotic languages. There is a Christian minority in the south.

History. Northeast Sudan, called NUBIA in ancient times, was colonized by Egypt about 2000 B.C. and was ruled by the CUSH kingdom from the 8th cent. B.C. to the 4th cent A.D. Most of Nubia was converted to Coptic Christianity in the 6th cent., but by the 15th cent. Islam prevailed. In 1821 the north was conquered by Egypt, but a revolt by the nationalist MAHDI in 1881 forced an Egyptian withdrawal. In the 1890s an Anglo-Egyptian force under Herbert KITCHENER destroyed the theocratic Mahdist state, and in 1899 most of Sudan came under the joint rule of Egypt and Britain (with Britain exercising actual control). Independence was achieved in 1956. In 1955 the animist southerners, fearing that the new nation would be dominated by the Muslim north, began a civil war that lasted 17 years. In 1972 Pres. Muhammad Gaafar al-NIMEIRY ended the war by granting the south a measure of autonomy. However, his imposition of Islamic law on the entire country in 1983 reopened the conflict. Nimeiry was deposed by a military coup in 1986. A short-lived civilian government was overthrown in 1989 by Lt. Gen. Omar Hassan al-Bashir; he officially became president in 1993. Bashir's government strictly enforced Islamic law, banned opposition parties, and jailed dissidents. In 1992 and 1994 the army mounted offensives against the rebels in S Sudan and ousted them from many areas. In recent years Sudan has supported Muslim fundamentalists internationally.



Sudbury, city (1991 pop. 92,884), central Ontario, Canada, part of the regional municipality of Sudbury (1991 pop. 161,210). Located in the CANADIAN SHIELD, it is the center for an important mining region that produces much of the Western world's nickel and large quantities of copper and other metals. Settlement began in 1887, after mineral deposits were discovered there.

sudden infant death syndrome (SIDS) or **crib death,** sudden, unexpected, and unexplained death of an apparently well infant under one year (usually between 2 weeks and 8 months). SIDS accounts for 10% of infant deaths and is the second-highest cause of death (after accidents) in infancy. The risk is higher in males, in low-birth-weight infants, in lower socioeconomic levels, during cold months, and for babies who sleep face down. Current theories suggest that the infant may have immature lungs, may have problems with brain-stem control of breathing, or may be rebreathing carbon dioxide; SIDS victims are thought to have brief episodes of apnea (breathing stoppage) before the fatal one. An alarm system that detects breathing abnormalities is sometimes used with infants suspected of being prone to SIDS.

Sudermann, Hermann [zōō'dərmän], 1857–1928, German dramatist and novelist. One of the early German naturalists, he wrote immensely popular works of psychological insight and social criticism, notably the novel *Dame Care* (1887); the play *Fritzchen* (1897); and the novel *The Song of Songs* (1908), which exposes the

crudity and immorality of the Prussian aristocracy and the corruption of Berlin society.

Sudetenland, region, N Czech Republic, named for the Sudetes, a mountain range running along the Polish-Czech border. Traditionally part of BOHEMIA, the Sudetenland was for centuries the home of a largely German-speaking population. The area was annexed to Germany by the MUNICH PACT (1938). It was restored to Czechoslovakia in 1945, and most of its German population was expelled. With the dissolution of Czechoslovakia (1993), it became part of the Czech Republic.

Suetonius (Caius Suetonius Tranquillus), A.D. c.69–c.140, Roman biographer. His *Lives of the Caesars* survives almost in full. Filled with anecdote, Suetonius' lively work was taken as a model by later biographers.

Suez Canal, canal, Egypt. The most important constructed waterway in the Eastern Hemisphere, it is c.100 mi (160 km) long, connecting the Mediterranean Sea (N) with the Gulf of Suez and the Red Sea (S), and greatly reducing the distance by sea between Europe and S and E Asia. Built (1859–69) by the French engineer Ferdinand de LESSEPS, it was acquired by Great Britain in 1875 and nationalized by Egypt in 1956. The canal, which has no locks, was closed to Israeli shipping and cargoes from 1948 to 1975 and to all shipping from 1967 to 1975, following the ARAB-ISRAELI WAR of 1967. Cleared of mines and wreckage, it was reopened in 1975 and enlarged (1976–80).

Sufism, Muslim philosophical and literary movement. It emerged among the SHIITES in the late 10th and early 11th cent., borrowing ideas from NEOPLATONISM, BUDDHISM, and CHRISTIANITY. Some members stressed ascetic practices; others stressed quietism. All were united in emphasizing the immediate personal union of the soul with God. The movement was strongest in Persia. The greatest philosophical exponent of Sufism was al-GHAZALI, and its greatest poets were the Persians Abu Said ibn Abi al-Khair, Farad ad-Din Attar, HAFIZ, Jami, and OMAR KHAYYAM.

sugar, compound of CARBON, HYDROGEN, and OXYGEN, belonging to a class of substances called CARBOHYDRATES. Sugars fall into three groups. Monosaccharides are the simple sugars, e.g., FRUCTOSE and GLUCOSE. Disaccharides, made up of two monosaccharide units, include LACTOSE, MALTOSE, and SUCROSE. The less familiar trisaccharides, made up of three monosaccharide units, include raffinose, found in sugar BEETS.

sugarcane, tall tropical perennial (genus *Saccharum*) of the GRASS family, native to Asia. It somewhat resembles CORN and SORGHUM, with a large terminal panicle and a noded stalk. Sugarcane and the sugar BEET are the major sources of SUGAR. The cane is harvested by cutting down the stalks and pressing them to extract the juice, which is concentrated by evaporation. Refined sugar is produced by precipitating out nonsugar components; it is almost pure SUCROSE. Cuba and India together produce over one third of the world's cane sugar. Sugarcane by-products include molasses, RUM, ALCOHOL, fuel, and livestock feed.

Suharto or **Soeharto,** 1921–, president of INDONESIA (1968–). A relatively unknown general, he led (1965) the army in crushing a Communist coup and effectively replaced Pres. SUKARNO. He became acting president in 1967, was elected president in 1968, and was reelected in 1971, 1978, 1983, 1988, and 1993. Under his leadership, Indonesia achieved political stability and economic growth, but dissent was suppressed in the name of consensus and Suharto and his family used their power to enrich themselves.

Sui, dynasty: see CHINA.

suicide, the deliberate taking of one's own life. It may be dictated by social convention, as with hara-kiri, in Japan, or by custom, as in those primitive societies in which nonproductive elders were expected to end their own lives for the welfare of the group. Long condemned by Judaism, Christianity, and Islam, suicide remains a crime in some countries. Britain abolished punishment for attempted suicide in 1961, and by the early 1990s only two U.S. states still listed suicide as a crime. Eighteen states, however, have laws against helping someone to commit suicide. Suicide and attempted suicide are now more often considered the result of psychological factors, such as severe DEPRESSION, guilt, and AGGRESSION, or of chronic illness. Suicidal behavior is also viewed as a form of communication, a cry for help. In the U.S., most suicide attempts are by women, but out of 30,000 successful suicides (1989), 24,000 were by men. In recent years the suicide rate among the elderly has risen 21%; the rate for people ages 15-23 has tripled since 1950. In the 1990s a right-to-die movement has supported the principle of doctor-assisted suicide in certain cases (see EUTHANASIA).

suite, in music, instrumental form derived from dance and consisting of a series of movements usually in the same key but contrasting in rhythm and mood. As the connection with actual dancing disappeared, the BAROQUE suite evolved, establishing the basic movements as allemande, courante, sarabande, and gigue. Suites for orchestra (including the partitas of J.S. BACH) were sometimes called OVERTURES. The 19th-cent. suite became a collection of pieces from the incidental music for plays or from ballet scores (as GRIEG's *Peer Gynt Suite*).

Sukarno, 1901–70, Indonesian statesman. With Mohammad HATTA, Sukarno played a crucial role in establishing (1945) the republic of INDONESIA and became its first president. In 1959 he assumed dictatorial powers and in 1963 proclaimed himself president for life. He increased Indonesian ties with China, and in 1965 a Communist coup was put down by the military under Gen. SUHARTO, who stripped Sukarno of power. In 1966 he was removed from the presidency and remained under house arrest until his death. His daughter, **Megawati Sukarnoputri,** 1947–, became leader of the opposition Indonesia Democratic party in 1993.

Sukkoth: see under JEWISH HOLIDAYS.

Sulayman, sultans of the OTTOMAN EMPIRE (Turkey). **Sulayman I** or **Sulayman the Magnificent,** 1494-1566 (r.1520–66), son and successor of SELIM I, ruled the Ottoman Empire at its height of power and prestige. He continued his father's conquests in the Balkans and the Mediterranean, conquering (1521) Belgrade and expelling (1522) the Knights Hospitalers from Rhodes. He annexed most of Hungary and entered into an alliance with FRANCIS I of France against the Hapsburgs. His vassal BARBAROSSA made the Turkish fleet the terror of the Mediterranean. On the whole, however, Sulayman was unsuccessful in his naval warfare against Holy Roman Emperor CHARLES V and Venice. He lost (1535) Tunis to Charles and failed to take Vienna (1529) and Malta (1565). He undertook several successful campaigns against Persia and conquered the Arabian coastlands. Sulayman was distinguished for his justice; his legal, military, and educational reforms were outstanding. He lived in great pomp and splendor and was a generous patron of the arts, architecture, and literature. He had two of his sons executed for conspiracy and was succeeded by another son, SELIM I. **Sulayman II,** 1642–91 (r.1687–91), was occupied during his brief reign with the war against Austria. Mustafa KÖPRÜLÜ was his grand vizier.

sulfa drug, any of a class of synthetic chemical substances derived from sulfanilamide and used to treat bacterial infections. These drugs inhibit the action of para-aminobenzoic acid, a substance bacteria need in order to reproduce. Sulfa drugs are used to treat fungal and urinary tract infections, leprosy, and ulcerative colitis, but resistant strains of microorganisms (streptococci, meningococci, and shigella) have made the drugs less effective. ANTIBIOTICS have largely replaced sulfa drugs in the treatment of bacterial infections.

sulfur (S) or **sulphur,** nonmetallic element, known to antiquity as the biblical brimstone and recognized as an element by Antoine LAVOISIER in 1777. Solid sulfur is yellow, brittle, odorless, tasteless, and insoluble in water. Sulfur is widely distributed in minerals and ores, some volcanic regions, and large underground deposits, and often occurs with coal, natural gas, and petroleum. It is found in most proteins and protoplasm of plants and animals. Sulfur is used in GUNPOWDER, matches, RUBBER vulcanization, insecticides, and the treatment of certain skin diseases. SULFURIC ACID is its most important compound; others are used as disinfectants, refrigerants, organic solvents, and SULFA DRUGS. See ELEMENT (table); PERIODIC TABLE.

sulfuric acid, chemical compound (H_2SO_4), colorless, odorless, extremely corrosive, oily liquid. It is sometimes called oil of vitriol. Concentrated sulfuric acid is a weak acid (see ACIDS AND BASES) and a poor ELECTROLYTE because relatively little is dissociated into ions at room temperature. When cold it does not react readily with such common metals as iron or copper. When hot it is an oxidiz-

ing agent. Hot concentrated sulfuric acid reacts with most metals and with several nonmetals, e.g., sulfur and carbon. When concentrated sulfuric acid is mixed with water, large amounts of heat are released. Sulfuric acid is a strong acid and a good electrolyte when diluted. A very important industrial chemical, sulfuric acid is produced by the oxidation and dissolution in water of sulfur dioxide (SO_2).

Sulla, Lucius Cornelius, 138 B.C.–78 B.C., Roman general, leader of the conservative senatorial party. He and MARIUS both wanted the appointment as commander against MITHRIDATES VI of Pontus; Sulla got it by marching (88 B.C.) against Rome. He conquered Mithridates, sacked (86 B.C.) Athens, and returned triumphantly to Rome. In the civil war that followed, he defeated the Marians. He massacred 8,000 prisoners and declared himself dictator (82 B.C.). Sulla retired (79 B.C.) after a reign notorious for cruelty and illegality.

Sullivan, Anne: see MACY, ANNE SULLIVAN.

Sullivan, Sir Arthur (Seymour), 1842–1900, English composer and conductor. He is famous for a series of brilliant comic operas (or OPERETTAS) written with the librettist W.S. GILBERT, e.g., *Trial by Jury* (1875), *H.M.S. Pinafore* (1878), *The Mikado* (1885), and *Ruddigore* (1887). He also wrote such serious music as the oratorio *Kenilworth* (1864) and the opera *Ivanhoe* (1886).

Sullivan, Harry Stack, 1892–1949, American psychiatrist; b. Norwich, N.Y. As head of the William Alanson White Foundation (1934–43) and the Washington School of Psychiatry (1936–47), he collaborated with psychologists and sociologists to develop his belief that PSYCHOANALYSIS needed to be supplemented by a thorough study of the impact of cultural forces upon the personality. He also contributed significantly to the understanding of SCHIZOPHRENIA and obsessional states.

Sullivan, John L(awrence), 1858–1918, American boxer; b. Roxbury, Mass. A powerful right-handed puncher, he won (1882) the bare-knuckles heavyweight championship over Paddy Ryan. The "Great John L.," idol of American sports fans, won (1889) the last bare-knuckles title bout over Jake Kilrain but, using gloves, was beaten (1892) by James J. Corbett.

Sullivan, Louis Henry, 1856–1924, American architect; b. Boston. He was of great importance in the evolution of MODERN ARCHITECTURE in the U.S. His dominating principle, that outward form should express function, countered the late-19th-cent. revival of traditional classicism, and gained few adherents. Associated after 1880 with Dankmar Adler, he became prominent with functionally straightforward designs like the Wainwright Building, St. Louis (1890), and the Transportation Building at the World's Columbian Exposition, Chicago (1893). Sullivan's views were published as *Kindergarten Chats* (1918) and *The Autobiography of an Idea* (1924). Few of his buildings survive, but he influenced a generation of American architects.

Sully, Thomas, 1783–1872, American painter; b. England. Influenced by Benjamin WEST and Thomas LAWRENCE during a stay in London, he returned to America and settled in Philadelphia in 1810. An elegant and romantic portraitist, he recorded such notable subjects as Queen Victoria (Metropolitan Mus.) and Presidents Jefferson and Monroe (U.S. Military Acad., West Point, N.Y.). Sully also painted noteworthy historical compositions, e.g., *Washington's Passage of the Delaware* (Mus. Fine Arts, Boston).

Sully-Prudhomme, René François Armond [sülē'-prüdôm'], 1839–1907, French poet, one of the PARNASSIANS. His works include *Justice* (1878) and *Happiness* (1888), long philosophical poems. In 1901 he received the first Nobel Prize in literature.

sulphur: see SULFUR.

Sulzberger, Arthur Hays, 1891–1968, American newspaper publisher; b. N.Y.C. He joined the New York *Times* in 1918, succeeding his father-in-law, Adolph S. OCHS, as publisher in 1935. He retained the paper's fine news coverage and built the *Times* radio station, WQXR, into a leader in news and music. His son, **Arthur Ochs Sulzberger,** 1926–, b. N.Y.C., was president (1963–79) and publisher (1963–92) of the *Times* and became chairman of the New York Times Co. in 1979. His son, **Arthur Ochs Sulzberger, Jr.,** 1951–, b. Mt. Kisco, N.Y., became publisher of the *Times* in 1992.

sumac or **sumach,** common name for the family Anacardiaceae, trees and shrubs native chiefly to the tropics but ranging into north temperate regions and typified by resinous, often acrid sap, a source of tannin. The sap of some plants in the family, e.g., POISON IVY, also contains an ESSENTIAL OIL that is a toxic skin irritant. PISTACHIO, MANGO, and CASHEW are members of the family that provide food. The true sumacs belong to the genus *Rhus.* Most *Rhus* species contain tannin, and some are cultivated for it. Several North American species have brilliant fall foliage; the fruit of the common staghorn sumac (*R. typhira*) of the E U.S. is used to make wine and for medicinal purposes.

Sumatra, island (1990 est. pop. 36,882,000), westernmost and second largest island of Indonesia, c.183,000 sq mi (473,970 sq km). Hot and rainy, it is c.1,110 mi (1,790 km) long and up to 270 mi (435 km) wide, with swamps in the east and a densely forested, mountainous interior. Mt. Kerintji (12,467 ft/3,800 m), in the volcanic Barisan range, is the highest point. Sumatra is sparsely settled but of great economic importance for its rich deposits of oil, coal, gold, silver, and tin and bauxite (on its offshore islands) and its productive rubber, coffee, tea, and sugarcane plantations. MEDAN and PALEMBANG are the chief population centers.

Sumer and **Sumerian civilization.** A notable non-Semitic culture appeared in S Mesopotamia (Sumer) at least as early as the 5th millennium B.C. By 3000 B.C. Sumerian city-states, e.g., Erech, Kish, Lagash, and UR, developed considerable power based on irrigated agriculture. Pottery and metalwork were made into fine arts, and the Sumerians probably invented CUNEIFORM writing. The Sumerians were the rivals of Semitic cities such as AKKAD and ultimately were conquered by them. A Sumerian revival under the third dynasty of Ur (c.2060 B.C.) lasted until that dynasty fell to ELAM, and the growth of BABYLONIA ended the Sumerians as a nation.

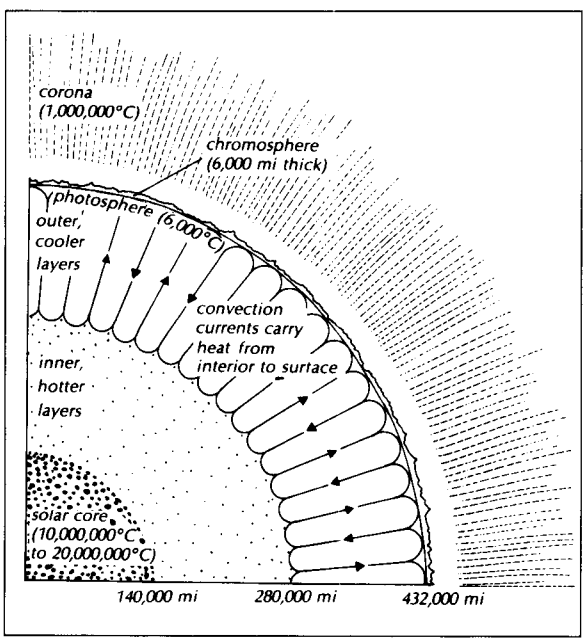
Sumerian and Babylonian art. The artistic tradition of MESOPOTAMIA was remarkable for its antiquity, variety, and richness. The art of the Sumerian civilization (found in excavations at UR, BABYLON, Erech, Mari, Kish, and Lagash) influenced all the major cultures of ancient W. Asia. Sumerian techniques and motifs were widely available because of the invention of CUNEIFORM writing before 3000 B.C. Clay was the Sumerians' most abundant material; stone, wood, and metal had to be imported. From very early times, their workmanship was of the highest quality, e.g., an alabaster vase from Erech (c.3500 B.C.; Iraq Mus., Baghdad). A major peak of artistic achievement is represented by a marble head, *Lady of Warka,* from Erech (c.3200 B.C.; Iraq Mus.). Ur yielded much outstanding Sumerian work, e.g., a wooden harp with the head of a bull on top, showing mythological scenes in gold and mosaic inlay on the sound box (c.2650 B.C., Univ. of Penn., Philadelphia). The famous votive stone sculptures from Tell Asmar represent tall, bearded figures with huge, staring eyes and long, pleated skirts. The ZIGGURAT temple was the most striking architectural achievement of the Sumerians; a ziggurat at Erech extended over half a million square ft (46,500 sq m). Among other Sumerian arts, the cylinder seals, used to mark documents or property, were highly sophisticated. Sculpture reached new heights under Sargon, king of Akkad, and a bronze head from Nineveh (c.2300 B.C.; Iraq Mus.) is thought to be his portrait. Invasions from the east destroyed Sargon's empire, but the city of Lagash survived. It was beautified with many statues of its governor Gudea, and other works of art. The glory of Sumer was revived from 2200 to 2100 B.C. During this period the great ziggurat of the moon god at Ur was constructed. Invasions of Semitic peoples from what are now Iran and Syria ended the last Sumerian golden age. The palace at Mari reveals the brilliance of a vanished world. In the 18th cent. B.C., BABYLONIA under HAMMURABI dominated Mesopotamia. A carved diorite head showing the marks of age on a sensitive face (1792–1750 B.C.; Louvre) is thought to be his portrait. A sculpture from Mari of a fertility goddess (Aleppo Mus.), holding a vase from which water flows down her skirt, attests to the genius of Babylonian sculptors. After Hammurabi's death, Mesopotamia was torn for centuries by invasions. It was not until the reign of NEBUCHADNEZZAR (c.605–562 B.C.) that the Babylonians developed to perfection one of their most striking arts: the polychrome-glazed brick walls modeled in relief, of which the foremost example is the Ishtar gates of Babylon. These contain 575 reliefs of lions, dragons, and bulls (6th cent. B.C.; one lion is in the Metropolitan Mus.) of superb workmanship.

The king's palace, its hanging (balconied) gardens, the Ishtar gates, and the processional road made Babylon the most magnificent city of its time. Less than a century later, Babylonia fell to more invasions, with the Persians, Greeks, and Romans ruling in succession. It was not until excavations in the 19th cent. A.D. that archaeologists brought to light its history, artwork, and influence.

summer solstice: see SOLSTICE.

Sumner, Charles, 1811–74, U.S. senator from Massachusetts (1851–74); b. Boston. An aggressive abolitionist, he was physically assaulted by Rep. Preston S. Brooks after making a strong antislavery speech (May 19–20, 1856). He was a leader of the radical Republicans' RECONSTRUCTION program and was active in the impeachment of Andrew JOHNSON.

sun, intensely hot, self-luminous body of gases (mainly hydrogen and helium) at the center of the SOLAR SYSTEM. The sun is a medium-size main-sequence STAR. Its mean distance from the earth is defined as one ASTRONOMICAL UNIT. The sun is c.865,400 mi (1,392,000 km) in diameter; its volume is about 1,300,000 times, and its mass 332,000 times, that of the earth. At its center, the sun has a density over 100 times that of water, a pressure of over 1 billion atmospheres, and a temperature of about 15,000,000K. This temperature is high enough for the occurrence of nuclear reactions, which are assumed to be the source of the sun's energy. Hans BETHE proposed a cycle of nuclear reactions known as the carbon cycle, in which carbon acts much as a catalyst, while hydrogen is transformed by a series of reactions into helium and large amounts of high-energy gamma radiation are released. The so-called proton-proton process is now thought to be a more important energy source: the collision of two protons ends with the production of helium atoms and the release throughout of gamma radiation. The bright surface of the sun is called the photosphere; its temperature is about 6000K. During an ECLIPSE of the sun, the chromosphere (a layer of rarified gases above the photosphere) and the corona (a luminous envelope of extremely fine particles surrounding the sun, outside the chromosphere) are observed. See also SOLAR WIND; SUNSPOTS.



Structure of the sun

Sun Belt or **Sunbelt,** popular name for the southern tier of U.S. states. It is generally considered to focus on California, Arizona, Texas, and Florida and to extend north and east as far as Virginia. It embraces a diverse area that—because of rapid economic growth, high federal spending levels, and climatic advantages—has experienced (1960–90) rapid gains in population and political importance as a result of migration from the so-called Frost Belt states of the N U.S. east of the Rockies.

sun dance, a summer ceremony among the indigenous peoples of the Plains (see NORTH AMERICA, INDIGENOUS PEOPLES OF), consisting of usually eight days of ritual smoking, fasting, and penance through self-torture. The rites were discouraged by missionaries and the U.S. government to such an extent that they are now almost forgotten and their true meaning has been lost.

Sunday, Billy (William Ashley Sunday), 1863–1935, American evangelist; b. Ames, Iowa. A professional baseball player (1883–90), he worked (1891–95) for the YMCA and later became an evangelist (1896) and a Presbyterian minister (1903).

Sunday: see SABBATH; WEEK.

sundial, instrument that indicates the time of day by the shadow, cast on a surface marked to show hours or fractions of hours, of an object on which the sun's rays fall. The shadow-casting object is called a gnomon. Corrections must be made for the difference (which varies daily) between solar (or apparent) time and clock (or mean) time and for the difference in longitude between the position of a sundial and the standard-time meridian of a given locality.

sunfish: see BASS.

sunflower, any annual or perennial herb (genus *Helianthus*) of the COMPOSITE family, native to the New World. The flower heads are commonly bright yellow and may reach 1 ft (30 cm) in diameter. Different parts of the common sunflower (*H. annuus*) are used in many ways: the seeds as a poultry food, bread grain, and a source of oil; the flowers for the production of nectar; and the leaves for fodder. It is the state flower of Kansas. Other species are used for food (see JERUSALEM ARTICHOKE) and as garden flowers.

Sung, dynasty: see CHINA.

Sungari, chief river of NE China, c.1,150 mi (1,850 km) long, flowing generally north to join the AMUR R. on the China-Russia border. The river, which passes the industrial cities of Jilin (Kirin) and HARBIN, is navigable for most of its length and is an important trade artery. Fengman Dam, begun under Japanese occupation during World War II and completed in 1946, provides hydroelectricity for Jilin.

Sunni [Arab. *Sunna,* = tradition], adherents of the largest branch of ISLAM, usually considered traditionalist or orthodox. The Sunni comprise about 85% of all Muslims. Unlike the SHIITES, they accept the traditions (Sunna) of MUHAMMAD as authoritative and approve the historic order of Muhammad's first four successors. (The Shiites maintain that Ali, the fourth, should have been the first.) Differences in ritual and law divide the Sunni into adherents of four schools: the Hanafites, the Malikites, the Shafites, and the Hanbalites.

Sunnyvale, city (1990 pop. 117,229), W Calif., near San Francisco; settled 1849, inc. 1912. It is a residential and industrial city in the Santa Clara Valley. Little of the once rich farmland is left; today the area processes food and makes electronic equipment paper products, and pharmaceuticals.

sunset laws, statutes that deal with the tendency of government agencies and programs to be self-perpetuating by providing for their periodic review.

sunshine laws: see FREEDOM OF INFORMATION ACT.

sunspots, dark, usually irregularly-shaped spots on the SUN's surface that are actually solar magnetic storms. The temperature of the spots is lower than that of the surrounding photosphere; thus the spots are, by contrast, darker. All but the smallest show a dark central portion (the umbra) with a lighter outer area (the penumbra). Sunspot activity reaches a maximum once every 11 years.

Sun Yat-sen, 1866–1925, Chinese revolutionary leader. Born near Guangzhou, he received (1892) a medical degree in Hong Kong and practiced in that city. Thereafter he plotted to overthrow the Ch'ing dynasty of China and to establish a republic. Influenced by Karl MARX, Sun organized (1905) in Japan a revolutionary league, the T'ung Meng Hui, and developed a political theory based on the Three People's Principles: nationalism, democracy, and the people's livelihood. After revolution erupted in China, Sun was elected (1911) provisional president of the Chinese republic. He soon resigned in favor of YÜAN SHIH-KAI, who became increasingly dictatorial. Sun became director of the KUOMINTANG party, revolted

against Yüan, and became (1921) president of a self-proclaimed national government at Guangzhou. In 1924, to hasten the conquest of N China, he began cooperating with Chinese Communists and accepted aid from the USSR. After the Kuomintang-Communist split (1927), each group claimed to be his heirs. Sun's wife was Soong Ch'ing-ling (see under SOONG, family).

superconductivity, total disappearance of electrical resistance in a wire or circuit. Discovered in 1911, superconductivity only appears in a specific material below a critical temperature. The major problems confronting the possible applications of superconductivity were the extremely low temperatures initially required (only a few degrees above absolute zero) and the fact that a strong magnetic field could destroy it. In recent years much research has been done in the field of "high-temperature" superconductivity using composite substances. In 1993 scientists reported attaining superconductivity at 161K (−112°C). The highest-temperature superconductors, however, required extremely high atmospheric pressures and have mercury, a toxic metal, as a component.

superego: see PSYCHOANALYSIS.

superfluidity, the capability of liquid helium cooled below a temperature of 2.19K (the lambda point) to flow freely, even upward, with no measurable friction and viscosity. Superfluid helium flows easily through capillary tubes (see CAPILLARITY) that resist the flow of ordinary fluids, and a DEWAR FLASK filled with superfluid helium from a larger container will empty itself back into the original container because the liquid helium flows spontaneously in an invisible film over the surface of the flask.

Superior, Lake, second largest (31,820 sq mi/82,414 sq km) lake in the world, largest freshwater lake in the world, and largest, highest (surface elevation 602 ft/183 m), and deepest (up to 1,302 ft/397 m) of the GREAT LAKES, on the U.S.-Canada border. Part of the St. Lawrence & Great Lakes Waterway, it is connected with Lake Huron by the St. Marys R. and the SAULT SAINTE MARIE CANALS.

supernova, exploding star (see VARIABLE STAR) that suddenly increases its energy output as much as a billionfold and then slowly fades to less than its original brightness. At peak intensity, it can outshine the entire galaxy in which it occurs. Supernovas represent a catastrophic stage of STELLAR EVOLUTION; a sudden implosion of the core of certain massive stars (see GRAVITATIONAL COLLAPSE) produces a rapidly rotating collapsed stellar remnant (see PULSAR), the explosive ejection of the stellar envelope at great velocity, and the release of enormous quantities of energy. Over 120 extended galactic radio sources have been identified as supernova remnants. Of these, only four have been positively associated with explosions that were observed in recorded history; they occurred in 1006, 1054 (the remnant of which is now visible as the CRAB NEBULA), 1572, and 1604. In 1987 a supernova visible to the naked eye (the first since 1604) appeared in the Large MAGELLANIC CLOUD.

superrealism: see PHOTOREALISM.

supersonic speed: see SHOCK WAVE; SONIC BOOM.

supersymmetry, in physics, theory concerning the relationship of the ELEMENTARY PARTICLES called BOSONS to those known as FERMIONS, and vice versa, and linking the four fundamental FORCES. In supersymmetry every ordinary elementary particle has as its counterpart a superparticle with similar properties except for angular momentum, or "spin," which differs by a half unit. According to supersymmetry, each ordinary fermion has a superpartner that is a boson, and each ordinary boson has a superpartner that is a fermion. The superpartners of fermions are named by adding the prefix *s-* to the fermion's name, e.g., the squark is the QUARK's counterpart, and those of bosons by adding the suffix *-ino* to the root of the boson's name, e.g., the photino is the PHOTON's counterpart. Proof of the theory—discovery of the predicted particles through their creation and detection in a PARTICLE ACCELERATOR—requires extremely high energy levels that are beyond the capability of current devices. See SUPERSTRING.

supply and demand, in classical economics, factors that are said to determine price and that may be thought of as the guiding forces in an economy based on private property. Supply refers to the varying amounts of a good that producers will supply at different prices; in general, a higher price yields a greater supply. Demand refers to the quantity of a good that consumers want (and are able to buy) at any given price. According to the law of demand, demand decreases as the price rises. In a perfectly competitive market, the upward-sloping supply curve and the downward-sloping demand curve yield a supply-and-demand schedule that, where the curves intersect, reveals the equilibrium, or market, price of an item. In reality, however, monopolies, government regulation, and other factors combine to limit the effect of supply and demand.

supply-side economics, school of economic thought based on the belief that economic expansion will result from lower tax rates. The theory holds that a reduction in taxes will increase supply (see SUPPLY AND DEMAND) by encouraging production, providing greater incentives to work, and stimulating the savings and investment needed to support business growth. Greater supply would also mean a slowdown in inflation. A tax cut, according to supply-side economics, would not reduce overall tax revenues, because increased prosperity will offset the effects of lower tax rates. Grounded in the historic economic doctrine of LAISSEZ FAIRE, the philosophy found a modern champion in Arthur Laffer and provided much of the rationale for Pres. REAGAN's tax-cut program (1981). Supply-siders maintain that the tax cuts spurred economic growth, but critics argue that the program caused massive federal deficits, penalized the poor and middle class, and induced excessive speculation that damaged the U.S. economy.

suprematism, Russian nonobjective art movement founded (1913) by Casimir MALEVICH in Moscow, parallel to CONSTRUCTIVISM. Suprematism sought "to liberate art from the ballast of the representational world." Major works consisted of geometric shapes flatly painted on a pure canvas surface. Malevich's *White on White* (Mus. Mod. Art, N.Y.C.) embodies the movement's principles. Its dissemination through the BAUHAUS influenced modern art and design.

Supreme Court, United States, highest court of the U.S., established by Article 3 of the CONSTITUTION. It has ultimate jurisdiction over all cases arising under the Constitution, laws, and treaties of the U.S. Since 1869 it has comprised nine members—the chief justice and eight associate justices—named by the president, subject to Senate confirmation. Its decisions are rendered by majority vote. Cases are brought before the Court by appeal—when the ruling of the highest state court concerning the constitutionality of statutes is questioned—or by a writ of certiorari, granted at the Court's discretion, to review decisions by lower courts. As the court of last resort it has two functions: interpreting acts of Congress and determining whether federal and state statutes conform to the Constitution. Under the tenure (1801–35) of the "great chief justice," John MARSHALL, the principle of judicial review of congressional enactments was firmly established in MARBURY V. MADISON (1803). The powers of the federal government were confirmed in such cases as Gibbons v. Ogden (1824), which allowed the government to regulate interstate commerce. In contrast to such assertiveness, the Court later refused, in the DRED SCOTT CASE (1857), to take a stand against slavery. During the NEW DEAL of the 1930s, the Supreme Court struck down several major pieces of social legislation. In the 1950s, under Chief Justice Earl WARREN, it moved to protect the rights of minorities, as in BROWN V. BOARD OF EDUCATION OF TOPEKA, KANSAS (1954), outlawing public-school segregation. The judicial liberalism of the "Warren Court" receded in the 1970s with the appointment of Chief Justice Warren BURGER and others during the Nixon administration. The Court's more conservative approach (e.g., UNIVERSITY OF CALIFORNIA REGENTS V. BAKKE) was strongly reinforced by the appointments of Pres. Reagan and Pres. Bush. In 1986 William Rehnquist replaced Warren Burger as Chief Justice. Under his leadership the conservative court has taken a more active role in reversing or modifying some past Supreme Court decisions.

Supreme Soviet: see SOVIET.

Sur: see TYRE.

Surabaya, Surabaja, or **Soerabaja** [all: sōōrəbī'ə], city (1990 pop. 2,483,871), capital of East Java prov., NE Java, Indonesia, on the Kali Mas R. Surabaya is the country's second largest city and its major naval base. A commercial and industrial center, it has railroad shops, automobile assembly and oil processing plants, and manufactures textiles, glass, and fertilizer. Damaged during the Indonesian independence struggle, it has been extensively rebuilt.

surface tension, the cohesion forces (see ADHESION AND COHESION) at the surface of a liquid. The molecules within a liquid are at-

1. UNITED STATES SUPREME COURT

Rehnquist, William Hubbs, 1924–, Chief Justice; b. Milwaukee, Wisc., grad. Stanford Law School (1952). He was an assistant attorney general from 1969 until his appointment to the Supreme Court (1971) by Pres. Nixon. A conservative Republican, he became known on the Court as a staunch advocate of law-and-order. He was appointed chief justice by Pres. Reagan in 1986.

Blackmun, Harry Andrew, 1908–, b. Nashville, Ill., grad. Harvard Law School (1932). He served as judge of the U.S. Court of Appeals for the Eighth Circuit from 1959 until his appointment to the Supreme Court (1970) by Pres. Nixon. Blackmun has tended toward a liberal view on civil rights while remaining essentially conservative in other areas.

Ginsburg, Ruth (Joan) Bader, 1933–, b. Brooklyn, N.Y., grad. Columbia Law School (1959). She taught law and was a women's rights lawyer before her appointment (1980) to the U.S. Court of Appeals for the District of Columbia. Regarded as a moderate, she was appointed by Pres. Clinton in 1993.

Kennedy, Anthony M., 1936–, b. Sacramento, Calif., grad. Harvard Law School (1961). He was named to the U.S. Court of Appeals, Ninth Circuit, in 1975. He served in this position until his appointment (1988) to the Court by Pres. Reagan. The court's youngest member, he is regarded as a political and legal conservative.

O'Connor, Sandra Day, 1930–, b. El Paso, Tex., grad. Stanford Law School (1952). She served as judge of the Arizona Court of Appeals from 1979 until her appointment (1981) by Pres. Reagan as the first woman on the Supreme Court. A conservative, she has shown an interest in preserving and strengthening states' powers.

Scalia, Antonin, 1936–, b. Trenton, N.J., grad. Harvard Law School (1960). He was an assistant attorney general in the Justice Department from 1974–77 and was appointed (1982) to the U.S. Court of Appeals for the District of Columbia. Appointed (1986) to the Court by Pres. Reagan, he is conservative but has taken libertarian positions on certain issues.

Souter, David Hackett, 1939–, b. Melrose, Mass., grad. Harvard Law School (1966). He was attorney general of New Hampshire (1976–78) and served as an associate justice of the New Hampshire superior court (1978–83) and supreme court (1983–90). In 1990 he was appointed by Pres. Bush to the Supreme Court.

Stevens, John Paul, 1920–, b. Chicago, Ill., grad. Northwestern Univ. School of Law (1947). He served as judge of the U.S. Court of Appeals for the Seventh Circuit from 1970 until his appointment to the Supreme Court (1975) by Pres. Ford. Stevens is regarded as independent and moderately conservative.

Thomas, Clarence, 1948–, b. Pin Point, Ga., grad. Yale Law School (1974). He headed the Equal Employment Opportunity Commission (1982–89) prior to his appointment (1990) to the U.S. Court of Appeals for the District of Columbia. A conservative and the only African-American justice, he was appointed by Pres. Bush in 1991.

tracted equally from all sides, but those near the surface experience unequal attractions and thus are drawn toward the center of the liquid mass by this net force. A result of surface tension is the tendency of a liquid to reduce its exposed surface to the smallest possible area.

surfing, sport of gliding toward the shore on a breaking wave, done on a board from 4 to 12 ft (122 to 366 cm) long. The larger surfboards have a stabilizing fin in the rear. The surfer paddles toward the beach until an incoming wave catches the board, then stands up and glides along or just under the crest of the wave. Developed in Hawaii, surfing spread to California in the 1920s and, by the 1960s, had become popular with youth in the U.S., Australia, and other countries.

Surgeon General, United States, head of the U.S. Public Health Service, which is responsible for protecting the people's health, reporting to the public on health issues, and collaborating with other countries in health activities.

surgery, branch of medicine concerned with the diagnosis and treatment of injuries and pathological conditions requiring manual or instrumental operative procedures. Surgery has been performed since prehistoric times (bloodletting, opening of abscesses) and was practiced with great skill and cleanliness by the ancient Greeks and Romans. During the Middle Ages in Europe unskilled and uneducated barber-surgeons dominated the field, and postoperative infection and GANGRENE were common. Surgery became more professional in the 18th cent. and entered its modern phase in the 19th cent. with the introduction of antiseptic techniques, sterilization, and ANESTHESIA. More recent advances include BLOOD TRANSFUSION techniques, new diagnostic tools (X RAYS, CAT SCAN, ULTRASOUND), ANTIBIOTICS and other DRUGS, microsurgery, and organ TRANSPLANTATION. Such techniques as balloon ANGIOPLASTY and endoscopic surgery (see ENDOSCOPE), utilizing tiny instruments and miniaturized video cameras and requiring smaller incisions, are now replacing some more invasive surgery.

Suriname [sŏŏrĭnäm', –näm'], officially Republic of Suriname, republic (1992 est. pop. 410,000), 63,037 sq mi (163,266 sq km), NE South America, bordered by the Atlantic Ocean (N), French Guiana (E), Brazil (S), and Guyana (W). PARAMARIBO is the capital. It is part of the Guiana region. Suriname is one of the world's great producers of bauxite, which accounts for about 70% of export earnings. Rice is the chief crop, and sugarcane, bananas, coffee, and coconuts are also grown. Timber and wood products are also important. The population is mixed, with Asian Indians, Creoles, and Indonesians the largest ethnic groups. Dutch is the official language, but most of the people speak Sranang Tongo a native patois. Hinduism, the Roman Catholic and Moravian churches, and Islam are the predominant faiths.

History. The Dutch established a colony here in 1616, and Dutch possession was confirmed by the Congress of VIENNA in 1815. Known as Netherlands or Dutch Guiana, the colony was granted a parliament in 1866. Suriname became autonomous in 1954 and independent in 1975. Just prior to independence, some 100,000 Surinamese, mainly of Asian descent, migrated to the Netherlands.

The key to pronunciation appears on page xiii.

2. SUPREME COURT JUSTICES THROUGHOUT HISTORY *(including dates on bench)*

CHIEF JUSTICES

John Jay, 1789–95	Salmon P. Chase, 1864–73	Harlan F. Stone, 1941–46
John Rutledge, 1795	Morrison R. Waite, 1874–88	Fred M. Vinson, 1946–53
Oliver Ellsworth, 1796–1800	Melville W. Fuller, 1888–1910	Earl Warren, 1953–69
John Marshall, 1801–35	Edward D. White, 1910–21	Warren E. Burger, 1969–86
Roger B. Taney, 1836–64	William H. Taft, 1921–30	William H. Rehnquist, 1986–
	Charles E. Hughes, 1930–41	

ASSOCIATE JUSTICES

John Rutledge, 1789–91	David Davis, 1862–77	Owen J. Roberts, 1930–45
William Cushing, 1789–1810	Stephen J. Field, 1863–97	Benjamin N. Cardozo, 1932–38
James Wilson, 1789–98	William Strong, 1870–80	Hugo Black, 1937–71
John Blair, 1789–96	Joseph P. Bradley, 1870–92	Stanley F. Reed, 1938–57
Robert H. Harrison, 1789–90	Ward Hunt, 1873–82	Felix Frankfurter, 1939–62
James Iredell, 1790–99	John M. Harlan, 1877–1911	William O. Douglas, 1939–75
Thomas Johnson, 1791–93	William B. Woods, 1881–87	Frank Murphy, 1940–49
William Paterson, 1793–1806	Stanley Matthews, 1881–89	James F. Byrnes, 1941–42
Samuel Chase, 1796–1811	Horace Gray, 1882–1902	Robert H. Jackson, 1941–54
Bushrod Washington, 1798–1829	Samuel Blatchford, 1882–93	Wiley B. Rutledge, 1943–49
Alfred Moore, 1799–1804	Lucius G. C. Lamar, 1888–93	Harold H. Burton, 1945–58
William Johnson, 1804–34	David J. Brewer, 1890–1910	Thomas C. Clark, 1949–67
Henry Brockholst Livingston, 1806–23	Henry B. Brown, 1891–1906	Sherman Minton, 1949–56
Thomas Todd, 1807–26	George Shiras, Jr., 1892–1903	John M. Harlan, 1955–71
Gabriel Duval, 1811–36	Howell E. Jackson, 1893–95	William J. Brennan, Jr., 1956–90
Joseph Storey, 1811–45	Edward D. White, 1894–1910	Charles E. Whittaker, 1957–62
Smith Thompson, 1823–43	Rufus W. Peckham, 1896–1909	Potter Stewart, 1958–81
Robert Trimble, 1826–28	Joseph McKenna, 1898–1925	Byron R. White, 1962–93
John McLean, 1829–61	Oliver W. Holmes, 1902–32	Arthur J. Goldberg, 1962–65
Henry Baldwin, 1830–44	William R. Day, 1903–22	Abe Fortas, 1965–69
James M. Wayne, 1835–67	William H. Moody, 1906–10	Thurgood Marshall, 1967–91
Philip P. Barbour, 1836–41	Horace H. Lurton, 1910–14	Harry A. Blackmun, 1970–
John Catron, 1837–65	Charles E. Hughes, 1910–16	Lewis F. Powell, Jr., 1971–87
John McKinley, 1837–52	Willis Van Devanter,1911–37	William H. Rehnquist, 1971–
Peter V. Daniel, 1841–60	Joseph R. Lamar, 1911–16	John Paul Stevens, 1975–
Samuel Nelson, 1845–72	Mahlon Pitney, 1912–22	Sandra Day O'Connor, 1981–
Levi Woodbury, 1845–51	James C. McReynolds, 1914–41	Antonin Scalia, 1986–
Robert C. Grier, 1846–70	Louis D. Brandeis, 1916–39	Anthony M. Kennedy, 1988–
Benjamin R. Curtis, 1851–57	John H. Clarke, 1916–22	David H. Souter, 1990–
John A. Campbell, 1853–61	George Sutherland, 1922–38	Clarence Thomas, 1991–
Nathan Clifford, 1858–81	Pierce Butler, 1923–39	Ruth Bader Ginsburg, 1993–
Noah H. Swayne, 1862–81	Edward T. Sanford, 1923–30	
Samuel F. Miller, 1862–90	Harlan F. Stone, 1925–41	

In 1980 a coup led by Sgt. Major Désiré Bouterse brought the soldiers' civilian allies to power; Bouterse assumed complete control from 1982 to 1987. In 1990 he again ousted the elected government and installed his political allies, but new elections (1991) gave his opponents control of parliament and Ronald Venetiaan became president. Bouterse resigned as army chief in 1992 amid corruption charges.

surrealism, literary and art movement influenced by Freudianism (see FREUD, SIGMUND), dedicated to expressing the imagination as revealed in DREAMS, free of the conscious control of reason and convention. Founded (1924) in Paris by André BRETON with his *Manifesto of Surrealism,* it can be traced back to French poets such as Arthur RIMBAUD, Charles BAUDELAIRE, and Guillaume APOLLINAIRE and to the Italian painter Giorgio de CHIRICO. In literature, surrealism was confined almost exclusively to France, and was based on the associations and implications of words. Its adherents included Paul Éluard and Jean COCTEAU, famous for his surrealist films. In art the movement was dominant in the 1920s and 30s. Salvador DALI and Yves TANGUY used dream-inspired symbols such as melting clocks. Max ERNST and René MAGRITTE used incongruous elements realistically painted. These "verists" differed from "absolute" surrealists, such as Joan MIRÓ, who used images from the subconscious.

Surrey, Henry Howard, earl of, 1517?–1547, English poet. He translated two books of Vergil's *Aeneid,* introducing blank verse into the English language, and with his friend Sir Thomas WYATT popularized the Petrarchan SONNET form.

surrogate mother, a woman who agrees, usually by contract and for a fee, to bear a child for a couple who are childless because the wife is infertile or physically incapable of carrying a developing fetus. Often the surrogate mother is the biological mother of the child, conceiving it by means of ARTIFICIAL INSEMINATION with sperm from the husband. In gestational surrogacy, the wife is fertile but incapable of carrying a growing fetus; the child is conceived by IN VITRO FERTILIZATION using her eggs and her husband's sperm, and the resulting embryo is implanted in the surrogate mother's uterus. Surrogate motherhood has raised complex ethical and legal issues, and lawsuits over custody after the child's birth have resulted from both types of surrogacy. In the highly publicized Baby M case (1986–88), Mary Beth Whitehead, the surrogate (and biological) mother, sued William and Elizabeth Stern, the baby's father and his wife, for custody of the child. Although the surrogate mother was not awarded custody in the Baby M case, she was granted visitation rights. A number of states have passed laws banning paid surrogacy.

surveying, accurate measurement of points and lines of direction on the earth's surface for the purpose of preparing maps or locating boundary lines. *Hydrographic surveying* records such features as bottom contours, buoys, channels, and shoals in bodies of water and along coastlines. *Land surveying* includes both *geodetic*

surveying, used for large areas and taking into account the curvature of the earth's surface (see GEODESY); and *plane surveying*, which deals with areas sufficiently small that the earth's curvature is negligible and can be disregarded.

Surveyor, in space exploration: see SPACE PROBE, table.

Su Shih: see SU TUNG-P'O.

suspension, in chemistry, mixture of two substances, one of which is finely divided and dispersed in the other. Particles in a suspension are larger than those in COLLOIDS or SOLUTIONS, and they precipitate (see PRECIPITATE) if the suspension is allowed to stand undisturbed. Common suspensions include sand in water, dust in air, and droplets of oil in air.

Sussex, kingdom of, one of the Anglo-Saxon kingdoms of England, located south of the Weald. It was settled (late 5th cent.) by the Saxons and converted (681–86) to Christianity. Conquered (685–88) by WESSEX, Sussex later fell (by 771) to King Offa of MERCIA. In 825 Sussex submitted to King Egbert of WESSEX.

Sutherland, Graham, 1903–80, English painter. He is famous for his paintings of war devastation. *Thorns* is a series of paintings realistically executed in sharp, cruel forms and symbolic of Jesus' Passion.

Sutherland, Dame Joan, 1926–, Australian soprano. She is famed for her performance of the bel canto opera repertory (see VOICE), e.g., the title role in DONIZETTI's *Lucia de Lammermoor*.

sutra: see SANSKRIT LITERATURE.

Sutter, John Augustus, 1803–80, American pioneer; b. Germany as Johann August Suter. He established a colony in California. Gold was discovered at his mill in 1848, and the activities of the fortune-seekers who swarmed over his land ruined him. Bankrupt, he moved to Pennsylvania in 1873.

Suttner, Bertha (Gräfin Kinsky), Freifrau von, 1843–1914, Austrian novelist and pacifist. Her pacifist novel *Lay Down Your Arms* (1889) had great social impact. She was the first woman awarded the Nobel Peace Prize (1905).

Su Tung-p'o or **Su Shih,** 1036–1101, Chinese poet and official, considered the greatest poet of the Sung dynasty. His satiric verses and opposition to official policy often cost him his position. Regret for the evanescence of beauty and the short span of life are frequent themes in his work.

Suva, city (1986 pop. 71,608), capital of FIJI, on Viti Levu.

Suvorov, Aleksandr Vasilyevich [sōōvô'rəf], 1729–1800, Russian field marshal. He fought in the RUSSO-TURKISH WARS of 1768–74 and 1787–92, and put down the PUGACHEV revolt and the 1794 Polish uprising. In the FRENCH REVOLUTIONARY WARS of 1798–99 he drove the French from N Italy and planned to march on Paris, but was ordered to join General Korsakov and Austrian Archduke Charles in Switzerland. While Suvorov's force was struggling through the St. Gotthard Pass, Charles was ordered back to the Rhine and Korsakov was defeated. Suvorov led his troops to Lindau and refused to undertake further action with the Austrians. Russia soon withdrew from the war.

Suzuki Harunobu: see HARUNOBU.

Suzuki Zenko, 1911–, Japanese politician. A founder of the ruling Liberal-Democratic party (1955), he became prime minister on the death of Ohira Masayoshi (1980). Criticism from within the party and a failure to reinvigorate the economy resulted in his resignation (1982).

Svalbard, island group (1992 est. pop. 3,000), 23,958 sq mi (62,051 sq km), in the Arctic Ocean, located c.400 mi (640 km) north of and belonging to Norway. The main islands are SPITSBERGEN, the largest, and Nordaustlandet, Edgeøya, Barentsøya, and Prins Karls Forland. Ice fields and glaciers cover more than 60% of the area. Mining, notably of coal, is the chief industry. Whaling and fur trading were important in the past. The islands were awarded to Norway by international treaty in 1920.

Svein: see SWEYN.

Sverdlovsk: see YEKATERINBURG.

Sverdrup, Otto, 1855–1930, Norwegian explorer. After participating in two arctic trips, he led an expedition (1898–1902) that sought to reach the NORTH POLE by Smith Sound but failed because of ice in Kennedy Channel. However, valuable topographical observations were made and unknown lands were found and explored.

Swabia, historic region in SW Germany. In the 9th cent. Swabia became one of the five stem duchies of medieval Germany; it included Alsace and E Switzerland. The duchy was bestowed on the HOHENSTAUFFEN dynasty in 1079 and broke up into many feudal and ecclesiastical holdings when the dynasty died out (1268). From the 14th to 16th cent. cities, nobles, knights, and prelates in the region formed Swabian leagues to protect trade and regional peace.

Swabian League, 1488–1534, association of Swabian cities and other powers in SW Germany for the protection of trade and for regional peace. It was supported by the Holy Roman emperors and comprised 26 cities. The league backed the election (1519) of Emperor CHARLES V and helped to defeat the peasants in the Peasants' War. Its dissolution was brought about through internal stresses, partly caused by the religious split brought on by the REFORMATION.

Swahili language, member of the Bantu group of African languages. See AFRICAN LANGUAGES (table); BANTU LANGUAGES.

swallow, common name for small perching BIRDS of the family Hirundinidae, of almost worldwide distribution. Swallows have long, narrow wings, forked tails, and weak feet. They are extremely graceful in flight, able to make abrupt changes in speed and direction. Their plumage is blue or black with a metallic sheen. American species include the common American barn swallow (*Hirundo rustica*) and the purple martin (*Progne subis*).

Swammerdam, Jan, 1637–80, Dutch naturalist. He was a pioneer in the use of the microscope and was probably the first to detect (1658) red blood cells. Before he turned to religious contemplation, his chief interest was the study of invertebrates; his descriptions of them, together with accurate and exquisitely executed drawings, was published posthumously in 1737–38.

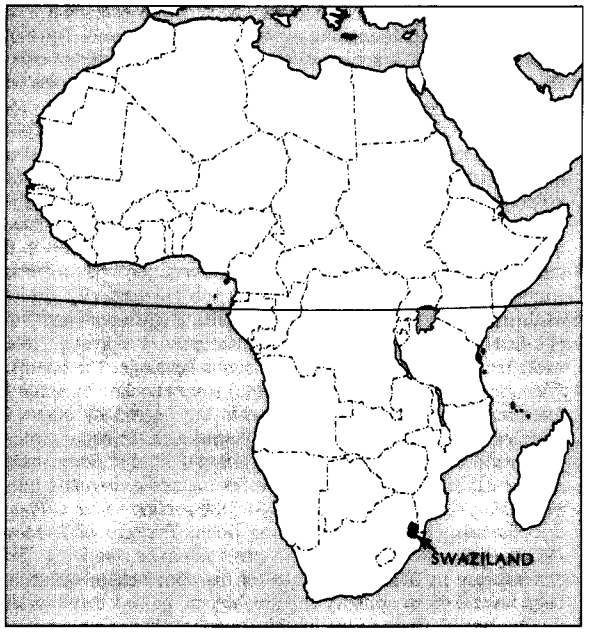
swamp, shallow body of water in a low-lying, poorly drained depression, usually containing abundant plant growth. A notable example of a U.S. swamp is the EVERGLADES in S Florida. Because the bottom of a swamp is at or below the water table, swamps serve to channel runoff into the groundwater supply, thus helping to stabilize the water table. During periods of very heavy rains, a swamp can act as a natural flood-control device. The increased use of drained swampland for urban development results in greater runoff and probability of flooding as well as the destruction of wildlife habitats. The term *bog* usually refers to a swampy depression with a low level of oxygen in the water and a thick floating mat of living and dead organic matter. *Marsh* implies a large wetland where low-lying grasses, rushes, and sedges predominate.

swan, large aquatic BIRD, related to the DUCK and GOOSE, with a long, gracefully curved neck. The orange-billed white trumpeter swan (*Cygnus buccinator*), seen in parks, breeds in the wild in parts of Europe, Asia, and the U.S. The trumpeter swan of North America (*Olor buccinator*), which has a trumpetlike call during the breeding season, was once nearly extinct but is now protected.

Swann v. Charlotte-Mecklenburg County Board of Education, case decided in 1971 by the U.S. SUPREME COURT. The Court held that the constitutional mandate (see BROWN V. BOARD OF EDUCATION) to desegregate public schools did not require all schools in a district to reflect the district's racial composition, but that the existence of all-white or all-black schools must be shown not to result from segregation policies. The Court added that because bus transportation had traditionally been employed by school systems, busing could be used in efforts to correct racial imbalances.

Swaziland, officially Kingdom of Swaziland, kingdom (1992 est. pop. 913,000), 6,705 sq mi (17,366 sq km), SE Africa, bordered by South Africa (S, W, and N) and Mozambique (E). The administrative capital is MBABANE. The country is mountainous, with steplike plateaus descending from the highveld in the west and then rising to the plateau of the Lebombo Mts. The four major river systems have vast hydroelectric potential and are used for irrigation. Agriculture, including forestry and ranching, is the principal sector of the economy, and sugar, wood pulp and timber, and cattle are the leading exports. There are large mineral deposits, the most important of which are asbestos and coal. Swaziland has close economic ties with South Africa. The Swazi (a Bantu people) constitute 90% of the population; the rest are South Africans and Europeans. English and Siswati, the Swazi language, are the official languages. About half of the people practice traditional religions; most of the rest are Christian.

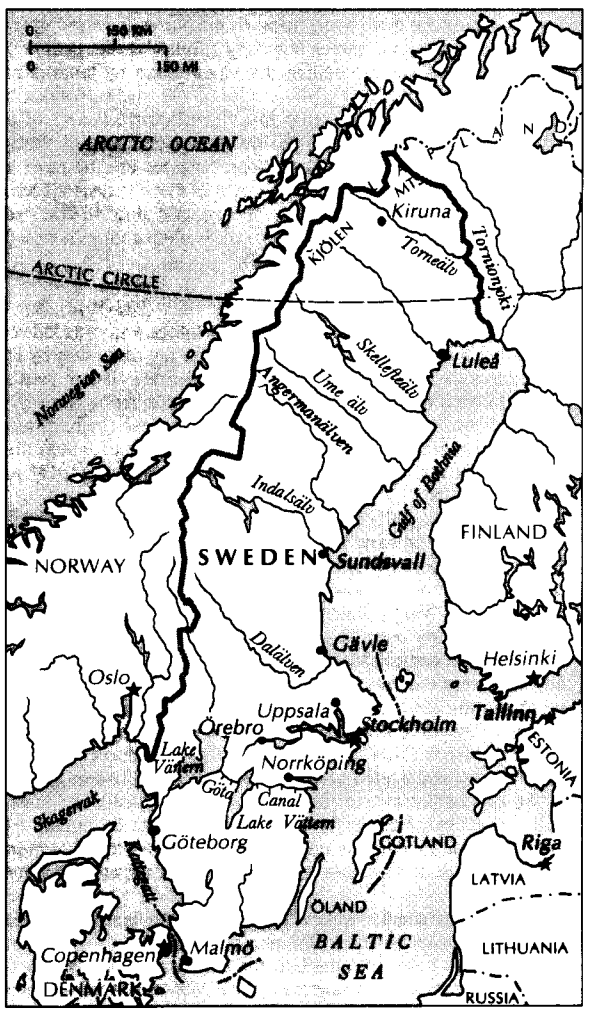
History. Fleeing Zulu attacks, the Swazi arrived in present-day



Swaziland from Mozambique in the early 19th cent. Europeans seeking concessions soon moved in, and Swaziland became a British High Commission Territory in 1903. It received limited self-government in 1963 and gained full independence in 1968, under King Sobhuza II. In 1973 he suspended the constitution, and the new constitution (1978) so diluted the vote that the king ruled nearly absolutely. Upon Sobhuza's death in 1982, crown prince Makhostine succeeded him, as Mswati III; the period of the regency (1982–85) was marked by factional politics and governmental instability. In the early 1990s there was increasing pressure in Swaziland for political democratization, and free parliamentary elections were held in 1993. The king, however, still holds most power.

Sweden, Swed. *Sverige,* officially Kingdom of Sweden, constitutional monarchy (1992 est. pop. 8,602,000), 173,648 sq mi (449,750 sq km), N Europe, on the E Scandinavian peninsula; bordered by Norway (W), Finland (NE), the Gulf of Bothnia (E), the Baltic Sea (SE), and the Skagerrak and Kattegat (SW). Major cities include STOCKHOLM (the capital), GÖTEBORG, MALMÖ, and UPPSALA. The two main geographical regions are the mountainous north, including part of LAPLAND, and the low-lying south, where most of the population lives. Rivers and over 100,000 lakes make up nearly one third of the area. Sweden is a highly industrialized nation with one of the highest living standards in the world. It is a producer of iron and other metal ores. Manufactures include high-grade steel, metal goods, machinery, transport equipment, forest products, and ships, much of which is exported. Farming produces dairy products, grain, sugar beets, potatoes, livestock, and poultry. The fur industry is also important. The people are largely ethnically homogeneous Swedish speakers; Finns and Lapps are the largest minorities. Over 90% of all Swedes belong to the Lutheran church.

History. Most Swedes are descendants of Germanic tribes that were probably settled in Scandinavia by the Neolithic period. By the 10th cent. A.D. the Swedes had extended their influence to the Black Sea. Christianity, introduced c.829, became fully established in the 12th cent. under Eric IX. Sweden and Norway were united (1319) under MAGNUS VII, and in 1397 the Kalmar Union united Denmark, Norway, and Sweden. The Danes dominated the union, however, and in 1523, stirred to resistance by a massacre (1520) of Swedish nobles at Stockholm, the Swedes rose against the Danes and established a separate state with GUSTAVUS I as king. Under GUSTAVUS II (r.1611–32), who successfully opposed the Hapsburgs in the THIRTY YEARS WAR, and CHARLES X (r.1654–60), who led successful wars against Poland and Denmark, Sweden became one of the great powers of Europe, controlling Finland, Latvia, Estonia, and other parts of the Baltic coast by the end of the 17th cent. The great period of empire came to an end, however, with the rise of a unified Russia and the defeat of Sweden in the NORTHERN WAR (1700–1721). In the Napoleonic Wars, in which Sweden fought against France, Sweden lost (1809) Finland to Russia but was awarded (1814) Norway, which remained in union with Sweden until 1905. The 19th cent. was marked by industrial progress, liberalization of government, and, because of poor economic conditions, large-scale emigration to the U.S. In the following century Sweden avoided involvement in both world wars (and preserved its neutrality during the COLD WAR) and initiated a sweeping program of economic expansion and social welfare legislation that made it one of the most prosperous and progressive nations in the world. From the mid-1960s, however, Swedish economic growth slowed, and the 1970s and 80s saw sizable increases in unemployment and the rate of inflation. Charles XVI Gustavus succeeded his grandfather, Gustavus VI, as king in 1973. Except for a short period (1976–82) of conservative control, the Social Democrats, led by Olof PALME from 1969, governed Sweden for over half a century. In 1986 Palme was assassinated and was succeeded by Ingvar Carlsson. Center-right parties won control of parliament in 1991, and Carl Bildt became prime minister. In 1992 recession and a currency crisis forced the government to pass austerity measures that raised taxes and cut services.



Swedenborg, Emanuel, 1688–1772, Swedish scientist, religious teacher, and mystic. His religious system is sometimes called Swedenborgianism. Appointed (1716) assessor of the Royal College of Mines, his engineering skill made him widely known; he also pub-

lished many works on philosophy, humanists, the animal kingdom, the brain, and psychology before resigning in 1747. He then gave himself wholly to the contemplation of spiritual matters, believing that God had revealed the true inner doctrines of the divine word to him alone. The teachings of his New Church were set forth in 1757, when he believed the second coming of the Lord had taken place. He had not planned to found a new sect, but his disciples organized the Church of the NEW JERUSALEM after his death.

Swedish language, member of the North Germanic, or Scandinavian, group of the Germanic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Sweelinck, Jan Pieterszoon, 1562–1621, Dutch organist and composer. The line of his pupils descends directly to J.S. BACH and HANDEL. His organ FUGUES give separate parts to the pedals.

sweeteners, artificial, substances used as low-calorie sugar substitutes. Saccharin, cyclamates, and aspartame have been the most commonly used artificial sweeteners. Saccharin, a coal-tar derivative three hundred times as sweet as sugar, was discovered in 1879. Cyclamates were approved for consumer use in 1951, but were banned in 1969 because of suspected carcinogenic properties. Aspartame, an amino-acid compound, was discovered in 1965.

sweet gum: see WITCH HAZEL.

sweet pea, annual climbing plant (*Lathyrus odoratus*) of the PULSE family, native to S Europe but now widely cultivated for its fragrant flowers. There are three main types: dwarf, summer flowering (garden sweet peas), and winter flowering (florists' sweet peas). The flowers may be various colors; the vines climb by tendrils and require support.

sweet potato, trailing perennial plant (*Ipomoea batatas*) of the MORNING GLORY family, native to the New World tropics. Raised mainly for human consumption, sweet potatoes are the most important tropical root crop and are grown in many varieties. Rich in VITAMIN A, they yield starch, flour, glucose, and alcohol. The sweet potato, which is unrelated to the POTATO, is often confused with the YAM, which belongs to another family.

sweet William: see PINK.

Sweyn or **Svein,** c.960–1014, king of Denmark (986–1014), son of Harold Bluetooth. He rebelled against his father, who was killed in battle, but Sweyn was expelled shortly after his accession by Eric the Victorious of Sweden. He later married Eric's widow, was restored to his throne, and joined Sweden in conquering Norway. In 1003–4 Sweyn invaded England for the second time (he had earlier exacted DANEGELD from ÆTHELRED) and established his rule there in 1013. His son CANUTE succeeded him in England (1014) and Denmark (1018).

Swift, Jonathan, 1667–1745, Anglo-Irish author and master of satire; b. Dublin. His early works were *The Battle of the Books,* upholding the superiority of the ancients to the moderns, and *Tale of a Tub,* a satire on religious excesses (both published 1704). Swift was active in Whig politics with ADDISON and STEELE, but turned against the party over its unfriendliness to the Anglican church. Pamphlets on ecclesiastical and political issues, in which he usually supported the Tories, engaged him from 1708 to 1714. In 1713 he joined the SCRIBLERUS CLUB and in 1714 was made dean of St. Patrick's Cathedral, Dublin. He became a hero to the Irish with his *Drapier's Letters* (1724) and the savage *Modest Proposal* (1729), in which he ironically advocated the breeding of Irish babies to be fed to the rich as a means of reducing Ireland's poverty. His masterpiece, *Gulliver's Travels* (1726), a ruthless SATIRE on human folly and 18th-cent. England, is unequaled in the intensity of its moralism. Ironically, it was later turned into an expurgated children's story.

swift, name for small, swallowlike BIRDS of the family Apodidae, found worldwide, chiefly in the tropics. Swifts are the most rapid flying animals known. In the U.S. the common Eastern species is the chimney swift (*Chaetura pelagica*). Western species include the black, Vaux's, and white-throated swifts. Nests of E Asian swifts, made entirely of a salivary secretion, are used in bird's-nest soup.

swimming, self-propulsion through water, usually as a competitive sport or recreation. The principal swimming strokes are the crawl, backstroke, sidestroke, breaststroke, and butterfly. The crawl, or Australian crawl, is considered the speediest. In executing it, the body is prone and alternating overarm strokes are used. The backstroke is done in a supine position with alternate over-the-head strokes. The sidestroke entails a forward underwater stroke with the body on one side. The breaststroke is accomplished in a prone position using a frog kick and movement of the arms from a point in front of the head to shoulder level. The butterfly the most difficult and exhausting stroke, is done in a prone position with a dolphin kick and a windmill-like double arm movement. In freestyle swimming any stroke may be used, but the crawl is usually favored. Swimming became organized as an amateur sport in the late 19th cent. It is a major Olympic event for both men and women. See also DIVING, SPRINGBOARD AND PLATFORM.

Swinburne, Algernon Charles, 1837–1909, English poet and critic. His first success, the poetic drama *Atalanta in Calydon* (1865), exhibited his talent for musical, sensuous language. The poems in *Poems and Ballads* (first series, 1866) were attacked by some for their sensuality and pagan sentiments but lauded by others for their technical genius. Swinburne's enthusiasm for Italian unification found expression in *A Song of Italy* (1867) and *Songs before Sunrise* (1871). His other poetic works include a dramatic trilogy about Mary Queen of Scots (1865–81); the second series of *Poems and Ballads* (1878); and the long poem *Tristram of Lyonesse* (1882). His literary criticism was extensive, ranging from Shakespeare to Dickens. Because of his poor health, which had been weakened by epilepsy and alcoholism, he was cared for during the last 30 years of his life by Theodore Watts-Dunton.

swine, cloven-hoofed MAMMALS of the family Suidae, native to the Old World and typified by long, mobile snouts, thick, bristly hides, and small tails. Domesticated swine, commonly called hogs or pigs (the latter more correctly reserved for young swine), are probably descended chiefly from the wild swine, or wild boar (*Sus scrofa*), of Eurasia and N Africa. Hogs are bred for their fat (lard), flesh (prepared as ham, bacon, and pork), and other products (e.g., LEATHER for gloves and footballs, and bristles for brushes). Commercially raised swine are grouped as meat-type (e.g., Hereford and Berkshire), lard-type (e.g., Poland China, Duroc, and Spotted), or bacon-type (e.g., Yorkshire and American Landrace). Hogs are highly susceptible to many diseases transmissible to humans, among them TRICHINOSIS.

swine fever: see HOG CHOLERA.

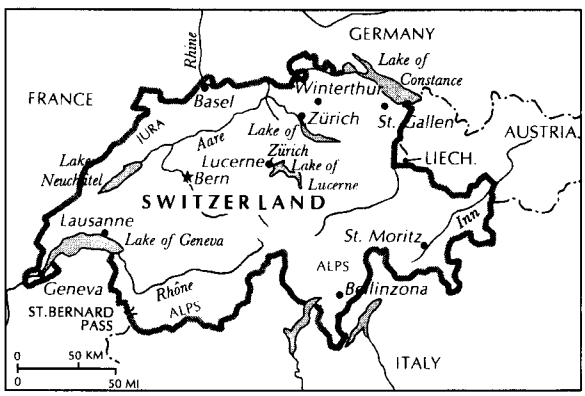
swing music: see JAZZ.

Swiss Guards, Swiss mercenaries who fought in various European armies from the 15th to the 19th cent. They were put at the disposal of foreign armies by the Swiss government in diplomatic treaties known as capitulations. They were especially important in the French army of LOUIS XIV and on the side of the royalists in the BOURBON Restoration. The Swiss banned all capitulations in 1874. Today the Swiss Guard exists only as the personal guard of the pope.

Switzerland, Fr. *Suisse,* Ger. *Schweiz,* Ital. *Svizzera,* officially Swiss Confederation, federal republic (1992 est. pop. 6,823,000), 15,941 sq mi (41,287 sq km), central Europe; bordered by France (W), Germany (N), Austria and Liechtenstein (E), and Italy (S). Major cities include BERN (the capital), ZÜRICH, BASEL, and GENEVA. The Jura Mts., in the northwest, and the spectacular ALPS in the south, occupy about 70% of the country's area. The Swiss Plateau, a narrow, hilly region between the two mountain ranges, has most of the country's population. The Rhine and Rhône rivers have their sources in Switzerland, and there are many lakes, among them Geneva and Constance. With few natural resources (waterpower is a notable exception) and a largely barren soil, Switzerland has attained prosperity through technological skill and export manufacturing. Principal products are machinery, precision instruments, chemicals, pharmaceuticals, watches, jewelry, textiles, and foodstuffs (notably cheese and chocolate). Tourism and international finance are important sources of income. German, French, Italian, and Romansh (a Rhaeto-Roman dialect) are the national languages. The population is about evenly divided between Roman Catholics and Protestants.

History. Conquered by Rome in 58 B.C., the region that is modern Switzerland fell successively to Germanic tribes (5th cent. A.D.), Swabia and Burgundy (9th cent.), and the Holy Roman Em-

pire (1033). By the 13th cent. the HAPSBURGS controlled much of the region, and their encroachment on local privileges led to the formation of a defense league (1291), the basis of the Swiss confederation, by the cantons, or states, of Uri, Schwyz, and Unterwalden. Later, other cantons joined the league, and wars against the Hapsburgs resulted in virtual independence in 1499. The loose Swiss confederation was seriously split in the 16th cent. by the REFORMATION (see CALVIN, JOHN; ZWINGLI), and religious civil wars wracked the country for almost two centuries. However, Switzerland remained neutral in the Thirty Years War, and its independence was recognized in the Peace of Westphalia in 1648. In 1798, during the French Revolution, French armies swept into Switzerland and established the Helvetic Republic. The confederation was substantially restored in 1815 by the Congress of VIENNA, which also guaranteed Switzerland's perpetual neutrality. In 1847 a brief and almost bloodless civil war resulted in the transformation of Switzerland into a more centralized federal state. Armed neutrality was maintained throughout both world wars. Since 1959 Switzerland has been governed by a four-party liberal-conservative coalition. The Swiss maintain a permanent observer status at the UN. In 1986 Swiss voters overwhelmingly rejected consideration of UN membership, but in 1992 they voted to join the World Bank and International Monetary Fund.



sword, weapon used in personal combat; it consists of a blade with a sharp point and one or two cutting edges, set in a hilt (handle) and usually protected by a metal case or cross guard. It developed from the dagger early in the Bronze Age. Blade materials evolved from iron to steel to finely tempered steel. Short swords with two cutting edges were used by the Greeks and Romans; very large, two-handed ones were favored by medieval knights. Well-known swords have included the curved scimitar of the Persians and Arabs and the long, single-edge Japanese SAMURAI sword set in a long hilt. Other types are the curved saber, favored by European CAVALRY, and the épée, or dueling sword, a straight, narrow, and stiff thrusting weapon without cutting edges. Obsolete as a military weapon, the sword still plays a part in military ceremonies. See FENCING.

swordfish, large food and game FISH (*Xiphias gladius*) of warmer Atlantic and Pacific waters, related to the SAILFISH and MARLIN. Its sharp, broad, elongated upper jaw is used to flail and pierce the smaller fish it eats. Swordfish, which breed as far north as Nova Scotia, may reach 15 ft (457 cm) in length and 1,000 lb (454 kg) in weight. They are commercially valuable.

sycamore: see PLANE TREE.

Sydenham, Thomas, 1624–89, English physician. A founder of modern clinical medicine and epidemiology, he conceptualized the causes and treatments of epidemics and provided classic descriptions of gout, smallpox, malaria, scarlet fever, hysteria, and chorea. He advocated observation instead of theorizing to determine the nature of disease and introduced the use of cinchona bark (containing quinine) to treat malaria and of laudanum to treat other diseases.

Sydenham's chorea: see under CHOREA.

Sydney, Sir Philip: see SIDNEY, SIR PHILIP.

Sydney, city (1991 urban agglomeration pop. 3,698,500), capital of New South Wales, SE Australia, surrounding Port Jackson inlet, on the Pacific Ocean. It is Australia's largest city, chief port, and main cultural and industrial center. Manufactures include ships, refined oil, chemicals, textiles, and automobiles. Sydney Harbour and Port Botany are the main ports. Founded as a penal colony in 1788, Sydney is Australia's oldest settlement. Its population surged during the Australian gold rushes of the 1850s. Sydney replaced MELBOURNE as the nation's largest population center after World War II. Landmarks include the Sydney Harbour Bridge (1932); the Gladesville Bridge (1964); the modernistic Sydney Opera House complex (1973); and the Centrepoint Tower (1981), Australia's tallest building. The city has several universities and museums, including the National Gallery of Art and the Australia Museum. In 1994 portions of suburban Sydney were devastated by wildfires. Sydney will be the site of the 2000 summer Olympic games.

Sylla, Lucius Cornelius: see SULLA, LUCIUS CORNELIUS.

syllogism, in logic, a mode of argument that forms the core of the body of Western logical thought, consisting of a sequence of three propositions such that the first two imply the conclusion. ARISTOTLE's formulations of syllogistic logic held sway in the Western world for over 2,000 years. The categorical syllogism comprises three categorical propositions, statements of the form *all A are B, no A are B, some A are B,* or *some A are not B.* A categorical syllogism contains precisely three terms: the major term, which is the predicate of the conclusion; the minor term, which is the subject of the conclusion; and the middle term, which appears in both premises but not in the conclusion.

Sylvester II, d. 1003, pope (999–1003), a Frenchman named Gerbert. Widely celebrated for his learning, he taught the Holy Roman Emperor OTTO III, who aided his election to the papacy. Sylvester energetically supported the Christianization of Poland and Hungary. He was the first French pope.

Sylvester, James Joseph, 1814–97, English mathematician. He taught in England and the U.S., and founded the *American Journal of Mathematics.* He is known for his work on algebraic invariants, matrices, determinants, and number theory, much of it in collaboration with Arthur CAYLEY.

symbiosis, habitual cohabitation of organisms of different species. The term usually applies to a dependent relationship that is beneficial to both members (also called mutualism). Symbiosis includes parasitism, a relationship in which the PARASITE depends on and may injure its host; COMMENSALISM, an independent and mutually beneficial relationship; and helotism, a master-slave relationship found among social animals. Symbiosis may occur between two kinds of plants (e.g., LICHEN-forming alga and fungus), two kinds of animals (e.g., herbivores and cellulose-digesting gut microorganisms), or a plant and an animal (e.g., FIG and fig wasp).

symbolic logic: see LOGIC.

symbolists, in literature, school that originated in late-19th-cent. France in opposition to NATURALISM and REALISM. Symbolism sought to convey impressions by suggestion rather than by direct statement, and it spread from poetry to the other arts. Experiments with FREE VERSE outlived symbolism itself. BAUDELAIRE was the greatest precursor of the movement, which included the poets MALLARMÉ, RIMBAUD, VERLAINE, and, later, CLAUDEL and VALÉRY; MAETERLINCK in drama; and DEBUSSY in music. Symbolism influenced the DECADENTS and IMAGISTS, as well as major 20th-cent. British and American poets like T.S. ELIOT and Wallace STEVENS.

Symonds, John Addington, 1840–93, English writer. His major work is *The Renaissance in Italy* (7 vol., 1875–86). Other writings include *Studies of Greek Poets* (1873–76), literary biographies, translations, and books of verse.

Symons, Arthur, 1865–1945, English poet and critic. A leading English SYMBOLIST, he interpreted the poetry of the French DECADENTS to the British through criticism, translations, and his own poems. *The Symbolist Movement in Literature* (1899) is his chief critical work.

symphonic poem, type of one-movement orchestral composition created by Franz LISZT; also called **tone poem.** Based on an idea or theme from a poetic, dramatic, or other nonmusical artistic source, it often "tells a story," as in Liszt's *Les Préludes;* Richard

STRAUSS's *Don Juan;* or RESPIGHI's *Pines of Rome;* or may simply be the impressionistic portrayal of the theme, as in DEBUSSY's *Afternoon of a Faun.*

symphony, a major work for orchestra with one or more movements in sonata form (see under SONATA). The Italian operatic overture, called sinfonia, was standardized by Alessandro SCARLATTI at the end of the 17th cent. into three sections (fast, slow, fast). In the 18th cent. HAYDN and MOZART synthesized all preceding techniques into the Viennese classical symphony, consisting of four movements (fast; slow; a dance, e.g., minuet; fast finale, e.g., rondo). BEETHOVEN expanded the dimensions of this form, intensifying the element of personal expression and introducing the use of a CHORUS in the symphony. The classical ideal continued in the symphonies of SCHUBERT, MENDELSSOHN, and SCHUMANN, but classical elements were sometimes overshadowed by romantic traits. Reacting against the romantic orchestral style, BRAHMS revived the classical model as defined by Beethoven. BRUCKNER combined classical form with Wagnerian harmonies and melodic structure (see WAGNER, RICHARD). Other important composers were DVOŘÁK and TCHAIKOVSKY, in the 19th cent., and MAHLER and SIBELIUS in the 20th cent. Contemporary composers such as STRAVINSKY and HINDEMITH have treated the symphony form with much freedom.

synagogue [from Gr., = assembly], place of assembly for Jewish worship. The institution probably dates from the Babylonian exile (6th cent. B.C.). By the 1st cent. A.D. it had become the center of Jewish religious, intellectual, and communal life. The destruction of the Temple in A.D. 70 and the dispersion of the Jews increased the synagogue's importance. In modern times in the West, its central role has shifted to purely religious activities, although recently that trend has been somewhat reversed. In the U.S., the Orthodox, Conservative, and Reform synagogue associations are organized in the Synagogue Council of America. See also JUDAISM.

synchrocyclotron: see PARTICLE ACCELERATOR.

synchrotron: see PARTICLE ACCELERATOR.

syncline: see FOLD.

syndicalism, economic and political doctrine that advocates control of the means of production by organized bodies of workers. Syndicalists view any form of state as an instrument of oppression and believe that the trade union should be the basic organization unit of society. They advocate direct action such as the general STRIKE and industrial sabotage. Syndicalism, especially strong in France, declined after World War I because of competition from Communist unions, government suppression, and political splits. In the U.S. it was represented chiefly by the INDUSTRIAL WORKERS OF THE WORLD.

Synge, John Millington [sĭng], 1871–1909, Irish poet and dramatist. Intense and poetic, his plays depict the harshness of rural Irish life. His one-act play *Riders to the Sea* (1904) is considered one of the finest tragedies ever written. In 1904 Synge, with W.B. YEATS and Lady GREGORY, helped found the Abbey Theatre, which presented his comedies *The Well of the Saints* (1905) and *The Playboy of the Western World* (1907).

synodic period, length of time it takes a solar-system body to return to an identical alignment (e.g., conjunction or opposition; see SYZYGY) with another body as seen from the earth. Because the earth moves in its orbit around the sun, the synodic period differs from the **sidereal period,** the length of time a body takes to complete a orbit relative to a background star.

Synoptic Gospels: see GOSPEL.

synthesizer: see ELECTRONIC MUSIC.

synthetic textile fibers, artificial FIBERS produced industrially by either synthesizing POLYMERS or altering natural fibers (see RAYON). Polyesters, e.g., Dacron, produced by the polymerization of the product of an alcohol and organic-acid reaction, are strong and wrinkle-resistant; microfiber, which was introduced in 1986, is a variety of polyester that has extremely thin filaments. Nylon, a synthetic thermoplastic material introduced in 1938, is strong, elastic, resistant to abrasion and chemicals, and low in moisture absorbency. Orlon, the trade name for a polyacrylonitrile fiber made from natural gas, oxygen, and nitrogen, combines bulk, light weight, and resistance to acids and sun. Vinyl fibers, e.g., Saran, are also widely used. See also FIBERGLASS.

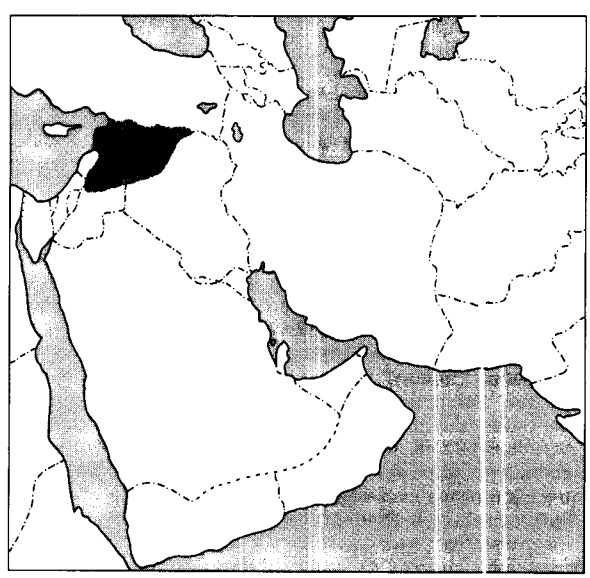
syphilis, SEXUALLY TRANSMITTED DISEASE caused by the spirochete *Treponema pallidum.* Some medical historians believe that syphilis was first recorded among sailors who had returned to Spain from the New World in 1493, but others have concluded that syphilis was already present in the Old World. It is most commonly transmitted by sexual contact, although transmission can occur through infected blood or an open wound, or from mother to fetus. Primary syphilis is characterized by a chancre, a superficial skin ULCER, at the site of infection; secondary, by generalized eruption of the skin and mucous membranes and inflammation of eyes, bones, and central nervous system; tertiary, by chronic skin lesions, damage to the heart and aorta, and central nervous system degeneration sometimes leading to blindness and insanity. Syphilis is treated with PENICILLIN, usually successfully unless extensive nervous system damage has occurred. New resistant strains have complicated treatment.

Syracuse, city (1990 pop. 124,606), SE Sicily, Italy, on the Ionian Sea. It is a port and market and tourist center. Founded (734 B.C.) by Corinthian Greeks, it became the leading city of ancient Sicily under the tyrant Gelon, who defeated CARTHAGE in 480 B.C. It was a center of Greek culture (AESCHYLUS, PINDAR, THEOCRITUS, and ARCHIMEDES lived there) under several tyrants, e.g., Hiero I and II, DIONYSUS THE ELDER, DIONYSUS THE YOUNGER, and DION OF SYRACUSE, whose reigns alternated with periods of democracy. Syracuse defeated Athens (414 B.C.), reached its height, then fell to Rome (212 B.C.) and declined. It was later conquered by Arabs (9th cent.) and Normans (1085). Numerous ruins testify to its past greatness.

Syracuse, city (1990 pop. 163,860), seat of Onondaga co., central N.Y., a port on Onondaga Lake and the Barge Canal; settled c.1788, inc. as a city 1848. Its many manufactures include air conditioners, electrical and electronic equipment, and automotive parts. Settled where salt springs had been discovered in 1654, Syracuse was a salt-making center until after the Civil War. When that industry declined, the city's favorable position on the ERIE CANAL fostered its industrial growth. It is an educational and cultural center with several colleges and museums.

Syr Darya, one of the principal rivers of arid central Asia, c.1,380 mi (2,220 km) long, used extensively for irrigation. It is formed in the FERGANA VALLEY, E Uzbekistan, by the confluence of the Naryn and Kara Darya rivers (which rise in the snowy Tian Shan) and flows west through N Tajikistan, then northwest through E Uzbekistan and S Kazakhstan along the edge of the KYZYL KUM desert to the northern end of the ARAL SEA.

Syria, officially Syrian Arab Republic, republic (1992 est. pop. 13,730,000), 71,467 sq mi (185,100 sq km), SW Asia, bordered by Israel, Lebanon, and the Mediterranean Sea (W), Turkey (N), Iraq (E), and Jordan (S). Principal cities include DAMASCUS (the capital) and ALEPPO. Most of Syria is occupied by the Syrian Desert, which is crossed by the EUPHRATES R. In the west are the Anti-Lebanon



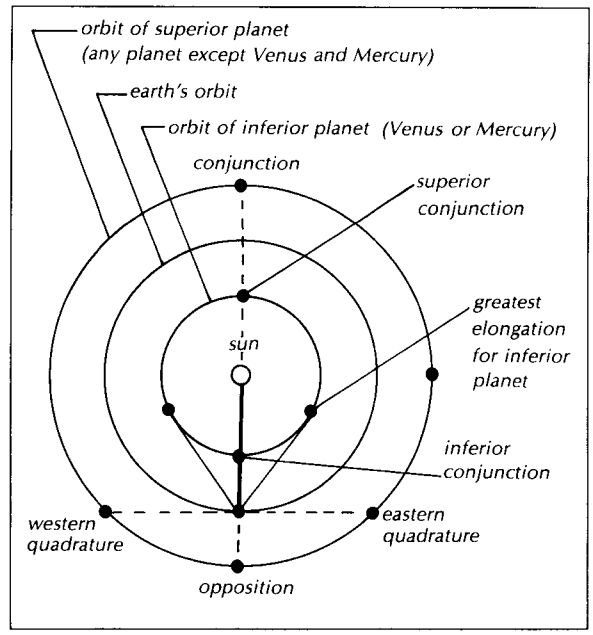
The key to pronunciation appears on page xiii.

Mts., including Mt. Hermon (9,232 ft/2,814 m), Syria's highest point; in the southwest the fertile plain of Hawran extends from the Jabal al-Duruz Mts. to the Sea of Galilee. Major crops include wheat, vegetables, sugar beets, barley, cotton, and tobacco. The state plays a major role in the economy, and a large-scale industrialization program begun after World War II has diversified the formerly agricultural economy. Petroleum production, small compared to that of other Middle Eastern countries, provides the leading export. Refined petroleum, cement, textiles, processed foods, chemicals, and precision-engineered products are the chief manufactures. The Euphrates Dam supplies most of the nation's electric power. Most Syrians are Arabic-speaking Muslims, mainly Sunnite with significant Alawite and Druse minorities; there are also Kurds, Armenians, and Circassians. About 10% of the people are Christian, mainly Orthodox. Arabic is the official language.

History. Situated on trade and military routes between the Mediterranean and Mesopotamia, Syria (which historically included all of modern Syria and Lebanon, and parts of Israel, Jordan, Iraq, and Saudi Arabia) has always been an object of foreign conquest. Settled (c.2100 B.C.) by the Amorites, a Semitic people from the Arabian peninsula, it fell to the HITTITES (15th–13th cent B.C.), the Assyrians and Babylonians (11th–6th cent. B.C.), the Persians (6th–4th cent. B.C.), and the Greeks (333 B.C.). Syria was Hellenized by the Seleucids and had fallen to Rome by 63 B.C. After a period of Byzantine rule (5th–7th cent. A.D.) Syria was conquered (633–40) by Muslim Arabs. Most Syrians converted to Islam, and Damascus, as the usual capital of the Umayyad caliph (661–750), became the center of the Islamic world. The area was later ruled by the Seljuk Turks, the MONGOLS, SALADIN, and the MAMLUKS. Christians also came to Syria on the CRUSADES (11th–14th cent.). It was part of the OTTOMAN EMPIRE from 1516 until the end of WORLD WAR I, and in 1920 France received a League of Nations mandate over the Levant States (roughly modern Syria and Lebanon). During WORLD WAR II Free French forces granted (1944) independence to Syria, but French troops did not leave until 1946. Syria joined with Egypt in the United Arab Republic in 1958, but withdrew in 1961. Independent Syria has been characterized by economic growth, political instability, and uncompromising hostility toward Israel (see ARAB-ISRAELI WARS). In 1981 Israel exacerbated the situation by annexing the GOLAN HEIGHTS, captured from Syria in the Six-Day War (1967). Syrian troops entered Lebanon in 1976, ostensibly to quell civil strife. During the 1982 Israeli invasion of Lebanon they suffered severe losses in combat with Israeli forces. The ruling Ba'ath party, which came to power in a 1963 coup, maintains a policy of socialism and Arab nationalism. In the 1980s Syria experienced internal unrest, moved closer to the USSR, espoused hard-line Arab positions, and was linked to international terrorists. By 1990, however, Syria was trying to improve relations with Western nations. Syria participated in initial peace talks with Israel in 1991.

Syriac [sēr'ēăk"], late dialect of ARAMAIC, which is a Hamito-Semitic language. See LANGUAGE (table).

syzygy, alignment of three celestial bodies along a straight or nearly straight line. Viewed from one of these bodies, the other two will be either in conjunction (aligned in the same direction) or in opposition (aligned on opposite sides of the sky). An inferior planet, whose orbit lies inside the earth's, can, in reference to the sun as seen from the earth, be either in inferior conjunction (lying directly between the earth and the sun) or in superior conjunction (on the opposite side of the sun from the earth); unlike a superior planet, whose orbit lies outside the earth's, and unlike the moon, an inferior planet can never be in opposition to the sun as seen from the earth. See also ELONGATION.



Syzygy: Alignments of celestial bodies necessary to produce syzygy (opposition, inferior conjunction, and superior conjunction) and quadrature conditions

Szatmar, Peace of: see RÁKÓCZY, FRANCIS II.

Szczecin [shchĕ'tsēn], Ger. *Stettin,* city (1989 est. pop. 409,000), NW Poland, on the Oder R., former capital of the Prussian province of POMERANIA. It is a major Baltic port and an industrial center with shipyards, ironworks, and chemical plants. A member of the HANSEATIC LEAGUE from the 13th cent., the city was ruled (1648–1720) by Sweden and then passed to Prussia. In 1945 it was transferred from Germany to Poland, and its German population was expelled and replaced by Poles.

Szent-Gyorgyi, Albert von [sĕnt"-dyördyĭ], 1893–1986, American biochemist; b. Hungary; came to U.S., 1947. For his studies of biological oxidations and his discovery of ascorbic acid in adrenal glands, he received the 1937 Nobel Prize in physiology or medicine. He studied muscle chemistry, discovered the protein actin in muscle, and was the first to isolate vitamin C. He directed (1947–75) research at the Inst. of Muscle Research, Woods Hole, Mass.

Szilard, Leo [sĭ'lärd], 1898–1964, American nuclear physicist and biophysicist; b. Hungary. Working with Enrico FERMI at the Univ. of Chicago, he developed the first self-sustained nuclear reactor based on uranium fission. One of the first to realize that nuclear chain reactions could be used in bombs, and instrumental in urging the U.S. government to create the first atomic bomb, he later actively opposed nuclear warfare.

T

Ta, chemical symbol of the element TANTALUM.

table tennis, ball and racket game, basically a miniature form of TENNIS. It is also called Ping-Pong, a trade name. The game is played on a table that measures 9 ft by 5 ft (2.74 m by 1.52 m). A transverse net 6 in. (15.24 cm.) high divides the surface. Players use a round-bladed paddle to hit the small celluloid ball. A point is scored when a service goes foul or a player fails to return a ball properly. The game originated in the late 19th cent. and first became popular in England. It is a major competitive sport in E Asia.

taboo or **tabu,** prohibition of an act or the use of an object or word under pain of severe punishment. A Polynesian word, *taboo* can apply to something sacred or to the dangerous or unclean. The object of a taboo in Polynesia is believed to have a power, or *mana,* so strong that it may be approached only by priests; breaking the taboo may require the ritual purification, or even death, of the offender to cleanse the community. Taboos are often declared at life changes, such as birth, death, and marriage, and are commonly recorded on a clan's TOTEM.

Tabriz [täbrēz'], city (1986 pop. 971,482), NW Iran, on the Aji Chai (Talkheh) R. It is a summer resort and a commercial, industrial, and transportation center. Tabriz, then known as Tauris, was (3d cent. A.D.) the capital of Armenia under King Tiridates III. It was sacked (c.1029) by the Oghuz Turks and captured (1054) by the Seljuk Turks. The city prospered under the Mongols (13th–14th cent.), and in 1514 it was taken by the Ottoman Turks. Owing to frequent earthquakes, Tabriz has only a few historic sites, e.g., the Blue Mosque (15th cent.).

tabu: see TABOO.

Taché, Sir Étienne Paschal [täshā'], 1795–1865, Canadian statesman. He served (1848–57) in several national administrations and as joint premier (1856–57, 1864) with J.A. MACDONALD. In 1864 he presided over the Quebec conference that helped to prepare for Canada's confederation.

Tacitus (Cornelius Tacitus), A.D. c.55–A.D. c.117, Roman historian. His high moral tone and severe criticism of contemporary Rome, fallen from the virtuous vigor of the old republic, underlies his three major works: the *Germania* (an account of the German tribes); the *Histories* (of which four books and a fragment, covering Galba's reign, A.D. 68–69, and the beginning of VESPASIAN's, survive); and the *Annals* (of which 12 books, covering the reign of TIBERIUS and parts of the reigns of CLAUDIUS and NERO, survive).

Tacoma, city (1990 pop. 176,664), seat of Pierce co., W Wash., on Commencement Bay and the Puget Sound at the mouth of the Puyallup R.; inc. 1884. It is a major seaport and a rail terminus, and one of the Northwest's leading industrial cities. Wood products, boats, and chemicals are important manufactures. Beautifully situated between bay and mountains, with Mt. Rainier in sight, Tacoma has a mild climate and draws many tourists.

tadpole, larval, aquatic stage of AMPHIBIANS, also called polliwog. Hatching from the egg, the tadpole is gill-breathing and legless and propels itself by means of a tail. During METAMORPHOSIS it develops lungs, legs, and other adult organs and, in the FROG and TOAD, loses the tail.

Tadzhikistan: see TAJIKISTAN.

Taegu [tī'gōō'], city (1985 pop. 2,029,853), S South Korea. A railroad junction and marketplace for an extensive agricultural and mining region, Taegu also has important textile and machine industries. It was a major bastion for UN forces during the KOREAN WAR and served as the temporary capital of South Korea.

Taft, William Howard, 1857–1930, 27th president of the U.S. (1909–13) and 10th chief justice of the U.S. Supreme Court (1921–30); b. Cincinnati. He was secretary of war (1904–8) and a close adviser to Pres. Theodore ROOSEVELT. Running as Roosevelt's successor in 1908, he defeated William Jennings BRYAN. He continued Roosevelt's policies, i.e., "trust busting" and, in Latin America, "dollar diplomacy," but he was more conservative than Roosevelt and antagonized the progressive elements in his party. His relations with Roosevelt deteriorated, and in 1912 he found himself running for reelection against his former mentor, who had formed the PROGRESSIVE PARTY (Bull Moose party). The Republican vote was split, and the Democratic candidate, Woodrow WILSON, won. Taft was appointed (1921) chief justice by Pres. HARDING; his chief contribution to the court was his administrative efficiency. His son, **Robert Alphonso Taft,** 1889–1953, was a U.S. senator from Ohio (1938–53) and the leader of conservative Republicans. An opponent of Pres. F.D. ROOSEVELT's New Deal, he was a leading advocate of isolationism before World War II. He helped write the Taft-Hartley Labor Act (1947). He strongly opposed postwar Democratic policies, voting against ratification of NATO and condemning the Korean and China policies of the Truman administration. Known as "Mr. Republican," he was a three-time candidate (1940, 1948, 1952) for the Republican presidential nomination. He served briefly (1953) as Senate majority leader until his death.

Taft-Hartley Labor Act: see LABOR LAW.

Tagalog language: see MALAYO-POLYNESIAN LANGUAGES.

Taglioni, Maria, 1804–84, Italian ballerina; b. Stockholm. She was a great success in *La Sylphide* (1832) at the Paris Opéra. She was known for her ethereal style and high elevations, and is considered a major ballerina of the romantic period.

Tagore, Sir Rabindranath, 1861–1941, Indian writer and philosopher. Born to a wealthy Bengali family, he studied law in England. He drew on classical Indian literature for his approximately 50 dramas, 100 books of verse (much of which he set to music), 40 novels and books of short fiction, essays, and such philosophical works as *Sadhana: The Realization of Life* (1913). For the poems in *Gitanjali* (1912) and for other writings he won the 1913 Nobel Prize in literature. In 1915 he was knighted. His school, Santiniketan [abode of peace], founded at Bolpur in 1901, grew into Visva-Bharat Univ., stressing social reform and world unity.

Tahiti, island (1988 pop. 115,820), 402 sq mi (1,041 sq km), S Pacific, in the Society Islands, FRENCH POLYNESIA. The capital is Papeete. It relies on tourism and produces vanilla, fruits, and copra. Settled by Polynesians (14th cent.), it was visited in the 18th cent. by Capt. James COOK and Lt. William BLIGH. It became French in 1843. GAUGUIN painted his best-known works there.

Tahoe, Lake, scenic resort lake, between NE California and W Nevada, in the E Sierra Nevada. It lies 6,228 ft (1,898 m) above sea level, has an area of 193 sq mi (500 sq km), is up to 1,645 ft (501 m) deep, and feeds into the Truckee R.

taiga, northern coniferous-forest belt of Eurasia, bordered on the north by the treeless TUNDRA and on the south by the STEPPE, comprising about one third of the world's forestland. The climate is characterized by long, severe winters and short summers. The principal species of trees are cedar, pine, spruce, larch, birch, and aspen.

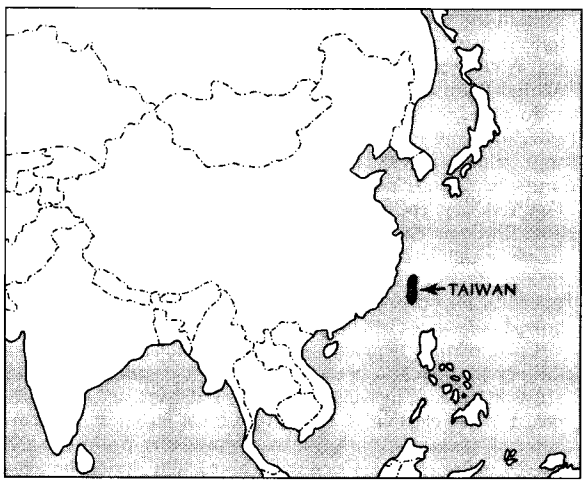
Taine, Hippolyte Adolphe [tĕn], 1828–93, French critic and historian. His deterministic theories, viewing the individual as the product of heredity and environment, became the theoretical basis of NATURALISM. His sociohistorical method of analysis influenced philosophy, aesthetics, literary criticism, and the social sciences. Works include *On Intelligence* (1870) and *The Origins of Contemporary France* (1876–93).

Taipei, city (1988 est. pop. 2,637,000), N Taiwan, capital of Taiwan and provisional capital of the Republic of China. Taiwan's largest city, it is the political, cultural, and industrial center of the island. Important manufactures include electronic and electrical goods, textiles, metals, and chemicals. Developed under Japanese rule

The key to pronunciation appears on page xiii.

(1895–1945), Taipei became the headquarters of CHIANG KAI-SHEK's Nationalists when they fled the mainland of China in 1949.

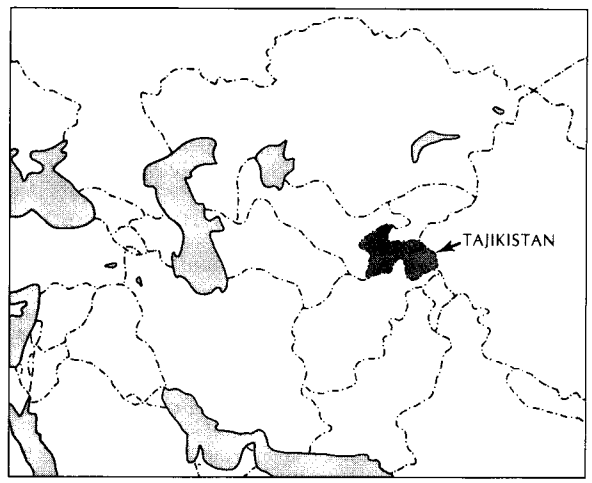
Taiping Rebellion, 1850–64, revolt against the Ch'ing dynasty of China. It was led by Hung Hsiu-ch'üan, a visionary who evolved a political creed including derived elements of Protestantism. His object was to found a new dynasty, the Taiping [great peace]. In 1853 the rebels captured Nanjing and made it their capital. They were finally defeated by new provincial armies and aid from the Western powers. An army led by C.G. GORDON successfully defended Shanghai.



Taiwan, Portuguese *Formosa,* officially Republic of China, island (1992 est. pop. 20,879,000), 13,885 sq mi (35,961 sq km), in the Pacific Ocean, separated from the mainland of S China by the 100-mi-wide (161-km) Taiwan Strait. Together with the PESCADORES and MATSU AND QUEMOY, it is the seat of the Republic of China government, which claims the right to rule all China. The capital is TAIPEI. Other major cities include KAOHSIUNG, Tainan, Taichong, and Chilung. About one quarter of Taiwan's land area is cultivated; rice, wheat, sugarcane, and sweet potatoes are the most important crops. In the 1970s industry replaced agriculture as the major export earner. Light industry is the major manufacturing sector, with electronics predominating. Other manufactures include electrical equipment, chemicals, motor vehicles, and machinery, and service industries are increasingly important. The main natural resources are woods and other forest products. The majority of Taiwanese are ethnic (Han) Chinese who began to emigrate to Taiwan in the 15th cent.; they speak the Mandarin, Fujianese (Amoy), and Hakka dialects. There is also a small number of Kiaoshan (Malayan) aborigines. Religions include Confucianism, Taoism, Buddhism, and Christianity.

History. First settled by the Chinese in the 7th cent., the island was reached by the Portuguese in 1590. It was held by the Dutch in the 1640s, and by China's Ch'ing dynasty from 1683. Occupied by Japan after the First Sino-Japanese War (1894–95), Taiwan remained in Japanese hands until 1945. When CHIANG KAI-SHEK and the Nationalists, or Kuomintang, were ousted (1949) from mainland CHINA by the Communists, they shifted the seat of their government to Taiwan. The U.S. long supported and aided the Nationalists, but in the 1970s Taiwan's international political position had eroded. In 1971 it lost China's seat in the UN to the People's Republic of China, and in 1979 the U.S. broke diplomatic relations with the Nationalists to establish relations with the People's Republic of China, although retaining substantial economic and cultural ties. Martial law, in effect since 1949, was lifted in 1987, and many jailed political dissidents were freed. Pres. Chiang Ching-kuo died in 1988 and was succeeded by LEE TENG-HUI, a Taiwan native. In 1991 Lee ended emergency rule, which had permitted the domination of the National Assembly by aging mainland delegates elected in 1947. In elections in 1992 the Kuomintang retained control of the assembly, but the major opposition party won nearly a third of the seats.

Taiyuan [tī-yüän], city (1990 est. pop. 1,960,000), capital of Shanxi prov., N China, in one of the world's richest coal and iron areas. It is a hub of coal mining and steel production, with machine, chemical, and other industries.



Tajikistan or **Tadzhikistan,** officially Republic of Tajikstan, republic (1992 est. pop. 5,680,000), 55,251 sq mi (143,100 sq km), central Asia, formerly a constituent republic of the USSR. It borders China (E); Afghanistan (S); Kyrgyzstan (N); and Uzbekistan (W, NW). The capital is DUSHANBE; other important cities are Khujand, Yavan, and Qŭrghonteppa (Kurgan-Tyube). The largely mountainous nation has what was the USSR's highest mountain, Communism Peak, formerly Garmo Peak (24,590 ft/7,495 m). The economy is largely agricultural, producing cotton, wheat, barley, fruit, mulberry trees (for silk), and livestock; irrigation is essential for most farming. Mineral resources include coal, antimony, gold, and salt. Manufactures are largely agriculture-related and include textiles, carpets, and leather products, canned goods, and metalworking. The majority of the population are Tajiks, a Sunni Muslim people; Uzbeks and Russians are the largest minorities. The official language is Tajik, which is closely related to Persian (Farsi).

History. Probably descended from the inhabitants of ancient Sogdiana, a Persian province between the Amu Darya and Syr Darya, the Tajiks were successful in farming, crafts, and trade by the 9th cent. Between the 13th and 19th cent. they were ruled by the Mongols, Uzbeks, and Russians. In the aftermath of the Russian Revolution (1917), the Tajiks rebelled and were not subdued by the Bolsheviks until 1921. The territory became an autonomous republic in Soviet Uzbekistan in 1924; in 1929 it became the Tadzhik SSR, a constituent republic of the USSR. Tajikistan declared (1991) its independence following the failed coup against Soviet Pres. Gorbachev. When the Tajik president sought to suspend the Communist party, the Communist majority in the parliament replaced him, which led pro-Islamic and pro-democratic opposition groups and their eastern Tajikistan allies to try to bring down the new president, former party boss Rakhman Nabiyev. In 1992 Nabiyev was ousted by opposition militias, and an ethnically based civil war erupted. Forces allied with the former Nabiyev government retook the capital, and the parliament elected Emomali Rakhmonov president. Fighting between government troops, supported by the Russian army, and pro-Islamic forces persisted along the Afghanistan border. Tajikistan is a member of the COMMONWEALTH OF INDEPENDENT STATES.

Taj Mahal, mausoleum, Agra, N India, the finest example of late Indian Muslim architecture. The Mogul emperor Shah Jahan ordered it after the death (1629) of his wife, Mumtaz Mahal. Designed by a Turkish architect, it was built (1630–48) in a walled garden with an oblong reflecting pool. The white marble exterior is inlaid with semiprecious stones, floral designs, and arabesques. The

dome, 80 ft (24.4 m) high and 50 ft (15.2 m) in diameter inside, forms a bulb outside, tapering to a spire topped by a crescent. The octagonal tomb chamber is lit by light passing through intricately carved screens.

Takeshita Noboru, 1924–, Japanese politician. He won 11 terms in parliament; was chief cabinet secretary (1971–72, 1974), construction minister (1976), and finance minister (1979–80; 1982–86); and was chosen (1987) to head the ruling Liberal Democratic party (LDP). He became prime minister and led Japan's emergence as a champion of the developing nations of Asia. He resigned in 1989. The head of the largest faction in the LDP, Takeshita remains a powerful force in Japanese politics.

Talbot, William Henry Fox, 1800–77, English inventor of photographic processes. From 1841 on he patented methods of making negatives and prints. His book *The Pencil of Nature* (1844) is illustrated with photographs.

talc, hydrous magnesium silicate mineral [$Mg_3Si_4O_{10}(OH)_2$], translucent to opaque, occurring in a range of colors and having a greasy, soapy feel. It is found in thin layers and in granular and fine-grained masses. SOAPSTONE is a granular form of talc. Important sources include Austria, Canada, India, and the U.S. Talc is used in making paper (as a filler), paints, powders, soap, lubricants, linoleum, electrical insulation, and pottery.

tallage, under FEUDALISM, a tax much like AIDS. In Norman England it partly replaced the DANEGELD. Kings and lords levied it on the towns within their demesne lands, but it was resisted and disappeared (c.1340) under Edward III. In France the upper classes were exempt from tallage, called the *taille,* and the burden of it fell mainly on peasants.

Tallahassee, city (1990 pop. 124,773), state capital and seat of Leon co., NW Fla.; inc. 1825. State government and state universities are the major employers; wood products and processed food are produced. Tallahassee, in a hilly, picturesque area, was an Apalachee settlement when DE SOTO arrived in 1539. Capital of the Florida Territory from 1824, it resisted Union attacks in the CIVIL WAR. The city is noted for its old homes and antebellum charm.

Talleyrand or **Talleyrand-Périgord, Charles Maurice de** [tăl-'ērănd"], 1754–1838, French statesman and diplomat. Despite his notorious impiety, he was made (1789) bishop of Autun and represented the clergy at the STATES-GENERAL of 1789. He supported the FRENCH REVOLUTION at first, but after the fall of the monarchy fled to England (1792) and then to the U.S. (1794). Returning to France (1796), he was foreign minister under the DIRECTORY (1797–99) and NAPOLEON I (1799–1807); however, Napoleon tended to ignore Talleyrand's cautious advice. After Napoleon's defeat Talleyrand persuaded the allies to restore (1814) the Bourbon monarchy and represented France at the Congress of VIENNA (1815), where he scored his greatest diplomatic triumphs. He later served LOUIS PHILIPPE as ambassador to London. Often labeled an opportunist, Talleyrand consistently aimed at peace and stability for Europe as a whole.

Tallinn, city (1989 pop. 482,000), capital of ESTONIA, north central Europe, on the Gulf of Finland opposite HELSINKI. It is a major Baltic port with a picturesque Old Town and a center of such industries as shipbuilding and metallurgy. Known to geographers by 1154, Tallinn was destroyed in 1219 by the Danes, who built a fortress on the site. A member of the HANSEATIC LEAGUE from 1285, it passed (1346–1710) to the Livonian Knights, Sweden, and Russia. It became the capital of independent Estonia in 1919 and was the capital of the Estonian SSR while the country was forcibly annexed by the USSR (1940–91).

Tallis or **Tallys, Thomas,** c.1510–1585, English composer. Best known for his hymn tunes, services, and anthems, he also wrote MOTETS, MADRIGALS, and instrumental music.

Talmud [Aramaic from Heb., = learning], compilation of Jewish Oral Law, with rabbinical commentaries, as distinguished from the Scriptures, or Written Law. Its two divisions are the MISHNA (in Hebrew), the text of the Oral Law, and the Gemara (in Aramaic), a commentary on the Mishna, which it supplements. The Gemara developed out of the interpretations of the Mishna by the Amoraim (Jewish scholars of A.D. c.200–c.500), whose hairsplitting arguments made the work a treasury of information and comment. The legal sections of the Talmud are known as the HALAKAH; the poetical digressions—legends and anecdotes—constitute the Aggada. Both the Palestinian and Babylonian schools produced Talmuds: the Talmud Yerushalmi (Jerusalem Talmud, compiled c.5th cent.) and the Talmud Babli (Babylonian Talmud, c.6th cent.); the latter became the authoritative work. A vast literature of commentaries on the Gemara, including those of Rashi, interpreted the older rulings in the light of the new experience of life in Christian Europe in the Middle Ages. A similar process has helped to keep the tradition alive in modern times. See also JUDAISM.

Tamar: see AMNON.

tamarack: see LARCH.

Tamayo, Rufino [tämä'yō], 1899–1991, one of Mexico's leading modern painters. Influenced by CUBISM, FAUVISM, and Mexican folklore, Tamayo concentrated on the formal and decorative in painting. A characteristic example is *Women of Tehuantepec* (1939; Albright-Knox Art. Gall., Buffalo).

tambourine: see DRUM.

Tamerlane: see TIMUR.

Tamil [tăm'Il], Dravidian language of India. See LANGUAGE (table).

Tammany, popular name for the Democratic political machine in New York City. The Tammany Society, or Columbian Order of New York City, was formed c.1786 and incorporated in 1789. At first mostly social, by the mid-1830s it was a dominant political force, fighting for reforms for the common people but increasingly controlled by the privileged classes. With the added support of newly arrived immigrants willing to exchange votes for badly needed assistance, corrupt Tammany bosses, e.g., William M. TWEED, ruled the city for almost a century. Following the state investigations (1930–31) headed by Samuel Seabury, Tammany suffered a telling defeat in the election of 1932 and did not regain its strength in succeeding elections. It had a brief revival after World War II but passed out of existence as a political machine during the mayoralty of John V. Lindsay (1966–74).

Tampa, city (1990 pop. 280,015; met. area 2,067,959), seat of Hillsborough co., W Fla., a port on Tampa Bay; inc. 1855. A highly industrialized city, it is the center of a metropolitan area that includes Clearwater and St. Petersburg. It is a resort and processing and shipping hub for the area's products, particularly phosphates. It has a shrimp fleet, breweries, and a famous cigar industry, centered in its colorful Ybor City section. Nearby Busch Gardens, a theme park with an African zoo and tropical gardens, is a well-known tourist attraction. The Spanish explored the area in 1528, but European settlement began only in 1823. Tampa was an important military base in the SPANISH-AMERICAN WAR.

Tampico, city (1980 pop. 271,636), E Mexico, on the Pánuco R. a few miles inland from the Gulf of Mexico. It is a major port and industrial center that has burgeoned in the 20th cent. since the discovery of oil. It has fisheries, refineries, shipyards, and varied manufactures. Once a Huastec site, it was settled by the Spaniards after 1530.

Tanaka Kakuei, 1918–93, Japanese prime minister (1972–74). A Liberal Democratic party (LDP) member, he normalized (1972) diplomatic ties with the People's Republic of China. Tanaka was forced to resign (1974) because of alleged financial malfeasance. He was later tried for accepting over $2 million in bribes from Lockheed Corp. and was convicted in 1983. He remained a powerful figure in Japanese politics until 1987, when TAKESHITA NOBORU won control of the LDP faction Tanaka had led.

Tananarive: see ANTANANARIVO.

Tancred, 1076–1112, a Crusader from 1096 (see CRUSADES). He took part in the captures of Antioch (1098), Jerusalem (1099), and Haifa (1100), and was regent for his uncle, BOHEMOND I. He took Edessa (1104) and was briefly ruler of Antioch. He refused to yield his conquests to Byzantine Emperor ALEXIUS I.

Taney, Roger Brooke [tô'nē], 1777–1864, 5th chief justice of the U.S. SUPREME COURT (1836–64); b. Calvert co., Md. As U.S. attorney general (1831–33) and secretary of the treasury (1833–34) under Pres. JACKSON, he helped crush the second BANK OF THE UNITED STATES. As chief justice, one of his most notable opinions was in the Charles River Bridge Case (1837), in which he reversed the Court's nationalist trend and curbed the growth of monopolies. Under his guidance, the Court also recognized the doctrine of STATES' RIGHTS. Taney's most notorious decision was in the DRED

The key to pronunciation appears on page xiii.

SCOTT CASE (1857); his ruling that slaves and their descendants had no rights as citizens and that Congress could not forbid slavery in the territories helped precipitate the CIVIL WAR, tarnished the image of the Court, and, until a recent rehabilitation, destroyed Taney's reputation as a jurist.

T'ang, dynasty: see CHINA.

Tanganyika, Lake, freshwater lake in the GREAT RIFT VALLEY of E Africa, c.420 mi (680 km) long and up to 45 mi (72 km) wide. Considered the second deepest lake in the world, it has a maximum depth of c.4,700 ft/1,400 m.

tangelo: see ORANGE.

tangerine: see ORANGE.

Tangshan, city (1990 est. pop. 1,500,000), NE Hopeh prov., China. A coal-mining center, Tangshan is also a major industrial hub producing iron and steel, machinery, motor vehicles, chemicals, and other products. Virtually destroyed in 1976 by a massive earthquake that killed over 250,000 people, it has since been rebuilt.

Tanguy, Yves [täNgē'], 1900–1955, French surrealist painter. A merchant seaman, he took up painting after seeing a work by CHIRICO. His imaginary dream landscapes are filled with amorphous floating objects and personages (see SURREALISM).

Tanizaki Junichiro, 1886–1965, Japanese writer. Often implicitly critical of adopting Western ways, he is perhaps best known for *Makioka Sisters* (1943–48), an account of a traditional, pre-World War II Osaka family. His other novels include *Some Prefer Nettles* (1928) and *The Key* (1956).

tank, military, armored vehicle that has caterpillar traction and is armed with machine guns, cannon, rockets, or flamethrowers. It was developed by the British and first used (Sept. 1916) in WORLD WAR I. In WORLD WAR II tanks and tank tactics were greatly improved. The German army, using large numbers of tanks, overran Poland in less than a month. In mass tank battles on the plains of Europe and N Africa the tide often swung toward the side with the best tanks. Since World War II the basic features of tanks and tank tactics have remained unchanged, although there have been numerous technological refinements. Tanks are vulnerable to recoilless weapons and various antitank missiles, but they remain indispensable, because of their mobility and versatile weaponry, wherever the terrain is suitable to their operation.

tannin, tannic acid, or **gallotannic acid** (approximate empirical formula: $C_{76}H_{52}O_{46}$), colorless to pale yellow, astringent, organic substance found in a wide variety of plants. Tannin can be extracted with hot water from the bark of oak, hemlock, chestnut, and mangrove; certain sumac leaves; plant gall; coffee; tea; and walnuts. In leather making, animal skin is treated with tannin to make it resist decomposition. Tannin is also used to make inks, as a mordant for DYES, and in medicine as an astringent and for treating burns.

tanning, process by which skins and hides are made into LEATHER. Vegetable tanning (shown in Egyptian tomb paintings dating from 3000 B.C.) uses tannin, is usually employed for heavy leathers, and requires more than a month to complete. Mineral tanning includes alum tanning and chrome tanning, the process most common today, requiring only a few hours. In oil tanning, or chamoising, a method used by Native Americans, the pelt is treated with fats and hung to dry; the leather is usually napped on both sides. A modern tanning process employs artificial agents (syntans).

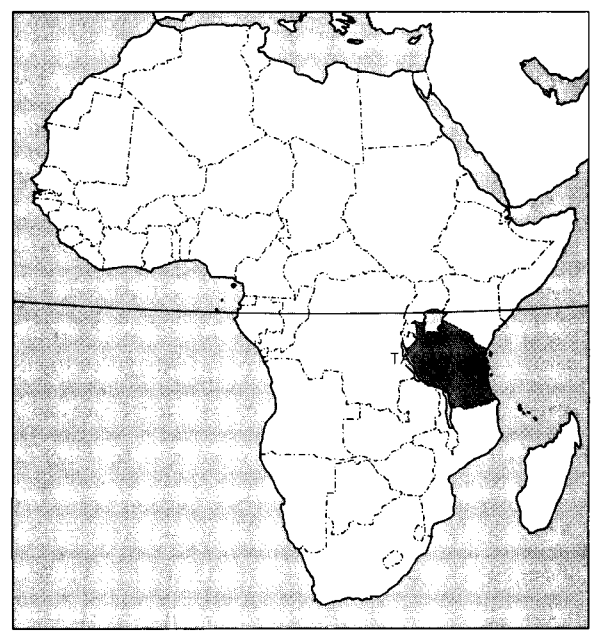
tantalum (Ta), metallic element, discovered in 1802 by A.G. Ekeberg. A rare, hard, malleable, blue-gray metal, it is extremely ductile and highly corrosion-resistant. Uses include electrolytic capacitors, chemical equipment, wires, abrasives, and dental and surgical instruments. See ELEMENT (table); PERIODIC TABLE.

Tantalus, in Greek mythology, king of Sipylos; son of ZEUS; father of PELOPS. Angered by his abominable behavior, Zeus condemned him to TARTARUS. There he suffered thirst and hunger in the presence of water and fruit he could not reach.

Tantra, in Hinduism and Buddhism, esoteric tradition of ritual and YOGA. It is known for the use of MANTRA (mystical words); mandala (sacred diagrams); worship of Shakti (female deities); and, more so in Hindu Tantra, ritual use of wine, meat, and sexual intercourse, in order to awaken the force called *kundalini* and merge with the Godhead. In Hindu Tantra the practices may be symbolic or material. In Buddhist Tantra those rituals opposing the moral precepts of Buddhism have been dropped, but the complex MEDITATION practices have been retained.

Tanzania, officially United Republic of Tanzania, republic (1992 est. pop. 27,792,000), 364,898 sq mi (945,087 sq km), E Africa, formed in 1964 by the union of Tanganyika and ZANZIBAR, an island in the W Indian Ocean. Mainland Tanzania is bordered by Mozambique, Malawi, and Zambia (S), Zaïre, Burundi, and Rwanda (W), Uganda and Kenya (N), and the Indian Ocean (E). Part of the country's boundaries are formed by three major lakes: MALAWI (Nyasa) in the south, TANGANYIKA in the west, and VICTORIA in the north. Principal cities are DODOMA (the capital) and DAR-ES-SALAAM (the former capital). Tanzania has three geographic zones: a fertile, coastal lowland; a vast interior plateau; and several mountain regions, with the famed Mt. KILIMANJARO (19,340 ft/5,895 m), the highest point in Africa, in the northeast. Serengeti, in the Kilimanjaro region, is one of several national parks and wildlife reserves. The economy is overwhelmingly agricultural, with most of the work force employed in subsistence farming, raising cassava and corn. Sisal, cotton, coffee, cloves, and cashew nuts are the major cash crops and supply the bulk of exports. Major manufactures include processed farm goods, textiles, and consumer items; refined petroleum, aluminum goods, and cement are also produced. Tanzania mines diamonds and other gemstones, gold, and salt; large iron-ore and coal reserves are mostly unexploited. Virtually all the people are members of Bantu speaking ethnic groups, but there are Arab and Indian minorities. About a quarter of the people adhere to traditional beliefs; the rest are about equally divided between Muslim and Christian religions. Swahili and English are the official languages.

History. A fossil found in OLDUVAI GORGE in NE Tanzania has been identified as the remains of a direct ancestor of modern humans, about 1.75 million years old. The area was later the site of Paleolithic cultures. By about A.D. 900 traders from SW Asia and India had settled on the coast, and there were commercial contacts with China. A century later the migration of Bantu-speaking peoples into the interior of Tanzania was well under way. Kilwa Kisiwani (situated on an island) became a major trade center by about 1200, dealing in gold, ivory, and other goods. In 1498 the Portuguese explorer Vasco da GAMA became the first European visitor; he made Kilwa tributary in 1502, and within a few years Portugal controlled most of the coast. Following incursions by the Zimba, a warlike African people, the Portuguese were expelled in 1698. In the 18th cent. Arabs from Oman established commercial control over the region, and in 1841 the Omani capital was moved from Muscat to Zanzibar. At the same time new caravan routes, trafficking in slaves



and ivory, were opened into the interior. German influence in Tanganyika grew in the 1880s, and the territory became a German protectorate in 1891. Following occupation by British and South African troops in WORLD WAR I, Tanganyika was made a British mandate. It gained independence in 1961, becoming a republic, with Julius NYERERE as president, in 1962. In 1964 it merged with newly independent Zanzibar to form the United Republic of Tanzania. President of Tanganyika 1962–64 and of Tanzania 1964–85, Nyerere instituted his own brand of "African socialism" called *ujamaa* (pulling together). Peasants were organized into village collectives; factories and plantations were nationalized; state-run corporations were established; egalitarianism was encouraged; major investments were made in primary schools; a one-party state was formed; and tribal conflicts were avoided. The steep rise in oil prices in the 1970s, however, and sharp drops in the value of Tanzania's exports—coffee and sisal hemp—reduced the country to poverty. Nyerere's successor as president, Ali Hassan Mwinyi, began an economic recovery program involving cuts in government spending, decontrol of prices, and encouragement of foreign investment, and modest growth resumed. In 1993 opposition parties were legalized and multiparty elections set for 1995.

Taoism, philosophy and religion of China. The philosophical system derives chiefly from the *Tao-te-ching,* a book traditionally ascribed to LAO-TZE but probably written in the mid-3d cent. B.C. It describes an ideal human condition of freedom from desire and of effortless simplicity, achieved by following the Tao [Chin., = path], the spontaneous, creative, effortless path taken by natural events in the universe. Quietistic in outlook, Taoists condemned as symptoms of excessive government the social virtues expounded by CONFUCIUS. Philosophical Taoism was later expounded in the brilliant satirical writings of Chuang-tze (c.369–c.286 B.C.). Later Taoism stressed the search for effects, such as immortality, supposed to flow from the Tao, and encouraged the study of ALCHEMY. By the 5th cent. A.D. Taoism had adopted many features of Mahayana BUDDHISM and offered a fully developed religious system for those who found the largely ethical system of CONFUCIANISM inadequate. In the 1950s, after the establishment of the Communist regime, Taoism was officially proscribed in China, and since the Cultural Revolution (1966–69) the religion has flourished mainly in Taiwan. Taoist ideas have enjoyed wide circulation in the West in the late 20th cent.

Taos, town (1990 pop. 4,065), seat of Taos co., N N.Mex., between the Rio Grande and the Sangre de Cristo Mts.; founded c.1615, inc. 1934. It developed (principally after 1898) as an art colony frequented by John MARIN, D.H. LAWRENCE, and others. Taos is now the site of studios, galleries, and a school of art. For years an important Spanish and Native American trading post, Taos was the center of the Pueblo Revolt (1680). Kit CARSON's house and grave are in Taos, and the Carson National Forest is nearby.

tape recorder, device for recording and replaying of sound, video, and digital information on plastic or paper tape. In an audio tape recorder, sound is picked up by a MICROPHONE and transformed into an electric current. The current is fed to a TRANSDUCER (in the tape recorder's recording head), which converts the current into corresponding magnetic flux variations that magnetize the fine particles of iron, cobalt, or chromium oxides on the tape as it passes by the head. During playback the tape passes over the playback head (often the same one used for recording) and the tape's magnetic field induces a current in the transducer. The current is then amplified and used to reproduce sound through a LOUDSPEAKER. "Tape hiss," sound composed of high frequencies picked up at random during recording, is suppressed by several systems, among them Dolby, Dolby-B, Dolby-C, and dbx. Digital audio tape (DAT) and digital compact cassette (DCC) recorders transform audio signals into digital pulses, which are then stored on the tape. Both eliminate tape hiss and reproduce sound more accurately than analog recorders. Digital tape recording devices are also used to store programs and data for COMPUTERS. See also VIDEOCASSETTE RECORDER.

tapeworm, name for parasitic flatworms in the class Cestoda, segmented worms sometimes reaching 15–20 ft (4.6–6.1 m) in length. Tapeworms attach themselves to the intestinal wall of the host, which may be VERTEBRATES or ARTHROPODS. Humans become infected with tapeworms from eating infected meat or fish. Infestation may produce no symptoms or may produce abdominal distress and weight loss. Drug treatment destroys the parasite.

tapir, nocturnal, herbivorous MAMMAL (genus *Tapirus*) of the jungles of Central and South America and SE Asia. Related to the HORSE and RHINOCEROS, it is about the size of a donkey and piglike in appearance, with a long, flexible snout and short legs. Tapirs live in forests, browsing on twigs; they swim well and can run fast when in danger. The Central American species (*T. bairdi*) is threatened by the destruction of its rain-forest habitat.

tar and pitch, viscous, dark-brown to black substances, obtained by the destructive DISTILLATION of certain organic materials, e.g., COAL, WOOD, and PETROLEUM. Although the terms *tar* and *pitch* are sometimes used interchangeably, pitch is actually a component of tar that can be isolated by heating. Tar, more or less fluid, is now used to produce BENZENE and various other substances. Tar from pine wood is used to make SOAP and medicinals. Coal tar derivatives are used to make DYES, cosmetics, and synthetic flavoring extracts. Pitch tends to be more solid than tar and is used to make roofing paper, in VARNISHES, as a coal-dust binder in making fuel briquettes, and as a lubricant. ASPHALT is a naturally occurring pitch.

tarantula, name for several species of large, hairy SPIDERS found in the Americas. The tarantula's body may measure 3 in. (7.6 cm) long and, with legs extended, up to 10 in. (25.4 cm) across. The largest may kill small vertebrates, but most feed on ARTHROPODS. Tarantula bites, although painful, are not usually dangerous to humans.

Tarascan, indigenous people of S Mexico (see MIDDLE AMERICA, INDIGENOUS PEOPLES OF), speaking a language with no known relation to other languages. Tarascan settlements date from 500 B.C. They had a well-developed civilization by the time the Spanish arrived and were subjugated by the Spanish only with difficulty. Traditionally known for weaving and hummingbird-feather mosaics, the Tarascans are still noted for their weaving, as well as for music and lacquerware. They are chiefly an agricultural people, with fewer than 100,000 inhabiting villages today in the state of Michoacán. Many Tarascans work as migrant laborers in the U.S.

Tarawa, most populous atoll (1985 pop. 24,598) of KIRIBATI, in the Pacific Ocean near the equator, site of the national capital, Bairiki. Formerly the administrative center of the British Gilbert and Ellice Islands colony, Tarawa was occupied during WORLD WAR II by Japan and fell (1943) to U.S. marines after a bloody battle.

Tarbell, Ida Minerva, 1857–1944, American author; b. Erie co., Pa. A leading MUCKRAKER, she is remembered for her investigations of industry, particularly in her *History of the Standard Oil Company* (1904). She also wrote several biographies.

tariff, tax on imported and, more rarely, exported goods. It is also called a customs duty. Tariffs, unlike other taxes, often have a broadly economic rather than narrowly financial goal, being designed less to increase a nation's revenue than to protect domestic industries from foreign competition. For that reason, protective tariffs, as they are often called, are opposed by advocates of free trade. In ancient times customs duties were assessed for the use of trade and transportation facilities, but by the 17th cent. they came to be levied only at the boundary of a country and usually only on imports. European powers established special low tariff rates for their colonies (see MERCANTILISM and NAVIGATION ACTS). Britain and France, in particular, used preferential tariffs to regulate the flow of raw materials from, and domestic manufactured goods to, their colonies. Other European nations retaliated by raising their tariffs, ushering in a period of high protective tariffs that lasted through the GREAT DEPRESSION. Since World War II the trend has been toward freer trade. Customs unions such as the Common Market (1957; see EUROPEAN UNION) have lowered or even eliminated tariffs among large groups of nations. Finally, the General Agreement on Tariffs and Trade (see UNITED NATIONS, table 3) has since the 1950s, been responsible for generally lower tariffs around the world.

Tarkenton, Fran(cis Asbury), 1940–, American football player; b. Richmond. One of football's greatest passing quarterbacks, he established lifetime records for most completions (3,686), most yards gained passing (47,003), and most touchdown passes (342) during

his career with the Minnesota Vikings (1961–66, 1972–78) and New York Giants (1967–71).

Tarkington, (Newton) Booth, 1869–1946, American author; b. Indianapolis. He is noted for novels of small-town midwestern life, e.g., *The Gentleman from Indiana* (1899), *The Magnificent Ambersons* (1918; Pulitzer), and *Alice Adams* (1921; Pulitzer). He is also known for such amusing novels of youth as *Penrod* (1914) and *Seventeen* (1916). His plays include a dramatization of his historical romance *Monsieur Beaucaire* (1901).

taro: see ARUM.

tarots, playing cards used mainly for fortune-telling, generally believed to have been introduced into Europe by gypsies in the mid-15th cent. In addition to 56 pictorial cards in four suits much like a modern 52-card deck, there are 22 additional pictorial cards, numbered 0 to 21. The pictures on the 78 cards are allegorical, representing forces of nature and the virtues and vices of humanity. Systems of interpretation vary greatly.

Tarquin, legendary Etruscan family ruling in early Rome. **Lucius Tarquinius Priscus** is said to have come to Rome on the advice of his prophetess wife, Tanaquil. There he was made king (616 B.C.). His son, **Lucius Tarqinius Superbus** (Tarquin the Proud), murdered his father-in-law, Servius Tullius, to get the throne. He ruled with despotism and cruelty. His son, **Sixtus Tarquinius,** ravaged Lucrece, the wife of his kinsman, **Tarquinius Collatinus.** The Romans drove Tarquin the Proud from the throne (510 B.C.). Lars Porsena tried to restore the family; failing, he made peace with Rome.

tarragon, perennial aromatic Old World herb (*Artemisia dracunculus*) of the COMPOSITE family. It has long been cultivated for its leaves, used for flavoring vinegar, salads, sauces, soups, and pickles.

Tartarus, in Greek mythology, lowest region of HADES, where the wicked, e.g., SISYPHUS, TANTALUS, were punished.

Tasaday, small band of supposed hunter-gatherers in a Philippine rain forest, allegedly contacted by Westerners for the first time in 1971 and reported to have lived in caves and to have used stone tools. The Philippine government has restricted scientific study, so it has been difficult to verify their status. On the basis of many kinds of evidence, it is widely believed that they are a hoax perpetrated by a former government official.

Tashkent: see TOSHKENT.

Tasman, Abel Janszoon, 1603?–59, Dutch navigator. In 1642 he discovered TASMANIA, which he named Van Diemen's Land, and NEW ZEALAND. He was the first explorer to circumnavigate AUSTRALIA, proving it to be an island continent.

Tasmania, island state (1992 est. pop. 470,000), 26,383 sq mi (68,332 sq km), SE Australia. It is separated from the mainland by Bass Strait and lies 150 mi (240 km) S of the state of Victoria. It is the smallest, wettest, and most mountainous of the Australian states. Hobart is the capital and largest city. Manufactures include metal products, textiles, and wood products. Copper, tin, lead, zinc, and iron ore are mined. Lamb, beef, veal, wool, fruits, and hops are important agricultural products. The Dutch navigator Abel TASMAN discovered the island and named it Van Diemen's Land in 1642. Capt. James COOK visited it in 1777, and in 1803 Great Britain took possession and established a penal colony at Hobart. The indigenous population was wiped out in the 19th cent., but a few thousand mixed-race descendants survive. Tasmania became a separate colony in 1825 and was federated as a Australian state in 1901.

Tasmanian devil, voracious MARSUPIAL (*Sarcophilus harrisi*) of the Dasyure family, now found only on Tasmania. Its body is about 2 ft (60 cm) long with a large head and weak hindquarters. Very strong for its size, it preys on animals larger than itself; it has been relentlessly hunted for its destruction of livestock and poultry.

Tasman Sea, arm of the South Pacific Ocean, between Australia and New Zealand. It was named for the Dutch explorer Abel TASMAN.

Tasso, Torquato, 1544–95, major Italian poet and tragic figure of the RENAISSANCE. He gained fame at 18 with the narrative *Rinaldo,* and in 1565 was invited to the court of the ESTE at Ferrara. There he wrote the PASTORAL play *Aminta* (1573) and the first version of his masterpiece, *Jerusalem Delivered* (1575), a religious EPIC about the First CRUSADE. That same year he suffered a blow to the head that left him intermittently insane. He greatly influenced MILTON, and the legend of his doomed love for Leonora d'Este was immortalized by BYRON, GOETHE, and others.

taste: see TONGUE.

Tatars or **Tartars,** Turkic-speaking peoples living mostly in Russia and Central Asia. They are largely SUNNI Muslims. Originally a nomadic tribe from E Central Asia, the Tatars intermixed with MONGOLS in the hordes of JENGHIZ KHAN, and the term Tatars came to mean invaders under Mongol leadership. When the Mongols receded eastward, the Tatars continued to dominate Russia, Ukraine, and Siberia. They adopted ISLAM in the 14th cent. In the late 15th cent. the Tatar empire (see GOLDEN HORDE, EMPIRE OF THE) broke up into separate states that fell under Russian or Ottoman Turkish rule. By the 16th cent. most Tatars were settled agriculturists. Tatar leaders, traders, and institutions had great influence on Russian history. In 1783 the last Tatar state, the Crimea, was annexed to Russia. Most Tatars live in the Volga region (where Tatarstan, the Tatar republic, is located) and the Urals, and some live in small groups in W Siberia. The Crimean Tatars were exiled to Kazakhstan and Uzbekistan in 1945 for alleged collaboration with the Germans in WORLD WAR II; in 1956 they regained their civil rights, and since the late 1980s many have returned to Crimea. Following the disintegration of the USSR, Tatarstan leaders began to press the Russian government for increased powers for the autonomous republic. In a 1992 referendum, over 61% of the voters supported a "sovereign" Tatarstan.

Tatarstan: see TATARS.

Tate, (John Orley) Allen, 1899–1979, American poet and critic; b. Winchester, Ky. A professor at several colleges, he edited the magazines *Fugitive* (1922–25) and *Sewanee Review* (1944–46). His perceptive critical writings include *On the Limits of Poetry* (1948) and *The Man of Letters in the Modern World* (1955). His skillful poetry, filled with bitter imagery, can be found in several volumes, notably *Collected Poems* (1977).

Tate, Nahum, 1652–1715, English poet and dramatist. He adapted SHAKESPEARE and with John DRYDEN wrote the second part of *Absalom and Achitophel* (1682). He was named poet laureate in 1692. POPE attacked him in the *Dunciad.*

Tate Gallery, London, originally the National Gallery of British Art. The building was given by Sir Henry Tate and opened in 1897 with 65 British paintings. It was extended by the Turner Wing (1910), three galleries for modern foreign art (1916), the John Singer Sargent Wing (1926), and the Glore Gallery (1987). Its collections of works by William BLAKE, J.M.W. TURNER, and the PRE-RAPHAELITES are particularly notable.

Tawney, Richard Henry [tô'nē], 1880–1962, English historian; b. Calcutta. A leading socialist and Labour party economist, he was an expert on early modern capitalism. He wrote *The Agrarian Problem in the 16th Century* (1912) and *Religion and the Rise of Capitalism* (1926).

taxation, system used by governments to obtain money from people and organizations. The revenue collected is used by the government to support itself and to provide public services. Although taxation is compulsory, it does not guarantee a direct relationship between the amount contributed by a citizen and the extent of services received. An enforced levy to meet an emergency is distinguished from taxation as not being part of a long-term system (e.g., capital levy, a high, one-time tax on a subject's total capital, usually imposed after a war). Fees for special services, such as postage, are not considered taxes. A government may secure its revenue without taxation, as from natural resources, manufactured products, or services, but nearly all nations today rely on taxation as their principal source of income. Ease of collection is considered a merit in a tax, and ability to pay is one test of the amount that an individual should contribute. Taxes are classified as proportional, progressive, or regressive, depending on how they relate to the ability to pay. A *proportional* tax takes the same percentage of each person's income, whether rich or poor. A *progressive* tax, such as the U.S. INCOME TAX, has a higher rate for persons with higher incomes. A general sales tax (a levy on the sale of goods and services, usually as a percentage of the selling price) is considered *regressive,* for in disregarding a person's ability to pay, it, in effect, taxes the poor more heavily than the wealthy by requiring

the poor to spend a larger proportion of income on basic needs. Increases or decreases in taxes, or changes in the types of taxes levied, are often used to regulate a nation's economy. For example, the 1981 federal tax law aimed at stimulating the U.S. economy lowered individual income taxes, gave businesses faster DEPRECIATION write-offs, provided savings incentives, and allowed for indexing (see INDEX NUMBER). See also specific types of taxes, e.g., EXCESS PROFITS TAX; INHERITANCE TAX.

taxidermy, process of preserving vertebrate animals in lifelike form by mounting the cleaned skins on a manmade skeleton. Once employed chiefly to preserve hunting trophies and souvenirs, taxidermy is now used mainly by science museums.

Taylor, Edward, c.1642–1729, considered America's foremost colonial poet; b. England. He came to America in 1668. A Congregational minister and ardent Puritan, he wrote verse similar to that of England's METAPHYSICAL POETS. His poetry was first published in 1939.

Taylor, Elizabeth, 1932–, American film actress; b. England. Noted for her beauty, her films include *A Place in the Sun* (1951), *Cleopatra* (1962), *Who's Afraid of Virginia Woolf?* (1966; Academy Award), and *A Little Night Music* (1977).

Elizabeth Taylor

Taylor, Frederick Winslow, 1856–1915, American industrial engineer; b. Germantown, Pa. Taylor, called the father of scientific management, developed management methods that were successfully introduced into many industries. See also TIME AND MOTION STUDY.

Taylor, Maxwell Davenport, 1901–87, U.S. general; b. Keytesville, Mo. He commanded airborne divisions in Europe during WORLD WAR II and was superintendent of West Point (1945–49). After commanding (1953–54) U.S. forces in Korea and the Far East, he served as army chief of staff (1955–59) but resigned when Pres. EISENHOWER disregarded his argument for an expanded, flexible army capable of fighting a limited war. Pres. KENNEDY named him chairman of the joint chiefs of staff (1962–64). As ambassador to South Vietnam (1964–65) under Pres. Lyndon JOHNSON, he urged U.S. support for the VIETNAM WAR.

Taylor, Paul, 1930–, American MODERN DANCE choreographer; b. Pittsburgh, Pa. He made his debut (1953) with Merce CUNNINGHAM, danced (1955–61) with Martha GRAHAM's company, and formed (1955) his own company. His early choreography was witty and innovative; his later works, such as *Le Sacre du Printemps (The Rehearsal)* (1980) and *Company B* (1991)., have been less radical.

Taylor, Zachary, 1785–1850, 12th president of the U.S. (1849–50); b. Orange co., Va. He joined the army in 1808, winning the nickname "Old Rough and Ready" in the BLACK HAWK WAR (1832) and in campaigns against the SEMINOLE in Florida. He took command (1845) of the army in Texas and won victories in the MEXICAN WAR, concluding with the decisive battle of Buena Vista (1847) against great odds. A popular hero, he was elected president on the Whig ticket in 1848. As president, he supported the WILMOT PROVISO and favored the rapid admission of California and New Mexico to the Union. His free-soil views put him in opposition to the measures that became the COMPROMISE OF 1850. Charges of corruption were lodged against members of his cabinet, but before he could order a reorganization he died of cholera on July 9, 1850. He had been in office only one year and four months. He was succeeded by Millard FILLMORE.

Tay-Sachs disease, rare hereditary disease caused by a genetic mutation that leaves the body unable to produce an enzyme necessary for fat metabolism in nerve cells, producing central NERVOUS SYSTEM degeneration. In infants, it is characterized by progressive mental deterioration, blindness, paralysis, epileptic seizures, and death by age four. Adult-onset Tay-Sachs occurs in persons who have a genetic mutation that is similar but allows some production of the missing enzyme. The disease occurs primarily among Jews of Eastern European descent but is also found in French Canadians whose roots are in the St. Lawrence region, certain Cajuns in Louisiana, and some Amish communities. Tay-Sachs can be detected in a fetus by CHORIONIC VILLUS SAMPLING or AMNIOCENTESIS. There is no treatment for Tay-Sachs.

Tb, chemical symbol of the element TERBIUM.

TB, in medicine: see TUBERCULOSIS.

Tbilisi [tabĭl'ēsē] or **Tiflis,** city (1989 pop. 1,260,000), capital of GEORGIA, SW Asia, on the Kura R. and the Transcaucasian RR. Its industries produce machinery, woven silk, and processed foods. Tbilisi was built on a site settled in the 4th cent. B.C. It was ruled (4th–11th cent A.D.) by the Persians, Arabs, Khazars and Turks; was the capital of an independent Georgian state (109[illegible]–1225); and was held (13th–18th cent.) by the Mongols, Iranians, and Turks. It passed to Russia in 1801. From 1918 to 1920 Tbilisi was again the capital of an independent Georgia; Georgia became independent again in 1991 when the USSR disintegrated.

Tc, chemical symbol of the element TECHNETIUM.

Tch-. For Russian names beginning thus and not listed here, see CH-; e.g., for Tchekhoff, see CHEKHOV.

Tchaikovsky, Peter Ilyich [chīkôf'skē], 1840–93, one of the most popular and influential Russian composers. He studied at the St. Petersburg Conservatory and later taught at the Moscow Conservatory (1865–78). An annuity from a wealthy patroness, Mme von Meck, allowed him for years to devote himself to music. Richly orchestrated, his music is melodious, intensely emotional, and often melancholy. Among the most successful of his compositions are his orchestral works, notably his last three symphonies; the fantasy *Romeo and Juliet* (1869, rev. 1870, 1879); the ballets *Swan Lake* (1876), *The Sleeping Beauty* (1889), and *The Nutcracker* (1892); the Piano Concerto in B Flat Minor (1875); and the Violin Concerto in D (1878). His operas include *Eugene Onegin* (1879) and *The Queen of Spades* (1890).

Tchelitchew, Pavel [chālē'chĕf], 1898–1957, Russian-American painter. His compositions are complex and fantastic, using multiple images and triple perspective to recreate the motion of the body. The best known of these is *Hide and Seek* (Mus. Mod. Art, N.Y.C.).

Te, chemical symbol of the element TELLURIUM.

tea, tree or bush, its leaves, and the beverage made from the leaves. The plant (*Thea sinensis, Camellia thea,* or *C. sinensis*) is an evergreen related to the CAMELLIA and native to India and probably parts of China and Japan. In the wild it grows to about 30 ft (9.1 m) in height, but in cultivation it is pruned to 3 to 5 ft (91 to 152 cm). Tea plants require a well-drained habitat in a warm climate with ample rainfall; the leaves are prepared by drying, rolling, and firing (heating). Black teas (e.g., pekoes), unlike green teas, are fermented before firing; oolong teas are partially fermented. Tea's stimulating properties are due to CAFFEINE, and its astringency to tannin. Grown in China since prehistoric times, tea was produced on a commercial scale there by the 8th cent. It was introduced (17th cent.) into Europe by the Dutch EAST INDIA COMPANY, and its popularity helped spur the opening of E Asia to Western com-

The key to pronunciation appears on page xiii.

merce. In colonial America a tax on tea led to the BOSTON TEA PARTY (1773). Today tea is used by more people and in greater quantity than any beverage except water.

teak, tall deciduous tree (*Tectona grandis*) of the VERVAIN family, native to India and Malaysia but now widely cultivated in tropical areas. Teakwood is moderately hard, easily worked, and very durable. The wood contains an ESSENTIAL OIL that resists the action of water and prevents the rusting of iron, and the heartwood is resistant to termites. Superior to all other woods for shipbuilding, teak is also used in furniture, flooring, and general construction.

Teamsters Union, giant U.S. labor UNION formed in 1903; its full name is the International Brotherhood of Teamsters, Chauffeurs, Warehousemen, and Helpers of America. Most members are truck drivers, but some are in agriculture, sales, optics, and other fields. The Teamsters grew steadily under the presidency (1907–52) of Daniel J. Tobin, especially after 1933, when they organized the long-distance trucking industry. During the presidency of Tobin's two immediate successors, Dave Beck and J.R. HOFFA, charges of corruption were leveled against the union. The revelations of a Senate Committee led the AFL-CIO to expel the Teamsters in 1957, and both Beck and Hoffa were later imprisoned. Subsequent presidents Frank E. Fitzsimmons (1971–81), Roy Lee Williams (1981–83, convicted of conspiring to bribe a senator), Jackie Presser (1983–88), and William J. McCarthy (1988–91) failed to improve its tarnished image. The union rejoined the AFL-CIO in 1987. In a union-wide secret ballot forced by the government in 1991, Ronald R. Carey, an insurgent candidate, was elected president. In 1990 the Teamsters had 1.7 million members.

Teapot Dome, in U.S. history, scandal that began during the administration of Pres. HARDING. In 1921, Sec. of the Interior Albert B. Fall secretly leased the naval oil reserves at Teapot Dome, Wyo., and Elk Hills, Calif., without competitive bidding. A Senate investigation (1922–23) revealed that Edward L. Doheny, who had leased the Elk Hills oil field, had "loaned" Fall large sums of money without interest, as had Harry F. Sinclair, recipient of the Teapot Dome lease. Fall was subsequently fined and sentenced to prison. Both Doheny and Sinclair were acquitted of bribery on legal technicalities, but Sinclair was later imprisoned for contempt of the Senate and attempted jury tampering. The oil fields were restored (1927) to the U.S. government by a Supreme Court decision.

tear gas: see POISON GAS.

Teasdale, Sara, 1884–1933, American poet; b. St. Louis. Her volumes of delicate, highly personal lyrics include *Love Songs* (1917; Pulitzer) and *Strange Victory* (1933). She committed suicide.

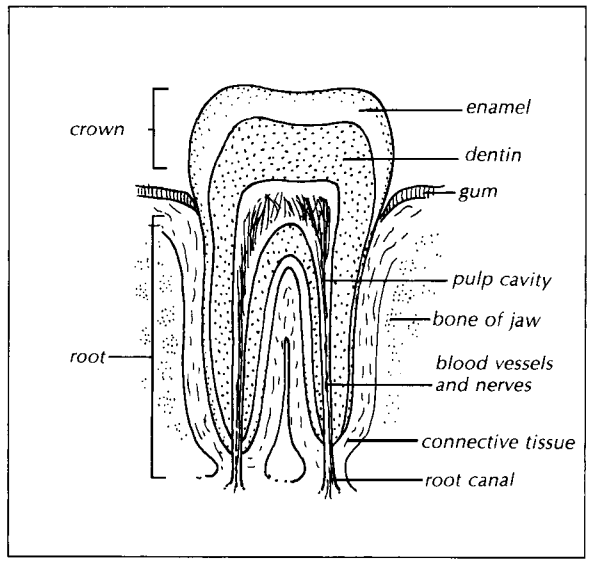
technetium (Tc), artificially produced radioactive element, discovered in a sample of deuteron-bombarded molybdenum in 1937 by C. Perrier and E.G. Segrè. The silver-gray metal is used in radioactive tracer studies. Spectra of some stars indicate the presence of the element; the naturally occurring element has not been found on earth. See ELEMENT (table); PERIODIC TABLE.

Tecumseh, 1768?–1813, chief of the SHAWNEE; b. Ohio. A noted military leader, he planned a confederacy of tribes to resist U.S. encroachment, but the defeat of his brother, the Shawnee Prophet, at Tippecanoe (1811) ended the Native American military movement. Tecumseh then fought alongside the British against the Americans in the WAR OF 1812. He died in the battle of the Thames.

teeth, hard, calcified structures embedded in the bone of the jaw that perform the function of chewing food. An adult mouth contains 32 permanent teeth. A tooth consists of the crown, the portion visible in the mouth, and one or more roots embedded in a gum socket. The gums cushion the teeth, while the jawbone firmly anchors the roots. The center of each tooth is filled with soft pulpy tissue containing blood vessels and nerves. Hard, bony dentin surrounds the pulp and makes up the bulk of the tooth. The root portion has an overlayer of cementum, and the crown has a layer of enamel, the hardest substance in the body.

Teflon, trade name for a solid, chemically inert POLYMER of tetrafluoroethylene (C_2F_4), $F_2C{=}CF_2$. Stable up to temperatures around 572°F (300°C), Teflon is used in electrical insulation, gaskets, and in making low-adhesion surfaces, e.g., for nonstick cookware.

Tegucigalpa [tāgōōsēgäl'pä], city (1988 est. pop. 552,000), S central Honduras, capital and largest city of Honduras. Founded in 1579 in a mountain valley, it was a Spanish colonial gold and silver mining



Cross-section of a tooth

center. It vied with Comayagua, its twin city across the Choluteca R., as the republic's capital until 1880. Its older section, built on a steep slope with narrow, stair-stepped streets, is unusually picturesque.

Teheran or **Tehran,** city (1986 pop. 6,042,584), capital of Iran, N Iran, near Mt. Damavand. It is Iran's largest city and its administrative, industrial, and commercial hub. It is also a leading center for the sale and export of carpets. Teheran rose to importance after the nearby city of Ragy was destroyed (13th cent.) by the Mongols, and in 1788 it became the capital of Persia. During World War II it was the site of the TEHERAN CONFERENCE (1943). Under MUHAMMAD REZA SHAH PAHLEVI (r.1941–79) the city was modernized. In 1979 Iranian militants seized the U.S. embassy in Teheran and held 52 Americans hostage for 444 days (until Jan. 20, 1981).

Teheran Conference, Nov. 28–Dec. 1, 1943, meeting in Iran during WORLD WAR II of U.S. Pres. F.D. ROOSEVELT, British Prime Min. Winston CHURCHILL, and Soviet Premier Joseph STALIN. Agreement was reached on Allied plans for the war against Germany and for postwar cooperation in the UNITED NATIONS.

Teilhard de Chardin, Pierre, 1881–1955, French paleontologist and philosopher. A Jesuit, Teilhard was forced to abandon teaching in 1926 because of his attempts to reconcile original sin with his concept of evolution. Thereafter he worked (1926–46) in China as a paleontologist and was involved in the discovery of Peking man (see HOMO ERECTUS). He also wrote *The Phenomenon of Man* (published posthumously, 1955), in which he outlined his concept of cosmic evolution and his conviction that belief in evolution does not entail rejection of Christianity. He saw humankind as the axis of the cosmic flow and the key to the universe, and evolution as leading ultimately to the "Omega Point," variously interpreted as the integration of all individual consciousness and as the second coming of Jesus. His works received unusually wide popular response after their posthumous publication.

Te Kanawa, Dame Kiri, 1944–, New Zealand opera and concert singer. She has appeared with the New York Metropolitan Opera, the Munich Opera, and other major opera houses worldwide. She is noted for her performances of the role of the Countess in *The Marriage of Figaro* and Rosalinde in *Die Fledermaus.*

Tel Aviv–Jaffa, city (1989 est. pop. 330,000), W central Israel, on the Mediterranean Sea. It is Israel's second largest city, its financial and commercial center, and a major diamond-processing center. The city is also a tourist resort with wide, attractive beaches. Tel Aviv was founded (1909) by Jews from Jaffa, a major Arab population center, and its population grew dramatically after 1920. It was Israel's first capital (1948–49) and many foreign embassies are still located in the city. A cultural center, it is the site of many theaters, leading museums, and several musical organizations, in-

cluding the Israel Philharmonic. Tel Aviv and Jaffa were merged in 1950. During the PERSIAN GULF WAR the city was subjected to Iraqi missile attacks.

telegraph, electrically operated device or system for distant communication (the first ever invented) by means of visible or audible signals. The method used throughout most of the world, based in large part on the mid-19th-cent. work of Samuel F.B. MORSE, utilizes an ELECTRIC CIRCUIT set up customarily by using a single overhead wire and employing the earth as the other conductor to complete the circuit. In the telegraph's simplest form, an electromagnet in the receiver is activated by alternately making and breaking the circuit. Reception by sound, with the MORSE CODE signals received as audible clicks, is the basis for a low-cost, reliable method of signaling. In addition to wires and CABLES, telegraph messages are now sent by such means as RADIO waves, MICROWAVES, and COMMUNICATIONS SATELLITES. **Telex** is a telegraphy system that transmits and receives messages in printed form. Today the telegraph is less widely used, having been supplanted by TELEPHONES, FACSIMILE MACHINES, and electronic mail.

Teleki, Count Paul [tĕ'lĕkĭ], 1879–1941, Hungarian premier (1920–21, 1939–41). He signed (1940) the Berlin Pact (see AXIS). When it became evident that Germany would force Hungary to invade Yugoslavia, Teleki committed suicide.

Telemachus, in Greek mythology, son of ODYSSEUS.

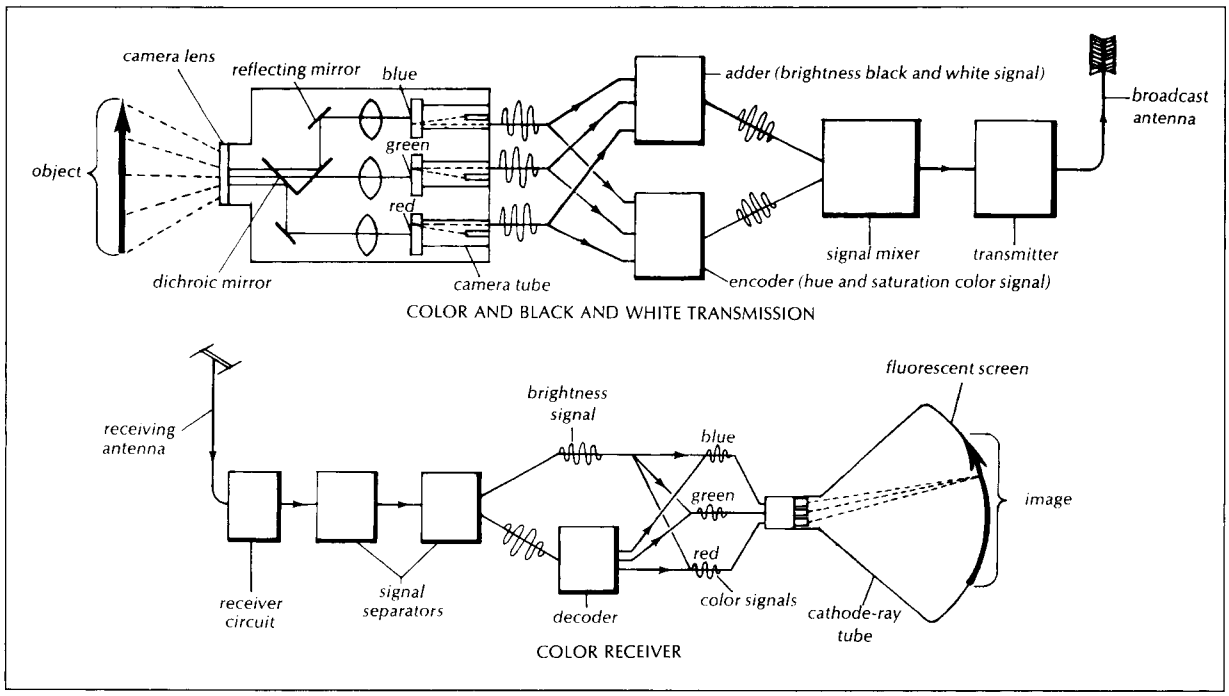
Telemann, Georg Philipp, 1681–1767, German composer. Extremely prolific, and in his day more popular than J.S. BACH, he wrote over 600 overtures, 40 operas, 12 services for the year, and other works in almost every form. His style combines COUNTERPOINT and airs from Italian opera.

teleology, in philosophy, term applied to any system attempting to explain a series of events in terms of ends, goals, or purposes. It is opposed to mechanism, which holds that all events are explained by the mechanical principles of causation. Teleologists have frequently identified purpose in the universe as God's will. The teleological proof of the existence of God argues that since there is design in the world, there must be a designer (God). A more recent, evolutionary view finds purpose in the higher levels of organic life but holds that it is not necessarily based on any transcendent being.

telephone, device for transmitting and receiving sound, especially speech, usually by means of wires in ELECTRIC CIRCUITS. The telephones now in general use are developments of the device invented by Alexander Graham BELL and patented by him in 1876 and 1877. A modern telephone transmitter, which is essentially a carbon MICROPHONE, contains loosely packed carbon grains. When someone speaks into the telephone, the diaphragm vibrates, causing the carbon grains to be compressed and released. This motion varies the current flow in the associated electric circuit. The current, when transmitted to a distant identical instrument, causes the diaphragm in it to vibrate in response to the fluctuations induced by the nearby magnetic field. Telephone lines used include ordinary open-wire lines; lead-sheathed CABLES consisting of many lines; coaxial cables; and, most recently, glass fibers (see FIBER OPTICS). Coaxial cables and fiber-optic lines are placed underground, but other cables may be either overhead or underground. Long-distance transmission of telephone messages is often accomplished by means of RADIO and MICROWAVE transmissions. In some cases microwaves are sent to an orbiting COMMUNICATIONS SATELLITE, from which they are relayed back to a distant point on the earth. Sophisticated services, including automatic switching systems, automatic dialing, call forwarding, and conference calling, have been developed in recent years. Telephone systems are increasingly important to the transmission of messages and data between digital devices, such as computers. To improve accuracy and speed, analog telephone systems (in which the shape of the electrical signal is analogous to the shape of the sound wave) are being replaced by digital systems. A digital system rapidly samples the sound waves and encodes them as binary pulses that can be decoded by the receiver. Such a system can carry more messages over the same link at the same time. In addition, computers can communicate over telephone circuits without MODEMS, greatly enhancing the efficiency of NETWORKS. See also CELLULAR TELEPHONE.

telescope, system of LENSES, MIRRORS, or both used to gather light from a distant object and form a real optical image of it. In the refracting telescope, or refractor (invented early 17th cent.), light is bent, or refracted, as it passes through a convex objective lens so that it converges to a point—the focus—behind the lens. In a reflecting telescope, or reflector (invented 1672), light is reflected by a concave paraboloidal mirror and brought to a focus in front of the mirror. The image is diverted to a more convenient location by one of several means (see diagrams of the Newtonian, Cassegrain, and Coudé foci). Reflecting telescopes that are radically different from conventional ground-based systems are the multimirror telescope, which uses multiple small, less expensive mirrors to

The key to pronunciation appears on page xiii.



Television video transmission and reception: The camera lens focuses collected light rays into mirrors, which separate the image into its three primary color component images. Each color component is focused onto the face of a camera tube. The scanning beam of each tube converts the primary color image into a color signal. The adder combines the three color signals to make the brightness signal. The encoder combines the signals to transmit hue and saturation information. A black-and-white tlevision receiver processes only the brightness signal. A color-television receiver separates the received signal into brightness and hue and saturation components, which are recombined to produce primary color signals for the picture tube.

achieve the same light-gathering power as a very expensive large mirror; the liquid mirror telescope, which uses a rotating mirror with a liquid mercury surface; and the HUBBLE SPACE TELESCOPE. A third type of telescope, the catadioptric system, focuses light by a combination of lenses and mirrors; two examples are the Schmidt camera telescope (invented 1930), used primarily for wide-angle photography of star fields and consisting of a spherical mirror and a special correction lens used in front of the tube, and the Maksutov telescope (invented 1941), which has a spherical meniscus in place of the Schmidt's correcting plate. A recent innovation is the multitelescope array, which employs interferometry techniques, adaptive optics, and reconstructive imaging by COMPUTERS to simulate the imaging power of a large telescope. The size of the object's image is the product of its angular size in radians (1 radian ≈ 57°) as seen from the telescope and the focal length (the distance from the focus to the lens or mirror). The brightness of the image depends on the telescope's total light-gathering power and hence is proportional to the area of the objective lens or primary mirror, or to the square of its diameter. A telescope's resolving power, or smallest angular separation between two light points that can be unambiguously distinguished, is proportional to the ratio of the wavelength of light being observed to the diameter of the telescope. The magnification, or magnifying power, of a telescope is the ratio of the angular sizes of the virtual image seen by the observer and the actual angular size, or, equivalently, to the ratio of the focal lengths of the objective and the ocular, or eyepiece. The mounting of a telescope must be massive, to minimize mechanical vibration that would blur the image, and must provide rotation about two perpendicular axes, to allow the telescope to be pointed in any direction. In the altazimuth mounting, used primarily for terrestrial telescopes, one axis points to the zenith and allows rotation along the horizon, and the other allows changes in altitude. Most astronomical telescopes use the equatorial mounting, in which one axis points at the celestial pole. Rotation about this polar axis allows changes in right ascension or celestial longitude; rotation about the declination axis, at right angles to it, allows changes in declination or celestial latitude. To compensate for the earth's rotation, a clock-drive mechanism is generally provided to turn the polar axis east to west at the rate of one rotation per sidereal day. See also OBSERVATORY, ASTRONOMICAL; RADIO ASTRONOMY.

teletext: see VIDEOTEX.

television, transmission and reception of still or moving images by means of electrical signals, especially by means of ELECTROMAGNETIC RADIATION using the techniques of RADIO. One of the most widely used image pickup devices, or camera tubes, is the iconoscope (invented by Vladimir ZWORYKIN, 1923), which consists of a thin sheet of mica upon which thousands of microscopic globules of a photosensitive silver-cesium compound have been deposited. Backed with a metallic conductor, this expanse of mica becomes a mosaic of tiny PHOTOELECTRIC CELLS and CAPACITORS. The differing light intensities of various points of a scene cause the cells of the mosaic to emit varying quantities of electrons. The cells are left with positive charges in strengths proportional to the electrons lost. An electron gun, or "scanner," passes its beam across the cells. As it does so, the charge is released, causing an electrical signal to appear on the back of the mosaic, which is connected externally to an AMPLIFIER. The strength of the signal is proportional to the amount of charge released. In the Vidicon, another type of pickup tube, the photoemissive mosaic is replaced by a photoconductive layer, resulting in increased efficiency. More recently the pickup tube has been replaced by solid-state semiconductors called charged-coupled devices (CCD). When light from an image is focused on a CCD, a pattern of electrical charges, which vary in proportion to the amount of light, is created. These charges are then transmitted to an amplifier. The CCD's small size and light weight have resulted in compact, all-solid-state cameras that have revolutionized remote television broadcasting. The scanning process, which is the essence of television accomplishment, operates as the human eye does in reading a page of printed material, i.e., line by line. A complex circuit of horizontal and vertical deflection coils controls this movement and causes the electron beam to

scan the back of the mosaic 30 times per second. Two principal means of recording television programs for future use are videotape recording and kinescope. Videotape recording is similar to conventional tape recording except that because of the wide frequency range—4.2 megahertz (MHz)—occupied by a video signal, the effective speed at which the tape passes the recording head is kept very high. Sound is recorded along with the video signal on the same tape. Kinescope is a method in which programs are recorded on motion-picture film. Appropriate changes in the signal-carrying circuitry allow kinescopes to be played back from a developed negative as well as from a positive. Systems for recording television programs on discs have also been developed (see VIDEODISC). When a television program is broadcast, the varying electrical signals are amplified and used to modulate a carrier wave (see MODULATION); the modulated carrier is usually fed to an ANTENNA, where it is converted to electromagnetic waves and broadcast over a large region. The waves are sensed by antennas connected to television receivers, and the image is reconstructed essentially by reversing the pickup operation. The final image is displayed on the face of a CATHODE-RAY TUBE, where an electron beam scans the fluorescent face, called the "screen," line for line with the pickup scanning. The tube's inside face glows when hit by the electrons, and the visual image is reproduced. Color television today uses an "element-sequential" system. Light from the subject is broken up into its three primary-color components (red, blue, and green), which are simultaneously scanned by three pickups. In the receiver the signals are brought together again. Each element, or dot, on the picture tube screen is subdivided into areas of red, blue, and green phosphors. Beams from three electron guns, modulated by the three color signals, scan the elements together in such a way that the beam from the gun using a given color signal strikes the phosphor of the same color. Digital television uses digital amplifier circuitry to improve sound and picture quality and also to allow the screen to be divided into windows, each displaying the image from a different transmission. High-definition television (HDTV) uses at least twice the number of scanning lines as, and a wider screen than, conventional television. These features enable HDTV to produce a picture that is sharper and more detailed, rivaling that produced by motion-picture film. Nonexperimental analog HDTV broadcasting began in Japan in 1991. Its acceptance has been slow due to the high cost of HDTV receivers and limited broadcast hours. The Federal Communications Commission is expected to approve a digital HDTV-system standard for the U.S. in 1995. See BROADCASTING; CABLE TELEVISION; VIDEOCASSETTE RECORDER.

telex: see TELEGRAPH.

Tell, William, legendary Swiss hero. A native of Uri, he refused obeisance to Gessler, the Austrian bailiff. As punishment he was forced to shoot an apple off his young son's head. In revenge, Tell killed Gessler, setting off the revolt that ousted the bailiffs on Jan. 1, 1308. The legend is a distortion of actual events that led in 1291 to the formation of the Everlasting League among the forest cantons of Uri, Schwyz, and Unterwalden. The best-known treatments of the story are SCHILLER's drama (1804) and ROSSINI's opera (1829).

Teller, Edward, 1908–, American physicist; b. Hungary. During World War II he did atom-bomb research at Columbia. He was instrumental in making possible the first successful U.S. HYDROGEN-BOMB explosion (1952) and was director (1952–60) of the Univ. of California's Livermore Radiation Laboratory. Teller also was a major proponent of Pres. Reagan's STRATEGIC DEFENSE INITIATIVE, particularly of the use of nuclear-powered X-ray lasers for missile defense, an approach that was abandoned in 1992.

tellurium (Te), semimetallic element, discovered in 1782 by Franz von Reichenstein. A silver-white, lustrous, brittle metalloid, it occurs in calaverite and sylvanite. It is used as an additive in steel to increase ductility and as a catalyst for petroleum cracking. See ELEMENT (table); PERIODIC TABLE.

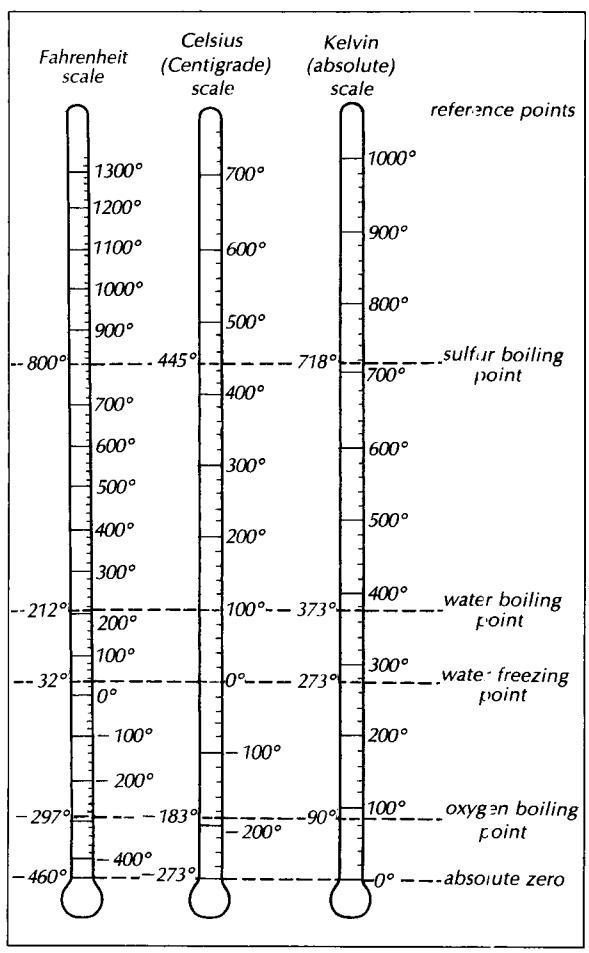
Telugu [tĕl'əgo͞o"], Dravidian language of India. See LANGUAGE (table).

Tempe, city (1990 pop. 141,865), S Ariz., on the Salt R.; inc. 1894. A fast-growing Phoenix suburb, it is a health resort, an agricultural center, seat of Arizona State Univ., and home of the Phoenix Cardinals football team. Native American ruins are nearby.

tempera, painting method in which finely ground pigment is mixed with a base such as albumen, egg yolk, or thin glue. When used on wood panels, as it was for altarpieces and easel paintings, it was applied on a smooth, white gesso underpainting. Tempera produces clear, pure colors that resist oxidation. Known from antiquity, it was the exclusive panel medium in the Middle Ages. It was not supplanted by the more subtle oil paint until c.1400 in N Europe and c.1500 in Italy. A modern revival of tempera included the 19th-cent. Swiss artist Arnold Böcklin and the 20th-cent. Americans SHAHN and WYETH.

temperance movements, organized efforts to induce people to abstain from alcoholic beverages. In response to increasing alcoholism, local and, later, international temperance societies (e.g., the Woman's Christian Temperance Union) developed in the 19th cent. in the U.S., Great Britain, and N Europe. In the U.S. they worked for liquor laws and in 1919 secured federal PROHIBITION. Outstanding temperance workers included Susan B. ANTHONY and Carry NATION.

temperature, the measure of the relative warmth or coolness of an object. The temperature of a substance measures not its heat content but rather the average kinetic energy of its molecules. Temperature is measured by means of a THERMOMETER or other instrument having a scale calibrated in units called degrees. A temperature scale is determined by choosing two reference temperatures and dividing the temperature difference between these points into a certain number of degrees. The size of the degree depends on the particular temperature scale being used. The most common reference temperatures are the MELTING POINT of ice and the BOILING POINT of water. The Celsius (centigrade) scale takes 0°C as the melting point and 100°C as the boiling point. The Fahrenheit scale assigns 32°F to the melting point and 212°F to the boiling



Temperature scales

point. The Réamur scale, used in some parts of Europe, sets the melting point at 0°R and the boiling point at 80°R. The Kelvin, or thermodynamic, scale is an absolute scale having degrees the same size as those on the Celsius scale, but assigning 0K to absolute zero, the theoretical lower limit of temperature (see diagram). See also ENERGY; GAS LAWS; HEAT; THERMODYNAMICS.

tempo, in music, the speed at which a composition is played. The composer's intentions as to tempo are conventionally indicated by a set of Italian terms such as *presto* (very fast), *allegro* (fast), *andante* (moderate, literally "walking"), *adagio* (slow), and *largo* (very slow); *accelerando* and *ritardando* are used to indicate a momentary increase or decrease of tempo. Although composers since Beethoven's time have given indications of speed, tempo has always remained a point of subjective interpretation.

Ten Commandments or **Decalogue,** in the Bible, the summary of divine law given by God to MOSES on Mt. Sinai. They are paramount in the ethical systems of Judaism, Christianity, and Islam. The order and division of the commandments differ somewhat in different Christian churches.

tendon, tough cord of dense connective tissue that attaches muscle to bone. If the muscle is thin and wide, the tendon may be a thin sheet. Tendons transfer muscle power over a distance, e.g., forearm muscles contract and pull on tendons that pull on finger bones to produce finger movements.

Teneriffe or **Tenerife:** see CANARY ISLANDS.

Teng Hsiao-p'ing: see DENG XIAOPING.

Tennessee, state in S central U.S.; bordered by North Carolina (E), Georgia, Alabama, and Mississippi (S), the Mississippi R., across which lie Arkansas and Missouri (W), and Kentucky and Virginia (N).

Area, 42,244 sq mi (109,412 sq km). *Pop.* (1990) 4,877,185, a 6.2% increase over 1980 pop. *Capital,* Nashville. *Statehood,* June 1, 1796 (16th state). *Highest pt.,* Clingmans Dome, 6,643 ft (2,026 m); *lowest pt.,* Mississippi R., 182 ft (56 m). *Nickname,* Volunteer State. *Motto,* Agriculture and Commerce. *State bird,* mockingbird. *State flower,* iris. *State tree,* tulip poplar. *Abbr.,* Tenn.; TN.

Land and People. In E Tennessee are ranges of the APPALACHIAN MOUNTAINS, including the GREAT SMOKY MOUNTAINS and the Cumberland Plateau. Central Tennessee has the gently rolling hills of its bluegrass country, and the west the flat Mississippi floodplain. The climate varies greatly, with severe winters in the mountainous eastern region and hot, humid summers in the western plains. More than 60% of the population lives in urban areas. MEMPHIS is the largest city, followed by NASHVILLE and KNOXVILLE. In 1990 the state was 83% white and 16% African American.

Economy. Tennessee's industrial sector, the leading source of employment, has become increasingly diversified, with chemicals, processed foods, transportation equipment, and machinery the principal products. The leading agricultural products are soybeans, cattle, dairy products, hogs, tobacco, corn, and hay. The state leads the nation in the extraction of pyrites and zinc, and produces coal, stone, and cement. The Grand Ole Opry, in Nashville, and Great Smoky Mts. National Park (see NATIONAL PARKS, table) are popular tourist destinations.

Government. The constitution of 1870 provides for a governor elected to a four-year term. The general assembly consists of a senate whose 33 members serve four-year terms and a house with 99 members elected every two years. The state is represented in the U.S. Congress by two senators and nine representatives and has 11 electoral votes.

History. The remains of the early MOUND BUILDERS can be found in Tennessee. It was the home of the CHEROKEE, CHICKASAW, and SHAWNEE when Robert Cavalier, sieur de LA SALLE, built (c.1682) a fort there. In 1756 the area was ceded to Britain. After the American Revolution, residents formed a short-lived independent government, the state of FRANKLIN (1784–88). Settlement increased, and by the late 1830s Native Americans had been forcibly removed to present-day Oklahoma. Although many residents opposed slavery, Tennessee seceded (1861) from the Union, and the state was—after Virginia—the bloodiest battlefield of the CIVIL WAR. Readmitted to the Union in 1866, Tennessee replaced the plantation system with farm tenancy, and coal mining and textile manufacturing grew in importance. The state attracted (1925) international attention with the famous SCOPES TRIAL, which tested a state law forbidding the teaching of EVOLUTION. The TENNESSEE VALLEY AUTHORITY (TVA), established (1933) by the federal government to provide cheap and abundant hydroelectric power, has been chiefly responsible for changing the basis of the state's economy from agriculture to diversified industry. From the late 1970s to early 90s, Tennessee has seen an influx of new businesses, especially from northern industrial states and Japan, and the trade and service sectors of its economy have grown.

Tennessee, river, c.650 mi (1,050 km) long, principal tributary of the Ohio R., which it joins at Paducah, Ky., after flowing N from the vicinity of Knoxville, Tenn. The once flood-prone river has been converted by the TENNESSEE VALLEY AUTHORITY into a series of lakes impounded by nine major dams. The river is linked to the Tombigbee R. and Gulf of Mexico by the Tennessee-Tombigbee Waterway.

Tennessee Valley Authority (TVA), U.S. government–owned corporation created (1933) to integrate development of the Tennessee R. basin area. Headquartered there, it undertook (1940) construction of a system of multipurpose dams and steam-generating facilities that has produced relatively cheap energy. It now also operates nuclear power plants and other energy facilities. The availability of low-cost power attracted businesses to the area and led to economic growth. TVA has also carried out land conservation, health, and education programs.

Tenniel, Sir John [tĕn'yəl], 1820–1914, English caricaturist and illustrator. Well known for his original, good-humored political cartoons in *Punch* (1851–1901), he is also famous for his illustrations of Lewis CARROLL's *Alice in Wonderland* and *Through the Looking Glass.*

tennis, indoor or outdoor game for two players (singles) or four players (doubles). Although originally lawn tennis was played only on grass courts, today the surfaces are more often of clay, asphalt, or synthetics. The court measures 78 ft by 27 ft (23.8 m by 8.2 m) for singles play; it is 4.5 ft (1.4 m) wider for doubles. A net 3 ft (91 cm) high in the middle divides the court laterally. Play is directed toward hitting the inflated, felt-covered ball (about the size of a baseball) with an oval-headed, fiber-strung racket into the opponent's court so that he or she cannot make a proper return. Points are scored in the progression 15, 30, 40, and game, with six games required to take a set. Usually, three set victories decide a match in men's play, two set victories in women's play. Modern tennis was developed in 1873 by an Englishman, Major Walter C. Wingfield, who borrowed from older forms of the game. The first "world championship," held (1877) at Wimbledon, England, became the famous tournament of that name. In the U.S., where tennis was introduced in 1874, the national men's championship has been contested since 1881, the women's since 1887. The Davis Cup international team competition (begun in 1900) focused world attention on the sport. Major tournaments, originally restricted to amateurs, have been open to professionals since 1968. Tennis has been an Olympic sport since 1988.

Tennyson, Alfred Tennyson, 1st **Baron,** 1809–92, English poet. His first book, *Poems, Chiefly Lyrical* (1830), was followed by *Poems* (1832), which included "The Lotus-Eaters" and "The Lady of Shalott." *Poems* (1842) expressed philosophic doubts in a materialistic age. "Locksley Hall," "Ulysses," "Morte d'Arthur," and other poems in the volume won acclaim. *The Princess* (1847) was followed by *In Memorian* (1850), an elegy sequence prompted by the death in 1833 of the poet's friend Arthur Henry Hallam. Tennyson became poet laureate in 1850. In 1855 *Maud* appeared. Between 1859 and 1888 he completed *Idylls of the King,* a 12-part Arthurian epic. In 1883 he was made a peer. A spokesman for the values of the Victorian age, and its most famous poet, Tennyson is today recognized for his mastery of poetic technique, superb use of sensuous language, and profundity of thought.

tenor: see VOICE.

tenpins: see BOWLING.

Ten Years War, 1868–78, fought by Cuban revolutionaries against Spanish domination of CUBA. The warfare was guerrilla fighting without major battles, but it raged furiously in the eastern provinces. Spanish forces carried out bloody reprisals against the patriots, who retaliated by attacking all Spanish supporters. The war

dragged on until Gen. Arsino Martinez de Campos of Spain negotiated the Treaty of Zanjón, granting reforms and governmental representation to Cubans (promises that were not kept). The war foreshadowed the Cuban war of independence (1895–98) and the SPANISH-AMERICAN WAR.

Teotihuacán, ancient commercial and religious center, 30 mi (48 km) NE of Mexico City, of an influential civilization that flourished between A.D. 300 and 900. The largest and most impressive urban site of ancient America, it is laid out in a grid and dominated by the Pyramid of the Sun. Other notable buildings include the Pyramid of the Moon and the Temple of QUETZALCOATL. The people of Teotihuacán brought sculpture, ceramics, the carving of stylized stone masks, and mural painting to a high degree of refinement. Their designs indicate a complex religious system. At its peak the city's population was over 100,000.

tepee, wickiup, and wigwam, types of dwelling used by Native Americans of various culture areas (see NORTH AMERICA, INDIGENOUS PEOPLES OF). The tepee, or tipi, used by nomadic Plains tribes, usually consisted of buffalo hides stretched over a cone formed of tent poles; it was strong and easy to move. Tribes to the south and west used the wickiup, made of brush or mats stretched over arched poles. The wigwam of the Eastern Woodlands, a domed or conical frame covered with bark or mats, might be either a single-family or a communal dwelling.

Tepe Gawra [Kurdish, = great mound], important settlement site in MESOPOTAMIA, N Iraq. Excavations (from 1927) unearthed 24 levels, dating from the 5th to 2d millennium B.C., with more advanced civilizations at the oldest levels (5000–3000 B.C.).

terbium (Tb), metallic element, discovered in 1843 by C.G. Mosander. It is a silver-gray, soft, ductile, malleable RARE-EARTH METAL in the LANTHANIDE SERIES. Terbium is used in lasers, semiconductor devices, and phosphors for color-television picture tubes. See ELEMENT (table); PERIODIC TABLE.

Ter Borch or **Terborch, Gerard** [tər bôrkh'], 1617–81, Dutch genre and portrait painter. He portrayed the life of the wealthy Dutch burgher class in elegant and serene paintings. His most famous pictures include *The Guitar Lesson* (National Gall., London) and the celebrated group portrait *The Peace of Münster* (1648; National Gall., London).

Terbrugghen, Hendrick [tĕrbrōōg'hən], 1588–1629, Dutch painter. Influenced by CARAVAGGIO, he painted intimate, restrained genre scenes that foreshadow in coloring the work of VERMEER. Many are nighttime scenes. A characteristic work is *Old Man Writing* (Smith College Mus., Northampton, Mass.).

Terence (Publius Terentius Afer), c.185 or 195–c.159 B.C., Roman writer of COMEDY; b. Carthage. Six of his comedies survive, freely adapted from the Greek plays of MENANDER and others. Polished and urbane, they are characterized by gentle humor and realistic characterization.

Teresa, Saint: see THERESA, SAINT.

Teresa, Mother, 1910–, Roman Catholic missionary in India, winner of the 1979 Nobel Peace Prize; b. Skopje (now in Macedonia) as Agnes Gonxha Bojaxhiu. Of Albanian parentage, she went to India at 17, becoming a nun and teaching school in Calcutta. In 1948 she left the convent and founded the Missionaries of Charity, which now operates schools, hospitals, orphanages, and food centers in more than 25 countries.

Tereshkova, Valentina Vladimirovna, 1937–, Soviet cosmonaut. She was the first woman to orbit the earth, in *Vostok 6* on June 16–19, 1963. She left the Soviet space program soon after and married cosmonaut Andriyan Nikolayev.

termite or **white ant,** soft-bodied social INSECT that feeds mainly on wood. Termites live in colonies of hundreds or thousands, consisting of large numbers of nonreproductive "workers" and "soldiers" and one or a few reproductive members—"kings" and "queens." Some build huge mounds, up to 40 ft (12.2 m) high, to house their colonies. Turning wood into cellulose by means of specialized bacteria or protozoans in the digestive tract, termites do millions of dollars of damage annually.

term limits, statutory limitations placed on the number of terms officeholders may serve. The issue of term limits became important in the U.S. during the late 1980s and early 90s, and focused on members of the U.S. Congress. Proponents feel that limitation cuts down on entrenched incumbents' abuses of power and their obsession with reelection, thus making government more responsive. Many call for a constitutional amendment similar to the 22d Amendment, which limits the president's tenure, to set uniform national limits. Opponents of limits cite the benefits of seniority and experience conferred by years in office. Colorado voters passed a term limits initiative in 1990, and in 1992 voters in 14 states approved various term limits laws. State term limits on federal legislators have been challenged in the courts.

tern, sea BIRD of the Old and New World, smaller than the related GULL, with long, pointed wings and forked tails. Also called sea swallows because of their graceful flight, they plunge headlong into the water to catch small fish.

Terpsichore: see MUSES.

terra cotta [Ital. = baked earth], form of hard-baked clay widely used in the decorative arts, especially as an architectural material, either in its natural red-brown color, painted, or with a baked glaze. Its early prevalence as a medium of artistic expression is indicated by vases, figurines, and tiles from predynastic Egypt; ancient Assyria, Persia, and China; and pre-Columbian Central America. Terra cotta first gained architectural importance in Greece, where from c.7th cent. B.C. it was used for roof tiles and ornamental details. Its golden age was the RENAISSANCE, when it was widely used in the architecture of N Italy and N Germany. It was later established in Italy as a sculptural material, and reached great distinction as a decorative material in the polychrome enameled reliefs of the DELLA ROBBIA family. Terra-cotta work in building and decoration spread from Italy in the 16th cent., often through migrant Italian artisans, to France and England. In the 18th cent. sculptors such as HOUDON used the material for sketches. Widely used in the U.S. in modern times as an exterior covering for steel structural skeletons, terra cotta was employed with particular skill by Louis SULLIVAN. Notable modern sculptures in terra cotta include those by MAILLOL, EPSTEIN, and PICASSO.

terrier, class of dogs originally bred to start small game and vermin from their burrows or to go to earth and kill their prey. Today they are raised chiefly as pets. See individual breeds, e.g., AIREDALE TERRIER, CAIRN TERRIER, FOX TERRIER, SCHNAUZER, SCOTTISH TERRIER, WEST HIGHLAND WHITE TERRIER.

territorial waters: see SEA, LAW OF THE.

Terror, Reign of: see REIGN OF TERROR.

terrorism, term usually applied to organized acts or threats of violence designed to intimidate opponents or to publicize grievances. The term dates from the REIGN OF TERROR (1793–94) in the French Revolution but has taken on additional meaning in the 20th cent. Political terrorism may be part of a government campaign to eliminate the opposition, as under HITLER, MUSSOLINI, STALIN, and others, or it may be part of a revolutionary effort to overthrow a regime, a common tactic in guerrilla warfare. Terrorism by radicals (of both the left and right) and by nationalists became widespread after World War II. Contemporary revolutionary groups that engage in terrorist activity include the "provisional" wing of the IRISH REPUBLICAN ARMY; the PALESTINE LIBERATION ORGANIZATION; and the SHINING PATH, in Peru.

Terry, Dame Ellen Alicia, 1848–1928, English actress; mother of Edward Gordon Craig. As leading lady (1878–1902) to Sir Henry IRVING she was admired for her charm and grace in Shakespearean roles, especially Beatrice in *Much Ado about Nothing.*

Tertullian, c.160–c.230, Roman Christian theologian. Converted (c.197) to Christianity, he became a formidable writer in defense of the faith. Some of Tertullian's opinions, however, differed from Catholic thought, and he left the church (213) to join the schismatic Montanists. Eventually he formed his own sect, the Tertullianists.

Tesla, Nikola, 1856–1943, American electrician and inventor; b. Croatia (then in Austria-Hungary); came to U.S., 1884. A pioneer in high-tension electricity, he made many discoveries and inventions of great value to the development of radio transmission and to the field of electricity, including an arc-lighting system, the Tesla induction motor, the Tesla coil, and various generators and transformers.

Test Act, 1673, passed by the British Parliament to exclude from public office (military and civil) all those who refused to take oaths

of allegiance and supremacy, to receive communion according to the Church of England, and to renounce belief in transubstantiation. It was directed mainly against Catholics. In 1678 it was extended to members of Parliament. The act was repealed (1828) at the time of CATHOLIC EMANCIPATION.

testes: see REPRODUCTIVE SYSTEM.

testosterone, principal male sex HORMONE. An ANABOLIC STEROID secreted by the testes (and synthesized in small amounts in the ovaries and placenta), it is necessary for the development of the external genitals in the male fetus, and at puberty its increased levels are responsible for male secondary sex characteristics (e.g., facial hair).

test-tube baby: see IN VITRO FERTILIZATION.

tetanus or **lockjaw,** acute infectious disease of the nervous system caused by TOXINS of the *Clostridium tetani* bacillus. Tetanus may follow the introduction of bacterial spores by any type of injury, including puncture wounds, animal bites, gunshot wounds, lacerations, and fractures. The toxin acts on the motor nerves and causes muscle spasms, most frequently in the jaw (lockjaw) and facial muscles. The disease is treated with an antitoxin or human immune globulin, but it is preferable to prevent tetanus by immunization.

Tethys, in astronomy, natural satellite of SATURN.

Tetley, Glen, 1926–, American modern dancer and choreographer; b. Cleveland, Ohio. He studied in New York City with Hanya Holm and danced with Martha GRAHAM's company. He danced (1962–65) with the Netherlands Dance Theater, becoming (1969) artistic director, and the Stuttgart Ballet (1974–76). His works include *Voluntaries* (1973) and *Greening* (1975).

Teton Range, range of the Middle Rocky Mts., in Wyoming and Idaho, part of Grand Teton National Park (see NATIONAL PARKS, table). It reaches its highest point (13,747 ft/4,190 m) at Grand Teton.

Teutones or **Teutons:** see GERMANS.

Teutonic Knights or **Teutonic Order** [tōōtŏn'ĭk], German military religious order founded (1190–91) in the Holy Land during the Third CRUSADE. It was made up of nobles, and its knights took monastic vows. It moved to E Europe in the early 13th cent. and in 1226 began a crusade against the heathen Prussians. Within 50 years the order established itself as the ruling government of PRUSSIA, which it Christianized by exterminating the native population and repopulating it with Germans. Its governments in East Prussia, West Prussia, and (after 1309) Pomerelia were under the protection of both pope and emperor. Despite that, Poland seized (1446) West Prussia and Pomerelia. The order's own grand master, Albert of Brandenberg, accepted (1525) the Reformation and declared Prussia a secular duchy with himself as duke, thereby stripping the Teutonic Order of all importance.

Texas, largest state in the coterminous U.S., located in the Southwest; bounded by Oklahoma (N), Arkansas and Louisiana (E), the Gulf of Mexico (SE), the Rio Grande, across which lies Mexico (S), and New Mexico (W).

Area, 267,338 sq mi (692,405 sq km). *Pop.* (1990) 16,986,510, a 19.4% increase over 1980 pop. *Capital,* Austin. *Statehood,* Dec. 29, 1845 (28th state). *Highest pt.,* Guadalupe Peak, 8,751 ft (2,667 m); *lowest pt.,* sea level. *Nickname,* Lone Star State. *Motto,* Friendship. *State bird,* mockingbird. *State flower,* bluebonnet. *State tree,* pecan. *Abbr.,* Tex., TX.

Land and People. The topography rises gradually from east to west. The Gulf coastal plain, perpetually wet with heavy rains, gives way inland to the southern extension of the Great Plains. Farther west is the semiarid tableland of the Llano Estacado and the Davis and Guadalupe mountains. About 80% of the population lives in urban areas. HOUSTON, the largest city in Texas and the fourth largest in the U.S., is followed in size by DALLAS, SAN ANTONIO, EL PASO, AUSTIN, and FORT WORTH. The state's population, the nation's third largest, is more than 25% Hispanic, and Hispanics have long had a significant influence on the state. In 1990 the state was over 75% white and 12% African American.

Economy. Texas is the nation's wealthiest mineral producer. The economy is dominated by the abundant energy resources, and the state is the leading U.S. source of natural gas and second largest U.S. oil producer. Other important minerals include helium, salt, sulfur, sodium sulfate, and clays. Industries include oil refining and the manufacture of machinery, transportation equipment, food products, and chemicals. In the 1980s and 90s research and development and manufacture of high-technology electronic equipment also became an important part of the state's economy. Only California surpasses Texas in the value of its agricultural output. Products of its farms and ranches include cattle, cotton, and cottonseed, as well as sorghum, wheat, dairy products, corn, and rice. Fishing thrives along the Gulf Coast. Tourism is important; Big Bend and Guadalupe Mts. national parks (see NATIONAL PARKS, table) and Padre Island National Seashore are popular destinations.

Government. The amended constitution of 1876 provides for a governor serving a four-year term. The legislature consists of a senate with 31 members elected to four-year terms and a house with 150 members serving two-year terms. Texas is represented in the U.S. Congress by 30 representatives and 2 senators and has 32 electoral votes.

History. The APACHE, COMANCHE, and other tribes inhabited the area when the Spanish established (1682) their first settlement on the site of present-day El Paso. Settlers from the U.S. began arriving in large numbers after Moses AUSTIN obtained (1821) a colonization grant. His son, Stephen F. AUSTIN, established the first American settlement. The Texas Revolution erupted (1835) when American settlers routed Mexican troops and declared (1836) their independence, which they were forced to defend in battles such as that at the ALAMO. The annexation of Texas by the U.S. in 1845 precipitated the MEXICAN WAR. Texas fought on the side of the CONFEDERACY during the Civil War. The discovery (1901) of the spectacular Spindletop oil field, near Beaumont, and of the E Texas oilfield in 1930 revolutionized the state's economy and resulted in prosperity. In the 1980s troubles in the oil industry, banking, and real estate ended economic growth, bringing widespread business failure and unemployment. The early 1990s, however, saw economic diversification and the beginnings of recovery.

Th, chemical symbol of the element THORIUM.

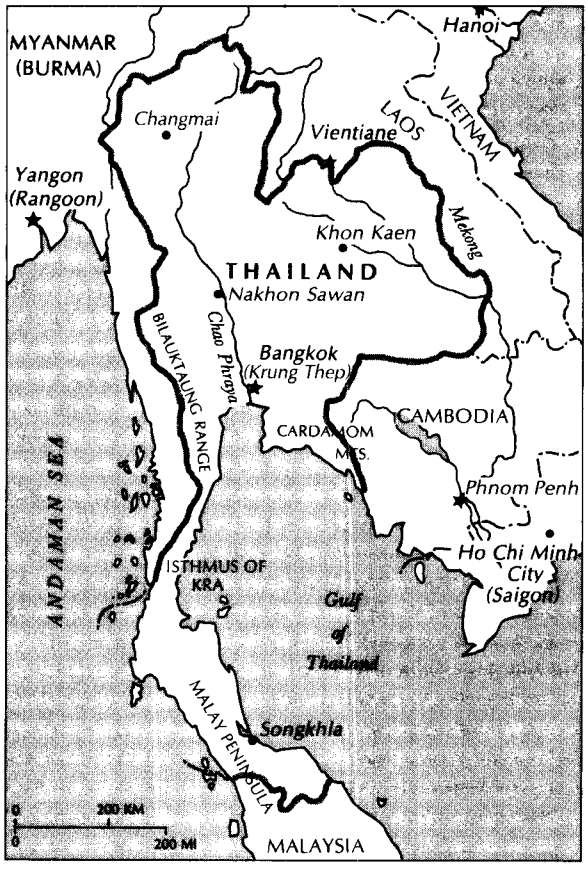
Thackeray, William Makepeace, 1811–63, English novelist and satirist. He briefly edited a magazine before going to Paris to study art in 1834. On returning to England in 1837 he did literary hack work and illustration. In 1840 his wife became insane; to pay for her care and that of their two daughters he worked continually, contributing to magazines such brilliantly satirical writings as *The Yellowplush Correspondence* (1837–38), in which a footman comments on literary and social trends; parodies of sentimental fiction; and illustrations. His *Book of Snobs* (1848) was very popular, as was the novel *Vanity Fair* (1848), a satirical panorama of upper-middle-class life, and the autobiographical novel *Pendennis* (1850). The publication of *Henry Esmond* (1852) was followed by an American tour, after which *The Newcomes* appeared (1853–55). On his second visit to the U.S. (1855–56) he gave lectures, published in 1860 as *The Four Georges.* The Esmond story continued in *The Virginian* (1857–59). In 1860 Thackeray became editor of the new *Cornhill* magazine, in which his last novels appeared.

Thaddaeus, apostle: see JUDE, SAINT.

Thailand, Thai *Prathet Thai* [land of the free], officially Kingdom of Thailand, formerly Siam, constitutional monarchy (1992 est. pop. 57,624,000), 198,455 sq mi (514,000 sq km) SE Asia, bordered by Myanmar (W, NW), Laos (N, E), Cambodia (SE), and Malaysia and the Gulf of Thailand (S). BANGKOK is the capital. A fertile, thickly populated plain, the core of the country, rises to mountains and forests in the north and the Korat plateau in the northeast and east; a narrow, mountainous peninsula extends southward into the Gulf of Thailand. The climate is tropical monsoonal. Thailand's economy is heavily agricultural. Rice is the main crop and the major factor in a normally favorable trade balance; rubber, teak, and tin are also valuable commodities. Industry is minor, and handicraft production exceeds factory output. Tourism is an important source of foreign exchange. Thais, ethnically related to the Shan of Myanmar and the Lao of Laos, constitute 75% of the population; there are large Chinese, Malay, Khmer, and Vietnamese minorities. Theravada Buddhism is the state religion. Thai is the official language.

History. The Thais migrated to the area from China in the 13th cent., establishing kingdoms at Sukhothai (1238) and Ayutthaya (c.1350) and extending their power into neighboring states. The

arrival of Portuguese traders in the 16th cent. marked the beginning of Siam's relations with the West. The kingdom was threatened with colonization by the French and British in the 19th cent., but although it lost its claims to Cambodia, Laos, and other territories, adroit diplomacy enabled it to retain its independence. Although modernized under Kings Mongkut (r.1851–68) and Chulalongkorn (r.1868–1910), Siam remained an absolute monarchy until a bloodless coup in 1932 forced Prajadhikop (r.1925–35) to grant a constitution. The country was renamed Thailand in 1939. After occupation by the Japanese during WORLD WAR II, Thailand experienced internal unrest, several military coups, and periods of martial law. In the VIETNAM WAR Thailand strongly supported the U.S. and was a site of U.S. air bases. In the war's aftermath, thousands of Vietnamese and Cambodian refugees severely strained the Thai economy in the 1970s and 80s. The military remained politically powerful into the 1990s, influencing governments through parties aligned with it and ousting prime ministers it opposed, most recently in 1991. In 1992 pro-military parties won a parliamentary majority, and the supreme commander of the military claimed the prime ministership. Demonstrations against military participation in the government led to its fall. In new elections (Sept. 1992) parties opposed to the military won a majority, and Chuan Leekpai became prime minister.



Thai language [tī], formerly Siamese, member of the Tai or Thai subfamily of the Sino-Tibetan family of languages. See LANGUAGE (table).

Thales, c.636–c.546 B.C., pre-Socratic Greek philosopher of Miletus, reputed founder of the Milesian or Ionian school of philosophy. The first recorded Western philosopher, Thales explained the physical world as deriving not from a mythological creation but from a single underlying substance, which he believed to be water. He is said to have introduced geometry into Greece and to have predicted a solar eclipse in 585 B.C. His pupils included ANAXAGORAS, ANAXIMANDER, and DIOGENES.

thalidomide, sleep-inducing drug found to produce skeletal defects in developing fetuses. It was sold without prescription in Europe from 1957 to 1961, when its use by pregnant women was correlated with a high incidence of babies born with shortened, malformed limbs (c.8,000 worldwide). This discovery stimulated the adoption of strict regulations in the testing of new drugs in the U.S.

thallium (Tl), metallic element, discovered by William Crookes in 1861. A soft, malleable, lustrous, silver-gray metal, it resembles aluminum chemically and lead physically. The metal is used in certain electronic components, and its sulfate is used as an insecticide. See ELEMENT (table); PERIODIC TABLE.

Thames, principal river of England, flowing generally east c.210 mi (340 km) from the Cotswold Hills through Oxford, Reading, and the center of London to a long estuary on the North Sea. In its upper course (near Oxford) it is often called the Isis. The Thames is spanned by more than two dozen bridges in London. The river is tidal to Teddington, and a flood-control barrier now protects London from inundation by North Sea gales.

Thanksgiving Day, national holiday in the U.S. commemorating the harvest reaped by the Plymouth Colony in 1621. The first national Thanksgiving Day was proclaimed by Pres. Washington for Nov. 26, 1789. Pres. Lincoln revived the custom in 1863. In 1941 Congress decreed that Thanksgiving should fall on the fourth Thursday of November. The customary turkey dinner is a reminder of the four wild turkeys served at the PILGRIMS' first thanksgiving feast.

Thant, U [thänt], 1909–74, Burmese diplomat, secretary general (1962–72) of the UNITED NATIONS. He became acting secretary general in 1961, on the death of Dag HAMMARSKJÖLD. Influential in settling disputes in West New Guinea (1962) and the Congo (now ZAÏRE; 1963), he played a mediating role in the CUBAN MISSILE CRISIS (1962), but was less successful in efforts to resolve the VIETNAM WAR. He retired in 1972.

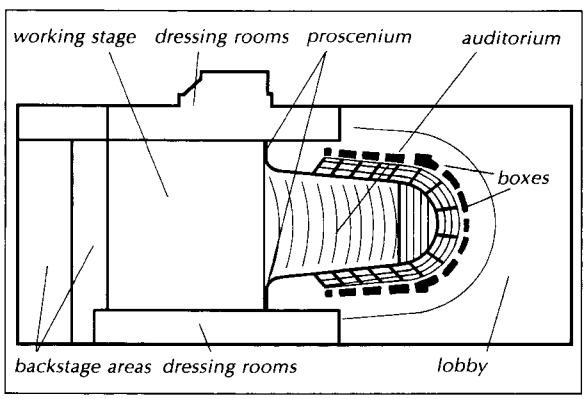
Tharp, Twyla, 1941–, American dancer and choreographer; b. Portland, Ind. An eclectic, innovative choreographer and dancer, she danced (1963–65) with Paul TAYLOR. She led her own dance companies (1967–85, 1986–88) and was with the AMERICAN BALLET THEATRE as an artistic associate and resident choreographer (1988–89). Since 1989 she has choreographed dances for various groups. She has also choreographed for stage and film musicals.

Thatcher, Margaret (Hilda Roberts), 1925–, British political leader, the first woman prime minister of Great Britain (1979–90). Elected (1959) to Parliament, she replaced (1975) Edward HEATH as Conservative party leader. She became prime minister after the Conservatives won in 1979, and announced a monetarist policy designed to curtail inflation by reducing the money supply and cutting social programs. In 1982 Thatcher responded to Argentina's seizure of the FALKLAND ISLANDS by dispatching troops who, after a brief war, regained the islands. A strong advocate of the free market, she sold off many state-owned enterprises and benefited when the economy grew in the mid and late 1980s. In foreign affairs she was a staunch ally of the U.S. and a strident opponent of greater economic and political integration in the European Community (EC). Her uncompromising position on the EC and her backing of an unpopular local government tax contributed to her downfall in the Conservative party; she was succeeded by John MAJOR. She was the longest serving British prime minister in the 20th cent. In 1992 Thatcher retired from the House of Commons and was created Baroness Thatcher of Kesteven.

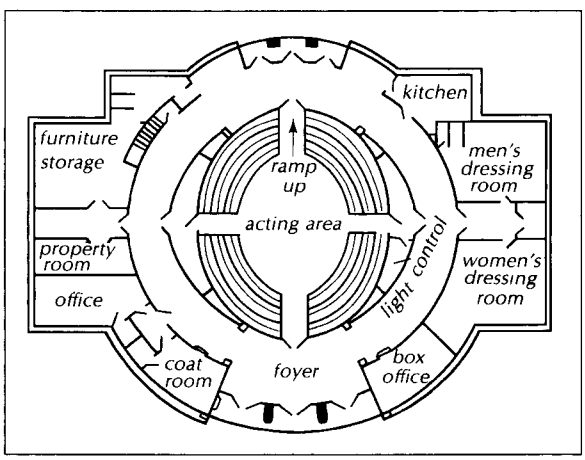
Thayendanegea: see BRANT, JOSEPH.

theater, building in which dramatic performances take place. Theater in ancient Greece developed from the worship of the god DIONYSUS, when religious rituals were performed in a natural AMPHITHEATER at the foot of a hill. The *orchēstra,* a level, circular space where the drama was performed, mainly by the CHORUS, was surrounded by a large, semicircular, open-air auditorium. The original religious nature of Greek drama made audiences receptive to the cosmic themes of TRAGEDY. As the religious and choral elements of drama diminished, the orchestra was reduced in size and importance, and by the Hellenistic period (2d–1st cent. B.C.) the focus of the action had shifted to a raised stage known as the *proskenion.* Roman theaters were based on Greek models but were built on a grandiose scale, being enclosed within exterior walls (although the interior was open to the air) and having elaborate stages. Ro-

man audiences never evinced an interest in serious drama, but they accepted romantic COMEDY as long as it had elements of FARCE. Banned by the Christian church for several centuries after the fall of Rome, drama returned to the Western world in the 9th cent. in the form of liturgical plays, performed first in churches and later (by the 13th cent.) outdoors on both fixed and mobile stages, in churchyards and market squares (see MIRACLE PLAY). The development of the modern theater dates from 1618, when Gian-Battista Aleotti built the Teatro Farnese at Parma, Italy, utilizing the proscenium arch to create a picture-frame stage and a U-shaped seating area for the audience. The separation of audience from stage was further intensified in the 19th cent. by the introduction of a curtain and the use of gas lighting, which made it possible to darken the auditorium. While the proscenium arch stage continues to dominate in the commercial theater, there has been much work to restore a vital relationship between audience and stage, and alternatives to the traditional designs include both the thrust stage, a platform surrounded by the audience on three sides, and the arena (theater-in-the-round), which is completely surrounded by the audience. For descriptions of individual theaters and theater groups, see the table accompanying this article.



Theaters



Thebes [thēbz], city of ancient S Egypt, on the NILE. In the XI dynasty (beginning c.2134 B.C.) it was a royal residence and a center of worship of the god AMON. Kings and nobles were buried in the Valley of the Tombs. Thebes declined with the empire: it was sacked by the Assyrians (661 B.C.). The surviving temples and tombs, including that of TUTANKHAMEN, are among the most splendid in the world.

Thebes, ancient city of BOEOTIA, Greece. At the end of the 6th cent. B.C. rivalry developed with ATHENS, and Thebes sided with Persia in the PERSIAN WARS. Later, Thebes joined the confederation against SPARTA in the PELOPONNESIAN WAR and ended Spartan domination with a decisive victory at Leuctra (371 B.C.). Thebes joined Athens against PHILIP II of Macedon, who defeated them at Chaeronea (338). A Theban revolt caused ALEXANDER THE GREAT to destroy the city (336). It was rebuilt by CASSANDER (c.315) but never regained its former greatness. The modern Thivai occupies the site of the Theban ACROPOLIS, part of which survives.

Themistocles [thəmĭs'təklēz], c.525–c.460 B.C., Athenian statesman. He was elected an archon (leader) in 493 B.C. In the PERSIAN WARS he persuaded the Athenians to build up their navy, and it was his strategy that brought about the decisive Athenian victory over the Persians at SALAMIS (480). He was exiled (c.471) and lived in Persia until his death.

Theocritus, fl. c.270 B.C., Hellenistic Greek poet. Inventor of the PASTORAL, he raised that form to its height. His style is finished and sometimes artificial, but the bucolic characters in his idylls seem alive. VERGIL, SPENSER, and others drew heavily on Theocritus.

theodolite, optical instrument used for a number of purposes in surveying, navigation, and meteorology. It consists of a telescope fitted with a spirit level and mounted on a tripod so that it is free to rotate about its vertical and horizontal axes. Theodolite measurements of the altitude and azimuth of a WEATHER BALLOON at precise intervals are used to compute the estimated wind velocity and direction of the portion of the atmosphere through which the balloon is passing.

Theodora, d. 548, Byzantine empress. She is alleged in the unreliable *Secret History* of PROCOPIUS to have been an actress and prostitute before her marriage (523) to JUSTINIAN I, who made her joint ruler. She helped to suppress the Nika rebellion caused by internal political strife, and she influenced Justinian's favorable policies toward MONOPHYSITISM.

Theodore Roosevelt National Park: see NATIONAL PARKS (table).

Theodoric the Great, c.454–526, king of the OSTROGOTHS and conqueror of Italy. Under Byzantine emperor ZENO he was made (484) consul and sent (488) to Italy to defeat ODOACER. He took RAVENNA in 493, and shortly after Odoacer's surrender Theodoric murdered him. His great power in Italy freed him of Byzantine supervision, and his long rule was beneficent. He respected Roman institutions and improved public works. The end of his reign was clouded by a quarrel with the pope over his ARIANISM and by his hasty execution of BOETHIUS. His tomb is one of Ravenna's finest monuments.

Theodosius, Byzantine rulers. **Theodosius I** (the Great), 346?–95, Roman emperor of the East (379–95) and emperor of the West (392–95), was the son of Theodosius, a general of Emperor Gratian, who chose him as joint ruler. He made an advantageous peace (381) with the marauding VISIGOTHS, securing Goths for his army. He overthrew the usurper Maximus, Gratian's assassin, and restored the legal successor, VALENTINIAN II. After Valentinian was killed (392) Theodosius defeated and killed (394) the usurper Arbogast and his puppet emperor, Eugenius. Baptized in 380, Theodosius rooted out ARIANISM and paganism, and called the First Council of CONSTANTINOPLE. To reverse his excommunication for massacring rebellious citizens, he did penance before AMBROSE, bishop of Milan. He divided the empire, leaving the East to his son ARCADIUS and the West to his son HONORIUS, thus making a permanent partition. **Theodosius II,** 401–50, Roman emperor of the East (408–50), was the son and successor of Arcadius. A scholar and theologian, Theodosius called the Council of Ephesus (431), which condemned NESTORIANISM, and he upheld the Robber Synod (449; see EUTYCHES). He founded (425) the Univ. of Constantinople and published (438) the Theodosian Code. During his reign ATTILA raided the empire.

Theognis, fl. 6th cent. B.C., Greek didactic poet. His passionate elegies to his young friend Cyrnus counsel moderation, faithfulness, and duty.

theology, in CHRISTIANITY, the systematic study of the nature of GOD and His relationship with humanity and with the world. (Asserting that other religions have theologies is controversial; e.g., within JUDAISM God is held to be unknowable.) The great theological problems of ancient times were the relation of JESUS to God and the relations of Jesus and God to humanity. The struggle over ARIANISM (on the nature of Jesus) is probably the most serious theological

quarrel Christianity has known, and the problem of GRACE still arouses theologians. In the Middle Ages SCHOLASTICISM systematized study of revealed truths, examining and clarifying an entire theological scheme; while scholasticism attempted to combine faith and reason, it forbade rational investigation of the bases of revealed truth. In the 19th cent. a new rational theology associated with biblical "higher criticism" arose; it accepted the adequacy of reason to criticize every truth. Such 20th-cent. existentialist theologians as Paul TILLICH and Reinhold NIEBUHR stressed that people, however well endowed with reason, must ultimately rely on the goodness of God.

theorem, in mathematics and logic, statement in words or symbols that can be established by means of deductive logic; it differs from an AXIOM in that a proof is required for its acceptance. A *lemma* is a theorem that is demonstrated as an intermediate step in the proof of another, more basic theorem. A *corollary* is a theorem that follows as a direct consequence of another theorem or an axiom.

theosophy [Gr., = divine wisdom], philosophical system with affinities to MYSTICISM that claims insight into the nature of God and the world through direct knowledge, philosophical speculation, or a physical process. Theosophy deduces the essentially spiritual nature of the universe from an assumption of the absolute reality of the essence of God. Theosophists generally believe that evil exists as a product of finite human desires; individuals can overcome it by arousing their latent spiritual powers. Emphasis is given to allegorical interpretation of sacred writings and doctrines. The Renaissance philosopher PARACELSUS combined scientific ideas with theosophical speculation. More recent theosophists include Jakob BOEHME, F.W.J. SCHELLING, and Emanuel SWEDENBORG. Asian philosophy and theology, especially of India, contain a vast body of theosophical doctrine, and modern theosophy draws much of its vocabulary from Indian sources. The Theosophical Society, with which theosophy is now generally identified, was founded in 1875 by Helena Petrovna Blavatsky. See also CABALA; GNOSTICISM; NEOPLATONISM.

Theotocopoulos, Domenicos: see GRECO, EL.

Thera or **Santorini,** volcanic island (1981 pop. 11,381), c.30 sq mi (80 sq km), SE Greece, in the Aegean Sea; one of the Cyclades. It is noted for its wine. In the Bronze Age Thera came under the influence of Crete (see MINOAN CIVILIZATION), but a devastating volcanic eruption (c.1645 B.C.) buried the island's settlements and threw massive amounts of dust into the earth's atmosphere, affecting the weather worldwide. It was resettled and later occupied (9th cent. B.C.) by the DORIANS. Excavations at a Minoan site have uncovered many well-preserved frescoes. Some controversial theories have equated ancient Thera with ATLANTIS.

Theresa or **Teresa, Saint** (Theresa of Ávila), 1515–82, Spanish CARMELITE nun, Doctor of the Church, one of the great mystics, and a leading figure in the Catholic Reformation (see REFORMATION, CATHOLIC). In 1562 she founded, at Ávila, the first of many convents of the Discalced Carmelites. St. Theresa combined intense practicality with the most rarefied spirituality. An excellent and tireless manager, she was endowed with great personal charm, tact, and boundless good nature. With her associate, St. JOHN OF THE CROSS, she produced a remarkable awakening of religious fervor that spread far beyond Spain. Her writings, notably her *Life* and the *Way of Perfection,* are among the greatest in mystical literature. Feast: Oct. 15.

Theresa or **Teresa, Saint** (Theresa of Lisieux), 1873–97, French CARMELITE nun, one of the most widely loved saints of the Roman Catholic Church, also known as the Little Flower of Jesus. Born Thérèse Martin, she entered an obscure convent at Lisieux at age 15 and died of tuberculosis nine years later. She exemplified the "little way"—achieving goodness by performing the humblest tasks. Her spiritual autobiography is one of the most widely read religious autobiographies. She was canonized in 1925. Feast: Oct. 1.

thermal capacity: see HEAT CAPACITY.

thermochemistry: see CHEMISTRY.

thermocouple, a temperature-measuring device formed by joining the ends of two strips of dissimilar metals in a closed loop, with the two junctions at different temperatures. Because the voltage that arises in this circuit is proportional to the temperature difference between the junctions, the temperature at one junction can be determined if the other junction is maintained at a known temperature.

thermodynamics, branch of science concerned with the nature of HEAT and its conversion into other forms of ENERGY. Heat is a form of energy associated with the positions and motion of the molecules of a body (see KINETIC-MOLECULAR THEORY OF GASES). The total energy that a body contains as a result of the positions and the motions of its molecules is called its internal energy. The first law of thermodynamics states that in any process the change in a system's internal energy is equal to the heat absorbed from the environment minus the WORK done on the environment. This law is a general form of the law of conservation of energy (see CONSERVATION LAWS). The second law of thermodynamics states that in a system the ENTROPY cannot decrease for any spontaneous process. A consequence of this law is that an engine can deliver work only when heat is transferred from a hot reservoir to a cold reservoir or heat sink. The third law of thermodynamics states that all bodies at absolute zero would have the same entropy; this state is defined as having zero entropy.

thermometer, instrument for measuring TEMPERATURE. A clinical thermometer consists of a small vacuum tube of uniform bore, with a temperature scale etched on its front. The tube is closed at one end and connected at the other with a chamber containing mercury or another liquid. When the chamber is heated, the fluid expands and rises into the tube.

thermonuclear energy: see NUCLEAR ENERGY.

thermoplastic, a material that repeatedly softens or melts when heated and hardens when cooled. Thermoplastic polymers consist of long polymer chains that are not connected to each other, e.g., not cross-linked. Thermoplastics include polyethylene, polypropylene, polystyrene, polyester, polyvinyl chloride, acrylics, nylons, spandex-type polyurethanes, polyamides, polycarbonates, fluorocarbons, and cellulosics.

Thermopylae, pass, E central Greece, between the cliffs of Mt. Oeta and the Malic Gulf. In ancient times it was an entrance into Greece from the north. There, in 480 B.C. the Spartans lost an heroic battle against the Persians.

thermoset, a material that can not be softened on heating. In a thermosetting polymer, the long polymer chains are joined to each other, e.g., cross-linked, during fabrication through the use of chemicals, heat, or radiation; this process is called curing or vulcanization. Important thermosets include alkyds, phenolics, ureas, melamines, epoxies, polyesters, silicones, rubbers, and polyurethanes.

Theseus, in Greek mythology, Athenian hero; son of King Aegeus. Of his many adventures the most famous was the slaying of the MINOTAUR, which he accomplished with the help of ARIADNE, daughter of King MINOS of Crete. As king of Athens he instituted several reforms, notably the federalization of the Attic communities. In the land of the AMAZONS he abducted Antiope, who bore him Hippolytus. When a vengeful Amazon army invaded Athens Theseus defeated it. Antiope was killed, and Theseus later married PHAEDRA. When he and his friend Pirithoüs attempted to take PERSEPHONE from HADES, they were imprisoned there until HERCULES rescued Theseus. When Theseus returned to Athens he found it corrupt and rebellious. He sailed to Skyros, where he was murdered by King Lycomedes.

Thespis, fl. 534 B.C., Attic Greek dramatist, traditionally the inventor of TRAGEDY. He is said to have modified the DITHYRAMB by introducing an actor separate from the chorus, enabling spoken dialogue to develop.

Thessalonians, two epistles of the NEW TESTAMENT, 13th and 14th books in the usual order, by St. PAUL (A.D. c.52). First Thessalonians, after a reminiscence of the founding of the Christian church at THESSALONIKI, gives advice on moral behavior and corrects a doctrinal point regarding the general resurrection. Second Thessalonians, a shorter letter, strongly condemns notions that the Second Coming is at hand.

Thessaloníki or **Salonica,** city (1981 pop. 402,443), N Greece, in Macedonia. It is a major port and industrial center, exporting grain, tobacco, and ores. Founded in 315 B.C. by Cassander, king of Macedon, it linked BYZANTIUM with the Adriatic region in Roman times and was the Roman provincial capital of Macedon after 146

B.C. The kingdom of Thessaloníki (1204), comprising most of N and central Greece, was the largest fief of the Latin Empire of CONSTANTINOPLE. It was variously held by the Greeks, Byzantines, and Ottoman Turks before being conquered (1912) by Greece in the BALKAN WARS. Although the city was devastated by a fire in 1917 and damaged severely in World War II, it retains many ancient ruins and fine churches.

Thessaly [thĕs'əlē], ancient region of N Greece. It was settled before 1000 B.C. Its chief cities were Larissa, Crannon, and Pherae. It was powerful in the 6th cent. B.C., but internal conflicts caused its decline. United briefly (374) by Jason, the tyrant of Pherae, it again became a force in Greece, but it was subjugated (344) by PHILIP II of Macedon. A province in the late Roman Empire, it passed to the Turks (1355) and then to modern Greece (1881).

Thetis, in Greek mythology, a nymph; mother of ACHILLES.

thiamine: see COENZYME; VITAMIN (table).

Thiers, Adolphe [tyĕr], 1797–1877, French statesman and historian. As a journalist, Thiers attacked the reactionary government of CHARLES X and helped bring about the JULY REVOLUTION of 1830. He held ministerial posts under LOUIS PHILIPPE and was premier (1836, 1840, 1848). After the FEBRUARY REVOLUTION of 1848, he opposed the Second Empire of NAPOLEON III. Thiers headed the provisional government after France's defeat in the FRANCO-PRUSSIAN WAR, crushed the COMMUNE OF PARIS, and was president (1871–73) of the republic. His historical works on the French Revolution and Napoleon are today considered superficial and inaccurate.

Thieu, Nguyen Van [tē'ōō, tyōō], 1923–, president (1967–75) of South VIETNAM. In 1963 he helped lead the coup that overthrew Pres. DIEM. He was elected president in 1967 and continually opposed negotiations with North Vietnam to end the VIETNAM WAR. When South Vietnam fell to the Communists (1975) Thieu fled into exile.

Thimphu or **Thimbu,** city (1990 est. pop. 27,000), capital of BHUTAN.

Third World, name applied to the technologically less-advanced, or developing, nations of Asia, Africa, and Latin America. The term was originally used to distinguish these countries from the Western nations and those that formed the Eastern bloc and usually excludes China.

Thirteen Colonies, in U.S. history, the British North American colonies that joined together in the AMERICAN REVOLUTION and became the original states of the U.S. They were: NEW HAMPSHIRE, MASSACHUSETTS, RHODE ISLAND, CONNECTICUT, NEW YORK, NEW JERSEY, PENNSYLVANIA, DELAWARE, MARYLAND, VIRGINIA, NORTH CAROLINA, SOUTH CAROLINA, and GEORGIA.

Thirty Tyrants, 404–403 B.C., oligarchy installed in ancient Athens by the Spartan commander LYSANDER after Sparta had won the PELOPONNESIAN WAR. It was overthrown at Piraeus by THRASYBULUS.

Thirty Years War, 1618–48, general European war, fought mainly in Germany. Although the war had many issues, it may be considered mainly a struggle of German Protestant princes and foreign powers (France, Sweden, Denmark, England, the United Provinces) against the unity and power of the HOLY ROMAN EMPIRE (represented by the HAPSBURGS) allied with the Catholic princes of Germany. The Hapsburg empire then included Austria, Spain, Bohemia, most of Italy, and the S Netherlands. The war began in Prague, when the Protestant Bohemian nobles deposed the Catholic King Ferdinand (later Emperor FERDINAND II) and elected the Protestant FREDERICK THE WINTER KING. The imperialist forces under TILLY and the Catholic League under Duke Maximilian I of Bavaria quickly defeated the Bohemians (1620) and other Protestant forces in the PALATINATE (1622–23). Thus ended the war's first phase. The second phase began in 1625 when CHRISTIAN IV of Denmark invaded Germany on the side of the Protestant princes, although his chief purpose was to halt Hapsburg expansion into N Germany. Defeats by WALLENSTEIN in 1626 and Tilly in 1627 forced him to withdraw. Imperialist forces promptly overran Schleswig, Holstein, and Jutland. In 1629 Christian signed a peace with the emperor, surrendering the N German bishoprics. That and the emperor's attempt to declare void Protestant titles to lands in N Germany represented a further threat to the Protestant forces. GUSTAVUS II of Sweden now entered the war. Like Christian of Denmark, he feared imperial designs in the north. He invaded Germany and enjoyed successes at Breitenfeld (1631) and Lech (1632). Gustavus was killed at Lützen (1632), although his troops were victorious. The anti-imperialist forces, including the Swedes, continued to fight. By 1634, however, Germany was in ruin, her fields devastated and blood-soaked. A general desire for peace led to the Peace of Prague (1635). It was accepted by all participants and helped to reconcile Protestants and Catholics. A general peace seemed to be forthcoming, but Cardinal RICHELIEU of France was unwilling to see the Hapsburgs retain power. He brought France openly into the war in 1635, beginning the last and bloodiest phase of the struggle. It then spread to the Low Countries, Italy, Scandinavia, and the Iberian Peninsula. The anti-imperialist commanders—Bernard of Saxe-Weimar; the Swedes Baner, Wrangel, and TORSTENSSON; and Louis II de CONDÉ and Turenne of France—were victorious. Peace talks began in 1640 but proceeded slowly, not being completed until 1648 (see WESTPHALIA, PEACE OF). The war had been devastating to the German people, and German agriculture, commerce, and industry were in ruins. Politically, the Holy Roman Empire was left a mere shell, and Hapsburg power had begun its long decline. France emerged as the chief power of Europe.

thistle, spiny, usually weedy plant, most commonly members of the COMPOSITE family that have spiny leaves and often showy heads of purple, rose, white, or yellow flowers. The Scotch thistle (usually identified as *Onopordum acanthium*), cultivated as an ornamental, is the national emblem of Scotland. The Russian thistle is a TUMBLEWEED.

Thomas, Saint, one of the Twelve APOSTLES, called Didymus. He refused to believe in the Resurrection until he saw Jesus' wounds; hence the expression "doubting Thomas."

Thomas, Clarence: see SUPREME COURT, UNITED STATES (table 1).

Thomas, Dylan, 1914–53, Welsh poet. His *Eighteen Poems* (1934) brought fame and controversy, which grew with *The Map of Love* (1939), *The World I Breathe* (1939), *Deaths and Entrances* (1946), and *In Country Sleep and Other Poems* (1952). His largely autobiographical prose, touched with fantasy, includes *Portrait of the Artist as a Young Dog* (1940), *Adventures in the Skin Trade* (1955), and *Quite Early One Morning* (1955). Thomas's mastery of sound, perhaps related to his fine voice, is evident in his radio piece *A Child's Christmas in Wales* (published 1954) and the drama *Under Milk Wood* (1954). His imagery is complex and difficult, but his humor and love of life attract immediately.

Dylan Thomas

Thomas, George Henry, 1816–70, Union general in the American CIVIL WAR; b. Southampton co., Va. He fought at the battle of SHILOH, and after his success in the CHATTANOOGA CAMPAIGN became

known as the "Rock of Chickamauga." In 1864 he defeated Gen. HOOD in the battle of NASHVILLE.

Thomas, Martha Carey, 1857–1935, American educator and feminist; b. Baltimore. Appointed (1884) to organize Bryn Mawr College for women, she was dean and taught English until 1894, then was president until 1922. A leader of the WOMAN SUFFRAGE movement, she wrote *The Higher Education of Women* (1900).

Thomas, Norman Mattoon, 1884–1968, American socialist leader; b. Marion, Ohio. Originally a Presbyterian minister, Thomas became leader of the Socialist party in 1926 and was repeatedly (1928, 1932, 1936, 1940, 1944, and 1948) its candidate for the presidency.

Thomas à Becket, Saint, or **Saint Thomas Becket,** 1118–70, English martyr, archbishop of Canterbury. Of good family and well educated, he attracted the attention of HENRY II, who made him chancellor (1155). Then, in an attempt to curb the growing power of the church, the king nominated his friend as archbishop of Canterbury. Foreseeing trouble, Thomas was reluctant to accept, but in 1163 he was ordained priest and consecrated archbishop. Henry and Thomas were soon opposed, particularly over the king's efforts to gain jurisdiction over "criminous clerks," clergymen accused of crime. Thomas, refusing to accept the Constitutions of CLARENDON and opposing the growing royal power, fled to the Continent (1164). In 1170 a kind of peace was arranged, and Thomas returned to England. Meanwhile, Henry had his son crowned by the archbishop of York; the bishops who took part in this ceremony were suspended by the pope. Antipathy between the king and archbishop grew strong, and in December 1170 the king issued his fateful plea to be rid of the archbishop. On Dec. 29, 1170, Thomas was murdered in Canterbury cathedral by Henry's partisans. The Christian world was shocked by Thomas's death, and in 1174 the king was forced to do penance at the saint's tomb in Canterbury, which became the greatest of English shrines. Feast: Dec. 29.

Thomas à Kempis, b. 1379 or 1380, d. 1471, German monk. In the Netherlands, he became (c.1413) an Augustinian priest. The great devotional work *The Imitation of Christ* has been traditionally ascribed to him, although some scholars doubt his authorship.

Thomas Aquinas, Saint, 1225–74, Italian philosopher and theologian, Doctor of the Church; known as the Angelic Doctor. He is the greatest figure of SCHOLASTICISM, one of the principal saints of the Roman Catholic Church, and the founder of the system declared (1879) by Pope Leo XIII the official Catholic philosophy. His major work, the monumental *Summa Theologica* (1267–73), is a systematic exposition of Christian theology on philosophical principles. His shorter treatise, *On Being and Essence* (1256), contains his metaphysics. St. Thomas's system embraces the moderate REALISM of Aristotle and is in opposition to the Platonism and Neoplatonism that had prevailed in Catholic theology since the time of St. AUGUSTINE. Unlike the Platonists, to whom truth was a matter of faith, St. Thomas held that faith and reason constitute two harmonious realms; theology and science cannot contradict each other. Likewise, there can be no conflict between philosophy and theology. In his universe, everything is arranged in ascending order to God, the only necessary, self-sufficient being. St. Thomas succeeded in synthesizing the naturalistic philosophy of Aristotle and Christian belief, perhaps the greatest achievement of medieval philosophy. Feast: Mar. 7.

Thompson, Benjamin: see RUMFORD, BENJAMIN THOMPSON, COUNT.

Thompson, Ernest Seton: see SETON, ERNEST THOMPSON.

Thomson, James, 1700–1748, Scottish poet. His most famous poem, *The Seasons* (1726–30), contains descriptions of nature that challenged the urban, artificial school of POPE and influenced forerunners of ROMANTICISM like Thomas GRAY.

Thomson, Sir Joseph John, 1856–1940, English physicist. Cavendish professor of experimental physics (1884–1919) at Cambridge, he won the 1906 Nobel Prize in physics for his study of the conduction of electricity through gases. Thomson discovered (1897) the ELECTRON and studied its charge and mass. He developed the mathematical theory of heat and electricity and worked with "positive rays" (positive ion beams), which led to a means of separating atoms and molecules according to their atomic weights. His long tenure as director of the Cavendish Laboratory at Cambridge helped make it a leading center for atomic research.

Thomson, Virgil, 1896–1989, American composer and music critic; b. Kansas City, Mo. Until c.1926 he wrote in a dissonant, neoclassic style; later he used a simplified style influenced by SATIE. His works include the operas *Four Saints in Three Acts* (1928) and *The Mother of Us All* (1947), with librettos by Gertrude STEIN; music for films, e.g., *The River* (1937); a CANTATA on the poems of Edward LEAR (1973); and many organ, piano, and chamber works.

Thomson, William: see KELVIN, WILLIAM THOMSON, 1ST BARON.

Thon Buri: see under BANGKOK, Thailand.

Thor, Germanic **Donar,** Norse god of thunder, might, and war; also associated with marriage, the hearth, and agriculture. He was armed with a magical hammer that returned to him, iron gloves, and a belt of strength. He was identified with the Roman JUPITER, whose day became Thor's day (Thursday).

Thoreau, Henry David, 1817–62, one of the most influential figures in American thought and literature; b. Concord, Mass. An advocate of TRANSCENDENTALISM, he was a close friend of EMERSON, with whom he edited the transcendentalist magazine *The Dial.* Thoreau built a cabin at Walden Pond, near Concord, in 1845 and remained there for more than two years. There he lived out his philosophy of individualism, observing nature, reading, and expanding on his ideas and activities in a journal that he later distilled into his most famous work, *Walden* (1854). The journal was also the source of his first book, *A Week on the Concord and Merrimack Rivers* (1849), as well as of several posthumously published works, e.g., *Excursions* (1863), *Cape Cod* (1865). Thoreau was also a significant naturalist and a powerful social critic. His essay "Civil Disobedience" (1849) has had far-reaching influence on various movements and on such leaders as GANDHI and Martin Luther KING.

Thorfinn Karlsefni, fl. 1002–15, Icelandic leader of an attempt to settle NORTH AMERICA. According to Norse SAGAS, he set out c.1010 to settle in Vinland, a section of North America discovered by LEIF ERICSSON. Thorfinn returned to GREENLAND after three years. There is much disagreement on the dates of his expedition and the sites visited.

thorium (Th), radioactive element, discovered in 1828 by Jöns Jakob BERZELIUS. A soft, ductile, lustrous, silver-white metal in the ACTINIDE SERIES, it has 12 known isotopes. It is important for its potential conversion into the fissionable fuel uranium-233 for use in NUCLEAR REACTORS. See ELEMENT (table); PERIODIC TABLE.

Thorndike, Edward Lee, 1874–1949, American educator and psychologist; b. Williamsburg, Mass. His great contributions to educational psychology were the tests he devised to measure children's INTELLIGENCE and ability to learn. He also compiled dictionaries for children and young adults. His influential works include *Animal Intelligence* (1898–1901), *Mental and Social Measurements* (1904), and *The Fundamentals of Learning* (1932).

Thornton, William, 1759–1828, American architect; b. Tortola, British Virgin Islands. His plans for the CAPITOL at Washington, D.C., were approved (1793) by Pres. WASHINGTON, and he supervised the project (1794–1802). Despite later alterations, much of the facade and central portion remain his design.

Thorpe, Jim (James Thorpe), 1888–1953, American athlete; b. near Prague, Okla. He was one of the greatest all-around male athletes the U.S. has ever produced. Part Native American, he played football at the Carlisle (Pa.) Indian School and led (1911–12) his team to upsets over several highly rated colleges. In the 1912 Olympics he won events in the PENTATHLON and DECATHLON. He surrendered his medals after it was revealed that he had played semiprofessional baseball, but they were restored posthumously in 1982. He later played professional football with the Canton (Ohio) Bulldogs.

Thorvaldsen or **Thorwaldsen, Albert Bertel** [both: tôr′ välsən], 1770–1844, Danish sculptor. He was a leader of the neoclassicists, and his adherence to Greek art is seen in his *Jason* (1802–3), rendered with respect for antique prototypes. He designed (1819) the famous *Lion of Lucerne,* a memorial to the SWISS GUARD, and his historical portrait sculptures include *Conradin, Last of the Hohenstaufen* (Naples). The Thorvaldsen Museum, Copenhagen, has a large collection of his work.

Thothmes I: see THUTMOSE I.

Thousand and One Nights or **Arabian Nights,** a series of anonymous stories in Arabic, a classic of world literature. The cohesive plot device concerns the efforts of Scheherazade, or Sheherazade,

The key to pronunciation appears on page xiii.

to keep her husband, Schariar, legendary king of Samarkand, from killing her by entertaining him with a tale a night for 1,001 nights. The best-known stories are those of Ali Baba, Sinbad, and Aladdin. Many are set in India, but their individual origins are unknown. The present form of the collection is Muslim in spirit and is thought to be from Persia or an Arabic-speaking country.

Thousand Islands, group of islands, N New York and S Ontario, in the St. Lawrence R., E of Lake Ontario. Extending c.50 mi (80 km), they are a popular resort area. The five-span Thousand Islands Bridge (7 mi/11 km long) crosses several of the more than 1,800 islands in the group, many of which are privately owned.

Thousand Oaks, residential city (1990 pop. 104,352), Ventura co., S Calif.; inc. 1964. The rapidly growing city has light industry and manufacturing. Once known as the Conejo Valley, it became a stagecoach stop in 1874. California Lutheran College is there, and Oxnard Air Force Base is nearby.

Thrace, region of SE Europe comprising NE Greece, S Bulgaria, and European Turkey, bordered by the Black Sea in the northeast, and the Sea of Marmara and the Aegean Sea in the south. Its major cities are ISTANBUL, Edirne, and Plovdiv. Mainly an agricultural region, it produces grains, tobacco, silk, cotton, and olive oil. The ancient Thracians had a developed culture in the BRONZE AGE but were considered barbarians by the Greeks, who established colonies there by 600 B.C. to exploit the gold and silver mines. The region benefited from Roman rule (1st cent. B.C.), but from the 3rd cent. A.D. it was a battleground for competing empires, e.g., Byzantine, Bulgarian, Ottoman. The present national boundaries were established in 1923.

Thrasybulus [thrăs"əbyo͞o'ləs], d. c.389 B.C., Athenian statesman. Banished by the THIRTY TYRANTS installed in Athens by Sparta after the Peloponnesian War, he gathered a force of exiles in Thebes and overthrew (403) the Tyrants.

Three Emperors' League, informal alliance formed in 1872 by the emperors of Austria-Hungary, Germany, and Russia. Its aims were to preserve the social order of the conservative powers of Europe and to keep the peace between Austria-Hungary and Russia, which were traditional rivals. The league was eventually superseded by the TRIPLE ALLIANCE AND TRIPLE ENTENTE.

Three Kings: see WISE MEN OF THE EAST.

Three Mile Island, site of a nuclear power plant 10 mi (16 km) south of Harrisburg, Pa. On Mar. 28, 1979, failure of the cooling system of the No. 2 NUCLEAR REACTOR led to overheating and partial melting of its uranium core and production of hydrogen gas, which raised fears of an explosion and dispersal of radioactivity. Thousands living near the plant left the area before the 12-day crisis ended, during which time some radioactive water and gases were released. A federal investigation, assigning blame to human, mechanical, and design errors, recommended changes in reactor licensing and personnel training, as well as in the structure and function of the NUCLEAR REGULATORY COMMISSION. The accident also increased public concern over the dangers of nuclear power and slowed construction of other reactors. See also NUCLEAR ENERGY.

thrombolytic drug or **clot-dissolving drug,** substance, such as streptokinase or tissue plasminogen activator (tPA), that causes the breakdown of blood clots that obstruct the flow of blood through the vessels. Its uses include injection during or shortly after a heart attack to prevent clots from blocking blood flow to the heart muscle.

thrombosis, obstruction of an artery or vein by a blood clot, or thrombus. An arterial thrombosis is generally more serious, usually blocking the supply of oxygen and nutrients to some area of the body; a thrombus in one of the arteries leading to the heart (causing a heart attack) or to the brain (causing a STROKE) can result in death. A thrombus in the vein is known as phlebothrombosis or thrombophlebitis (see PHLEBITIS). Thrombosis is treated with ANTICOAGULANTS and THROMBOLYTIC DRUGS.

thrush, BIRD of the family Trudidae, found worldwide and noted for its beautiful song. Most thrushes are modestly colored, with spotted underparts; some have bright plumage, e.g., the red-breasted American ROBIN (*Trudus migratorius*), and the Eastern BLUEBIRD, bright blue with a red breast. Other thrushes are the hermit thrush, NIGHTINGALE, European "blackbird," and wheatear.

Thucydides [thōōsĭd'ĭdēz], c.460–c.400 B.C., Greek historian of Athens, one of the greatest of ancient historians. His one work, a history of the PELOPONNESIAN WAR to 411 B.C., is a military record, devoid of social and political references apart from those pertaining to the war. It is marked by accuracy and a studied impartiality and is noted for its eloquent speeches, particularly the funeral oration of PERICLES.

Thugs, Indian religious sect of murderers and thieves that existed from the 13th cent. to the 19th cent., when the British finally suppressed it. Members of the sect worshiped the goddess Kali and committed their murders in sacrifice to her. They were also known as the Phansigars [stranglers] because they strangled their victims, usually wealthy travelers.

Thule, name the ancients gave to the northernmost land of Europe, an island found c.310 B.C. by the Greek Pytheas and since then identified with various northern lands. "Ultima Thule" figuratively means the farthest goal of human effort.

thulium (Tm), metallic element, discovered in 1879 by P.T. Cleve. A soft, malleable, ductile, lustrous silver-white RARE-EARTH METAL in the LANTHANIDE SERIES, it forms compounds with oxygen and the halogens, most of which are light green. Thulium-170 emits X rays and is used in portable X-ray units. See ELEMENT (table); PERIODIC TABLE.

thunder, sound produced when a flash of LIGHTNING passes through air, heating the adjacent air and causing it to expand rapidly. A short flash of lightning creates a relatively short crash of thunder. Rolling thunder occurs either when there is a long flash of lightning, generating thunder over a great distance, or when obstructions such as clouds, mountains, or differing layers of air cause echoes and reverberations. See also THUNDERSTORM.

Thunder Bay, city (1991 pop. 113,946), W Ontario, on the Thunder Bay Inlet of Lake SUPERIOR. It is Canada's principal lakehead port on the GREAT LAKES and handles much of the grain shipped from Canada's prairie provinces. Other industries include oil refining and the manufacture of steel, chemicals, and transportation equipment. Thunder Bay, formed in 1970 by the amalgamation of the former twin cities of Fort William and Port Arthur, is at the former site of a 17th-cent. fur-trading post and of a fort built (1801) by the NORTH WEST COMPANY as its western headquarters.

thunderstorm, violent local atmospheric disturbance accompanied by LIGHTNING, THUNDER, and heavy RAIN, often by strong gusts of WIND, and sometimes by HAIL. The typical thunderstorm caused by convection occurs on a hot summer afternoon when the sun's warmth has heated a large body of moist air near the ground. This air rises and is cooled by expansion. The cooling condenses the water vapor in the air, forming a cumulus CLOUD. If the process continues violently, the cloud becomes immense; the summit often attains a height of 4 mi (6.5 km) above the base, and the top spreads out in the shape of an anvil as the transition to a cumulonimbus cloud occurs. The turbulent air currents within the cloud cause a continual breaking up and reuniting of the raindrops, building up strong electrical charges that result in lightning.

Thurber, James, 1894–1961, American humorist; b. Columbus, Ohio. He was a staff member (1927–33) of and principal contributor to the *New Yorker* magazine. A deep psychological insight underlies his wistful, ironic cartoons and stories. Collections of his works include *The Owl in the Attic* (1931), *The Thurber Carnival* (1945), and *Thurber Country* (1953). He collaborated with E.B. WHITE on the satire *Is Sex Necessary?* (1929) and with Elliott Nugent on the play *The Male Animal* (1940).

Thuringia [thōōrĭn'jə], Ger. *Thüringen,* state (1990 est. pop. 2,684,000), c.6,000 sq mi (15,540 sq km), central Germany. WEIMAR is the capital. The area's first occupants, the ancient Germanic tribe of Thuringians, fell to the Franks in the 6th cent. A.D. and were converted to Christianity in the 8th cent. By the 11th cent. Thuringia's rulers, dominated after 1247 by the WETTIN dynasty of Saxony, had emerged as princes of the Holy Roman Empire. The division of the Wettin lands in 1485 gave the major share to the Ernestines, who split Thuringia into several duchies (e.g., Saxe-Coburg, Saxe-Gotha, Saxe-Weimar). A center of the Lutheran Reformation (16th cent.), Thuringia joined the German Confederation (1815) and the German Empire (1871). After expulsion of their rulers in 1918, the duchies merged under the Weimar Republic as the state of Thuringia. The state was reconstituted as part of East

Germany in 1946, abolished in 1952, and reconstituted again in 1990 upon German reunification.

Thursday: see WEEK.

Thutmose [thūt'mōz, tūt-] or **Thothmes** [thōth'mēz, tōt'mēs], kings of EGYPT. **Thutmose I,** d. 1495 B.C. (r. c.1525–1495 B.C.), was the third ruler of the XVIII dynasty and the successor of AMENHOTEP I. He conquered the NILE up to the Third Cataract, and reached the EUPHRATES through Syria. His son **Thutmose II** (r. c.1495–1490 B.C.) married his half-sister, Hatshepsut, who took over the real power of government. After his death she became regent for Thutmose III, his son by a minor queen, and ruled for 22 years. At her death (1468) **Thutmose III,** d. 1436 B.C., emerged as sole ruler of Egypt and as a great conqueror. He consolidated SYRIA, except PHOENICIA, and reduced every ruler N of the Euphrates to tributary status. His empire (the zenith of the New Empire) enriched Egypt with wealth and with manpower. He also built temples up and down the Nile.

Thyestes: see ATREUS.

thyme, aromatic, shrubby plant (genus *Thymus*) of the MINT family. Common thyme, used as a seasoning, is the Old World *T. vulgaris,* an erect plant with grayish branches. It is cultivated mainly in Spain and France.

thymus gland, mass of glandular tissue located in the neck or chest of most vertebrates (see ENDOCRINE SYSTEM). Found in the upper chest under the breastbone in humans, the thymus is essential to the development of the body's system of IMMUNITY beginning in fetal life. The thymus processes white blood cells known as lymphocytes (see BLOOD), which kill foreign cells and stimulate other immune cells to produce antibodies. The gland grows throughout childhood until puberty and then gradually decreases in size.

thyroid gland, endocrine gland (see ENDOCRINE SYSTEM), situated in the neck, that regulates the body's metabolic rate (see METABOLISM). It consists of two lobes connected by a narrow isthmus. Thyroid tissue is made up of millions of tiny, saclike follicles that store thyroid hormone in the form of thyroglobulin, a protein containing iodine. When secreted into the bloodstream, thyroglobulin is converted to thyroxine and small amounts of other similar hormones. Sufficient dietary iodine and stimulation by the PITUITARY GLAND are necessary for proper thyroxine production. Metabolic disorders result from oversecretion or undersecretion of the thyroid.

thyristor, semiconductor switch used chiefly in power-control applications. Also called a silicon-controlled rectifier (SCR), it is a variation of the TRANSISTOR. A thyristor is capable of producing large direct currents by rectification of alternating currents and can be automatically triggered "off" for specified periods of time. Thyristors are used in variable-speed electric motors, power supplies for electrochemical processes, lighting and heating control, and controllers for electric utility power systems.

Ti, chemical symbol of the element TITANIUM.

Tiahuanaco, ancient ruin in W Bolivia, near Lake TITICACA. Perhaps the work of the AYMARA, it was probably the center of a pre-Incan empire. Building, never completed, began before A.D. 500. Stone blocks weighing up to 100 tons were brought from several miles off, fitted, notched, and dressed with a precision unequaled even by the INCA. Tiahuanaco painted pottery is one of the great achievements of PRE-COLUMBIAN ART.

Tianjin or **Tientsin,** city (1990 est. pop. 5,770,000), NE China, on the Hai R. Located in E central Hebei prov., it is administered directly by the central government. Tianjin is one of China's largest cities, a leading international port, and a transport center for N China. It is an important manufacturing center specializing in steel, machinery, chemicals, textiles, and food processing. A 19th-cent. treaty port, it was occupied by Western powers during the BOXER UPRISING (1900) and was the site of foreign concessions until 1946.

Tiberius (Tiberius Julius Caesar Augustus), 42 B.C.–A.D. 37, Roman emperor (A.D. 14–37); son of Tiberius Claudius Nero and Livia Drusilla, later wife of AUGUSTUS. He was governor of Transalpine Gaul and campaigned in Germany and Illyricum. In A.D. 14 he succeeded Augustus as emperor and continued his policies, except that he cut luxury expenses. By doing so and by reforming taxes, he improved the government's financial state but made himself extremely unpopular. In later years he grew suspicious and ruled from Capri.

Tibet, Mandarin *Xizang,* autonomous region (1990 pop. 2,196,000), c.471,700 sq mi (1,221,700 sq km), SW China, bordered by Myanmar (SE); India, Bhutan, and Nepal (S); India and Kashmir (W); and Chinese provinces (N, E). Major cities are LHASA (the capital), Xigazê, and Gyangzê. Tibet is largely a high arid plateau surrounded by mountain ranges, including the HIMALAYAS in the south and the Kunlun in the north. The CHANG (Yangtze), MEKONG, and BRAHMAPUTRA rivers rise in Tibet. The economy is predominantly pastoral, based on raising livestock, particularly yaks; the leading crop is barley. The inhabitants are of Mongolic stock and speak a Tibeto-Burman language. They follow a form of Buddhism known as Lamaism (see TIBETAN BUDDHISM), the chief figures of which are the DALAI LAMA and the Panchen Lama; until the Chinese suppressed the monasteries in the 1960s, as much as one sixth of the male population were Lamaist monks.

History. An independent kingdom flourished in Tibet by the 7th cent. A.D. It was under Mongol influence from the 13th to the 18th cent., when it came under nominal Chinese control. With the overthrow of the Ch'ing dynasty in China in 1911, Tibet reasserted its independence, which it maintained until 1950. In that year China invaded; Tibet was made an autonomous region of China in 1951. An anti-Chinese uprising in 1959 was crushed and repressive measures introduced. The Dalai Lama and many priests fled to India; but by the 1980s some Buddhist temples had resumed operation. In the late 1980s there were violent anti-Chinese demonstrations in Tibet, and martial law was imposed (1989). Despite government repression, demonstrations against Chinese rule have continued.

Tibetan art and architecture have been almost entirely religious in character (see TIBETAN BUDDHISM). The art of Tibetan Lamaism retains strong elements drawn from HINDUISM and BUDDHISM in India, and was later influenced by the arts of Nepal and China. In architecture, the chorten, or Tibetan STUPA, was derived from Indian prototypes. Tibet is famed for its gigantic monastery-cities housing thousands of monks, such as the one in Zhaxilhünbo (15th cent.). The 17th-cent. monastery at Lhasa has a series of monastic skyscrapers that echo the forms of surrounding mountain peaks. Tibetan sculpture, often gilt bronze statuettes, consists of slim, elegant figures with heart-shaped heads, resembling the Indian Pala or Nepalese figures and frequently ornamented with elaborate jewels. Tibetan paintings appear most frequently in the form of tankas or temple banners, usually in brilliant colors on cotton or silk. The central figures of tankas may follow Nepalese or Indian types, but their decorative details are often Chinese. It is difficult to date these paintings, since the text, canons of proportion, and technical rules for making them have been almost unvaried for centuries. Although the symbolism is highly complex, there are representations of the BUDDHA in his myriad aspects.

Tibetan Buddhism, religion derived from the Indian Mahayana form of BUDDHISM and prevailing in Tibet, Bhutan, Sikkim, Mongolia, and parts of Siberia and SW China. Much of its ritual is based on TANTRA and on Bon shamanism, a primitive Tibetan religion. Tradition has it that Buddhism was introduced into Tibet in the 7th–8th cent. A.D. Buddhist texts and commentaries were later translated from the Sanskrit. Suppressed at first by the Bon shamans, the new faith was reformed in the 11th cent. by an Indian monk, Atisa, founder of the Kadampa sect. The 13th cent. brought rule by the Sas-Kya abbots, chosen by Kublai Khan. Ensuing corruption led to the much-needed reforms of the Yellow Hat sect (14th–15th cent.). In 1641 a ruling Mongol prince granted temporal and spiritual control over all Tibet to the fifth grand lama [Tibetan, = superior one], the Dalai Lama. The Dalai Lama soon became the temporal leader of Tibet, and spiritual supremacy resided with the chief abbot of the Zhaxilhünbo monastery near Xigazê, known as the Panchen Lama. Succession to either position is said to depend on direct reincarnation. Dedicated Tibetan Buddhists seek NIRVANA, but the popular religion retains shamanistic elements and includes hymns and prayers and the worship of many spirits. In 1959, following the Tibetan revolt against the Chinese, the 14th Dalai Lama went into exile in India. The Chinese installed the Panchen Lama in his place as ruler, and repressed Buddhism in Tibet. Since the 1980s, however, there has been greater tolerance of religious practice in Tibet.

The key to pronunciation appears on page xiii.

Tibetan language, member of the Tibeto-Burman subfamily of the Sino-Tibetan family of languages. See LANGUAGE (table).

tick: see MITE.

Ticonderoga, resort village (1990 pop. 2,770), NE N.Y., on a neck of land between Lakes George and Champlain; settled 17th cent., inc. 1889. At Ticonderoga and nearby Crown Point, battles of the FRENCH AND INDIAN WAR and AMERICAN REVOLUTION were fought. Fort Ticonderoga (built 1755, restored 1909) is now a museum.

tidal wave: see TSUNAMI.

tide, alternate rise and fall of sea level in oceans and other large bodies of water. These changes are caused by the gravitational attraction of the moon and, to a lesser extent, of the sun for the earth. At any one time there are two high tides on the earth, the direct tide on the side facing the moon, and the indirect tide on the opposite side. It is believed that the indirect tide is caused by the moon actually pulling the earth away from the water on the far side. The average interval between high tides is about 12 hr 25 min. The typical tidal range, or difference in sea level between high and low tides, in the open ocean is about 2 ft (0.6 m), but it is much greater near the coasts. The world's widest tidal range occurs in the Bay of FUNDY in E Canada. Tides are also raised in the earth's solid crust and atmosphere.

Tieck, Ludwig [tēk], 1773–1853, German writer. He led the transition from STURM UND DRANG to ROMANTICISM. His fairy tales, e.g., *The Blond Eckbert* (1796); poetic drama, e.g., *Kaiser Octavianus* (1804); and fiction exemplify the romantic approach to these genres. Tieck translated *Don Quixote* and completed with others the translations of SHAKESPEARE begun by A.W. von Schlegel (see under SCHLEGEL, FRIEDRICH VON).

Tientsin: see TIANJIN.

Tiepolo, Giovanni Battista [tyĕ'pōlō], 1696–1770, Italian painter. He was the most important Venetian painter and decorator of the 18th cent. Having won fame for his FRESCOES in the Labia Palace and the doge's palace, he was summoned (1750) to Würzburg (Bavaria) to do frescoes illustrating the life of Emperor Frederick I. In 1752 he went to Madrid to decorate the royal palace with such frescoes as the *Apotheosis of Spain.* As pure virtuosity, Tiepolo's scintillating brushwork, superb draftsmanship, and clarity of color are unsurpassed.

Tierra del Fuego [Span., = land of fire], archipelago, 28,476 sq mi (73,753 sq km), separated from the southern tip of mainland South America by the Strait of MAGELLAN and divided between Chile and Argentina. The region is sparsely populated and subject to high winds and heavy rainfall. The economy is based on petroleum and sheep.

Tiffany, Louis Comfort, 1848–1933, American artist and designer; b. N.Y.C. After studying painting, he founded the interior-decorating firm of Tiffany Studios in New York City. It specialized in *favrile* glasswork, ranging from lamps and vases to stained-glass windows, characterized by iridescent colors and natural forms in the ART NOUVEAU style.

tiger, large carnivore (*Panthera tigris*) of the CAT family, found in the forests of Asia. Its yellow-orange coat features numerous prominent black stripes. Males may attain 10 ft (3 m) in length and 650 lb (290 kg) in weight. Tigers are solitary, mainly nocturnal hunters and are good swimmers but poor climbers. They have been extensively hunted for their pelts and for their bones (used in traditional Chinese medicines) and are a threatened species.

Tigris, major river of SW Asia, flowing c.1,150 mi (1,850 km) generally southeast from the Taurus Mts., E Turkey, across a wide floodplain in Iraq, to join the EUPHRATES at BASRA and to form the SHATT AL ARAB. It is widely used for irrigation in Iraq and increasingly in Turkey, and is navigable by shallow draft vessels upstream to Basra. Some of the great cities of ancient MESOPOTAMIA, including NINEVEH, Ctesiphon, and Seleucia, stood on the banks of the river, called the Hiddekil in the Bible.

Tijuana [tēhwä'nä], city (1990 pop. 742,686), NW Mexico, just south of the U.S. border. A growing center of light industry, it has prospered mainly as a border resort noted for its racetracks and bullfights. The border at Tijuana is crossed by some 14 million tourists a year.

Tilden, Bill (William Tatem Tilden II), 1893–1953, American tennis player; b. Philadelphia. He became one of the world's foremost tennis stars, winning the U.S. singles title seven times in the 1920s and the British singles title three times (1920–21, 1930). "Big Bill" led the U.S. to victory in Davis Cup play and later won professional titles.

Tilden, Samuel Jones, 1814–86, American political leader; b. New Lebanon, N.Y. A successful lawyer, Tilden was elected governor of New York in 1874 and was the Democratic candidate for president in 1876. He polled more popular votes than the Republican, Rutherford B. HAYES. There were disputed electoral votes in several states, however, and a congressional commission of eight Republicans and seven Democrats, voting on strict party lines, awarded all the disputed states to Hayes, making him the winner by one electoral vote.

till: see DRIFT.

Till Eulenspiegel: see EULENSPIEGEL, TILL.

Tillich, Paul Johannes [tĭl'ĭk], 1886–1965, American philosopher and theologian; b. Germany. He taught theology in Germany until his opposition to the Nazi regime caused his dismissal (1933). He then taught at Union Theological Seminary, New York City (1933–54), Harvard Univ. (1954–62), and the Univ. of Chicago (1962–65). His thought embraced the concept of the "Protestant Principle" and aimed at a correlation of the questions arising out of the human condition and the divine answers drawn from the symbolism of Christian revelation.

Tilly, Johannes Tserklaes, count of, 1559–1632, imperial general in the THIRTY YEARS WAR; b. Belgium. He commanded the army of the Catholic League and won victories in Bavaria and the Palatinate. He assumed command of the imperial army (1630) and stormed Magdeburg (1631), where his troops massacred the populace and sacked the city. He was defeated by the Swedish army of Gustavus II at Breitenfeld (1631) and on the Lech (1632), where he was mortally wounded.

timberline, elevation above which trees cannot grow. Its location is influenced by latitude, prevailing wind directions, and exposure to sunlight. The timberline is roughly marked by the 50°F (10°C) isotherm. In general, it is highest in the tropics and descends in elevation toward the poles.

Timbuktu, city (1987 pop. 31,925), central Mali, connected to the Niger R. by a canal system. Its salt trade and handicraft industries make it an important meeting-place for the nomads of the SAHARA. Founded (11th cent.) by the TUAREG, it became by the 14th cent. a major commercial and cultural center in the MALI empire and was famous for its gold trade. Under the SONGHAI empire (15th and 16th cent.) the city was a center of Muslim learning, but it declined after being sacked by the Moroccans in 1593. It fell to the French in 1894.

time and motion study, analysis of the operations required to produce a manufactured article in a factory, with the aim of increasing efficiency. Each operation is studied minutely and analyzed in order to eliminate unnecessary motions and thus reduce production time and raise output. The first effort at time study was made by F.W. TAYLOR in the 1880s. Early in the 20th cent., Frank and Lillian Gilbreth developed a more systematic and sophisticated method of time and motion study for industry, taking into account the limits of human physical and mental capacity and the importance of a good physical environment.

Times Square: see BROADWAY.

Timişoara [tēmēshwä'rä], Hung. *Temesvár,* city (1989 est. pop. 333,000), W Romania, on the Beja Canal. Its manufactures include textiles, processed food, and machinery. Annexed to Hungary in 1010, it fell to the Turks (1552) and to the HAPSBURGS (1718). In 1920 it passed to Romania. Its Roman Catholic and Orthodox cathedrals date from the 18th cent.

Timor, island (c.13,200 sq mi/34,200 sq km), Indonesia, largest and easternmost of the Lesser Sundas. It is long, narrow, and almost wholly mountainous. Rice, coconuts, and coffee are grown; stretches of grassland support cattle. The inhabitants are of Malayan and Papuan descent. Divided between the Portuguese and the Dutch by treaties in 1859 and 1914, the Dutch (western) half became part of the new nation of Indonesia in 1950. In 1975 Portuguese Timor declared its independence as East Timor, but Indonesia invaded and annexed it. Guerrillas fought the Indonesian

army into the 1990s, and the army responded brutally in an attempt to crush resistance.

Timothy, two epistles of the NEW TESTAMENT, 15th and 16th books in the usual order. With TITUS they make up the Pastoral Epistles, giving advice on governing a church. First Timothy discusses public prayer and the qualifications of the clergy. Second Timothy is more personal, emphasizing courage and fidelity and warning of trials to come.

Timur or **Tamerlane,** c.1336–1405, Mongol conqueror, first of the TIMURIDS; b. Kesh, near Samarkand. From SAMARKAND, his capital, he invaded Persia, S Russia, India (where he took Delhi), and the Levant. In Asia Minor he defeated (1402) the Ottoman Turks and captured their sultan, Beyazid I. He died while planning an invasion of China. Though notorious for his acts of cruelty—he may have slaughtered 80,000 in Delhi—he was a patron of the arts.

Timurids, dynasty founded by TIMUR. At his death (1405), his empire extended from the Euphrates to the Jaxartes and Indus rivers. By 1410 the Western empire, including Baghdad, had been lost to the so-called Black-Sheep Turkoman horde. But the Eastern empire, ruled by Shah Rukh, Timur's son, flourished. His great cities, SAMARKAND and HERAT, became the center of Persian culture and commerce. His son, Ulagh Beg (r.1447–49), made Samarkand a center of Muslim civilization. After him, the Timurid empire fell to the White-Sheep Turkoman horde and the Uzbeks. BABUR is regarded as the last of the Timurids.

tin (Sn), metallic element, known and used by humans at least as early as the BRONZE AGE. It is a lustrous, silver-white, very soft, and malleable metal that can be rolled, pressed, or hammered into extremely thin sheets (tin foil). A tin coating, applied by dipping or electroplating, protects iron, steel, copper, and other metals from rust. Compounds of tin are used for mordants in dyeing, for weighting silk, and as reducing agents. Stannous fluoride, added to toothpastes and water supplies, prevents tooth decay. Toxic organic compounds are used as fungicides and catalysts. Cassiterite, or tinstone, is the chief ore. See ELEMENT (table); PERIODIC TABLE.

Tinbergen, Jan [tĭn'bĕr"gən], 1903–, Dutch economist. Professor at the Netherlands School of Economics (1933–73), he shared, with Ragnar FRISCH, the first Nobel Prize in economics (1969), for work in ECONOMETRICS.

Tinbergen, Nikolaas, 1907–88, British zoologist, b. Netherlands. For his work in reviving and developing the science of animal behavior, he shared the 1973 Nobel Prize in physiology or medicine with Karl von FRISCH and Konrad LORENZ. His studies of the display behavior of certain species revealed that such displays result from a state of conflict between opposing motivations ("fight or flee"). He also clarified the evolutionary origins of many social signals and their subsequent ritualization.

Tindal or **Tindale, William:** see TYNDALE, WILLIAM.

Tintoretto [tēntōrĕt'tō], 1518–94, Venetian painter; b. Jacopo Robusti. He was called Il Tintoretto [little dyer] from his father's trade. He supposedly studied with TITIAN, but tradition has it that his precocity made Titian jealous. His early paintings are difficult to verify because he assimilated the styles of others, e.g., Bonifazio Veronese and Paris Bordone. His *St. Mark Rescuing a Slave* (1548; Academy, Venice) shows MICHELANGELO's influence but has startling lighting effects and a dramatic rendering of the narrative. In the next decade, his work tended toward MANNERISM, with flickering light, distorted figures, and irrational spatial elements, e.g., in his *Last Judgment* (Madonna dell'Orto, Venice). His cycle of paintings for the Scuolo di San Rocco (begun 1564) includes an enormous *Crucifixion* and is remarkable for startling changes in viewpoint, frenetic movement, and mystic conception. The last phase of his art was highly visionary, with almost phosphorescent lighting effects, e.g., in his *Last Supper* and *Entombment* (San Giorgio Maggiore, Venice). His works in American collections include the *Finding of Moses* and *Miracle of the Loaves and Fishes* (both: Metropolitan Mus.) and *Baptism of Clorinda* (Art Inst., Chicago).

tipi: see TEPEE.

Tippett, Sir Michael, 1905–, English composer. He has utilized British folk and American JAZZ elements in some of his music. His works include the ORATORIO *A Child of Our Time* (1946); the operas *The Knot Garden* (1970) and *The Mask of Time* (1984); and four symphonies (1945, 1958, 1973, 1977).

Tiradentes [tērəthĕn'təs], 1748–92, Brazilian revolutionary patriot; b. José Joaquim da Silva Xavier. In the late 1780s he led an independence movement against Portuguese rule and for democratic government; the movement was betrayed and Tiradentes was executed.

Tiranë [tērä'nə] or **Tirana,** city (1990 est. pop. 210,000), capital of Albania, central Albania, on the Ishm R. The country's largest city, it is located on a fertile plain and produces textiles, metal products, and other manufactures. Lignite is mined nearby. The city, founded in the early 17th cent. by the Turks, was enlarged (1920) when it became the capital. Tiranë was held (1939–43) by Italy during World War II. Government buildings and an 18th-cent. mosque are located in Scanderbeg Square, the city's center.

Tiresias [tīrē'shəs, –sēəs], in Greek mythology, blind soothsayer who appears in many legends, e.g., OEDIPUS.

Tirso de Molina [tēr'sō dā mōlē'nä], pseud. of **Fray Gabriel Téllez,** 1584?–1648, Spanish dramatist. A major figure of the Spanish GOLDEN AGE, he wrote *The Trickster of Seville* (1630), the first literary treatment of the Don Juan legend, as well as several hundred other plays.

tissue, in biology, aggregation of similar cells. In animals, the epithelial, nerve, connective, and muscle tissues are fundamental; blood and lymph are commonly classed separately as vascular tissues. Organs usually consist of several tissues. Higher plants contain meristem tissue (cells that grow, divide, and differentiate), protective tissue like cork, storage and support tissues, and vascular tissues.

tissue culture, the growing of plant or animal CELLS outside of the body, as in a nutrient medium in a laboratory. It is used in the study of specific cells, the production of various cellular products, and the classification of tumors. Plant tissue cultures are also used to CLONE plants with desired qualities, such as a type of disease resistance or flower color.

Tisza, Count Stephen [tĭ'sŏ], 1861–1918, Hungarian premier (1903–5, 1913–17). Tisza sought to make Hungary a forceful partner in the AUSTRO-HUNGARIAN MONARCHY. He first opposed war with SERBIA in 1914 but later approved it. After taking a military command in World War I he was assassinated.

Titan, in astronomy, natural satellite of SATURN.

Titan, in Greek mythology, one of 12 primeval deities; children of URANUS and GAEA. They were CRONUS, Iapetus, Hyperion, Oceanus, Coeus, Creus, Theia, RHEA, Mnemosyne, Phoebe, Tethys, and Themis. Their descendants, e.g., PROMETHEUS, ATLAS, HECATE, HELIOS, were also called Titans. Led by Cronus, they deposed Uranus and ruled the universe. They were in turn overthrown by the OLYMPIANS, led by ZEUS, in a battle called the Titanomachy. Afterward Cronus ruled the Isle of the Blessed and Atlas held up the sky. The others, except Prometheus, who had helped Zeus, were condemned to TARTARUS.

Titania, in astronomy, natural satellite of URANUS.

Titanic, British liner that sank on the night of Apr. 14–15, 1912, after striking an iceberg in the North Atlantic. The disaster, which occurred on the ship's maiden voyage, claimed the lives of more than 1,500 of the 2,200 people aboard. Many perished because of a shortage of lifeboats. More stringent safety rules for ships and an iceberg patrol were later instituted. An expedition led by Robert G. Ballard discovered the wreck in 1987.

titanium (Ti), metallic element, discovered in 1791 by William Gregor. It is a lustrous, silver-white, and very corrosion-resistant metal that is ductile when pure and malleable when heated. The metal and its alloys, which are light in weight and have very high tensile strength, are used in aircraft, spacecraft, naval ships, guided missiles, and armor plate for tanks. Titanium dioxide is used as a gemstone (titania) and paint pigment. Widely distributed in compounds (e.g. RUTILE) in nature, titanium is present in the sun and certain other stars, in meteorites, and on the moon. See ELEMENT (table); PERIODIC TABLE.

Titian [tĭsh'ən], c.1490–1576, Venetian painter; b. Pieve di Cadore, in the Dolomites, as Tiziano Vecellio. One of the most celebrated artists of the RENAISSANCE, Titian had immense influence on succeeding generations of painters, especially in his use of color. He studied painting in the shop of Gentile and Giovanni Bellini (see BELLINI, family) and worked with GIORGIONE. After their deaths, he

The key to pronunciation appears on page xiii.

was considered the finest painter in Venice. In 1518 he completed the famous altarpiece of the *Assumption of the Virgin* (Church of Santa Maria Gloriosa dei Frari, Venice), and for the rest of his career he was showered with honors and commissions from the rulers of Europe. Emperor CHARLES V made him a Count Palatine, and Philip II of Spain was one of his patrons. In 1545, Titian went to Rome, where he met MICHELANGELO and did the striking (unfinished) portrait of Pope Paul III and his grandsons Ottavio (the second duke of Parma) and Cardinal Alessandro Farnese (Pinacoteca, Naples). For Cardinal Farnese he did a *Danaë* (Naples), of which he later made several versions. He painted the magnificent *La Gloria* (1554; Prado) for Charles V, and in 1553 he started a cycle of mythological paintings for Philip II, which included *Diana and Callisto* and *Diana Surprised by Acteon* (both 1559; National Gall. Edinburgh), and the *Rape of Europa* (1559; Gardner Mus., Boston). Titian's work can be divided into three phases. The first shows the influence of Bellini and Giorgione, e.g., in *Sacred and Profane Love* (c.1513; Borghese Gall., Rome). Full dramatic monumentality and great sumptuousness of color characterize the second phase, e.g., in *Christ Crowned with Thorns* (c.1542; Louvre). In his last phase, an intense mystical spirit and a new looseness of brush stroke and subtlety of color can be seen, e.g., in *Pietà* (Academy, Venice), which was intended for his own tomb and finished by Palma Giovane.

Titicaca, largest freshwater lake in South America, c.3,200 sq mi (8,290 sq km), located high in the ANDES between Bolivia and Peru, at an elevation of c.12,500 ft (3,810 m). It is by far the highest large lake in the world. The densely populated shores have been a center of civilization on the ALTIPLANO since before the time of the INCAS.

Titius-Bode law, empirical relationship between the mean distances of the planets from the sun. If each number in the series 0, 3, 6, 12, 24, . . . (where a new number is twice the previous number) is increased by 4 and then divided by 10 to form the series 0.4, 0.7, 1.0, 1.6, 2.8, 5.2, 10.0, 19.6, 38.8, 77.2, . . . , the law holds that this series gives the mean distances of the planets from the sun, expressed in ASTRONOMICAL UNITS. This relationship was discovered (1766) by Johann Titius and published (1772) by Johann Bode. It agreed well with the actual mean distances of the planets then known (and of Uranus and the asteroid belt, both discovered later), but not with those of the later-discovered planets Neptune and Pluto.

titmouse, BIRD of the family Paridae, which includes tits, titmice, and CHICKADEES. Small birds with short, pointed bills and gray and brown plumage, titmice are found chiefly in the Northern Hemisphere. They travel in flocks with other birds, e.g., nuthatches and WOODPECKERS, and can be taught tricks.

Tito, Josip Broz, 1892–1980, Communist president of Yugoslavia (1953–80). He served in the Red Army during the Russian civil war and led the partisan movement against the German occupation of Yugoslavia in WORLD WAR II. At the end of the war he firmly controlled the government and Communist party. He had his rival, Gen. MIHAJLOVIĆ, executed and forced the abdication of King PETER II. From 1945 until his death Tito ruled with virtually no opposition, partly because of his highly efficient secret police. He broke with STALIN in 1948, freed Yugoslavia from the external control of the USSR, and made it the most liberal Communist nation in Europe. He was a leader of the nonaligned nations.

titration, the determination of the CONCENTRATION of acids or bases (see ACIDS AND BASES) in SOLUTION by the gradual addition of an acidic solution of known volume and concentration to a basic solution of known volume, or vice versa, until complete neutralization (observable by the color change in an added INDICATOR, such as phenolphthalein) has occurred.

Titus (Titus Flavius Sabinus Vespasianus), A.D. 39–81, Roman emperor (A.D. 79–81). Son of Emperor VESPASIAN, he acted as coruler with his father after A.D. 71. He captured and destroyed Jerusalem in A.D. 70. On succeeding his father, he pursued a policy of conciliation, sought popular favor, and became known as a benevolent ruler. His brother DOMITIAN succeeded him. The **Arch of Titus** was erected by Domitian to commemorate Titus's conquest of Jerusalem.

Titus, EPISTLE of the NEW TESTAMENT, 17th book in the usual order. With First and Second TIMOTHY it makes up the Pastoral Epistles, purportedly by St. PAUL. Titus deals with matters of church government.

Tiy [tē], fl. 1385 B.C., queen of Egypt; wife of Amenhotep III, mother of IKHNATON. She was unusually influential in state affairs. **Tiy,** fl. 1167 B.C., wife of RAMSES III, plotted against him but failed to gain the throne for her son.

Tiziano Vecellio: see TITIAN.

Tl, chemical symbol of the element THALLIUM.

Tlingit, 14 related indigenous peoples of the Pacific Northwest (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with a language of the Nadene stock (see NATIVE AMERICAN LANGUAGES). They lived on the coast of SE Alaska and nearby islands, with a typical Northwest Coast culture. After Russians built (1799) a fort near the site of SITKA, there was constant conflict with the Tlingit. In settlements of claims against the government the Alaska tribes received (1971) millions of acres of land and almost $1 billion, with which a tribal corporation was established. In 1990 there were 13,925 Tlingits in the U.S.

Tm, chemical symbol of the element THULIUM.

TNT or **trinitrotoluene,** $CH_3C_6H_2(NO_2)_3$, crystalline AROMATIC COMPOUND. Trinitrotoluene is a high EXPLOSIVE, but, unlike NITROGLYCERIN, it is unaffected by ordinary shocks and must be set off by a detonator. Because it does not react with metals, it can be used in filling metal shells. It is often mixed with other explosives, e.g., with ammonium nitrate to form amatol.

toad, certain insect-eating AMPHIBIANS of the order Anura, similar to the FROG but often more terrestrial as adults. Commonly referring to species with shorter legs, a stouter body, and thicker skin than the frog, the term *toad* is properly restricted to the so-called true toads (family Bufonidae). These are characterized by warty skins, prominent parotid glands behind the eyes, and a white, poisonous fluid exuded through the skin and from the parotid glands. Ranging from 1 to 7 in. (2.5 to 18 cm) in size, toads inhabit cool, moist places and lay their eggs in water.

toadstool: see MUSHROOM.

tobacco, plant (genus *Nicotiana*) of the NIGHTSHADE family, and the product manufactured from its leaf and used in cigars and cigarettes, snuff, and pipe and chewing tobacco. The chief commercial species, *N. tabacum,* is believed native to tropical America. The tobacco plant is a coarse, large-leaved perennial, but it is usually cultivated as an annual. Tobacco requires a warm climate and rich, well-drained soil. After being picked, the leaves are cured, fermented, and aged to develop aroma. The amount of nicotine (the ALKALOID responsible for tobacco's narcotic and soothing effect) varies, depending on tobacco strain, growing conditions, and processing. The use of tobacco originated among natives of the New World in pre-Columbian times. Introduced into Spain and Portugal in the mid-16th cent., initially as a panacea, it spread to other European countries, and by 1619 tobacco had become a leading export crop of Virginia. Since the 1950s there has been concern over the harmful effects of nicotine, the tarry compounds, and CARBON MONOXIDE in tobacco smoke; smoking has been especially linked to lung cancer and heart disease.

Tobago: see TRINIDAD AND TOBAGO.

Tobin, James, 1918–, American economist; b. Champaign, Ill. Sterling Professor of Economics at Yale, Tobin won the 1981 Nobel Prize in economics for his analyses of the impact of financial markets on spending and investment. He also served (1961–62) on the President's Council of Economic Advisers.

Tobit, biblical book included in the Western canon but not in the Hebrew Bible, and placed in the APOCRYPHA in the Authorized Version. It tells of Tobit, a devout, blind Jew in exile, and of his son Tobias. Tobias and his dog are led by the archangel Raphael to the house of Sara, who is afflicted by the demon Asmodeus. Tobias marries Sara, exorcises the demon, and cures his father's blindness. The book probably was composed before 200 B.C.

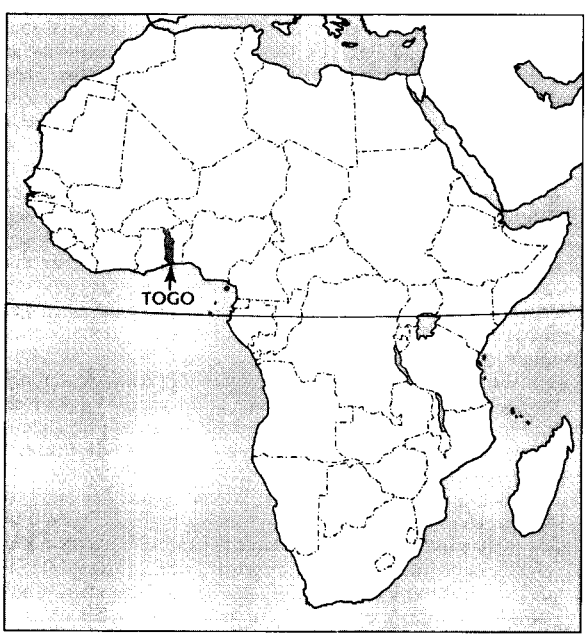
Tobruk, city (1984 pop. 75,282), NE Libya, a port on the Mediterranean Sea. During WORLD WAR II it was an objective fiercely contested (1941–42) by the British and Germans. First seized by Allied forces, Tobruk was briefly held by the Germans and then retaken by the British.

Tocqueville, Alexis de, 1805–59, French social philosopher. Prom-

inent in French politics. he was briefly foreign minister after the REVOLUTION OF 1848. His fame rests on his classic work *Democracy in America* (2 vol., 1835), based on observations made during a trip to the U.S. A liberal, he believed that political democracy and social equality would eventually replace Europe's aristocratic institutions.

Togo, officially Togolese Republic, republic (1992 est. pop. 3,959,000), 21,622 sq mi (56,000 sq km), W Africa, bordered by the Gulf of Guinea (S), Ghana (W), Burkina Faso (N), and Benin (E). LOMÉ is the capital. Beyond a sandy strip along the coast are, successively, a region of fertile clay soils, the Mono Tableland, a mountainous area rising to c.3,940 ft (1,200 m), and, in the extreme north, the rolling sandstone Oti Plateau. The standard of living in Togo is among the highest in W Africa. Most of the labor force is engaged in agriculture, but mining is of growing importance. The principal food crops are manioc, millet, yams, and corn; the leading cash crops are coffee, cocoa, palm kernels, cotton, and peanuts. Major deposits of high-quality phosphates have been worked on a large scale since 1963; Togo is one of the world's ten largest phosphate producers. An oil refinery processes crude oil imported from Nigeria. The principal ethnic groups are the Ewe in the south and Voltaic-speaking peoples in the north. Most adhere to traditional beliefs, but there is a large Christian, and a smaller Muslim, minority. French is the official language.

History. Formerly part of the German protectorate of TOGOLAND (1886–1914), the area that is now Togo was administered by France after World War I (1922–1960). It gained independence, as the Republic of Togo, in 1960, resisting attempts by Kwame Nkrumah of Ghana (which includes the former British Togoland) to merge the two nations. The early years of the republic were characterized by political instability. In 1967 Lt. Col. Gnassingbé Eyadéma came to power in a bloodless coup and established an authoritarian, one-party state. By 1991 growing unrest led him to relinquish power to an transitional government, but the army forced partial restoration of his powers. Togolese voters approved (1992) a new constitution that reduced presidential power. In 1993 Eyadéma won reelection in a contest that was boycotted by the main opposition parties.



Togo Heihachiro, 1846–1934, Japanese admiral, Japan's greatest naval hero. In the RUSSO-JAPANESE WAR he defeated Russian fleets at Port Arthur (1904) and in the battle of Tsushima (1905), thus establishing Japanese naval superiority.

Togoland, historic region (c.33,500 sq mi/86,800 sq km) in W Africa. Its western part is now in GHANA, and its eastern part is the Republic of TOGO.

Tohono O'Odham or **Papago,** indigenous people of the Southwest (see NORTH AMERICA, INDIGENOUS PEOPLES OF), speaking a Uto-Aztecan language of the Aztec-Tanoan stock (see NATIVE AMERICAN LANGUAGES). Like their PIMA neighbors, they are descended from the Hohokam peoples. Farmers and cattle raisers, they were severely oppressed by the APACHES. Today most live on reservation lands near Tucson, Ariz.; income from leases of mineral-bearing lands have added to tribal resources. In 1990 there were 16 041 Tohono O'Odham in the U.S.

Tojo Hideki, 1884–1948, Japanese general and prime minister (1941–44). A militarist, he approved the attack on Pearl Harbor and other Japanese offensives in WORLD WAR II. At home his regime asserted totalitarian control. In Apr. 1945, Tojo recommended that the war be fought to a finish. After Japan's defeat, he was tried by the Allies as a war criminal and was convicted and executed.

Tokelau, formerly Union Islands, dependency of New Zealand (1992 est. pop. 1,800), c.6 sq mi (16 sq km), South Pacific Ocean, consisting of three small atolls: Atafu, Nukunonu (the largest), and Fakaofa. The Polynesian inhabitants have a subsistence economy; copra is the chief export. Tokelau was discovered in 1765 and was a British possession from 1889 to 1925, when it was mandated to New Zealand. In 1948 New Zealand acquired formal sovereignty (effective 1949).

Tokugawa [tō"kōgä'wä], family that held the shogunate (see SHOGUN) and controlled Japan from 1603 to 1867. Founded by IEYASU, the Tokugawa regime was a centralized feudalism, and the Tokugawa themselves ruled directly about one fourth of the country. The daimyo, or barons, owed allegiance to the Tokugawa but were permitted to rule their own domains. Despite its efficient organization, the regime collapsed in 1867 during the MEIJI restoration.

Tokyo, city (1990 pop. 8,163,127), capital and largest city of Japan, E central Honshu, at the head of Tokyo Bay. Greater Tokyo consists of an urban area, farms and mountain villages, and the Izu Islands; with YOKOHAMA it forms the world's most populous metropolitan area (1991 est. pop. 27,245,000). Tokyo is the administrative, financial, and cultural center of Japan. It is also a major industrial and transportation hub, with the world's first public monorail line and high-speed "bullet trains" that link it with other cities. Manufactures include electronic equipment, automobiles, and a wide variety of consumer goods. It is a world economic center that rivals New York and London. Founded in the 12th cent. as Edo, it was the capital of the shogunate from 1603 to 1868, when the emperor was restored to power and made Edo the nation's capital, renaming it Tokyo. In 1923 an earthquake and fire destroyed nearly half the city. Heavy Allied bombing in World War II devastated much of Tokyo, including nearly all of its industrial plants. Left intact were the imperial palace and surrounding embassies, the diet (government) building, and many office buildings. The city's famed landmarks include the Meiji and Hie shrines, ancient temples, and the Korakuen landscape garden. The Ginza is Tokyo's shopping and entertainment center. One of the world's foremost educational cities, Tokyo has over 100 colleges and universities. Frequent rebuilding in the wake of disasters has made it one of the world's most modern cities.

Tolbert, William Richard, Jr., 1913–80, president of LIBERIA (1971–80). A protegé of William Tubman, Tolbert succeeded him as president in 1971. He was killed (1980) in a coup led by Samuel K. Doe, an army sergeant.

Toledo, Francisco de [tōlā'thō], 1515?–84, Spanish viceroy of PERU (1569–81). He consolidated the Spanish conquest of Peru by breaking the power of the great landowners. He unjustly had the Inca leader Tupac Amaru executed (1571).

Toledo [tōlā'thō], city (1988 est. pop. 59,600), capital of Toledo prov., central Spain, in New Castile, on the Tagus R. Predating Rome, to which it fell in 193 B.C., it was later (6th cent.) the capital of the Visigothic kingdom. Its archbishops have long been Spain's primates. Under the MOORS (712–1085) and the kings of CASTILE it was a center of Moorish, Spanish, and Jewish culture and was noted for its sword blades and textiles. In the 16th cent. it was the seat of the Spanish INQUISITION. Many works by El Greco (see GRECO, EL), who lived in Toledo, hang in the cathedral (begun

1226), the Hospital of San Juan Bautista (15th–16th cent.), and the Church of Santo Tomé.

Toledo, city (1990 pop. 332,943), seat of Lucas co., NW Ohio, on the Maumee R. and Lake Erie; inc. 1837. It is one of the major GREAT LAKES shipping, commercial, and industrial cities. Glass, oil products, machines, tools, and automobile parts are leading manufactures. Gen. Anthony WAYNE built Fort Industry there (1794) after the Battle of Fallen Timbers; the city was settled in 1817. The area was the object of an Ohio-Michigan border dispute (the "Toledo War," 1835–36). Toledo's Museum of Art and the Univ. of Toledo are notable institutions.

Tolkien, J(ohn) R(onald) R(euel), 1892–1973, English novelist and scholar. A medievalist at Oxford Univ., he became famous as the author of *The Hobbit* (1937) and the epic trilogy *Lord of the Rings* (1954–56), all fantasy novels about the mythological kingdom of Middle Earth; the posthumous *Silmarillion* (1977) continues the saga.

Toller, Ernst [tôl'ər], 1893–1939, German expressionist dramatist and poet (see EXPRESSIONISM). His plays of social protest include *Transfiguration* (1919), *Man and the Masses* (1920), and *The Machine-Wreckers* (1922). He left Germany in 1932. In 1939 he committed suicide in New York City.

Tolstoy, Leo, Count, Rus. *Lev Nikolayevich Tolstoy* [təlstoi'], 1828–1910, Russian novelist and philosopher. Of a noble family, he was orphaned at nine and brought up by aunts. He left the university without a degree and returned to his family estate, Yasnaya Polyana, where he tried to aid and educate the serfs. After a profligate period in Moscow and St. Petersburg, he joined his brother, an officer, in the Caucasus (1851). In 1852 he enlisted. *Childhood* (1852), part of an autobiographical trilogy that includes *Boyhood* (1854) and *Youth* (1857), was his first published work. Leaving the army in 1855, he lived alternately on his estate and in St. Petersburg. In 1862 he married Sophia Andreyevna Bers, a young, well-educated girl, who bore him 13 children. *War and Peace,* his first masterpiece, appeared in 1863–69. An epic of the Napoleonic invasion, it illustrates Tolstoy's view that history proceeds inexorably to its own ends. *Anna Karenina* (1875–77), his second masterpiece, is a tragedy of adultery with profound social and spiritual dimensions. Around 1876 Tolstoy underwent a crisis culminating in his conversion to a doctrine of Christian love, nonviolent acceptance of evil, and renunciation of wealth. He devoted the rest of his life to practicing and propagating his faith, expounded in such works as *What I Believe* (1884). He considered wrong such institutions as the government and church; he was excommunicated in 1901, but his fame protected him from serious state interference. Moral issues are central to his later works, notably "The Death of Ivan Ilyich" (1886), a story; *The Power of Darkness* (1886), a drama; and the novel *Resurrection* (1899). In the essay *What Is Art?* (1898) he argued that the artist is morally bound to create works understandable to most people, and denounced his own earlier works. In 1910 a breach with his family caused Tolstoy to leave home; he died a few days later.

Toltec [Nahuatl, = master builders], indigenous civilization of Mexico, probably with ancient links to the MIXTEC and ZAPOTEC (see MIDDLE AMERICA, INDIGENOUS PEOPLES OF). The Toltec warrior aristocracy gained ascendancy in the valley of Mexico after the fall (900) of TEOTIHUACÁN, making their own capital at Tollán (Tula). Masters of architecture and the arts, they were advanced workers of stone and smelters of metals, had a calendric system, and are said to have discovered the intoxicant pulque. Their religion, centering on the god QUETZALCOATL, incorporated human sacrifice, sun worship, and a sacred ball game. The Toltec dominated the MAYA (11th–13th cent.) until nomadic Chichimec peoples destroyed their empire, opening the way for the AZTEC.

tomato, plant (*Lycopersicon esculentum*) of the NIGHTSHADE family, and its fruit (commonly considered a vegetable because of its uses). Numerous varieties are cultivated, e.g., the small cherry tomato, the yellow pear tomato, and the large, red beefsteak tomato. Popular in salads and processed into juice, catsup, and canned goods, the tomato was recognized as a valuable food only within the last century.

Tombstone, city (1990 pop. 1,220), SE Ariz.; inc. 1881. During a silver boom (1877–90) it had a reputation as one of the West's richest and most lawless towns. That and its climate made it a popular tourist attraction. It was named a national historic landmark in 1962. Famous sights include Boot Hill cemetery; the Bird Cage Theater; and the O.K. Corral, scene of a famous 1881 gun battle.

Tom Thumb, 1838–83, American entertainer; b. Bridgeport, Conn., as Charles Sherwood Stratton. A midget whose height never exceeded 40 in. (101.5 cm), he achieved fame and fortune when the showman P.T. BARNUM arranged for his exhibition (1842–82). He later appeared with his wife, a dwarf.

tom-tom: see DRUM.

tonality, in music, quality by which all TONES of a composition are heard in relation to a central tone called the keynote, or tonic. Some relationship to a tonic is characteristic of all music except that in which it is deliberately avoided (see ATONALITY and TWELVE-TONE MUSIC). The term *tonality* is also used in contrast to *modality* (see MODE).

tone. In music, a tone is distinguished from noise by its definite PITCH, caused by the regularity of the vibrations that produce it. Any tone possesses the attributes of pitch, intensity, and quality. Pitch is determined by the frequency of the vibration, measured by cycles per second. Intensity, or loudness, is determined by the amplitude, measured in decibels. Quality is determined by the overtones (subsidiary tones), the distinctive timbre of any instrument being the result of the number and relative prominence of the over tones it produces. The term *whole tone* or *whole step* refers to the interval of a major second, as in moving from one white key to the adjoining white key on the piano. *Halftone, semitone,* or *half step* refers to the interval of a minor second, as in moving from a white key to the adjoining black key on the piano.

tone poem: see SYMPHONIC POEM.

Tonga, officially Kingdom of Tonga, independent constitutional monarchy (1992 est. pop. 103,000), 270 sq mi (699 sq km), in the S Pacific Ocean. It comprises c.170 islands, of which the three main groups are Tongatapu, Haapai, and Vavau. Nukualofa, in Tongatapu, is the capital. Tonga has a tropical climate and a mainly subsistence farming economy. Copra, bananas, and postage stamps printed for purely philatelic purposes are the chief exports. The king is the head of state and also dominates the national legislature, which consists of the king's cabinet, nine noble members, and nine commoners. The islands were discovered between 1616 and 1643 and renamed the Friendly Islands by Capt. James COOK, who visited them in 1773 and 1777. English missionaries arrived (1797) and helped to strengthen British political influence. In 1900, Tonga became a British protectorate but remained internally self-governing. A new treaty in 1968 reduced British control, and Tonga became fully independent in 1970. In the late 1980s reformers won the commoner seats in the assembly and called for increasing commoner representation, but the king opposed any change that would dilute the monarchy's power. The present ruler is King Taufa'ahau Tupou IV (1965–). See PACIFIC OCEAN map.

tongue, muscular organ on the floor of the mouth in higher animals. In humans it functions primarily in chewing, swallowing, and speaking. The human tongue is covered by a mucous membrane containing small projections, or papillae, which give it a rough surface. Tiny taste organs, or buds, are found on the papillae, with many concentrated toward the back of the tongue. Sweet, sour, salty, and bitter flavors stimulate the taste cells in these buds to send impulses along associated nerves to the brain.

Tonkin, historic region (c.40,000 sq mi/103,600 sq km), Southeast Asia, bordered by China (N), the Gulf of Tonkin (E), Annam (S), and Laos (S, W); now part of Vietnam. The capital was HANOI. Tonkin was conquered by the Chinese in 111 B.C. and became independent in A.D. 939. Governed by native dynasties until French expeditions arrived in 1873 and 1882, Tonkin was the scene of a colonial war (complicated by Chinese intervention) that ended with a French protectorate. The Japanese occupied the region during WORLD WAR II. In 1954, after an independence struggle against the French, Tonkin became part of North Vietnam. It was incorporated into united Vietnam after the VIETNAM WAR.

Tonkin Gulf resolution, in U.S. history, Congressional resolution (1964) authorizing military action in Southeast Asia. After U.S. de-

stroyers allegedly were attacked in the Gulf of Tonkin in 1964 by North Vietnamese gunboats, Pres. Lyndon B. JOHNSON asked Congress for authority to retaliate and for a mandate for future military action. The resolution passed overwhelmingly and Johnson and his successor, Richard NIXON, regarded it as authorization to pursue the VIETNAM WAR in Southeast Asia. Congress repealed it in 1970.

tonsils, name commonly referring to the palatine tonsils, two ovoid masses of lymphoid tissue on either side of the throat, at the back of the tongue. The pharyngeal tonsils, or adenoids, are similar masses located in the space between the back of the nose and the throat. The lingual tonsils are situated on the back of the tongue. The tonsils act as filters against disease organisms.

Toomer, Jean, 1894–1967, African-American writer; b. Washington, D.C., as Nathan Eugene Toomer. A major figure of the HARLEM RENAISSANCE, he is known for one work, *Cane* (1923), a collection of stories, poems, and sketches about African-American life in rural Georgia and the urban North.

topaz, aluminum silicate mineral [$Al_2SiO_4(F,OH)_2$], used as a gem. Commonly colorless or some shade of yellow, the stone is transparent with a vitreous luster. Topaz crystals occur in highly acidic igneous rocks and in metamorphic rocks. Important sources include Brazil, Siberia, Myanmar, and Sri Lanka.

Topeka, city (1990 pop. 119,883), state capital and seat of Shawnee co., NE Kans., on the Kansas R.; inc. 1857. It was laid out (1854) by Free Staters, and became state capital in 1861. The noted Menninger Clinic is one of its several psychiatric research and therapy institutions. Agricultural marketing and shipping are major economic activities. Known for its broad, tree-lined streets, it has a notable museum and library.

topology, branch of MATHEMATICS concerned with those properties of geometric figures that are invariant under continuous transformations. A continuous transformation is a one-to-one correspondence between the points of one figure and the points of another figure such that points that are arbitrarily close on one figure are transformed into points that are also arbitrarily close on the other figure. Two figures are topologically equivalent if one can be deformed into the other by bending, stretching, twisting, or the like, but not by tearing, cutting, or folding; thus topology is sometimes popularly called "rubber-sheet geometry." A circle and a square are topologically equivalent, as are a cylinder and a sphere, but a torus (doughnut shape) is not equivalent to a sphere, because no amount of bending or twisting will change it into a sphere. Topology may be roughly divided into *point-set topology,* which considers figures as SETS of points having such properties as being open, closed, compact, connected, and so forth; *combinatorial topology,* which considers figures as combinations (complexes) of simple figures (simplexes) joined together in a regular manner; and *algebraic topology,* which makes extensive use of algebraic methods, particularly those of group theory. There is considerable overlap among these branches.

Torah [Heb., = teachings or learning], Hebrew name for the PENTATEUCH, the first five books of the Bible. The Torah, or Written Law, which Orthodox Jews believe was revealed directly by God to MOSES on Mt. Sinai, laid down the fundamental laws of moral and physical conduct. In a wider sense the Torah comprises all teachings of JUDAISM, including the entire Hebrew Scripture, the TALMUD, and any generally accepted rabbinical interpretation.

tornado, dark, funnel-shaped cloud containing violently rotating air that develops within a heavy cumulonimbus cloud mass and extends to the earth. The diameter of a tornado varies from a few feet to a mile; the rotating winds reach velocities of 200 to 300 mph (320 to 480 km/hr), and the updraft at the center may reach 200 mph (320 km/hr). In comparison with a HURRICANE, a tornado covers a much smaller area but is much more violent and destructive. The atmospheric conditions required for the formation of a tornado include great thermal instability, high humidity, and the convergence of warm, moist air at low levels with cooler, drier air above. Tornadoes occuring over water are called waterspouts.

Toronto, city (1991 pop. 635,395), provincial capital, S Ontario, part of the municipality of metropolitan Toronto (1991 pop. 2,275,771), on Lake Ontario. Ringed by fast-growing suburbs, it is Canada's second largest city, a major commercial and financial hub, and Ontario's principal GREAT LAKES port and industrial center. The skyline of the city, which changed dramatically beginning in the 1960s, is marked by such landmarks as the CN (Canadian National) Tower, one of the world's tallest free-standing structures; the golden towers of Royal Bank Plaza; and the avant-garde architecture of Eaton Square and the O'Keefe Centre. The city occupies the site of a French fort (1749–59), in an area purchased by the British from Native Americans in 1787. Proclaimed (1793) the capital of Upper Canada (now Ontario), it was settled in part by Loyalists fleeing the American Revolution. It was twice raided by Americans and partly destroyed during the WAR OF 1812. Then known as York, it was renamed Toronto in 1834.

Toronto, University of, at Toronto, Ont., Canada; founded 1827 (as King's College); achieved university status 1849. It is the largest university in Canada. Provincially supported, it has faculties in the arts and sciences and many professional fields, as well as schools of graduate studies and physical and health education. The university also includes the Royal Conservatory of Music.

torque or **moment of force,** a quantity expressing the effectiveness of a force to change the net rate of rotation of a body. It is equal to the product of the force acting on the body and the distance from its point of application to the axis around which the body is free to rotate. Units of torque include the foot-pound (or pound-foot), the dyne-centimeter, and the newton-meter.

Torquemada, Tomás de [tôrkämä'thä], 1420–98, Spanish churchman. A DOMINICAN, he became (1483) inquisitor general of Castile and Aragón. His reputation for cruelty derives from the harsh procedures that he devised for the Spanish INQUISITION. He was largely responsible for the expulsion (1492) of the Jews.

Torrance, city (1990 pop. 133,107), Los Angeles co., S Calif.; inc. 1921. An industrial center, it has aircraft, electronics, and oil industries, and numerous other manufactures.

Torrens, Sir Robert Richard, 1814–84, Australian statesman; b. Ireland. He secured the passage (1858) of the Torrens Act, a landholding reform which substituted public registration of title for the old conveyance system.

Torres Bodet, Jaime [tôr'rās bôdĕt'], 1902–74, Mexican writer and diplomat. Among his books of poetry are *Fervor* (1918), symbolist in tone; *Crypt* (1937); and the bilingual *Selected Poems* (1964). Such fictional works as *Margarita of the Mist* (1927) and *Birth of Venus* (1941) reveal his erudite playfulness.

Torrijos Herrera, Omar [tōrē'hōs ārā'rä], 1929–81, Panamanian military ruler. After seizing power in a military coup (1968), he curtailed civil liberties and instituted economic and social reforms. He signed (1978) the Panama-U.S. treaties that transferred the PANAMA CANAL and Panama Canal Zone to PANAMA.

torsion: see STRENGTH OF MATERIALS.

Torstensson, Lennart, 1603–51, Swedish general in the THIRTY YEARS WAR. Trained by GUSTAVUS II in the use of the new mobile field artillery, he led (1641–46) the Swedish troops to many victories. He was the military teacher of CHARLES X.

tort, in law, a civil wrong against a person or property for which damages may be claimed as compensation. A tort violates duties imposed by law on all persons, as distinguished from the duties a CONTRACT imposes on the parties making it. CRIMINAL LAW involves state action against wrongdoers, while torts give the injured parties the right to sue. A wrongful act may be both a tort and a crime; thus, the crime of BURGLARY may be actionable as the tort of trespass. Torts are classified primarily as intentional, e.g., LIBEL, ASSAULT, FRAUD, or as injury arising from NEGLIGENCE. Damages are usually awarded in tort cases. They may be nominal, symbolic recognition of the wrong done, even though substantial harm did not occur; or compensatory, to redress the plaintiff's loss or injury. Where there was fraud or intentional wrongdoing, the court may award punitive or exemplary damages to punish the defendant. In some circumstances, e.g., NUISANCE, the court may issue an INJUNCTION.

tortoise, terrestrial TURTLE, especially one of the family Testudinidae. Tortoises inhabit warm regions worldwide except in Australia. Most famous is the giant tortoise of the Galapagos Islands (*Testudo elephantopus*), which can be over 4 ft (120 cm) long and weigh over 500 lb (225 kg). Tortoises are extremely long-lived; some are known to have survived for more than 150 years.

The key to pronunciation appears on page xiii.

Tory, English political party. The name was used derogatorily for supporters of the duke of York (later JAMES II). After 1688 the Tories comprised mainly country gentry who were closely identified with the Church of ENGLAND. Reaching their zenith under Queen ANNE, with Robert Harley and Henry St. John as leaders, they were discredited for JACOBITE leanings under GEORGE I. Power passed for the next 50 years to their rivals, the WHIGS. Revived (after 1783) by the younger William PITT, the Tories became reactionary after the French Revolution, and lost strength following the REFORM BILL of 1832. Remnants of the Tory party became known as the CONSERVATIVE PARTY.

Toscanini, Arturo [tōskänē'nē], 1867–1957, Italian conductor, one of the world's greatest conductors. He began his career as conductor of the Rio de Janeiro opera (1886). Returning to Italy, he conducted the premieres of LEONCAVALLO's *Pagliacci* (1892) and PUCCINI's *La Bohème* (1896), and was later musical director at La Scala, Milan. In the U.S., he conducted at the METROPOLITAN OPERA (1908–14), the New York Philharmonic (1926–36), and the NBC Symphony, which was formed for him (1937–54).

Toshkent or **Tashkent,** city (1992 est. pop. 2,133,000), capital of UZBEKISTAN, central Asia, in the foothills of the Tian Shan mts. The largest central Asian city, and among the oldest, it is the economic heart of the region, with such manufactures as textiles, farm machinery, and consumer goods. The Toshkent oasis produces cotton, fruits, and grains. First mentioned in the 1st cent. B.C., Toshkent came under Arabic rule (7th cent. A.D.) and passed to KHOREZM (12th cent.). It fell (13th–15th cent.) to JENGHIZ KHAN, TIMUR, and the Uzbeks. Under Russian rule after 1865, it was the capital of the Turkistan Autonomous SSR (1918–24) and replaced (1930) SAMARKAND as the capital of the Uzbek SSR (independent as Uzbekistan since 1991). A major earthquake in 1966 heavily damaged the city.

totem, an object, usually an animal or plant, revered by an individual or a particular social group. A group totem represents the bond of unity and is often considered the ancestor or brother of the group's members; marriage between those of one totem is often prohibited as incest. The group's symbol and protector, the totem may be pictured on the body or masks, or carved on totem poles.

Totila or **Baduila,** d. 552, last king of the OSTROGOTHS (541–52). By taking Naples (543) and Rome (546) he became master of central and S Italy. JUSTINIAN I spurned his peace offers and sent (552) an army under NARSES against him. Totila was routed and killed, leaving Italy under Byzantine control.

Tottel, Richard, 1530?–1594?, English publisher. His anthology, *The Book of Songs and Sonnets* (1557), known as Tottel's Miscellany, presented poems by Sir Thomas WYATT and other poets of the English Renaissance.

toucan, perching BIRD of the New World tropics, related to the WOODPECKERS. Toucans vary in size from the jay-sized toucanets to the 24-in. (62-cm) tocos of the Amazon basin. Their enormous, often brightly colored, canoe-shaped bills are adapted to cutting up fruits and berries.

touch-me-not, common name for any plant of the genus *Impatiens* of the JEWELWEED family.

Toulouse, city (1990 pop. 358,688), capital of Haute-Garonne dept., S France, on the Garonne R. A cultural and commercial center, it is also the center of the French aerospace industry. A part of Roman Gaul, it was (419–508) the capital of the Visigoths and (781–843) of the Carolingian kingdom of Aquitaine. Under the counts of Toulouse, who ruled most of the region of Languedoc, it was the artistic and literary center of medieval Europe. It passed to the French crown in 1271. An old quarter and many buildings are preserved, e.g., a Romanesque basilica and Gothic cathedral.

Toulouse-Lautrec, Henri de [tōōlōōz'-lōtrĕk'], 1864–1901, French painter and lithographer. His growth was permanently stunted, the result of a childhood accident. Influenced by DEGAS, he was inspired by sporting subjects and the life of music halls, cabarets, and circuses. His work is graphic in nature. Using garish and artificial colors, he brought new immediacy to his posters, particularly those of the Moulin Rouge. His works include *At the Moulin de la Galette* (1892; Art Inst., Chicago).

Touré, Sékou [tōōrā'], 1922–84, president of GUINEA (1958–84). A Marxist who rose through the labor movement, he became president of Guinea when it left (1958) the FRENCH COMMUNITY. Despite generally repressive rule and anti-Western policy, he later encouraged private U.S. investment to support Guinea's gradually deteriorating economy.

tourmaline, complex aluminum and boron silicate mineral $[(Na,Ca)(Al,Fe,Li,Mg)_3Al_6(BO_3)_3Si_6O_{18}(OH)_4]$, used as a gem. Colors are red, pink, blue, green, yellow, violet, and black; sometimes it is colorless. Two or more colors, arranged in zones or bands with sharp boundaries, may occur in the same stone. Tourmalines are found in pegmatite veins in granites, gneisses, schists, and crystalline limestone. Important sources include Elba, Brazil, Russia, Sri Lanka, and parts of the U.S.

tournament or **tourney,** in the Middle Ages, public contest between armed horsemen in simulation of real battle. Based on the ideas of chivalry and accompanied by much pageantry, the tourney probably originated in France in the 11th cent. The field, or lists, was enclosed by barriers and flanked by pavilions for notables. Because many knights were killed or injured, a less dangerous version known as tilting was devised.

tourney: see TOURNAMENT.

Tours, city (1990 pop. 129,509), capital of Indre-et-Loire dept., W central France. It is a wine market and tourist center. A Gallo-Roman town, it was a center of medieval Christian learning, notably under GREGORY OF TOURS and ALCUIN. There CHARLES MARTEL halted (732) the Moorish conquest of Europe. It has produced many great artists.

Toussaint L'Ouverture, François Dominique [tōōsăn' lōō vĕrtür'], c.1774–1803, Haitian patriot. A self-educated, freed slave, he joined the black rebellion (1791) to liberate the slaves. With Generals DESSALINES and CHRISTOPHE, he forced (1798) the British to withdraw from HAITI, quelled (1799) a mulatto uprising, and resisted a French invasion (1802). But he was treacherously seized by the French and died in a dungeon in France. His valiant life and tragic death made him a symbol of the fight for liberty.

Tower of London, ancient fortress, east of the City of London, on the N bank of the Thames. Formerly a royal residence and jail for illustrious prisoners, it is now an arsenal and museum. A dry moat and castellated walls surround the White Tower, built c.1078. Subsequent towers include the Wakefield Tower, which houses the crown jewels. The Traitors' Gate and Bloody Tower are associated with notables including Sir Thomas MORE and Anne BOLEYN. Many persons beheaded there or on neighboring Tower Hill are buried in the chapel. Yeomen of the Guard (Beefeaters) still guard the Tower.

Townes, Charles Hard, 1915–, American physicist and educator; b. Greenville, S.C. He taught (1948–59) at Columbia Univ. and was provost (1961–66) of the Massachusetts Institute of Technology. For his work on the theory and application of the MASER and for other work in quantum electronics connected with both maser and LASER devices, he shared with Nikolai Basov and Alexander Prokhorov the 1964 Nobel Prize in physics.

Townsend, Francis Everett, 1867–1960, American reformer; b. Fairbury, Ill. In 1933, at the height of the GREAT DEPRESSION, he proposed a relatively simple old-age pension plan. Although bills to enact the Townsend plan were continually defeated, its popularity contributed to passage of SOCIAL SECURITY legislation.

Townshend Acts, 1767, revenue acts passed by the English Parliament to replace the repealed STAMP ACTS. They placed duties on various items imported into the American colonies. The colonists reacted strongly, and the BOSTON MASSACRE and the BOSTON TEA PARTY were among the resulting incidents.

toxemia, disease state caused by the presence in the blood of bacterial TOXINS or other harmful substances. The effects of the bacterial endotoxins include fever, hemorrhage, and shock; exotoxins attack specific tissues, e.g., botulinus toxin affects the nervous system. The term toxemia is also used for **preeclampsia,** a condition occurring late in pregnancy that is associated with high blood pressure, protein in the urine, and edema; it was believed to be caused by toxins. If untreated it can lead to eclampsia—maternal convulsions and COMA—and renal and cardiovascular damage or death.

toxic shock syndrome, acute, sometimes fatal, disease characterized by high fever, nausea, diarrhea, lethargy, blotchy rash, and

sudden drop in blood pressure. It is caused by several toxin-producing strains of bacteria, particularly streptococcal and staphylococcal bacteria. Streptococcal forms, in which the bacterium typically enters the body through a cut, are more common. Staphylococcal toxic shock is most prevalent among menstruating women using high absorbency tampons.

toxic waste: see POLLUTION; WASTE DISPOSAL.

toxin, poison produced by living organisms. **Exotoxins,** secreted by bacterial cells, have specific reaction sites in the host; e.g., the toxin associated with DIPHTHERIA affects mucous membranes and that associated with BOTULISM destroys nerve tissue. Substances such as snake venom are also considered exotoxins. The pathological effects of **endotoxins,** which are formed inside bacterial cells and freed when they die, are similar regardless of the type of bacteria (see TOXEMIA). The presence of toxins stimulates the production of antibodies, or antitoxins, one of the body's defenses against disease (see IMMUNITY).

toy dog, class of very small breeds of dogs kept as pets. Some are selectively bred small forms of larger breeds; others are naturally small. See individual breeds, e.g., CHIHUAHUA, MALTESE, PEKINGESE, POMERANIAN, SHIH TZU, toy POODLE.

Toynbee, Arnold Joseph, 1889–1975, English historian. In his major work, *A Study of History* (12 vol., 1934–61), he propounded the problems of history in terms of great cultural groups and civilizations rather than of nationalities. The main thesis of the work is that the well-being of a civilization depends on its ability to respond successfully to challenges, human and environmental. Of 26 civilizations in history, he saw only Western Latin Christendom as still alive.

toyon: see CHRISTMASBERRY.

track and field athletics, sports of foot racing, hurdling, jumping, vaulting, and weight throwing. They are usually separated into two categories—track (the running events) and field (the throwing and vaulting events). Individuals and teams compete on a field comprising an oval track and an infield for the field events. In the U.S. the most popular events include the 100-m, 200-m, 400-m, 880-m, the 1,500-m, 3,000-m (women), 5,000-m (men), and 10,000-m runs; the 100-m (women), 110-m (men), and 400-m hurdle races; the 400-m and 1,600-m relays; the long (or broad) jump; the high jump; the pole vault; the shot put; the discus throw; the javelin throw; and the hammer throw. The DECATHLON is the major composite event in Olympic track and field competition. Cross-country, distance, and walking races are usually classed with track and field athletics, as is the MARATHON RACE. The sport dominated the original OLYMPIC GAMES in ancient Greece.

Tracy, Spencer, 1900–1967, American film actor; b. Milwaukee, Wis. He won Academy Awards for his character portrayals in *Captains Courageous* (1937) and *Boys' Town* (1938). Other films include *Adam's Rib* (1949) and *The Last Hurrah* (1958).

trade union: see UNION, LABOR.

Trafalgar, battle of, Oct. 21, 1805, naval encounter of the Napoleonic Wars, fought off Cape Trafalgar, on the SW coast of Spain. The British fleet, under NELSON, won a brilliant victory over the French and Spanish navies under Pierre de Villeneuve. Nelson was fatally wounded in the encounter.

tragedy, form of drama, central to Western literature, in which a person of superior intelligence and character, a leader of the community, is overcome by the very obstacles he is struggling to remove. The earliest tragedies were part of the Attic religious festival held in honor of the god DIONYSUS (5th cent. B.C.). The most famous ancient tragedies are probably the *Oresteia* of AESCHYLUS, SOPHOCLES' *Oedipus Rex,* and EURIPIDES' *Trojan Women.* ARISTOTLE pointed out tragedy's ritual function: the spectators are purged of their own emotions of pity and fear through their vicarious participation in the drama. The dramas of the Roman tragedian SENECA were based on certain conventions—unity of time and place, violence, bombast, revenge, and the appearance of ghosts. Seneca's plays served as models for such RENAISSANCE tragedies as Christopher MARLOWE's *Tamburlaine* (1587) and Thomas KYD's *Spanish Tragedy* (1594). These in turn prefigured the towering tragedies of the period: Marlowe's *Dr. Faustus* (1588); SHAKESPEARE's *Othello, Macbeth, Hamlet* and *King Lear* (1600–1607), and John WEBSTER's *Duchess of Malfi* (1614). All of these plays dramatize the conflicts of kings, conquerors, or, at the very least, geniuses. The tradition of the tragic hero continued for the next 300 years in the work of the Spaniards LOPE DE VEGA and CALDERÓN DE LA BARCA; the Frenchmen Pierre CORNEILLE and Jean RACINE; and the Germans G.E. LESSING, GOETHE, and SCHILLER. Tragedy can reflect another vision of life, again rooted in religious drama—the mystery plays and morality plays of medieval France and England. These plays, of which EVERYMAN is the best known, emphasize the accountability and suffering of ordinary people. The tragic lot of the common people is explored in such later dramas as George Lillo's domestic tragedy *The London Merchant* (1731) and Georg BÜCHNER's political tragedy *Danton's Death* (1835). In Henrik IBSEN's *A Doll's House* (1879) and *An Enemy of the People* (1882), ordinary people behave heroically, acknowledging their faith in the validity of the tragic vision. The cataclysmic events of the 20th cent. have produced a radical diminution of that vision. In such plays as Eugene O'NEILL's *Mourning Becomes Electra* (1931), Bertolt BRECHT's *Mother Courage* (1941), Arthur MILLER's *Death of a Salesman* (1949), and Samuel BECKETT's *Waiting for Godot* (1953), life is depicted as so horrible and absurd that heroic behavior is not only impossible, it is irrelevant.

Traherne, Thomas, 1636?–1674, English METAPHYSICAL POET. His finest work, expressing an ardent, childlike love of God, appeared in the 1670s but was lost until rediscovered and published as *Poems* (1903) and *Centuries of Meditations* (1908).

trailing arbutus, Mayflower, or **ground laurel,** American wildflower (*Epigaea repens*) of the HEATH family. The plant blooms in early spring; its creeping stems bear clusters of fragrant pink or white flowers, sometimes hidden by the hairy evergreen leaves. It is the provincial flower of Nova Scotia and the state flower of Massachusetts.

Trajan (Marcus Ulpius Trajanus), A.D. c.53–117, Roman emperor (A.D. 98–117); b. Spain. The adopted son and successor of Emperor Nerva, he brought DACIA under Roman control and conquered much of PARTHIA. He did much building in Rome (including the Forum of Trajan). HADRIAN succeeded him.

tranquilizer, drug whose action on the central nervous system relieves emotional agitation. Antipsychotic drugs, or major tranquilizers, ease the symptoms of psychotic states, including agitation, delusions, and anxiety. These drugs include chlorpromazine (Thorazine), the first agent to be widely applied to mental disorders and still the standard drug. ANTIANXIETY DRUGS, or minor tranquilizers, are prescribed to relieve anxiety and tension. See also LITHIUM.

transactinide elements, chemical elements with atomic numbers greater than 103, that of lawrencium, the last member of the ACTINIDE SERIES. See TRANSURANIUM ELEMENTS.

transcendentalism, in American literature, movement that flourished in New England c.1836–60. A reaction against Calvinist orthodoxy and Unitarian rationalism, it was influenced by the German idealist philosophers, notably KANT, and by such English authors as CARLYLE, COLERIDGE, and WORDSWORTH. Its tenets included belief in God's immanence in humans and nature, and in individual intuition as the highest source of knowledge. An optimistic philosophy, it emphasized individualism, self-reliance, and rejection of traditional authority. Its ideas were most eloquently expressed in the essays of EMERSON and in *Walden* (1854) by THOREAU. Other important transcendentalists included George Ripley, Bronson ALCOTT, and Margaret FULLER. Their journal was *The Dial* (1840–44); BROOK FARM stemmed from the movement.

transcendentalism, in philosophy, term describing systems holding that there are modes of being beyond the reach of mundane experience. It is closely associated with KANT, who states that transcendental elements of thought (such as concepts of space and time and categories of judgment) cannot be perceived directly through experience; nevertheless, they add to empirical knowledge. He called these elements *noumena* (as opposed to *phenomena*).

Transcendental Meditation: see MEDITATION.

transdermal patch or **transdermal delivery system:** see SKIN PATCH.

transducer, device that accepts an input of energy in one form and produces an output of energy in some other form, with a known, fixed relationship between the input and output. One class of

transducers consists of devices that produce an electrical output signal, e.g., MICROPHONES, RECORD-PLAYER cartridges, and PHOTOELECTRIC CELLS. Other transducers accept an electrical input, e.g., LOUDSPEAKERS, light bulbs, and SOLENOIDS. Transducers may be either active or passive. Active transducers require a source of energy in addition to the input signal to produce the output signal, whereas passive transducers require only an input signal.

transformational-generative grammar, linguistic theory associated with Noam CHOMSKY, particularly with his *Syntactic Structures* (1957), and with Chomsky's teacher Zellig Harris. Generative grammar attempts to define rules that can generate the infinite number of grammatical (well-formed) sentences possible in a language. It starts not from a behaviorist analysis of minimal sounds but from a rationalist assumption that a deep structure underlies a language, and that a similar deep structure underlies all languages. Transformational grammar seeks to identify rules (transformations) that govern relations between parts of a sentence, on the assumption that beneath such aspects as word order a fundamental structure exists. Transformational and generative grammar together have been the starting point for a tremendous growth in LINGUISTICS studies since the 1950s.

transformer, electrical device that transfers an alternating current or voltage (see POTENTIAL, ELECTRIC) from one ELECTRIC CIRCUIT to another using electromagnetic INDUCTION. A simple transformer consists of two coils of wire electrically insulated from each other and arranged so that a change in the current through the primary coil will produce a change in voltage across the secondary coil. The ratio of the alternating-current (AC) output voltage to the AC input voltage is approximately equal to the ratio of the number of turns in the secondary coil to the number of turns in the primary coil. This capability for transforming voltages is the basis for a great many applications. Transformers are classified according to their use; power transformers (see POWER, ELECTRIC) are used to transmit power at a constant frequency, audio transformers are designed to operate over a wide range of frequencies with a nearly constant ratio of input to output voltage, and radio-frequency transformers operate efficiently within a narrow range of high frequencies.

transform fault: see FAULT; PLATE TECTONICS.

transgenic animal: see PHARMING.

transistor, electronic device used as a voltage and current AMPLIFIER, consisting of SEMICONDUCTOR materials that share common physical boundaries. The materials most commonly used are silicon and germanium into which impurities have been introduced. In *n*-type semiconductors there is an excess of free electrons, or negative charges, whereas in *p*-type semiconductors there is a deficiency of electrons and therefore an excess of positive charges. Transistors are a key component of INTEGRATED CIRCUITS and are used in many applications, including RADIO receivers, electronic COMPUTERS, and automatic control instrumentation (e.g., in spaceflight and guided missiles). Since the invention (announced in 1948) of the transistor by the American physicists John BARDEEN, Walter H. Brattain, and William Shockley, many types have been designed. These are generally classified as bipolar or field effect. A **bipolar transistor** consists of three layers—the top and bottom layers, called the emitter and the collector, are of one conductivity type, while the middle layer, called the base, is of the other conductivity type. The dividing surfaces between the conductivity types are called *p-n* junctions. The electrons pass through the junctions from one layer to the other. The transistor action is such that if the electric POTENTIALS on the segments are properly determined, a small current between the emitter and base connections results in a large current between the emitter and collector connections, thus producing current and amplification. A **field-effect transistor** functions in a similar fashion except that the resistance to the electron flow is modulated by an external electric field. In a junction field-effect transistor (JFET), the controlling electric field is produced by a reversed bias *p-n* junction (one in which a voltage is applied so as to make the *p* side negative relative to the *n* side); in a metal oxide semiconductor field-effect transistor (MOSFET), the electric field is due to a charge on a CAPACITOR formed by a metal electrode and an insulating oxide layer that separates the electrode from the body of the semiconductor. See also MICROELECTRONICS; THYRISTOR

transit instrument or **transit,** telescope devised to observe stars as they cross the meridian of LONGITUDE and used for determining time. Its viewing tube swings on a rigid horizontal axis restricting its movements to the arc of the meridian. The meridian circle (a modern transit) is equipped with precisely graduated circles mounted on the horizontal axis and with stationary verniers, or reading microscopes, mounted on the fixed supports of the telescope that enable the observer to read the circles. By giving both the altitude and transit time, this instrument yields the right ascension and declination—the position on the celestial sphere—of the star (see ASTRONOMICAL COORDINATE SYSTEMS).

transition elements or **transition metals,** elements of group VIII and the b groups (I through VII) of the PERIODIC TABLE, characterized by the filling of an inner *d* or *f* electron orbital as atomic number increases. Many chemical and physical properties of these elements are due to their unfilled *d* or *f* orbitals. Transition elements generally have high densities and melting points, magnetic properties, and variable valence arising from the electrons in the *d* or *f* orbitals. These metals form stable coordination complexes, or complex IONS, many of which are highly colored and exhibit paramagnetism.

Transkei, black South African homeland, or BANTUSTAN (1990 est. pop. 4,500,000), 15,831 sq mi (41,002 sq km), SE South Africa, declared independent by South Africa in 1976, but not recognized as independent by any other nation. It borders on Lesotho (N) and the Indian Ocean (SE); the capital is Umtata. Most of its inhabitants are Xhosa. The first homeland to be granted independence, Transkei severed diplomatic relations with South Africa from 1978 to 1980 over territorial disputes. It was reabsorbed into South Africa in 1994.

Transleithania: see AUSTRO-HUNGARIAN MONARCHY.

transmission, in AUTOMOBILES, system for transmitting power from the engine to the wheels. The system is designed to change the high rotational speed and low torque (turning force) of the engine's crankshaft into the higher-torque rotation needed to turn the wheels over a range of speeds. A **manual transmission** consists of a system of interlocking GEAR wheels arranged so that by operating a lever the driver can choose one of several ratios of speed between an input shaft turned by the engine and an output shaft that turns the wheels. For a standing start the driver selects the first, or lowest, gear, which produces high turning power at a low output shaft speed. Higher gears produce less torque at higher output shaft speeds. To allow smooth shifting from one gear to another, a clutch mechanism disengages the engine from the transmission during gear changes. The **automatic transmission** (introduced in 1939), in which gear changes are made without driver intervention, uses a fluid device called a torque converter to connect the engine with the gearbox and to control gear changes. A **continuously variable transmission** uses a belt that connects two variable-diameter pulleys to provide an unlimited number of ratio changes and uninterrupted power to the wheels.

transpiration, in terrestrial plants, loss of water by evaporation mainly through the pores (stomata) of the LEAF but also through the plant's surface cells. The pull of transpiration on the fluid in the plant is one cause of the ascent of SAP from the ROOTS, and thus helps provide the necessary moisture for cell functions (see PHOTOSYNTHESIS). Desert plants are modified in ways that decrease transpiration (see SUCCULENT).

transplantation, medical, process by which a tissue or organ is removed and replaced by a corresponding part. Transplants usually range from those employing tissue (such as skin, bone, or cartilage) from the patient's own body (called an autograft transplant) to those involving the replacement of vital organs (such as the heart or kidney) from the body of another individual (a homograft, or allograft, transplant). Transplantation of complex organs calls for the surgical connection of the larger blood vessels of the donor organ to those of the recipient; connective tissue cells gradually link the graft and host tissues. Replacements for diseased or defective tissue (e.g., a cornea or the heart) are generally obtained from donors who have died; paired, large, or regenerating organs or tissues such as kidney, skin, bowel, bone marrow, or

blood can be donated by living individuals (see BLOOD TRANSFUSION). Tissue can also come from aborted fetuses, as in FETAL TISSUE IMPLANTS. Organs such as the heart must be transplanted as soon after the donor's death as possible; skin, corneas, bone, and some blood fractions can be stored. Transplanted tissue from another individual contains antigens that stimulate an immune response by the host's lymphocytes (see BLOOD; IMMUNITY), and the main obstacle to successful transplantation is the rejection of foreign tissue by the host. To minimize rejection, an antigenic typing system (called the HLA system and similar to blood typing) is used to determine the degree of tissue compatibility between the donor and the recipient. IMMUNOSUPPRESSIVE DRUGS are also used to interfere with the production of antibodies (the body's usual response to foreign substances) in the recipient. Current research is using the increased knowledge of immune response on the molecular level to manipulate the body into accepting foreign tissue. Human tissue grafting was first performed about 100 years ago by Jacques Reverdin, a Swiss surgeon. In 1902 the French surgeon Alexis CARREL developed a method of joining blood vessels that made the transplantation of organs feasible and stimulated the use of transplantation in experimental biology. The first successful transplant of a human KIDNEY was made by Richard H. Lawler in Chicago in 1950; and the first human HEART transplant was performed by the South African surgeon Christiaan BARNARD in 1967. Since then, advances in BIOENGINEERING have also made possible the implantation of artificial body parts, such as artificial joints, and in 1982 resulted in implantation of the first permanent artificial heart (see HEART, ARTIFICIAL). Investigations continue into the development of completely artificial organs. Human transplants have also been made experimentally using organs from baboons, chimpanzees, and monkeys since 1963.

Transportation, United States Department of, federal executive department established (1967) to coordinate and administer overall transportation policy. Its divisions have jurisdiction in the areas of highway planning and construction; urban mass transit; railroads; aviation; and the safety of waterways, ports, highways, and oil and gas pipelines. It also includes the U.S. COAST GUARD.

transuranium elements, radioactive chemical elements with atomic numbers greater than 92 (URANIUM). Only NEPTUNIUM (at. no. 93) and PLUTONIUM (at. no. 94) occur in nature; they are produced in minute amounts in the radioactive decay of uranium. The transuranium elements of the ACTINIDE SERIES were discovered as synthetic radioactive isotopes. Both American and Soviet scientists claimed to have discovered independently the unstable transactinide elements 104, 105, and 106, and West German scientists reported discovering the unstable transactinide elements 107, 108, and 109.

Transvaal, province (1991 est. pop. 8,630,000), 110,450 sq mi (286,065 sq km), NE South Africa, situated at an elevation of 3,000–6,000 ft (910–1,830 m) in the VELD. It has produced much of the world's gold since deposits were discovered in the WITWATERSRAND (or Rand) in 1886. The province also mines diamonds and produces coal, uranium, platinum, and chromium. Much of South Africa's industry is concentrated along the Rand and around PRETORIA, JOHANNESBURG, and other Transvaal cities. First settled (mid-1830s) by Boer farmers, it became the first Republic of South Africa and led resistance to British rule. Under the new South African constitution of 1994 it was divided into several provinces.

Transylvania, historic region and province (21,292 sq mi/55,146 sq km), central Romania, separated in the south from Walachia by the Transylvanian Alps and in the east from Moldavia and Bukovina by the Carpathian Mts. CLUJ-NAPOCA is the chief city. Transylvania has deposits of lignite, iron, and other resources, and produces steel, chemicals, and other manufactures. Agriculture, stock raising, and wine making are also important. Part of the Roman province of Dacia, Transylvania was ruled (11th–16th cent.) by Hungary. Magyars, Germans, Romanians, and other peoples settled the area. From the 15th cent. Turkey and Austria vied for control of the region; Austrian control was established in 1711. Transylvania was part of Hungary in the Austro-Hungarian Empire (1867–1918). After WORLD WAR I the region was ceded to Romania. Hungary annexed N Transylvania in 1940; after WORLD WAR II it was returned to Romania.

Travis, William Barrett, 1809–36, hero of the Texas Revolution. He was in command of the Texas troops defending the ALAMO. After SANTA ANNA's Mexican forces stormed the fort (Mar. 1836), all the defenders, including Travis, Davy CROCKETT, and James BOWIE, were massacred.

Treasury, United States Department of the, federal executive department established (1789) to advise the president on fiscal policy and act as financial agent for the government. It receives and pays out money for the government, and through the SECRET SERVICE it is also in charge of protecting the president. Its divisions also include the U.S. Mint, the INTERNAL REVENUE SERVICE, the Office of the Comptroller of Currency, the Bureau of Engraving and Printing, the Customs Service, the U.S. Savings Bond Division, the Bureau of Alcohol, Tobacco, and Firearms, the Bureau of Public Debt, and the Office of Thrift Supervision (1989).

Treaty of Paris: see PARIS, TREATY OF.

Treaty of Versailles: see VERSAILLES, TREATY OF.

Trebizond, empire of, 1204–1461, one of the Greek states that sprang up after the overthrow (1204) of the Byzantine Empire by the army of the Fourth CRUSADE. Founded by the Comnenus brothers, David and ALEXIUS I of Trebizond, Trebizond remained independent when the Byzantine Empire was restored (1261). Although at times subject to Turks or Mongols, Trebizond grew prosperous as the trade route through Asia Minor to E Asia, and from Russia and the Middle East to Europe. In 1461 this last refuge of Hellenistic culture fell to the Ottoman Turks under MUHAMMAD II.

Tree, Ellen: see under KEAN, EDMUND.

Tree, Sir Herbert Beerbohm, 1853–1917, English actor-manager; b. Herbert Draper Beerbohm; half brother of Max BEERBOHM. As a manager he was noted for his Shakespearean productions, in which he stressed visual elements with elaborate effects. His wife and leading lady, **Helen Maud Holt,** 1863–1937, was especially adept at comedy.

tree, perennial woody plant with a single main STEM (the trunk or bole) from which branches and twigs extend to form a characteristic crown. Trees are either deciduous, i.e., having broad leaves that are shed at the end of the growing season, or evergreen (see CONIFER), having needle- or scale-like leaves that are shed at intervals of 2 to 10 years. Some broad-leafed shrubs follow the conifer pattern, and the LARCH sheds its needle-like leaves deciduously. Tree identification is through leaf shape and overall appearance. Trees are an important source of wood, food, and products such as resins, RUBBER, QUININE, turpentine, and CELLULOSE.

tree shrew, small, arboreal prosimian, or lower PRIMATE, of the family Tupaiidae, found in S Asia. Tree shrews superficially resemble squirrels and are usually brown, reddish, or olive in color, with large eyes, good vision, and flexible hands with sharp claws. They are territorial, omnivorous, and extremely active and quarrelsome.

Treitschke, Heinrich von [trīch'ka], 1834–96, German historian, professor, and Prussian state historiographer. Anti-Semitism and a fanatic nationalism distort the excellent scholarship of his works, notably his *History of Germany in the Nineteenth Century* (5 vol., 1879–94).

trek, in South African history, the great migration (1835–36) of Dutch farmers (Boers); called the Great Trek. Escaping British domination of the Cape of Good Hope, they founded the Orange Free State, the Transvaal, and Natal.

trench: see OCEAN; PLATE TECTONICS.

Trent, Council of, 1545–47, 1551–52, 1562–63, ecumenical council of the Roman Catholic Church. Convoked by Pope PAUL III to meet the crisis of the Protestant REFORMATION, it was the chief expounder of the Catholic reform (see REFORMATION, CATHOLIC). Its definitions and reform decrees treated Scripture, the sacraments, education, the Mass, the clergy, relics, feasts, and other topics. The reforms touched all aspects of religious life and set the pattern of modern Catholicism. The official *Catechism of the Council of Trent* was published in 1566.

Trent Affair, a diplomatic incident between the U.S. and Great Britain during the American CIVIL WAR. In Nov. 1861 Capt. Charles Wilkes halted the British mail packet *Trent* and removed two Confederate commissioners, J.M. Mason (see under MASON, GEORGE) and John SLIDELL, and had them interned in Boston. The British

reacted sharply, and for a time it appeared they might retaliate by either recognizing the CONFEDERACY or declaring war on the U.S. The U.S. secretary of state, W.H. SEWARD, sent a note disavowing the action and released the men, thereby averting a crisis.

Trenton, city (1990 pop. 88,675), state capital (since 1790) and seat of Mercer co., W N.J., at the head of navigation on the Delaware R.; settled by Friends 1679, inc. as a city 1792. Situated between New York and Philadelphia, it is a transportation center and an important industrial city. Its pottery industry dates from colonial times. Steel cables, rubber goods, textiles, plastics, and a variety of metal products are manufactured. On Dec. 26, 1776, having crossed the Delaware unexpectedly, George WASHINGTON defeated a Hessian force at Trenton; the Americans then struck at PRINCETON. A 155-ft (47-m) granite monument commemorates the battle.

Trevelyan, Sir George Otto, 1838–1928, English historian and politician. A Whig member of the House of Commons (1865–97), he wrote the pro-American *American Revolution* (4 vol., 1899–1907) and *George the Third and Charles Fox* (1912). His works were popular in the U.S. His son, **George Macaulay Trevelyan,** 1876–1962, taught history at Cambridge and was master of Trinity College (1940–51). He was a master of the "literary" school of historical writing, and his reaction against the "scientific" school was influential. His best-known works include *History of England* (1926), *British History in the Nineteenth Century* (1922), and *England under Queen Anne* (3 vol., 1930–34).

triangle, in music: see PERCUSSION INSTRUMENT.

triangulation: see GEODESY.

Triassic period: see GEOLOGIC ERA (table).

triathlon, sports competition composed of three activities: swimming, bicycling, and running. Triathlons range in difficulty from the Ironman Triathlon (est. 1978) in Hawaii—a 2½-mile swim, 112-mile bicycle race, and 26-mile run—to much easier races like the Central Park (N.Y.C.) Triathlon—¼-mile swim, 12-mile bicycle race, and 5-mile run.

tribe, social group, usually with a distinguishing area, dialect, cultural homogeneity, and unifying social organization. It ordinarily has a leader and may have a common ancestor or patron deity. Member families or small communities are linked by economic, social, religious, or blood ties. In a narrower sense, *tribe* refers to the widest territorially defined, politically independent unit in a tribal society.

tribune, in ancient Rome, one of various officers. There were military tribunes, senior officers of the legions, elected by the people from c.508 B.C. to 367 B.C. The office of tribune of the PLEBS, designed to protect plebeian rights, especially against abuse by magistrates, was formed in 493 B.C. By 449 B.C. there were ten tribunes who were plebeians elected by an assembly of plebs. The tribune's person was inviolable. He had the right to veto a decision of a magistrate and the right to prosecute corrupt magistrates before a public body.

trichinosis or **trichiniasis,** parasitic disease caused by the roundworm *Trichinella spiralis,* following ingestion of raw or inadequately cooked meat, especially pork. The larvae mature in the intestines and are carried by the bloodstream to muscles, where they become embedded and remain. The host experiences irregular fever, profuse sweating, and muscular soreness; these symptoms usually subside soon after infestation, although vague muscle pain and fatigue may persist.

trichomoniasis, sexually transmitted disease caused by the parasitic protozoan *Trichomonas vaginalis.* In women, it can cause urinary tract infection and a painful vaginitis marked by a thin, foamy, irritating discharge. In men, it can infect the urethra and bladder. The infection is treated with metronidazole (Flagyl).

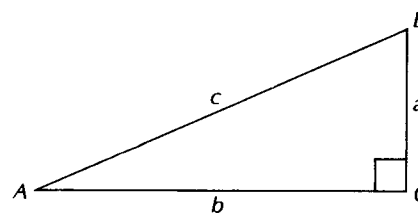
Trier [trēr], Fr. *Trèves,* city (1989 est. pop. 95,700), Rhineland-Palatinate, W Germany, on the Moselle R. It is a port, an industrial center with such manufactures as textiles and tobacco products, and the hub of the Moselle wine region. Founded c.15 B.C. by AUGUSTUS, it was a commercial and cultural center under the Romans and as part of the HOLY ROMAN EMPIRE. The city was held (19th–20th cent.) by France and by Prussia. Its historic structures include an amphitheater (c.100) and a Romanesque cathedral (11th–12th cent.). Karl MARX was born in Trier.

Trieste, city (1990 pop. 233,047), capital of Friuli-Venezia Giulia, NE Italy, at the head of the Adriatic. A major seaport, it is a commercial and industrial center. A medieval free commune menaced by Venice, it placed itself (1382) under the Austrian dukes. It became a free port in 1719. A center of IRREDENTISM, Trieste and its province were annexed (1919) by Italy. After World War II they were claimed by Yugoslavia, made (1947) a free territory under UN protection, and divided (1954) between the two countries, with Italy receiving the city. Landmarks include the Cathedral of San Giusto and Miramar castle.

triglyceride, ester formed from glycerol and three fatty acid molecules. FATS AND OILS are triglycerides. In humans, triglycerides supply fuel for energy. They are stored in adipose (fat) tissue or float in the bloodstream. Normally, triglycerides are obtained from foods, but excessive sugar and alcohol consumption can cause them to be synthesized in the body. Elevated levels of triglycerides in the blood are associated with an increased risk of heart disease.

trigonometry, the study of certain mathematical relations originally defined in terms of the angles and sides of a right triangle, i.e., one containing a right ANGLE (90°). Six basic relations, or trigonometric functions, are defined. If A, B, and C are the angles of a right triangle ($C = 90°$) and a, b, and c are the lengths of the respective sides opposite these angles, then six functions can be expressed for one of the acute angles, say A, as various ratios of the opposite side (a), the adjacent side (b), and the hypotenuse (c), as set out in the table. Although the actual lengths of the sides of a right triangle may have any values, the ratios of the lengths will be the same for all similar right triangles, large or small. It may be seen that $\sin B = \cos A$, $\cos B = \sin A$, $\tan B = \cot A$, and so forth. The values of the sine and the cosine are always between 0 and 1, the values of the secant and the cosecant are always equal to or greater than 1, and the values of the tangent and the cotangent are unbounded, increasing from 0 without limit. The values of the trigonometric functions can be found in a set of tables or on a calculator. The notion of the trigonometric functions is extended beyond 90° (the largest angle size in a right triangle) by defining the functions with respect to CARTESIAN COORDINATES; the functions then take on negative as well as positive values in a pattern that

TRIGONOMETRIC FUNCTIONS



Function (abbreviation)	*Definition*
sine (sin)	$\sin A = \frac{\text{opposite}}{\text{hypotenuse}} = \frac{a}{c}$
cosine (cos)	$\cos A = \frac{\text{adjacent}}{\text{hypotenuse}} = \frac{b}{c}$
tangent (tan)	$\tan A = \frac{\text{opposite}}{\text{adjacent}} = \frac{a}{b}$
cotangent (cot or ctn)	$\cot A = \frac{\text{adjacent}}{\text{opposite}} = \frac{b}{a}$
secant (sec)	$\sec A = \frac{\text{hypotenuse}}{\text{adjacent}} = \frac{c}{b}$
cosecant (csc)	$\csc A = \frac{\text{hypotenuse}}{\text{opposite}} = \frac{c}{a}$

repeats every 360°. This repeating, or periodic, nature of the trigonometric functions leads to important applications in the study of such periodic phenomena as light and electricity. A general triangle, not necessarily containing a right angle, can also be analyzed by means of trigonometry. Spherical trigonometry, the study of triangles on the surface of a sphere, is important in surveying, navigation, and astronomy.

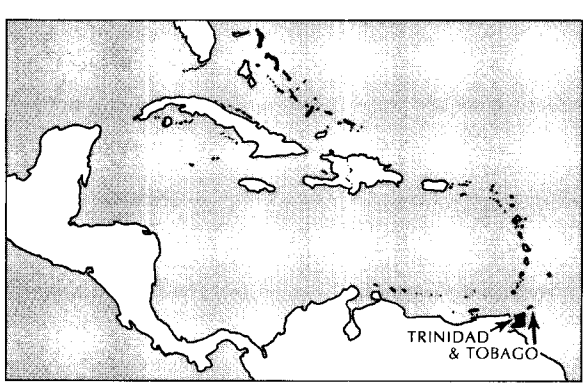
Trilling, Lionel, 1905–75, American critic; b. N.Y.C. A professor at Columbia, he wrote essays (e.g., *The Liberal Imagination,* 1950, *The Opposing Self,* 1955) that combine social, psychological, and political insights with literary criticism and scholarship. His other works include a novel and biographies. His wife, **Diana Trilling,** 1905–, b. N.Y.C., is a literary and cultural critic. Her works include *We Must March My Darlings* (1977), a collection of essays; *Mrs. Harris* (1981), an analysis of the murder of a successful physician; and *The Beginning of the Journey* (1993), a memoir.

trillium or **wake-robin,** attractive spring wildflower (genus *Trillium*) of the LILY family, native to North America and E Asia. The single flower may be white, pink, dark red, yellow, or green, and the leaves, petals, and sepals are typically in threes.

trilobite, extinct marine invertebrate animal (an ARTHROPOD) with a flat, oval body covered by a horny shell; the name refers to a pair of furrows that divide the body lengthwise into three sections. Trilobites were abundant in Cambrian and Ordovician seas; they became extinct in the Permian period (see GEOLOGICAL ERAS, table).

Trinidad and Tobago, officially Republic of Trinidad and Tobago, republic (1992 est. pop. 1,299,000), West Indies, N of Venezuela, comprising the islands of Trinidad (1,864 sq mi/4,828 sq km) and Tobago (116 sq mi/300 sq km). The capital is PORT OF SPAIN (on Trinidad). Trinidad is predominantly flat, with low mountains in the north; Tobago is mountainous and forested. The climate of both islands is warm and humid. More industrialized than most West Indian nations, the country exports chemicals, petroleum products, bananas, cocoa, and sugar; has natural gas resources under development; and derives income from tourism. Unemployment is high, however. More than half the people are of African descent, and most of the rest Asian Indian. English (the official language) and a French patois are spoken.

History. Trinidad was visited by COLUMBUS in 1498 and was a Spanish outpost until it was taken by Britain in 1797. Tobago, which had been held by the Dutch and French, became British in 1803, and the islands were joined politically in 1888. After a brief period in the WEST INDIES Federation, they became an independent state in 1962 and a republic with a parliamentary system of government in 1976. Prime Min. Eric Williams and his People's National Movement (PNM) dominated Trinidadian politics from independence until his death in 1981. In 1987 A.N.R. Robinson, leader of the National Alliance for Reconstruction, became prime minister. He survived an attempted coup in 1990, but discontent with his economic austerity program returned the PNM to power in 1991, and Patrick Manning become prime minister.



Trinity, fundamental doctrine of Christianity by which God is considered as existing in three persons—the Father, the Son (who became incarnate as JESUS), and the HOLY GHOST. The doctrine was defined very early, but received amplification at the first ecumenical councils.

Triple Alliance, War of the, 1865–70, fought by PARAGUAY against the alliance of ARGENTINA, BRAZIL, and URUGUAY. Paraguayan dictator Francisco Solano LÓPEZ imprudently declared war (1865) to revenge Brazil's military reprisals following Uruguay's civil war. Paraguay heroically defended itself against its larger, more powerful neighbors, but a large part of its male population was killed, and the country was devastated.

Triple Alliance and Triple Entente, two opposing international combinations of states that dominated Europe's history from 1882 until they came into armed conflict as the Central Powers and the Allies, respectively, in WORLD WAR I. Although there were numerous areas of contention between the two groups, the two principal problems that finally brought them to war involved rival claims in Morocco and the Balkans. The **Triple Alliance** was formed when the secret Dual Alliance of Germany and Austria-Hungary (1879) was joined by Italy in 1882. Serbia also joined in 1882, and Romania in 1883. Italy and Romania were never entirely comfortable within the alliance, however, and in fact both fought on the side of the Allies in the war. The **Triple Entente** followed the rapprochement (1890) between France and Russia and their secret Dual Alliance (openly acknowledged in 1895). In 1904, France and Britain, despite their traditional rivalry, formed the Entente Cordiale, which was brought about mainly because of their disquiet over German commercial and colonial imperialism. In 1907, Britain formally joined the Dual Entente, thereby converting it to the Triple Entente.

Tripoli, city (1984 pop. 990,697), capital of Libya, NW Libya, a port on the Mediterranean Sea. It is Libya's largest city and a commercial and industrial center. Manufactures include processed food and textiles. The city was founded (probably 7th cent. B.C.) by Phoenicians. It was captured by the Romans (1st cent. B.C.), the Vandals (5th cent. A.D.), and the Arabs (7th cent.). The Spanish took it in 1510, the Ottoman Turks in 1551. Tripoli became a major base of the Barbary pirates, whom the U.S. fought (1801–5) in the TRIPOLITAN WAR. It passed to Italy in 1911 and was taken (1943) by the British during WORLD WAR II. Some Roman monuments remain. In response to Libya's alleged support of terrorist activity, the U.S. bombed Tripoli in 1986.

Tripolitan War, 1800–1815, intermittent conflict between the U.S. and the BARBARY STATES. Piracy had long been a normal source of income in the N African Barbary States, and the U.S. adopted the practice, common to European nations, of paying tribute to buy immunity from pirate raids. When the pasha of Tripoli demanded (1800) more tribute than previously agreed upon, the U.S. refused payment and hostilities broke out. A settlement of sorts was effected in 1805, but tribute demands continued until 1815, when a squadron under DECATUR forced the dey of Algiers to sign a treaty renouncing the practice.

Tristan: see TRISTRAM AND ISOLDE.

Tristan da Cunha [trĭs'tăn də kōō'nə], group of volcanic islands (1991 est. pop. 300), S Atlantic, about midway between South Africa and South America. They were discovered by the Portuguese in 1506, annexed by Great Britain in 1816, and made a dependency of the British colony of SAINT HELENA in 1938. The inhabitants were evacuated to Britain following a volcanic eruption in 1961 but returned in 1963.

Tristram and Isolde, medieval romance. An Anglo-Norman version of c.1185 is the oldest extant. GOTTFRIED VON STRASSBURG wrote a German version c.1200. The story, originally independent, was later incorporated into ARTHURIAN LEGEND. The basic plot in all versions involves Tristram's journey to Ireland to bring Isolde back to Cornwall to be the bride of his uncle, King Mark. A potion the couple unknowingly swallow makes them fall in love. Modern treatments of the tale include those by SWINBURNE and Richard WAGNER.

tritium: see HYDROGEN.

Triton, in astronomy, natural satellite of NEPTUNE.

Triumvirate, in ancient Rome, ruling board or commission of three men. Triumvirates were common in the Roman republic. The **First Triumvirate** was the alliance of Julius CAESAR, POMPEY, and Marcus Licinius Crassus (see CRASSUS, family), formed in 60 B.C., but the alliance had no official sanction. The **Second Triumvirate**

was legally established by the senate in 43 B.C. and was renewed in 37 B.C. The members were Octavian (AUGUSTUS), Marc ANTONY, and Marcus Aemilius Lepidus (see LEPIDUS, family).

Trois Rivières or **Three Rivers,** city (1991 pop. 49,426), S Quebec, E Canada, at the junction of the St. Maurice and St. Lawrence rivers. It is one of Quebec's principal ports and industrial centers, with the manufacture of pulp and paper dominating the economy. Trois Rivières was founded in 1634 by CHAMPLAIN. It was a fortified port and a base for French exploration and missionary work in the interior during the 17th and 18th cent.

Trojan War, in Greek mythology, war between Greeks and Trojans. It began when PARIS abducted HELEN, wife of MENELAUS. Under AGAMEMNON, the Greeks besieged Troy for nine years. They finally won when, pretending to depart, they left a wooden horse, which the Trojans, ignoring the warnings of CASSANDRA and LAOCOÖN, took into the city. Warriors hidden in the horse opened the city gates to the Greek army, which sacked Troy. Among the Greek heroes were ACHILLES, Patroclus, ODYSSEUS, and Nestor; the Trojan heroes, led by HECTOR, included AENEAS, Memnon, and Penthesilea. The gods took a great interest in the war. HERA, POSEIDON, and ATHENA aided the Greeks, while APHRODITE and ARES favored the Trojans. The war's final year forms the main part of HOMER's *Iliad.* The Trojan War probably reflected a real war c.1200 B.C. over control of trade in the DARDANELLES.

Trollope, Anthony, 1815–82, English novelist. Although he did not publish his first novel until he was 40, he produced some 50 books, many written while he was working as a civil servant. Henry JAMES stated that Trollope's greatness lies in his "complete appreciation of the usual." His Barsetshire novels—among them *The Warden* (1855), *Barchester Towers* (1857), *The Small House at Allington* (1864), and *The Last Chronicle of Barset* (1867)—are a series of six books depicting, sometimes satirically, the lives of ordinary people in the fictional county of Barsetshire. Trollope's later novels are more concerned with politics and urban society. They include *Phineas Finn* (1869) and *The Prime Minister* (1876), two of the six Palliser novels. He also wrote travel books, and biographical and autobiographical works. His mother, **Frances Trollope,** 1780–1863, was also a novelist and travel writer.

trombone: see WIND INSTRUMENT.

Tropic of Cancer, parallel of LATITUDE at 23°27′ north of the EQUATOR. It is the northern boundary of the TROPICS and marks the farthest point north at which the sun can be seen directly overhead at noon. The sun reaches its vertical position over the Tropic of Cancer at about June 22, the summer SOLSTICE in the Northern Hemisphere.

Tropic of Capricorn, parallel of LATITUDE at 23°27′ south of the equator. It is the southern boundary of the TROPICS and marks the farthest point south that the sun can be seen directly overhead at noon. The sun reaches its vertical position over the Tropic of Capricorn at about December 22, the summer SOLSTICE for the Southern Hemisphere.

tropics, all the land and water of the earth between the TROPIC OF CANCER and the TROPIC OF CAPRICORN. The entire zone receives the sun's rays more directly than areas in higher latitudes, and therefore the average annual temperature is higher and seasonal changes in temperature are less. However, because of factors other than latitude (e.g., distance from the ocean, prevailing winds, elevation), several different climatic types are found, including rain forest, STEPPE, SAVANNA, and DESERT.

tropism, response of a plant or one of its parts, involving orientation toward (positive tropism) or away from (negative tropism) one or more external stimuli. For example, plant roots grow toward gravity and moisture and away from light. Other tropistic stimuli are heat, electricity, and chemical agents. The term *taxis* is applied to similar involuntary movements in animals and motile unicellular plants.

Trotsky, Leon [trôt'skē], 1879–1940, Russian revolutionary, a leader in the founding of the USSR; b. Lev Davidovich Bronstein. The son of a prosperous farmer, he became a Marxist in 1896. Exiled to Siberia in 1900, he escaped in 1902 with a passport bearing the name of one of his jailers, Trotsky. In London, with LENIN, he edited the Social-Democratic journal *Iskra* ("the spark"). After the 1905 RUSSIAN REVOLUTION he led the St. Petersburg SOVIET, or workers' council, but was soon arrested. In prison he formulated his theory of permanent revolution, predicting that in Russia bourgeois and socialist revolution would be combined and that worldwide proletarian revolution would follow. Escaping from Siberia again, he worked as a journalist in Vienna, Paris, and New York City. He returned to Russia in May 1917, and was a leading organizer of the Bolshevik seizure of power in Nov. 1917. In the new cabinet he was people's commissar for foreign affairs, but differences with Lenin over the Treaty of BREST-LITOVSK (1918) led him to resign. As people's commissar of war he organized the victorious Red Army in the civil war (1918–20). On Lenin's death (1924), Trotsky and STALIN were the chief rivals for succession. Stalin, general secretary of the party and a skilled infighter, opposed Trotsky's advocacy of world revolution with his plan for "socialism in one country." Trotsky was ousted as commissar of war (1925), expelled from the party (1927), and deported from the USSR (1929). Turkey granted him asylum. In 1933 he moved to France and in 1935 to Norway, which under Soviet pressure expelled him in 1936. In the Moscow treason trials (1936–38) he was accused of heading an anti-Soviet plot. Settling in Mexico City, he continued to oppose Stalinism in his writings, until his murder by Spanish-born Ramón Mercader.

troubadours, aristocratic poet-musicians (fl. late 11th–13th cent.) of S France (Provence). Their poems were sung in a dialect called *langue d'oc* and favorite subjects were courtly love, war, and nature. Many troubadours were noblemen and crusader knights; famous ones included Peire Vidal and Bertrand de Born. They declined after many were caught up in the Albigensian Crusade (see ALBIGENSES). Their counterparts in N France were called TROUVÈRES.

trout: see SALMON.

trouvères, medieval poet-musicians (fl. late 12th–13th cent.) of N and central France. The trouvères imitated the TROUBADOURS of the south. Their songs, written in a dialect called *langue d'oïl,* include love lyrics, romances, and the heroic CHANSONS DE GESTE.

Troy, ancient city of Asia Minor, also called Ilion or, in Latin, Ilium; known from Homer's account of the TROJAN WAR in the *Iliad.* Excavations by Heinrich SCHLIEMANN and others identified the site of the ancient city as the mound called Hissarlik, in Asian Turkey. It was established as a Phrygian city, with a culture dating from the BRONZE AGE.

troy weights: see ENGLISH UNITS OF MEASUREMENT; WEIGHTS AND MEASURES, table.

Trucial States: see UNITED ARAB EMIRATES.

Trudeau, Garry, 1948–, American cartoonist. Trudeau created the comic strip *Doonesbury* (1975; Pulitzer). The comic strip has addressed such controversial issues as Watergate, the drug culture, homelessness, and homosexuality, and some newspapers run *Doonesbury* on the editorial page. In 1983 he coauthored a stage version of the comic strip.

Trudeau, Pierre Elliott [trōōdō'], 1919–, prime minister of CANADA (1968–79, 1980–84). He served (1967–68) in Lester PEARSON's ministry and succeeded him as Liberal party leader and prime minister. His government pursued a policy of independence of U.S. influence and promoted Canada's control of its economy. Trudeau sought to redefine federal-provincial relations and to contain the QUEBEC separatist movement. Briefly out of office (1979–80) after the Conservatives won the 1979 election, he returned to power in 1980. That year he proposed a new constitution for Canada, independent of the British Parliament, and on Apr. 17, 1982, Queen Elizabeth II signed the CONSTITUTION ACT, 1982, which gave Canada complete independence.

Truffaut, François, 1932–84, French film director. His engrossing, often charming, films have great visual power. They include *The 400 Blows* (1959), *Jules and Jim* (1961), *Day for Night* (1973), and *The Last Métro* (1980).

truffle, edible, subterranean FUNGUS harvested commercially chiefly in W Europe, although there are hundreds of species in N America. Truffles are small, solid, fleshy SAPROPHYTES that usually grow close to the roots of trees in woodlands. The several species range in color from gray or brown to nearly black and have a piquant, aromatic flavor. The wild truffles of the forests of Périgord, France, have long been regarded as a delicacy, and their collection is an important industry. They are hunted with dogs and hogs, which are

able to scent them out underground. Truffles are cultivated in N Spain, France, and the U.S.

Trujillo Molina, Rafael Leonidas [trōōhē'yō mōlē'nä], 1891–1961, president of the DOMINICAN REPUBLIC (1930–38, 1942–52). After seizing power by an army coup (1930), he ran an efficient but ruthless dictatorship for 31 years until his assassination. He accomplished considerable material progress, but his terroristic methods led to unprecedented repression.

Truman, Harry S, 1884–1972, 33rd president of the U.S.; b. Lamar, Mo. He grew up on a farm near Independence, Mo., and served in World War I. In 1919 he married Elizabeth (Bess) Virginia Wallace; they had one daughter, Mary Margaret. After a decade in local Democratic politics, he was elected U.S. senator in 1934 and reelected in 1940. During World War II, he achieved national prominence as chairman of a committee investigating government spending. He was nominated for vice president in 1944 and elected along with Pres. Franklin D. ROOSEVELT. Roosevelt's death on Apr. 12, 1945, thrust Truman into the presidency at a crucial time—the closing days of World War II. After the war in Europe ended on May 8, Truman authorized the use of the ATOMIC BOMB against Japan at HIROSHIMA (Aug. 6) and NAGASAKI (Aug. 9). On Aug. 14, Japan surrendered. Truman's domestic program, essentially a continuation of Roosevelt's NEW DEAL, was frustrated by the resurgence of the Republicans, who won control of Congress in 1946. In foreign affairs, increasing tensions with the USSR resulted in the COLD WAR. Truman took increasingly tough stands. The Truman Doctrine (1947) was aimed at protecting Greece and Turkey from Communist domination. The MARSHALL PLAN (1947) was designed to effect the economic recovery of Western Europe. The NORTH ATLANTIC TREATY ORGANIZATION (1949) was a multinational defense plan. In the 1948 presidential election Truman won a stunning (and unexpected) victory over Thomas E. DEWEY. Foreign affairs also dominated his second term, particularly American involvement in the KOREAN WAR. Truman chose not to run for reelection in 1952 and retired to Independence. His term of office was marked by controversy from beginning to end. Among his controversial acts were his decision to use the atomic bomb, the "loss" of China to the Communists, and his firing of Gen. Douglas MACARTHUR during the Korean War. He was much respected for his plain speaking and for his ability to make hard decisions, however, and during the 1970s public opinion polls consistently showed him to be among the most admired of American presidents.

Trumbull, John, 1750–1831, American poet; b. Westbury, Conn. One of the CONNECTICUT WITS, he was the author of the satires *The Progress of Dulness* (1772–73) and *M'Fingal* (1775–82).

Trumbull, John, 1756–1843, American painter; b. Lebanon, Conn.; son of Gov. Jonathan Trumbull. He studied under Benjamin WEST in London and there began his life work, a series of historical paintings on the American Revolution. His small paintings, e.g., *Battle of Bunker's Hill* (1786), and his miniature studies for the series (the best done 1789–93) are among his finest works. Several of Trumbull's historical panoramas are in the CAPITOL rotunda.

Trump, Donald, 1946–, American businessman; b. N.Y.C. After attending the Wharton business school, he joined the family real estate business. He attracted public attention for his flamboyant dealings in real estate, casinos, sports, and transportation. Among his holdings are Trump Tower in New York City, and Trump Castle, Trump Plaza, and the Taj Mahal casino in Atlantic City.

trumpet: see WIND INSTRUMENT.

trust, corporate, in the U.S., a large-scale business combination. Typically, a corporate trust is created when stockholders in various enterprises assign control of these concerns to a single holding company and its board of trustees, thus eliminating competition. A *horizontal trust* combines corporations in the same line of business. A *vertical trust* controls all or part of a series of operations from the procurement of raw materials to the retailing of a product. By extension, the term *trust* has been applied to any very large business regarded as operating monopolistically in restraint of trade. See also ANTITRUST LAWS.

trusteeship, territorial, system (est. 1946) whereby nations administer dependent territories under the supervision of the UN Trusteeship Council. (See UNITED NATIONS, table). Its aim is to bring all territories to self-governing status. It succeeded the MANDATES system of the LEAGUE OF NATIONS. After World War II there were 11 trust territories; of these, all except Palau (administered by the U.S.) have now gained self-governing status.

Tryon, William, 1729–88, English colonial governor in North America. He was governor of North Carolina (1765–71), where he rigorously suppressed the REGULATOR MOVEMENT. He was also governor of New York (1771–78) during the AMERICAN REVOLUTION.

trypanosome, microscopic one-celled organism (PROTOZOAN) that usually lives as a parasite in the bloodstream of a vertebrate. Most undergo part of their development in the digestive tracts of insects that transmit the parasite with their bite. Some cause serious diseases in humans and animals, e.g., African sleeping sickness, caused by *Trypanosoma gambiense* and transmitted by the TSETSE FLY.

tsetse fly, any of several blood-sucking African FLIES. Several species transmit the TRYPANOSOME that causes African sleeping sickness in humans.

Tshombe, Moise Kapenda [chōm'bā], 1919–69, political leader in the Republic of the Congo (now ZAÏRE). When the Belgian Congo became independent in 1960, he became provisional president of the rich Katanga (now Shaba) province, which he proclaimed in secession from the rest of the Congo. He had strong Belgian backing, but eventually he was forced (1963) to capitulate. In 1964 he became premier of the Congo in a coalition government, but he was ousted in 1965 and went into exile. In 1967 he was kidnapped and taken to Algeria, where he died incommunicado.

Tsimshian, indigenous people of the Northwest Coast (see NORTH AMERICA, INDIGENOUS PEOPLES OF), probably with a Penutian language (see NATIVE AMERICAN LANGUAGES). They lived along the coast of British Columbia and Alaska, subsisting on codfish, halibut, and salmon, and also water and land mammals. Today the Tsimshian, on a reservation in their region, earn a living by fishing and forestry. In 1990 there were 2,432 Tsimshian in the U.S.

Tsin, dynasty: see CHINA.

Tsinan: see JINAN.

Tsingtao: see QINGDAO.

Tsiolkovsky, Konstantin Eduardovich [tsēōlkōv'skē] 1857–1935, Russian inventor and rocket expert. His most important theoretical work was concerned with the possibility of rocket flight into outer space. His *Investigation of Outer Space by Means of Reaction Apparatus* appeared in 1903. In 1929 he presented a design for a multistage rocket. He also conceived of artificial earth satellites, including manned space platforms.

Tsitsihar: see QIQIHAR.

Tsukuba Science City [tsōōkōō'bä], city (1984 est. pop. 34,000), central Honshu, Japan. Planned (1963) as a scientific research center, it was the site of a science exposition in 1985. Over 40 research facilities are there, including a high-energy physics laboratory and the Univ. of Tsukuba.

tsunami [tsōōnä'mē], **seismic sea wave,** or **tidal wave,** series of catastrophic ocean waves generated by earthquakes, volcanic eruptions, or landslides beneath the sea. In the open ocean tsunamis may have wavelengths of up to several hundred miles but heights of less than 3 ft (1 m). Because this ratio is so large, tsunamis can go undetected until they approach shallow waters along a coast. Their height as they crash upon the shore mostly depends on the geometry of the submarine topography offshore, but they can be as high as 100 ft (30 m) and cause severe damage and loss of life.

Tsushima Shuji: see DAZAI OSAMU.

Tsvetayeva or **Tsvetaeva, Marina Ivanovna,** 1892–1941, Russian poet. She was a major Russian poet, who survived the civil war, emigrated to Prague and Paris, and returned to Russia (1939). She wrote on a variety of subjects, using language and rhythms skillfully. Particularly noteworthy are her longer poems *Poem of the Mountain* (1926), *Poem of the End* (1926), and *Ratcatcher* (1925–26). Her works were not published in the USSR until 20 years after her death.

Tuareg, nomadic BERBERS of the Sahara, numbering about 800,000. Nominally Muslim, they have their own language and alphabet and have traditionally maintained a feudal society. Fiercely independent and in control of the trans-Saharan trade in slaves gold, and ivory for hundreds of years, they resisted European conquest. Dur-

The key to pronunciation appears on page xiii.

ing the 1970s drought, many starved or were forced to leave the desert. Groups of Tuaregs have fought for autonomy from Niger and Mali since the 1980s.

tuatara or **tuatera,** lizardlike REPTILE (*Sphenodon punctatus*), last survivor of the order Rhynchocephalia, which flourished in the early Mesozoic era before the rise of DINOSAURS. Also called sphenodon, it lives on a few islands off New Zealand, where it is protected. The olive-colored, yellow-speckled tuatara reaches 2 ft (60 cm) or more in length and has a spiny crest down its neck and back.

tuba: see WIND INSTRUMENT.

tuber, enlarged tip of a RHIZOME (underground STEM) that stores food. Tubers, although modified, contain all the usual stem parts—BARK, WOOD, pith, and nodes.

tuberculosis, contagious disease caused by the bacterium *Mycobacterium tuberculosis,* identified by Robert KOCH in 1882. Also known as TB and consumption, the disease primarily affects the lungs, although the intestines, joints, and other parts of the body may also become infected. It is spread mainly by inhalation, occasionally by ingestion through contaminated foods (e.g., unpasteurized milk) and utensils. Symptoms as the disease progresses include fever, weakness, loss of appetite, and, in the pulmonary form, cough and sputum. The incidence of tuberculosis—once affecting millions—greatly decreased in many developed countries with improved sanitation, early detection through X rays and skin tests, and antituberculosis drugs, but in the late 1980s the number of cases began to rise, particularly among AIDS patients, the poor, and immigrants from developing countries. Another troubling development was the spread of strains resistant to isoniazid, the drug most often used in treatment. A vaccine, Bacillus Calmette Guérin (BCG), that confers partial, temporary immunity is given by the World Health Organization to high-risk children.

Tubman, Harriet, c.1820–1913, African-American ABOLITIONIST; b. Dorchester co., Md. A slave, she escaped in 1849 and became one of the most successful "conductors" on the UNDERGROUND RAILROAD, leading more than 300 slaves to freedom. She was a friend of leading abolitionists and worked for Union forces during the Civil War as a laundress, nurse, and spy.

Tuchman, Barbara W(ertheim), 1912–89, American historian; b. N.Y.C. She won the Pulitzer Prize for history twice, for *The Guns of August* (1962), about the onset of WORLD WAR I, and for *Stilwell and the American Experience in China* (1971). Her other works include *The Zimmermann Telegram* (1958); *A Distant Mirror* (1978), a study of the 14th cent.; and *Practicing History* (1982), an essay collection.

Tucker, Richard, 1914–75, American tenor; b. Brooklyn, N.Y. He made his debut at the METROPOLITAN OPERA (1945) and became one of its leading lyric tenors in French and Italian operas.

Tucson, city (1990 pop. 405,390), seat of Pima co., SE Ariz.; inc. 1877. Located in a desert valley surrounded by mountains, it has a dry, sunny climate and is a tourist center. It also has electronic, optic, aerospace, and research industries, and processes and distributes the area's cotton and livestock. Copper mining is important in the area. The present city was established (1776) as a walled presidio. It was transferred to the U.S. by the GADSDEN PURCHASE (1853). Points of interest include the nearby San Xavier mission (present building 1783–97), the Arizona-Sonora Desert Museum, the Univ. of Arizona, and several military bases.

Tudor, royal family that ruled England (1485–1603). Its founder was a Welshman named Owen Tudor who married CATHERINE OF VALOIS, the widow of HENRY V. Their son Edmund married Margaret Beaufort (a descendant of JOHN OF GAUNT) and had a son Henry, who assumed the Lancastrian claims to the throne. Henry defeated RICHARD III at Bosworth Field and became (1485) king as HENRY VII. By his marriage to Elizabeth of York, Henry united the Lancastrian and Yorkist claims. Of his children, MARGARET TUDOR married JAMES IV of Scotland, Mary of England married LOUIS XII of France, and Henry succeeded him as HENRY VIII. Three of Henry VIII's children, EDWARD VI, MARY I, and ELIZABETH I, ruled England. The Tudors strengthened the English monarchy and witnessed a flowering of culture. The accession (1603) of JAMES I, a descendant of Margaret Tudor, began the STUART dynasty.

Tudor, Antony, 1909–87, English choreographer and dancer. He was influenced by expressionism and the MODERN DANCE idiom, and is known for the psychological dramas, e.g., *Romeo and Juliet* (1942), *Undertow* (1945), and *The Tiller in the Fields* (1978), he has created for the AMERICAN BALLET THEATRE (ABT) and other companies. He was ballet director at the Metropolitan Opera (1957–63) and associate director of the ABT (1974–1980).

Tudor style, phase of English architecture and decoration in the reigns (1485–1558) of Henry VII, Henry VIII, and Mary I, a transitional style between Gothic Perpendicular and Palladian. Manor houses, built for the new trading families, exhibit the style's characteristics of greater domesticity and privacy: rooms multiplied as the great hall's importance diminished; oak-paneled interiors had plaster relief ornament; furniture increased. Exteriors showed modified perpendicular features, e.g., square-headed, mullioned windows. Brickwork combined with half-timber, high pinnacled gables, and numerous chimneys to create a distinctive look. Principal Tudor examples are parts of Hampton Court Palace (begun 1515) and some colleges of Oxford and Cambridge.

Tuesday: see WEEK.

Tu Fu [dōō fōō], 712–70, Chinese poet, considered the greatest Chinese poet. Pervaded by an ironic awareness of spiritual and social decay, his poetry expresses bitterness over his poverty-stricken life and laments the sufferings of the poor and the corruption and cruelty of the imperial court.

Tuileries [twēˈlərēz], former palace in Paris. Planned by Catherine de' Medici and begun (1564) by Philibert DELORME, it occupied part of the present Tuileries gardens. It was rarely used until 1789, when Louis XVI was forced to move there from Versailles (see FRENCH REVOLUTION). Napoleon I made it his chief residence, as did his successors. The palace was destroyed by fire during the COMMUNE OF PARIS (1871). The formal gardens, by LENÔTRE, remain, affiliated with the LOUVRE.

tulip, hardy plant (genus *Tulipa*) of the LILY family, native from the Mediterranean to Japan and widely cultivated by the Dutch. Tulips, which are grown from BULBS, have deep, cup-shaped flowers of many rich colors. Said to have been introduced into Europe from Turkey in 1554, they were objects of wild financial speculation in 17th-cent. Holland.

tulip tree: see MAGNOLIA.

Tull, Jethro, 1674–1741, English agriculturist and inventor. He advocated the use of manures, pulverizing the soil, planting with drills, and thorough tilling of the soil during the growing period. He invented (c.1701) a mechanical drill for sowing.

Tully: see CICERO.

Tulsa, city (1990 pop. 367,302), seat of Tulsa co., NE Okla., on the Arkansas R.; inc. 1898. It is a major center of the U.S. oil industry, with refineries and business and research offices; aerospace and metal-processing industries are also important. Tulsa grew after the coming of the railroad in 1882 and boomed when oil was discovered nearby in 1901. A waterway connecting the city with the Gulf of MEXICO was opened in 1971, making the city an inland port.

tumbleweed, plant that breaks from its roots at maturity, dries into a rounded tangle of branches, and rolls long distances with the wind, scattering seeds as it goes. Tumbleweeds are especially abundant in PRAIRIE and STEPPE regions. One of the most common is the Russian thistle (*Salsola pestifer*), not a THISTLE but a member of the goosefoot family. Native to Asia, it is a pest on the prairies of the W U.S.

tumor or **neoplasm,** tissue composed of cells that grow in an abnormal way; it may be benign or malignant. Normal tissue contains feedback controls that allow for tissue repair but do not permit expansion once a certain number of cells have developed. Tumor cells, lacking such feedback controls, proliferate and monopolize body nutrients. Benign tumors, which differ from normal tissue in structure, grow excessively and, although rarely fatal, may grow large enough to interfere with normal functioning and require surgical removal. Malignant tumors (see CANCER) also grow excessively, but their cells lack the biological controls that normally keep cells specialized; these cells can infiltrate surrounding normal tissue and may later spread (metastasize) via BLOOD and the LYMPHATIC SYSTEM to other sites. Both benign and malignant tumors are classified according to the type of tissue in which they are found. For example, fibromas are neoplasms of fibrous connective

tissue, and melanomas are abnormal growths of pigment (melanin) cells.

tuna or **tunny,** largest FISH of the MACKEREL family. Hunted as game and food, the family includes the little tuna (10 lb/4.5 kg) of the Atlantic, the most important commercially; the bluefin tuna (*Thunnus thynnus*), the giant of bony fishes (200–500 lb/90–225 kg); and the Pacific albacore (up to 60 lb/27 kg), marketed as "whitemeat tuna."

tundra, treeless plains to the north of the coniferous forest belt in N North America and N Eurasia. For most of the year the mean monthly temperature is below the freezing point. Winters are long and severe, and mean monthly summer temperatures rarely exceed 50°F (10°C). Precipitation is slight and evenly distributed throughout the year. The underlying subsoil (permafrost) is always frozen. Mosses, lichen, and some flowering plants grow during the brief summer, and the few large animal species include the caribou, arctic fox, and snowshoe rabbit. The tundra is a fragile, easily disturbed ecosystem.

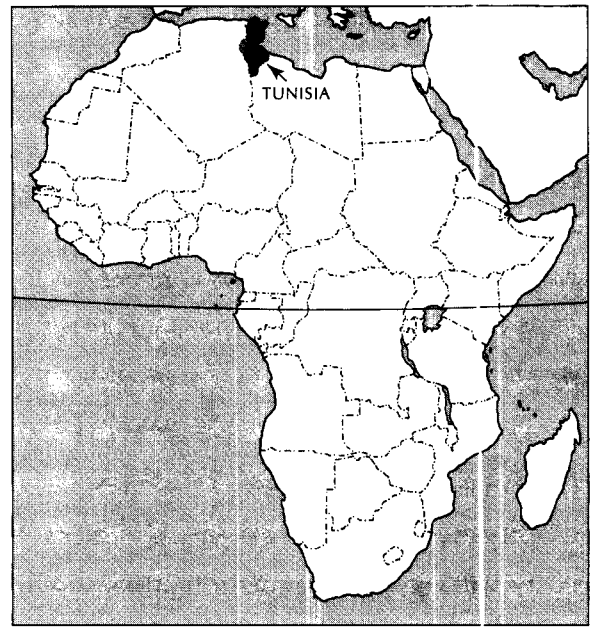
tungsten (W) or **wolfram,** metallic element, first isolated in 1783 by the de Elhuyar brothers. It is a silver-white to steel-gray, very hard, ductile metal (one of the most dense) and has a higher melting point than any other metal. Tungsten is used for wires and for filaments for light bulbs and electronic tubes. Tungsten STEELS are hard and strong at high temperatures. Tungsten carbide is used in place of diamond for dies and as an abrasive. See ELEMENT (table); PERIODIC TABLE.

tunicate, marine CHORDATE with a resemblance in the larval stage to VERTEBRATES. Familiar tunicates are the sea squirts, or ascidians, sedentary filter-feeders with cylindrical bodies, usually found attached to rocks. The tunic, or thick vest, for which they are named, is transparent or translucent and composed of CELLULOSE, a material extremely rare in the animal kingdom. Some tunicates have gelatinous containers called houses instead of tunics.

Tunis, city (1984 pop. 596,694), capital of Tunisia, NE Tunisia, on the Lake of Tunis. Its major products include textiles, carpets, and olive oil; tourism is important economically. The city has notable mosques, the Univ. of Tunis (1960), and a national museum. The ruins of CARTHAGE are nearby. Tunis is probably pre-Carthaginian; it became the capital of Tunisia under the Hafsid dynasty (13th–16th cent.). After the Turks took the city in 1534, Tunis prospered as a center of piracy and trade. French occupation lasted from 1881 to 1956. Tunis was an important base during World War II. From 1979 to 1990 it was the headquarters of the ARAB LEAGUE.

Tunisia, Fr. *Tunisie,* officially Republic of Tunisia, republic (1992 est. pop. 8,446,000), 63,378 sq mi (164,150 sq km), NW Africa, bordered by Algeria (W), the Mediterranean Sea (N and E), and Libya (SE). TUNIS is the capital. The ATLAS MOUNTAINS in the north form a dry plateau that merges with fertile plains near the coast; in the south, below the Chott Djerid and other salt lakes, stretches the SAHARA desert. The irregular coastline has several fine harbors. Agriculture is the mainstay of the economy, but mining and tourism are important. Wheat, barley, grapes, olives, sugar beets, citrus fruits, and dates are the leading crops, and phosphates and petroleum are the principal minerals. Manufactured goods include steel, textiles, and processed food. Remittances from Tunisians working abroad, particularly in France, are an important source of foreign currency. The population is largely Berber and Arab, and Islam is the dominant religion. Arabic the official language, although French is widely spoken.

History. Settled in the 12th cent. B.C. by Phoenicians, Tunisia became (6th cent. B.C.) the center of the powerful city-state of CARTHAGE, which was destroyed by Rome in 146 B.C. Taken by the Vandals (5th cent. A.D.) and the Byzantines (6th cent.), the Arabs conquered Tunisia in the 7th cent., and the Berber population was converted to Islam. The area came under a succession of Muslim rulers, reaching its peak under the Berber Hafsid dynasty (c.1230–1574). In the late 16th cent. Tunisia was seized by the Ottoman Turks, and as one of the BARBARY STATES it became a stronghold of pirates, on whom the treasury depended for several centuries. European intervention began in the 19th cent., and in 1881 Tunisia became a French protectorate. Nationalist agitation, which first surfaced in the 1920s, became intense after World War II, and independence was achieved in 1956. In 1957 the country became a republic, with Habib BOURGUIBA as president. Under Bourguiba, who was elected president-for-life in 1975, Tunisia was a moderate Arab state, following a generally pro-Western foreign policy; support for a negotiated settlement with Israel strained the country's relations with its Arab neighbors, however. Domestically, Bourguiba emphasized modernization and planned economic growth. In 1981 he authorized the legal formation of opposition political parties, indicating a possible shift in the direction of liberal democracy. In 1987 Bourguiba was deposed, on grounds of senility, by Gen. Zine el-Abidine BEN ALI, who promised continued democratic reform, but he has ruled in an increasingly autocratic fashion and sought to crush Islamic-fundamentalist opposition to his government. In recent years relations with Libya have improved, and Tunisia joined with its North African neighbors in forming (1989) the Arab Maghreb Union (see under MAGHREB).



tunneling, in physics, quantum-mechanical effect by which a particle can pass through a barrier that the particle has insufficient energy to overcome, a process forbidden by ordinary classical mechanics. Tunneling results from the wavelike properties of particles; the wave associated with the particle "decays" through the barrier—the wave's amplitude decreases—but the amplitude of the wave on the other side of the barrier is large enough that there is a finite probability of finding the particle there. The tunnel DIODE was the first convincing demonstration of tunneling in solids. Tunneling between two superconducting materials is known as the Josephson effect.

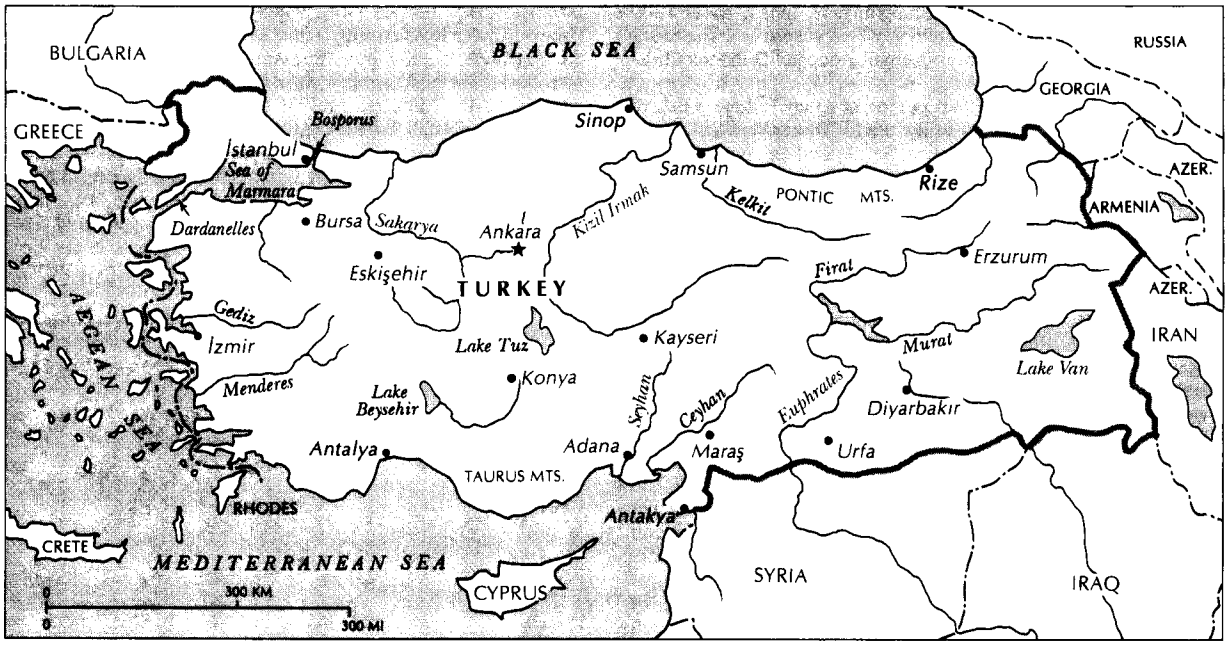
Tunney, Gene (James Joseph Tunney), 1898–1978, American boxer; b. N.Y.C. He won (1922) the light-heavyweight title over Battling Levinsky, but lost it that same year (to Harry Greb) in his only defeat as a professional. In 1926 he defeated Jack DEMPSEY for the heavyweight championship and repeated his victory in 1927. He retired as champion in 1928.

Tupac Amaru [tōōpäk'ämä'rōō], 1742?–81, Spanish-American reformer and revolutionary of Inca descent. He led an unsuccessful revolt (1780) in what is now Peru against Spanish suppression of the indigenous people and was captured and executed. Many of the reforms he fought for were eventually granted.

tupelo: see BLACK GUM.

Tupí: see GUARANÍ.

turbine, rotary engine that uses a continuous stream of fluid (gas or liquid) to turn a shaft that can drive machinery. In the **hydraulic turbines** used in hydroelectric power stations, falling water strikes a series of blades or buckets attached around a shaft, causing the



shaft to rotate, this motion in turn being used to drive the rotor of an electric GENERATOR. In a **steam turbine,** high-pressure steam forces the rotation of disks attached to a shaft. Steam turbines are used to drive most large electric generators and ship propellers. The term **gas turbine** is usually applied to a unit whose essential components are a COMPRESSOR, a combustion chamber, and a turbine. The turbine drives the compressor, which feeds high-pressure air into the combustion chamber; there it is mixed with a fuel and burned, providing high-pressure gases to drive the turbine. In a turboprop engine, the turbine is used to turn a propeller as well as the compressor. In a turbojet engine, the gases first drive the turbine and then are expelled from the engine to provide propulsion. Gas turbines are used mainly as aircraft engines (see JET PROPULSION).

turbulence, in physics, a state of constant, irregular change in the flow of a fluid. Turbulence is characteristic of systems that consist of large numbers of particles, and its unpredictability and randomness long thwarted attempts to understand it. Developments in NONLINEAR DYNAMICS have led to an understanding of the onset of turbulence, and the use of SUPERCOMPUTERS has resulted in improved modeling of turbulent states. Until the early 1970s it was held that laminar, or smooth, flow became turbulent through a gradual increase in instability until the flow became unpredictable. Experimental work, however, has shown that the onset of turbulence occurs abruptly.

Turgenev, Ivan Sergeyevich [tōōrgā'nyĭf], 1818–83, Russian novelist, short-story writer, and dramatist. Born to a landowning family, he first achieved literary success with "Khor and Kalinich" (1847), a story of peasant life included in *A Sportsman's Sketches* (1852); the book may have figured in ALEXANDER II's abolition of serfdom. In 1850 Turgenev wrote his best-known play, *A Month in the Country;* it was to influence CHEKHOV. The novels *Rudin* (1855), *A Nest of Gentlefolk* (1859), and *On the Eve* (1860) were followed by his masterpiece, *Fathers and Sons* (1861); like his other novels, it is a study of the intelligentsia. His later works include the novels *Smoke* (1867) and *Virgin Soil* (1877), and such stories as "First Love" (1870).

Turgot, Anne Robert Jacques [türgō'], 1727–81, French economist and statesman. As intendent of Limoges (1761–74) he won acclaim for his policies of encouraging new agricultural methods, free trade, and industry. In 1774 he became controller general of finances under LOUIS XVI and tried thereafter to enact stringent reforms. His six edicts (1776), which included the abolishment of guilds and the proposed taxation of all landowners, aroused the opposition of vested interests and forced his resignation (1776). Turgot was also a contributor to the ENCYCLOPÉDIE.

Turin, city (1990 pop. 1,002,863), capital of PIEDMONT, NW Italy. An industrial center and transportation hub, it produces motor vehicles, textiles, and machinery. Rome, the Lombards, and the Franks held it, and it became (12th–13th cent.) a free commune. It passed to the house of SAVOY c.1280, and became, in turn, capital of Savoy (after 1562), of the kingdom of Sardinia (1720–1861), and of the new Italian kingdom (1861–64). It suffered heavy damage in World War II; most of the important buildings that remain date from the 17th–19th cent.

Turing, Alan Mathison, 1912–54, British mathematician and computer theorist. His early work in predicate logic led to a proof (1937) that some mathematical problems are not susceptible to solution by automated computation. During World War II, he was instrumental in breaking the German Enigma cipher. After the war he helped design computers and did groundwork in the field of ARTIFICIAL INTELLIGENCE. See also TURING TEST.

Turing test, a procedure to test whether a computer is capable of humanlike thought. As proposed (1950) by British mathematician Alan TURING, a person sits with a teletype machine isolated from two correspondents—one is another person, one is a computer. By asking questions through the teletype and studying the responses, the isolated person tries to determine which correspondent is human and which the computer. If that proves impossible, the computer is credited with having passed the test.

Turkey, Turk. *Türkiye,* officially Republic of Turkey, republic (1990 pop. 56,969,109), 301,380 sq mi (780,574 sq km), SW Asia and SE Europe, bordered by Iraq, Syria, and the Mediterranean Sea (S), the Aegean Sea (W), Greece and Bulgaria (NW), the Black Sea and Georgia (N), and Armenia and Iran (E). Major cities include ANKARA (the capital), ISTANBUL, IZMIR, and ADANA. Asian Turkey, which constitutes 97% of the country, is separated from European Turkey by the BOSPORUS, the Sea of Marmara, and the DARDANELLES. European Turkey is largely rolling agricultural land, while Asian Turkey is mostly highland and mountains, with narrow lowland strips along the seacoasts. The economy is basically agricultural, but industrialization has been emphasized since the late 1940s. Chief crops include wheat and other cereals, cotton, tobacco, and fruit; livestock raising is important. Leading manufactures are textiles, processed foods, iron and steel, petroleum, cement, chemicals, and forest products. Coal and lignite, chromium, copper, iron, antimony, and mercury are mined; some petroleum is produced. Turkey is also noted for its carpets, Meerschaum pipes, and pottery.

The Turks, a highly composite ethnic mixture, mostly speak Turkish; there is a sizable Kurdish minority (see KURDISTAN). The country is almost entirely Muslim, with small groups of Orthodox Christians and other religions.

History. Anatolia, the western portion of Asian Turkey, is one of the oldest inhabited regions in the world. Turkey was part of the Hittite, Persian, Roman, Byzantine, Seljuk, and Ottoman empires. However, Turkey's history as a national state does not begin until after WORLD WAR I, when the Treaty of Sèvres (1920) reduced the once mighty OTTOMAN EMPIRE to insignificance. In 1923 the present boundaries of Turkey (except for Alexandrette, acquired in 1939) were established and Turkey was formally proclaimed a republic, with Kemal ATATÜRK as its first president. During the 15 years of his authoritarian rule, the country's political and economic structure as well as its religious and social bases were transformed. Islam ceased to be the state religion; the Latin alphabet replaced Arabic script; new industries were developed under state ownership; and women were emancipated. When Kemal died (1938), Turkey was becoming a Western-style state. Ismet İnönü, who succeeded Atatürk, kept Turkey neutral during most of WORLD WAR II; it joined the Allies only in Feb. 1945. Turkey became a member of NATO in 1952 and permitted the establishment of U.S. military bases. Political turmoil in the 1950s resulted in a military coup (1960), and a new constitution in 1961 created the second Turkish republic. Civilian rule returned in 1973. Clashes between the left and right increased during the late 1970s, and in 1980 the armed forces, led by Gen. Kenan Evren, once again seized power. A new constitution was approved by Turkish voters in 1982, and Evren was elected to a seven-year term as president. He was succeeded by Turgut Özal, a conservative politician, in 1989. Parliamentary elections in 1991 ousted Özal's Motherland party from government and shifted power to the new prime minister, Süleyman DEMIREL, of the conservative True Path party. Pres. Özal died in 1993 and was succeeded by Demirel and Tansu Çiller became prime minister, the first woman to hold that post. Tension with Greece has been a chronic problem. In 1974 a Greek-oriented coup in CYPRUS prompted Turkey to invade and occupy part of that island; war between Greece and Turkey was averted only by U.S., British, and UN intervention. Since the mid-1980s there has been fighting in SE Turkey between government forces and Kurdish guerrillas.

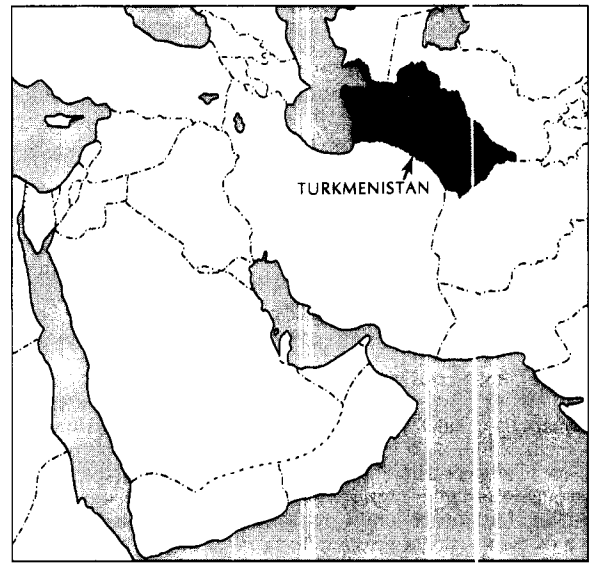
turkey, large, nonmigratory game and poultry bird of the family Meleagrididae, related to the GROUSE and PHEASANT. Turkeys are indigenous to the New World, where fossils date back to the Oligocene era. The domestic turkey is descended from the Mexican turkey, taken to Europe by CONQUISTADORS in the 16th cent. The wild turkey is a woodland bird, gregarious except at breeding time, and a good flier.

Turkic [tûr'kĭk], group of languages forming a subdivision of the Altaic subfamily of the URALIC AND ALTAIC family of languages. See LANGUAGE (table).

Turkish language, member of the Turkic subdivision of the Altaic subfamily of the URALIC AND ALTAIC family of languages. See LANGUAGE (table).

Turkmenistan or **Turkmenia,** republic (1992 est. pop. 3,838,000), 188,455 sq mi (488,100 sq km), central Asia, formerly a constituent republic of the USSR. It borders Afghanistan and Iran (S); Uzbekistan and Kazakhstan (E, NE); and the Caspian Sea (W). The capital is ASHGABAT (Ashkhabad); other important cities include Chardgov, Nebitdag, Dashhowuz, and Mary (Merv). The Kara Kum desert occupies 90% of the country; the Kara Kum canal provides irrigation and hydroelectricity. Turkmenistan's natural gas desposits have made it one of the wealthiest of the former Soviet states; among its other resources are oil, salt, phosphate, mirabilite, and sulfur. Karakul sheep (whose wool is made into carpets), cattle, and other livestock are raised, and silkworms are bred. Cotton is the chief crop; others include grains, sesame, and wine grapes. Industries include metalworking, oil refining, and many agriculturally related manufactures. The Turkmens (or Turkomans), a Sunni Muslim, Turkic-speaking people, comprise 60% of the population; other groups include Russians, Uzbeks, Kazakhs, and Tatars. Turkmen is the official language, and Russian is widely spoken.

History. Turkmenistan was part of the kingdom of ancient Persia and was later (8th–19th cent.) ruled by the Arabs, the Seljuk Turks (see KHOREZM), JENGHIZ KHAN, TIMUR and the TIMURIDS, and the Uzbeks. Under Russian rule from 1881, the area initially resisted the Bolsheviks but fell to the Red Army by 1920. In 1925 the Turkmen Soviet Socialist Republic was formed from Turkmenian portions of Soviet Turkistan. In 1991 the republic's parliament declared Turkmenistan independent following a referendum; after the Soviet Union collapsed, the republic joined the COMMONWEALTH OF INDEPENDENT STATES. The former Communist party has retained its hold on power in Turkmenistan, although there has been some movement toward privatizing the economy. Pres. Saparmurad Niyazov was reelected in 1992; he was the only candidate in the election.



Turks, Turkic-speaking peoples found today in Turkey, the Soviet Union, Chinese Turkistan, Iran, and Afghanistan, totaling 73 million. Of widely varying histories and ethnic intermixtures, the different groups vary greatly in appearance and culture, being unified chiefly by linguistic affinity and social organization. The name Turk was first used in the 6th cent. by the Chinese for a nomadic people whose empire stretched from Mongolia to the Black Sea. Turkic peoples controlled this vast area until 924. The most important Turkic groups in the history of W Asia and Europe were the Seljuks and the Ottoman Turks. After the Turks adopted ISLAM, they began migrating in great numbers to the Middle East. By 1055 the Seljuks had conquered Iran; by 1071 they controlled Armenia, Syria, and much of Asia Minor. In the 12th cent. the Seljuk empire broke up into independent states that were overrun in the next century by JENGHIZ KHAN. After the Mongol wave receded, the Osmanli Turks completed the overthrow of the BYZANTINE EMPIRE, and in the 14th and 15th cent. they created the vast OTTOMAN EMPIRE. See also BULGARS, EASTERN; CUMANS; GOLDEN HORDE, EMPIRE OF THE; KHAZARS; TATARS; UIGURS.

Turks and Caicos Islands [kī'kōs], British dependency (1992 est. pop. 12,700), 166 sq mi (430 sq km), a group of over 30 cays and islands SE of the Bahamas. The capital, Jamestown, is on Grand Turk. Offshore banking and tourism are the economic mainstays; lobster and conch the primary exports. The population is largely of African descent.

turmeric: see GINGER.

Turner, Frederick Jackson, 1861–1932, American historian; b. Portage, Wis. He taught at the Univ. of Wisconsin (1885–1910) and Harvard (1910–24). His address "The Significance of the Frontier in American History," delivered before the American Historical Association in 1893, was an epoch-making work that opened up new and important fields for historical study. His other works include *The Rise of the New West* (1906) and *The Significance of Sections in American History* (1932).

Turner, John Napier, 1929–, prime minister of Canada (1984). A Liberal, he entered parliament in 1962 and served in various ministerial posts after 1968. When Prime Min. TRUDEAU resigned in 1984, Turner succeeded him. The Liberals were soundly defeated in elections several months later; Turner remained party leader until 1990.

Turner, Joseph Mallord William, 1775–1851, English landscape painter, the foremost English romantic painter and the most original of English landscape artists. He began exhibiting at the Royal Academy at the age of 16. He had a remarkable ability to distill the best from the tradition of landscape, and he traveled constantly, making inspirational sketches. His *Sun Rising through Vapor* (National Gall., London) shows Dutch influence, whereas *Crossing the Brook* (Tate Gall., London) shows the influence of CLAUDE LORRAIN. Despite his success, Turner lived the life of a recluse, maintaining a large gallery for exhibiting his works. His painting became increasingly abstract as he strove to portray light, space, and the elemental forces of nature. Characteristic of his later period is *Rain, Steam, and Speed* (National Gall., London). His late Venetian works, which describe atmospheric effects with brighter colors, include *The Grand Canal* (Metropolitan Mus.) and *Approach to Venice* (National Gall., Wash., D.C.). He encountered criticism as his style became increasingly free, but was defended by Sir Thomas LAWRENCE and the youthful RUSKIN. He left more than 19,000 watercolors, drawings, and oils to the nation.

Turner, Nat, 1800–1831, African-American slave and revolutionary; b. Southampton co., Va. Believing himself divinely appointed to lead his fellow slaves to freedom, he commanded about 60 followers in a revolt (1831) that killed 55 whites. Although the so-called Southampton Insurrection was quickly crushed and Turner was caught and hanged six weeks later, it was the most serious uprising in the history of U.S. slavery and virtually ended the organized abolition movement in the South.

Turner, Ted (Robert Edward Turner III), 1938–, American television broadcasting executive; b. Cincinnati. He founded (1976) a television station, WTBS, and built it into the Turner Broadcasting System, including (1980) the Cable News Network (CNN), (1988) a movie channel, and (1992) the Cartoon Network. He also owns the Atlanta Braves baseball team and Atlanta Hawks basketball team and won the 1977 *America*'s Cup yachting race. He married Jane FONDA in 1991.

turnip, garden vegetable of the same genus (*Brassica*) of the MUSTARD family as the CABBAGE, native to Europe. Grown for its edible green leaves (greens) and its nutritious rounded primary root, it is also used as stock feed. The two principal kinds are the white (*B. rapa*) and the yellow (*B. napobrassica*), also known as rutabaga or Swedish turnip.

turpentine, yellow to brown semifluid oleoresin (see RESIN) exuded from the sapwood of pines, firs, and other conifers. It consists of an ESSENTIAL OIL (oil of turpentine) and a type of resin called rosin. Commercial turpentine is oil of turpentine with the rosin removed. When pure, it is a colorless, transparent, oily liquid with a penetrating odor and characteristic taste. Turpentine is used chiefly as a solvent and drying agent in paints and VARNISHES.

turquoise, hydrous aluminum and copper phosphate mineral [$Al_2(OH)_3PO_4{\cdot}H_2O$ + Cu]. Usually found in microscopic crystals, it is opaque with a waxy luster, varying in color from greenish gray to (gem-quality) sky blue. Because of their porosity, the gem varieties absorb dirt and grease, changing the color to an unattractive green; exposure to heat or sunlight can also harm the color. The finest specimens are from Iran; other sources are the Sinai peninsula and the SW U.S.

turtle, REPTILE (order Chelonia) with an armorlike shell and strong, beaked, toothless jaws. Turtles are found throughout most of the temperate and tropical world. The land-living species are commonly called TORTOISES; the name *terrapin* is generally applied to large freshwater or brackish water species. Turtles range in length from a few inches to over 7 ft (11 m); many specimens have lived over 50 years in captivity. The 200 to 300 species of turtle are classified in 12 families. The largest family of the Northern Hemisphere is the family of common freshwater turtles (Emydidae). Turtles are the oldest living group of reptiles, dating back to the time of the earliest DINOSAURS.

Tuscany region (1990 pop. 3,560,582), 8,876 sq mi (22,989 sq km), N central Italy, bordering on the Tyrrhenian Sea in the W. FLORENCE is the capital. The region is mostly hilly and mountainous. There is much industry, but farming is also important. Tuscany's Chianti wine is world famous. The region was the home of the ETRUSCAN CIVILIZATION and was conquered (mid-4th cent. B.C.) by the Romans. In the 11th and 12th cent. many cities became free communes, and some (PISA, Lucca, SIENA, and Florence) developed into strong republics. Under the MEDICI, the ruling family of Florence, Tuscany became (1569) a grand duchy. In 1860 it voted to unite with Sardinia and became (1861) part of the new kingdom of Italy. The area was a leading cultural center in the Renaissance.

Tuscarora: see IROQUOIS CONFEDERACY.

Tussaud, Marie Gresholtz [tōōsō'], Swiss modeler in wax. While imprisoned in France during the REIGN OF TERROR, she modeled heads of famous persons, using heads from decapitated bodies. In 1802 she inherited her uncle J.C. Curtius's wax museum and immigrated to London, where she established Madame Tussaud's Exhibition, a museum that remains a major tourist attraction.

Tutankhamen or **Tutenkhamon** [tōōt"ängkä'mən, –ĕngk–], fl. c.1350 B.C., Egyptian king of the XVIII dynasty; son-in-law of IKHNATON. Ikhnaton had replaced the god AMON with Aton; under Tutankhamen this movement ended, and the capital was moved back to THEBES, sacred to Amon. Tutankhamen's tomb was found (1922) almost intact by Howard CARTER and the earl of CARNARVON, providing great impetus to Egyptology.

Gold mummy case from tomb of Tutankhamen

Tutsi or **Watutsi,** cattle-raising people of central Africa; they are also known as Watusi or Batusi. An aristocratic people, they are a minority in both RWANDA and BURUNDI, countries that are former Tutsi kingdoms. The Tutsi, who probably originated in Ethiopia, long held the peasant Hutu in feudal subjugation. In the 1970s, 80s, and 90s, despite much integration of Tutsi and Hutu culture, many members of both tribes died in bloody fighting in Burundi and Rwanda. The Tutsi are spectacularly tall, often over 7 ft (2.1 m) in height.

Tutu, Desmond Mpilo, 1931–, South African religious leader. He was the first black to be Anglican dean of Johannesburg (1975), general secretary of the South African Council of Churches (1978), bishop of Johannesburg (1984), and the archbishop of Cape Town (1986). He advocates nonviolence and interracial reconciliation in the struggle against APARTHEID and has worked in the West to encourage economic sanctions against the South African government. In 1984, he was awarded the Nobel Peace Prize.

Tutuola, Amos, 1920–. Nigerian novelist, noted for his idiosyncratic use of Yoruba legend and fantasy in tales written in a vernacular African English. His first novel, *The Palm-Wine Drunkard* (1952), is probably his best known.

Tuvalu, island nation (1992 est. pop. 9,500), 10 sq mi (26 sq km), composed of nine low coral atolls, formerly known as the Ellice (or Lagoon) Islands, scattered over the W Pacific Ocean. The capital is Fongafale, on Funafuti. Subsistence farming and fishing are mainstays of the economy, with copra the chief cash crop for export. Postage stamps and coins, however, are the largest source of foreign earnings. The population is primarily Polynesian; nearly all are members of the Protestant Church of Tuvalu.

History. The islands were discovered by Capt. John Byron in 1764 and were administered by Britain as part of a protectorate (1892–1916) and as part of the Gilbert and Ellice Islands colony (1916–74). The colony became self-governing in 1971, and in 1974 Ellice Islanders voted for separate British dependency status as Tuvalu. The islands became independent in 1978. Since 1989 Bikenibeu Paeniu has been prime minister. See PACIFIC OCEAN map.

TVA: see TENNESSEE VALLEY AUTHORITY.

Twain, Mark, pseud. of **Samuel Langhorne Clemens,** 1835–1910, one of the masters of American literature; b. Florida, Mo. After a boyhood in Hannibal, Mo., and work as a printer, he became a Mississippi River pilot (1857). In 1862 he moved west and began writing for newspapers, first in Virginia City, Nev., then in San Francisco, taking as a pseudonym a term from his river pilot days, "Mark Twain." He first won fame with his comic tale "The Celebrated Jumping Frog of Calaveras County" (1865). After a trip to Hawaii (1866), he became a successful humorous lecturer and, after a journey to the Holy Land, he published *The Innocents Abroad* (1869). In 1870 he married and settled in Hartford, Conn., where he wrote some of his best work: *The Gilded Age* (1873), a satirical novel written with Charles Dudley WARNER; *The Prince and the Pauper* (1882), a children's novel; the nonfictional *Life on the Mississippi* (1883); the satire *A Connecticut Yankee in King Arthur's Court* (1889); and the two famous evocations of his youth, *The Adventures of Tom Sawyer* (1876) and *The Adventures of Huckleberry Finn* (1884). In *Huckleberry Finn,* widely considered his masterpiece, Twain created one of the most memorable characters in American fiction, painted a realistic picture of 19th-cent. life, and revolutionized the language of fiction through his use of vernacular speech. In 1893, plunged into debt, he lectured his way around the world, recording his experiences in *Following the Equator* (1897). His later years were saddened by the deaths of two daughters and his wife, and his later works, e.g., *The Man Who Corrupted Hadleyburg* (1899), *What Is Man?* (1905), *The Mysterious Stranger* (1916), are somber, pessimistic, and misanthropic.

Tweed, William Marcy, 1823–78, American politician and Tammany leader; b. N.Y.C. "Boss Tweed" controlled nominations and patronage in New York City Democratic politics after 1857 through his control of the TAMMANY organization. He and the notorious **Tweed Ring,** which consisted of Tweed, the mayor, the city comptroller, and the city chamberlain, sold political favors and defrauded the city of at least $30 million, largely through padded construction contracts. Jay Gould and James FISK were business cronies, and after 1868 Tweed extended his influence to Albany. Reformers, notably S.J. TILDEN and Thomas NAST, effected his downfall, and he died in prison.

Tweed Ring: see under TWEED, WILLIAM MARCY.

Twelfth Night, Jan. 5, the vigil or eve of EPIPHANY, so called because it is the 12th night from Christmas.

Twelve Tables: see ROMAN LAW.

twelve-tone music, those compositions based on a particular ordering (called a series or row) of the twelve pitches that constitute the diatonic SCALE divided into equal semitones. Thus it is one type of SERIAL MUSIC. Abandoning the melodic and harmonic interweaving of lines featured in works of traditional TONALITY, the twelve-tone system evolved in the 1920s in the works of A. SCHOENBERG and his pupils A. BERG and A. von WEBERN. It has been used by such contemporary composers as Milton BABBITT and Pierre BOULEZ. See also ATONALITY.

Twenty-one Demands, 1915, ultimatum secretly presented to China by Japan during WORLD WAR I. They included control of the German leasehold in Shantung prov., rights to exploit Manchuria and Mongolia, and control of Chinese coal deposits. Other powers were to be excluded from further territorial concessions. The Japanese also sought control of China's military, commercial, and financial affairs, but this provision was dropped, partly at U.S. insistence. Chinese President YÜAN SHIH-KAI was forced to accept the remaining demands.

Two Sicilies, kingdom of the, name adopted (1816) by the kingdoms of NAPLES and Sicily when they were officially merged under King FERDINAND I. The kingdom was conquered (1860) by GARIBALDI and became part of the kingdom of Italy.

Tycho Brahe: see BRAHE, TYCHO.

Tyler, Anne, 1941–, American novelist; b. Minneapolis. Often set in the American South, her novels portray ordinary human life, particularly family relationships, with wit and great perception. Among her novels are *A Slipping Down Life* (1970), *Dinner at the Homesick Restaurant* (1982), *The Accidental Tourist* (1985), *Breathing Lessons* (1988), and *Saint Maybe* (1991).

Tyler, John, 1790–1862, 10th president of the U.S.; b. Charles City co., Va. Educated in law at the College of William and Mary, he was the son of John Tyler (1747–1813), governor of Virginia from 1808 to 1811. The younger Tyler also was governor (1825–27) of VIRGINIA and U.S. senator (1827–36). A moderate states' rights Democrat, he was a reluctant supporter of Andrew JACKSON during his two terms as president but eventually broke with the Democrats and joined the new WHIG PARTY. In 1840 he was running mate to the Whig presidential candidate, William Henry HARRISON, and they waged the victorious "Tippecanoe and Tyler too" campaign. Harrison died on Apr. 4, 1841, after only one month as president, and Tyler became the first vice president to succeed to the presidency. Tyler was never close to the Whig leaders, particularly Henry CLAY, and after he vetoed Whig measures and his cabinet had resigned, he quickly alienated most of them and found himself a president without a party. The Whigs rejected him in 1844 and nominated Clay. Tyler's chief accomplishments as president were the WEBSTER-ASHBURTON Treaty (1843) with Great Britain and the annexation of Texas as a state.

Tyler, Royall, 1757–1826, American author; b. Boston. A lawyer and law professor, he was chief justice of the Vermont supreme court (1807–13). He is remembered for his comedy *The Contrast* (1787) and for other plays, a novel, verse, and essays.

Tyler, Wat, d. 1381, English rebel, leader of the Peasants' Revolt of 1381. After the Black Death of 1348–49 had killed much of England's population, labor was scarce and wages rose. Parliament passed (1351) the Statute of Labourers to restrict wages, and nobles sought to hold their labor by enforcing old manorial rights. This bred discontent; rebellion broke out when the poll tax was increased (1380). Tyler and the rebels seized Canterbury, then marched to London, burning and plundering houses. RICHARD II came to meet Tyler and promised to abolish serfdom, feudal service, and market monopolies. A second meeting ended in a brawl in which Tyler was mortally wounded. The king's promises were forgotten, and the revolt was harshly suppressed.

Tylor, Sir Edward Burnett, 1832–1917, pioneering English anthropologist who specialized in primitive mentality and animism. His essentially modern cultural theories are expounded in *Anthropology* (1881, abr. ed. 1960).

Tyndale, Tindal, or **Tindale, William,** c.1494–1536, English biblical translator and Protestant martyr. Sympathetic with the new learning, he translated the New Testament into English. Opposed in England, he went to the Continent, where he met Martin LUTHER and began (1525) printing his New Testament. In England it was suppressed (1526), but he continued translating the Scriptures and writing tracts defending the English REFORMATION. He was seized (1535) in Antwerp, condemned for heresy, and executed. His work was the basis for the Authorized (King James) BIBLE.

Tyndall, John, 1820–93, English physicist, science lecturer, and writer; b. Ireland. He was professor (1853–87) and superintendent (1867–87) at the Royal Institution, London. He investigated light, sound, and radiant heat and studied Alpine glaciers. The scattering of light by COLLOIDS, known as the Tyndall effect, is named for him.

typewriter, instrument for producing printed letters by manual operation. The first practical commercial typewriter was invented in

the U.S. in 1867 by Christopher Sholes and his colleagues, and was manufactured by the gunsmith Philo Remington in 1874. This early model had only capital letters; a shift-key model appeared in 1878. The electric typewriter came into use c.1935. In the 1960s some machine designs replaced type levers with a type-surfaced metal ball that moves rapidly across a stationary paper holder; the metal ball was later replaced by a daisy wheel. Computerized typewriters can store data and reproduce it automatically, as well as function as a personal computer printer, but in many instances typewriters have been replaced by word processors or computers using WORD PROCESSING programs.

typhoid fever, acute generalized infection caused by *Salmonella typhosa.* The main sources of infection are contaminated water or milk and food handlers who are carriers. Symptoms include high fever, rose-colored spots on the abdomen and chest, and diarrhea or constipation. Complications, especially in untreated patients, may be numerous. The disease is treated with the ANTIBIOTIC chloramphenicol; typhoid VACCINATION is a valuable preventive measure.

typhoon: see HURRICANE.

typhus, any of a group of infectious diseases caused by rickettsias, microorganisms classified between bacteria and viruses. Symptoms include fever and the early onset of rash and headache. Typhus is treated with ANTIBIOTICS and can be prevented by VACCINATION.

tyrant, in ancient history, ruler who gained power by usurping the legal authority. Greek tyranny was an outgrowth of the struggle of the rising popular classes against the aristocracy. Usually, a leader won popular support, overthrew the existing government, and seized power. Many tyrants ruled well and with benefit to their subjects. The word had no connotation of moral censure until the rise of constitutional, democratic government in Athens in the 5th cent. B.C. Greek tyrants included Periander of Corinth and PISISTRATUS of Athens.

Tyre or **Sur,** town (1988 est. pop. 14,000), SW Lebanon, on the Mediterranean Sea. Built on an island, it was an ancient seaport of PHOENICIA and had far-flung colonies by 1100 B.C. The Tyrians founded CARTHAGE in the 9th cent. B.C. Tyre was famous for its commerce and its purple Tyrian dye. Although taken by the Assyrians, Babylonians, and Persians, the city survived. It also recovered from a siege and sack by Alexander the Great, who built a mole that has since made the island a peninsula. In A.D. 64 the city became part of the Roman Empire. Later a Crusader stronghold, it was destroyed by Muslims in 1291. The city contains many Greco-Roman remains. In 1982 Tyre, a stronghold of the PALESTINE LIBERATION ORGANIZATION, fell to Israeli forces after heavy fighting during the Israeli invasion of S Lebanon (see ARAB-ISRAELI WARS).

Tyrol, prov. (1991 pop. 630,350), W Austria, in the Alps. The region attracts many tourists. Farming, forestry, and salt production are important occupations, and their are chemical industries. Conquered by Rome in 15 B.C., Tyrol was later part of the Frankish empire. It passed to Bavaria in 1805 but was returned to Austria in 1815. S Tyrol was given to Italy in 1919.

Tyrrhenian Sea, part of the Mediterranean Sea, lying between the west coast of peninsular Italy and the islands of Sardinia, Corsica, and Sicily. NAPLES and PALERMO are major ports.

Tyson, Mike G., 1966–, American boxer; b. N.Y.C. At 20, Tyson became the youngest heavyweight champion in history with a second-round knockout of Trevor Berbick in 1986. He had compiled a 37–0 record when he lost the title to James (Buster) Douglas in 1990. In 1992 he was convicted of rape and other charges in Indiana and sentenced to three concurrent 10-year terms in prison, 4 years of which were suspended.

Tyumen [tyo͞omĕn'yə], city (1989 pop. 478,000), SW Siberian Russia, on the Tura R. On the Trans-Siberian RR, Tyumen is a major transfer point for river and rail freight. It also has shipyards, and the surrounding area is rich in oil and natural gas. Founded in 1585, Tyumen is the oldest city in SIBERIA.

Tz'u Hsi [tso͞o shē], 1834–1908, dowager empress of China (1861–1908) and regent (1861–73, 1874–89, 1898–1908). Consort of Emperor Hsien Feng (d. 1861), she bore his successor, T'ung Chih, and after his death (1875) named her nephew, Kuang Hsü, to the throne. In 1898 she resumed the regency after he had tried to enact political reforms. She encouraged the BOXER UPRISING against foreigners.

U

U, chemical symbol of the element URANIUM.

Uccello, Paolo [o͞ot-chĕl'lō], c.1396–1475, Florentine painter. One of the earliest masters of perspective, he was little appreciated in his own time. Uccello's rigorous system of perspective and unsparing realism are combined in his cycle of *Noah* for Santa Maria Novella. His most famous scenes are from the *Battle of San Romano* (Uffizi; Louvre; and National Gall., London), notable for his experiments with foreshortening.

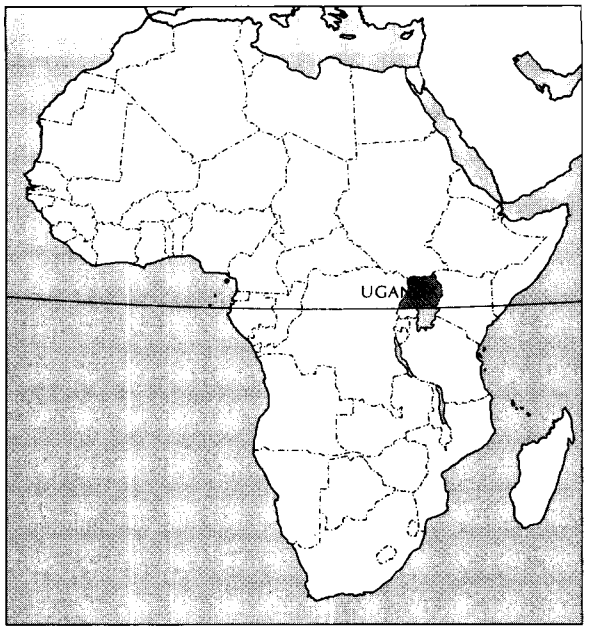
Udall, Nicholas, 1505–56, English dramatist and schoolmaster. His one extant play, *Ralph Roister Doister* (c.1553), is regarded as the first complete English COMEDY. It blends influences of TERENCE and PLAUTUS with native English humor.

Ueberroth, Peter V., 1937–, American business and sports executive, b. Evanston, Ill. President of the organizing committee for the financially successful 1984 Los Angeles Olympics, he served (1984–89) as commissioner of major league baseball. He also headed (1992–93) efforts to rebuild LOS ANGELES after the 1992 riots.

Uffizi [o͞of-fē'tsē], palace in Florence, Italy, built in the 16th cent. by VASARI for Cosimo I de' Medici as public offices. It houses the state archives of Tuscany and the **Uffizi Gallery,** one of the richest art collections in the world. The Florentine, Italian, Dutch, and Flemish schools are all well represented. Among its Greek, Roman, and Renaissance sculptures is the Venus of the Medici (Greek, 3d cent. B.C.). In 1993 a car bomb damaged or destroyed portions of the palace and some works of art.

UFO: see UNIDENTIFIED FLYING OBJECT.

Uganda [yo͞ogän'də, o͞ogän'dä], officially Republic of Uganda, republic (1992 est. pop. 19,386,000), 91,133 sq mi (236,036 sq km), E central Africa, bordered by Tanzania and Rwanda (S), Zaïre (W), Sudan (N), and Kenya (E). KAMPALA is the capital. Uganda lies astride the equator. Most of the country is a fertile plateau, in the center of which is Lake Kyoga. Around the perimeter are the lakes Albert, Edward, and Victoria; the Albert Nile R.; and several mountain ranges, with Margherita Peak (16,794 ft/5,119 m), the country's highest point, in the southwest. The economy is overwhelmingly agricultural, with cassava, sweet potatoes, plantains, millet, and sorghum the chief subsistence crops, and coffee (up to 90% of export earnings), cotton, tea, and tobacco the principal cash crops. Stock-raising, fishing, and hardwood production are also significant. Uganda's economy, especially the vital farming sector, was devastated during the Idi AMIN regime of the 1970s and subsequent civil war. Two thirds of the population belong to Bantu-speaking ethnic groups; Nilotic speakers make up most of the rest. English is the official language, but Swahili is widely spoken. Most



of the people are Christians, but many follow traditional beliefs as well; a small minority are Muslims.

History. Around A.D. 1100 Bantu-speaking people migrated into the area that is now Uganda, and by the 14th cent. they were organized into several independent kingdoms. The most powerful of these were Bunyoro (16th–17th cent.) and later (18th–19th cent.) Buganda. Visits by J.H. SPEKE (1862) and H.M. STANLEY (1875) opened the area to British influence, and Buganda became a British protectorate in 1894. The protectorate was subsequently extended to the rest of Uganda, but the independence of Buganda's rulers hampered the development of national unity. In 1962 Uganda gained independence under a federal constitution that gave Buganda a large measure of autonomy. However, under the leadership of A. Milton OBOTE, a new constitution was adopted in 1966, abolishing the traditional kingdoms and concentrating power in the hands of Obote, who became president. Obote was overthrown in 1971 by Maj. Gen. Idi Amin, who inaugurated a period of dictatorial rule that plunged the nation into chaos. He purged the Lango and Acholi tribes, moved against the army, and in 1972 expelled 60,000 non-citizen Asians. By 1977, it is estimated, 300,000 Ugandans had been killed in Amin's reign of terror. Finally, in 1979, an invasion by Tanzanian troops and Ugandan exiles drove out Amin's forces, and Amin fled the country. Elections in 1980 returned Obote to the presidency, but he was deposed in 1986 by the army, which was then defeated by rebel forces led by Yoweri Museveni. Museveni made progress in stabilizing the country and permitted the restoration (1993) of the traditional kingships, but Uganda has suffered from the effects of widespread AIDS.

Ugarit [ōōgərēt'], ancient city, capital of the Ugarit kingdom, W Syria. Excavations (begun in the 1920s) have uncovered remains of the city dating from the 5th millennium B.C. Its greatest period was the 15th and 14th cent. B.C., and the city declined in the 12th cent. B.C. Ugaritic is a Semitic language related to classical Hebrew.

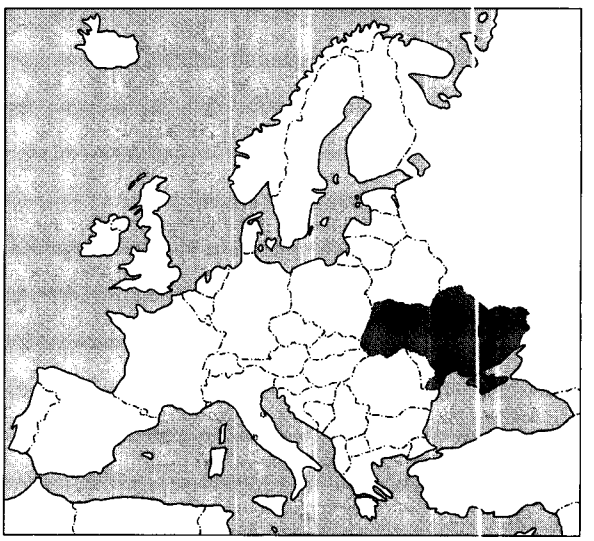
Ugrian [yōō'grēən, ōō'–] or **Ugric** [yōō'grĭk, ōō'–], subgroup of the Finno-Ugric group of languages, which is, in turn, a subdivision of the Uralic subfamily of the URALIC AND ALTAIC family of languages. See LANGUAGE (table).

Uhland, Ludwig [ōō'länt], 1787–1862, German poet, leader of the Swabian group. His lyrics and ballads, including "The Minstrel's Curse" and "The Good Comrade," made him one of the most popular German poets of the romantic period.

Uigurs or **Uighurs,** Turkic-speaking people, numbering 4 million, living mainly in W China. They became prominent in the 7th cent. when they supported the T'ang dynasty (see CHINA). In 744 they took Mongolia. When ousted (840) by the Turkic Kyrgyz, they founded an empire in XINJIANG, China, that lasted until the MONGOL invasion (13th cent.). The Uigurs were nomads with some agriculture and trade. First converted to MANICHAEISM, they later became SUNNI Muslims. Today most people in the Xinjiang Uygur Autonomous Region are of Uigur descent.

Ukraine, Ukr. *Ukraina,* republic (1992 est. pop. 51,940,000), 232,046 sq mi (601,000 sq km), SE Europe, formerly a constituent republic of the USSR. It borders Poland (NW); Slovakia, Hungary, Romania, and Moldova (SW); the Black Sea and Sea of Azov (S); Russia (E, NE); and Belarus (N). Its capital is KIEV; the chief BLACK SEA port is ODESSA. DNIPROPETROVSK, DONETSK, and KHARKIV are major industrial centers. Long known as the "breadbasket of the Soviet Union," Ukraine has rich farmlands that produce wheat and other grains, potatoes, sugar beets, sunflowers, and flax. Grain production has fallen, however, since independence. Resources include iron, coal, manganese, zinc, mercury, petroleum, and natural gas. There is also a great concentration of heavy industry, including metallurgical, machine-building, and chemical industries. Many industries, however, are heavily subsidized, and this has contributed to Ukraine's economic collapse since independence. The population is largely Ukrainian; there are Russian and other minorities. The official language is Ukrainian, but Russian is also widely spoken. The Orthodox Eastern and West Ukrainian Catholic churches are the largest faiths.

History. The Ukrainians are descended from Neolithic pastoral tribes of the Dnieper and Dniester valleys. SCYTHIA ruled most of Ukraine (8th–1st cent. B.C.). Invasions (3rd–6th cent. A.D.) by the Goths (see OSTROGOTHS; VISIGOTHS), HUNS, and Avars were followed by KHAZAR rule (7th–9th cent.), which ended with the rise of KIEVAN RUSSIA. The region fell to the Mongols of the GOLDEN HORDE (13th cent.) and was ruled by Poland-Lithuania (14th–17th cent.) before coming under Russian control in the late 18th cent. (see COSSACKS; MAZEPA; POLAND, PARTITIONS OF). In 1918 it declared its independence, but that ended with the triumph of the Bolsheviks and the founding of the Ukrainian Soviet Socialist Republic in 1922. During World War II Ukraine was devastated by the German occupation (1941–44). Postwar treaties enlarged the republic. With the coming of *glasnost,* Ukrainian nationalist and separatist sentiments were increasingly voiced. In 1991, following the failed hard-line coup against Soviet Pres. Gorbachev, the republic declared its independence from the USSR. In a popular election, Leonid KRAVCHUK was elected as the nation's first president, and Ukraine joined Russia and Belarus in founding the COMMONWEALTH OF INDEPENDENT STATES (CIS), precipitating the total collapse of the USSR. Disagreements between the president and parliament impeded economic reform and led to the scheduling of early elections for 1994. Ukraine has been extremely wary of Russia's influence in post-Soviet interrepublican affairs and has moved to limit its economic integration with the Russian-dominated CIS. CRIMEA, with its Russian majority



The key to pronunciation appears on page xiii.

and the Russian Black Sea fleet port at SEVASTOPOL, has been a particular trouble spot.

Ukrainian language, also called Little Russian, member of the East Slavic group of the Slavic subfamily of the Indo-European family of languages. See LANGUAGE (table).

ukulele: see STRINGED INSTRUMENT.

Ulaanbaatar: see ULAN BATOR.

Uladislaus [ōō"lä'dĭslous], Hungarian kings. **Uladislaus I:** see LADISLAUS III, king of Poland. **Uladislaus II,** c.1456–1516, king of Hungary (1490–1516) and, as Ladislaus II, king of Bohemia (1471–1516), was the son of CASIMIR IV of Poland. In 1478 MATTHIAS CORVINUS, king of Hungary, acquired Moravia, Silesia, and Lusatia from him. On Matthias's death (1490) Uladislaus was elected king of Hungary, but he proved a weak ruler. In 1515 he concluded a treaty with Holy Roman Emperor MAXIMILIAN I by which Hungary and Bohemia eventually passed to the HAPSBURG dynasty.

Ulan Bator or **Ulaanbaatar** [both: ōōlän'bä'tôr], city (1987 est. pop. 511,000), capital of Mongolia, in the E central part of the country. The political, cultural, economic, and transportation center of the country, it lies on a railroad linking (since 1955) Russia and Beijing. Manufactures include woolen textiles, clothing, soap, paper, and cast iron. Founded in 1649 as a monastery town, Ulan Bator still preserves the monastery section and is the seat of the nation's only university. It became the Mongolian capital in 1924.

Ulanova, Galina [ōōlä'nuvə], 1910–, Russian ballerina. She made her debut in 1928. She spent the first half of her career at the KIROV BALLET (1928–44) and was then the prima ballerina (1944–62) of the BOLSHOI BALLET. She was noted for her performances in *Giselle* and *Swan Lake.*

Ulbricht, Walter, 1893–1973, Communist leader (1950–71) in the German Democratic Republic (East Germany). He exiled himself (1933) to the USSR and returned to Germany with the Russian troops in 1945. A hard-line party leader, he was responsible for building (1961) the Berlin Wall.

ulcer, inflamed, open sore, usually slow to heal, on the skin or mucous membranes. It may develop as a result of injury, prolonged bed rest, vascular disease, or unknown reasons; therapy is directed at the underlying cause. **Peptic ulcers** occur in the mucous membrane of the intestinal tract in areas accessible to acid secreted by the stomach. The exact causes are unknown, but the bacterium *Helicobacter pylori* is a contributing factor in many peptic ulcers. Use of ASPIRIN and some other ANALGESICS, increased stomach acid secretion, alcoholic beverages and cigarettes, and tissue vulnerability to the acid, and emotional disturbance are also believed to play a part. Treatment includes antacids, drugs that block gastric-acid secretion, and antibiotics.

Ullmann, Liv (Johanne), 1939–, Norwegian stage and film actress; b. Japan. She is best known for her roles in films directed by Ingmar BERGMAN, e.g., *Persona* (1966), *Shame* (1968), *Cries and Whispers* (1972), and *Autumn Sonata* (1978).

Ulster, northernmost of the historic provinces of Ireland. Six of its nine counties make up Northern Ireland, often referred to as Ulster; the rest are in the Republic of Ireland.

ultrasonics, the study and application of SOUND waves with frequencies greater than 20,000 cycles per second, i.e., beyond the range of human hearing. Ultrasounds are commonly produced by piezoelectric transducers. They are used for nondestructive testing, and for the cleaning of fine machine parts and surgical instruments. In medicine, ULTRASOUND devices are used to examine internal organs without surgery. Ultrasonic whistles are audible to dogs and are used to summon them.

ultrasound, in medicine, technique that uses sound waves to study and treat hard-to-reach body areas. In scanning with ultrasound, high-frequency sound waves are transmitted to the area of interest and the returning echoes recorded. First developed in World War II to locate submerged objects, the technique is now widely used in virtually every branch of MEDICINE, e.g., in obstetrics to study the fetus, in cardiology to detect heart damage, and in ophthalmology to detect retinal problems. It is also used to heat joints, relieving arthritic joint pain, and for such procedures as lithotripsy, in which shock waves break up kidney stones, eliminating the need for surgery. Ultrasound is noninvasive, involves no radiation, and avoids the possible hazards—such as bleeding, infection, or reactions to chemicals—of other diagnostic methods.

ultraviolet astronomy, study of celestial objects by means of ULTRAVIOLET RADIATION. Because atmospheric interference makes UV radiation difficult to observe from ground-based telescopes, high-altitude balloons, sounding rockets, and orbiting OBSERVATORIES are employed. UV line spectrum measurements are used to discern the chemical composition, densities, and temperatures of interstellar gas and dust, and the temperature and composition of hot, young stars. UV observations can also provide essential information about the evolution of galaxies.

ultraviolet radiation, invisible ELECTROMAGNETIC RADIATION with frequencies (about 10^{15} to 10^{18} Hz) between that of visible violet light and X rays; it ranges in wavelength from about 400 to 4 nanometers. Ultraviolet (UV) radiation can be detected by the FLUORESCENCE it induces in certain substances and by its blackening of photographic film. Most of the UV component of sunlight is absorbed by the OZONE LAYER of the atmosphere, but UV-B radiation (280–320 nanometers) can cause sunburn and skin cancer and UV-A radiation (320–400 nanometers) can cause photosensitivity reactions and possibly skin cancer. Vitamin D is produced in humans by the action of UV radiation on ergosterol, a substance present in the skin. UV radiation can also be produced artificially in arc lamps, and black light is long wavelength UV radiation (365 nanometers).

Ulysses, Latin for ODYSSEUS.

Ulysses, in space exploration: see SPACE PROBE (table).

Umar ibn al-Khattab, c.586–644, 2d Muslim caliph. An early convert to Islam, he expanded the borders of the Muslim empire. Tradition credits him with instituting such Muslim practices as the obligatory pilgrimage (hajj) to Mecca.

umbra: see ECLIPSE; SUNSPOTS.

Umbrian [ŭm'brēən], extinct language belonging to the Italic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Umbriel, in astronomy, natural satellite of URANUS.

Unamuno, Miguel de, 1864–1936, Spanish philosophical writer; of Basque descent. His major work, *The Tragic Sense of Life in Men and Nations* (1913), expresses his highly individualistic EXISTENTIALISM, a philosophy based on faith in faith itself. He also wrote poetry, essays, and novels, all expressing his impassioned concern with life and death.

Uncas, c.1588–c.1683, first chief of the MOHEGANS. An ambitious but troublesome subchief of the PEQUOT, he formed a new tribe and sided with the British in the Pequot Wars (1638). For the rest of his life he was embroiled in difficulties with other Native Americans and with the British.

uncertainty principle: see HEISENBERG, WERNER; QUANTUM MECHANICS.

Uncle Sam, name used to designate the U.S. government. The origin of the term is uncertain, but some sources attribute it to Samuel Wilson (1766–1854) of Troy, N.Y. Wilson, whose nickname was "Uncle Sam," was an inspector of army supplies in the WAR OF 1812.

unconscious, in psychology, that aspect of mental life that is separate from immediate consciousness and is not subject to recall at will. Sigmund FREUD regarded the unconscious as a vast portion of the mind, including the instinctual drives and the repressed residue of unacceptable experiences and desires. C.G. JUNG added the concept of an inherited unconscious, known as the collective unconscious, to the Freudian view. Although some psychological schools reject the idea of the unconscious, most modern psychologists accept that a person has latent, or unretrieved, memories and ideas.

Underground Railroad, in U.S. history, loosely organized system for helping fugitive slaves escape to Canada or to areas of safety in free states. Although legend has it as a highly organized group with "passengers", "conductors," and "stations," in fact it seldom operated in an organized manner, and most help to fugitives was given by individual persons.

Undset, Sigrid [ōōn'sĕt], 1882–1949, Norwegian novelist. Her masterpiece, the trilogy *Kristin Lavransdatter* (1920–22), tells of love

and religion in medieval Norway. Always strongly ethical, her writing deepened in religious intensity after her conversion (1924) to Roman Catholicism. She was awarded the 1928 Nobel Prize in literature.

UNESCO, abbreviation for United Nations Educational, Scientific, and Cultural Organization. See UNITED NATIONS (table 3).

unemployment insurance, compulsory or voluntary insurance against loss of wages during involuntary unemployment. Most W European countries adopted some form of unemployment compensation early in the 20th cent. The U.S. program, introduced in 1935, covers about 85% of the work force. Each state has its own laws and operates its own program.

Ungaretti, Giuseppe, 1888–1970, Italian poet; b. Egypt. His pure style, achieved by condensation to essentials, is in the tradition of the French SYMBOLISTS. His works are collected in the 12 volumes of *Life of a Man* (1958).

Unh, chemical symbol of the element UNNILHEXIUM.

unicameral system: see LEGISLATURE.

UNICEF, the United Nations Children's Fund (originally, United Nations International Children's Emergency Fund). See UNITED NATIONS (table 4).

unicorn, fabulous equine beast with a horn in the middle of its forehead. It was once considered native to India and was reportedly seen throughout the world. Pure white, it has been used as a symbol of virginity and, in iconography, is associated with the Virgin Mary and with Jesus. Hunting the unicorn was a tapestry subject in the late Middle Ages and Renaissance.

unidentified flying object (UFO) or **flying saucer,** an object or light phenomenon reportedly seen in the sky whose appearance, trajectory, and general dynamic and luminescent behavior do not suggest a logical, conventional explanation. Although many alleged sightings have been interpreted as reflections of the sun's rays from airplanes, as weather balloons, or as various meteorological phenomena, some sightings remain unexplained by investigators in terms of known phenomena.

Unification Church: see MOON, SUN MYUNG.

unified field theories, in physics, a set of theories that seeks to relate all the known, basic forces that exist in nature. Scientists generally agree upon the existence of four basic forces. Two of these, ELECTROMAGNETISM and GRAVITATION, are long-range forces, and the other two, the WEAK INTERACTION and STRONG INTERACTION, are short-range forces, effective only at the scale of the atomic nucleus. Early field theories, such as James Clerk MAXWELL's electromagnetic theory, were extended by quantum field theory (see QUANTUM MECHANICS). The first modern theory was the ELECTROWEAK THEORY, which succeeded in unifying electromagnetism and the weak interaction. Grand unification theories (GUTs) unify the electroweak interactions with the strong interaction. No GUT has as yet been verified. A new class of unified field theories called supergravity theories propose to unify gravitation with the other basic forces; like the GUTs, these are unverified.

uniformitarianism, the doctrine that past geological changes in the earth were brought about by the same causes as those now taking place. As first advanced in 1785 by James HUTTON, it stressed the slowness and gradualness of rates of change. It was initially overshadowed by the doctrine of CATASTROPHISM and was opposed because it seemed contrary to religious beliefs. In the 19th cent. it gained support through the efforts of Sir Charles LYELL. More recent theories, which effect something of a synthesis, are based upon Lyell's conception of the slow operation of historic geological forces over the vastness of time but allow for periods when such activity was accelerated and intensified.

Union, Act of. For the union of England and Scotland (1707), see GREAT BRITAIN; for the union of Ireland with Great Britain (1800), see IRELAND.

union, labor, or **trade union,** association of workers for the purpose of improving their economic status and working conditions through COLLECTIVE BARGAINING. Historically there have been two major types of labor unions: the horizontal, or craft, union, in which all the members are skilled in a certain craft (e.g., carpenters); and the vertical, or industrial, union, composed of workers in the same industry, whatever their particular skills (e.g., automobile workers). A company union is an employee-controlled union having no affiliation with other labor organizations. The term *closed shop* refers to a company that hires only union members. In a union shop, employees are required to join a union within a specified time after being hired. An open shop does not restrict its employees to union members. Labor unions are essentially the product of the INDUSTRIAL REVOLUTION of the 19th cent. In Great Britain miners and textile workers were organized in the 1860s. Most European labor organizations today are either political parties or are affiliated with political parties, usually left-wing ones. Many union movements in the underdeveloped countries have led anticolonial campaigns toward political independence. In the U.S. unions began developing in the 1830s. Among the important early organizations were the KNIGHTS OF LABOR and the INDUSTRIAL WORKERS OF THE WORLD. A milestone in the history of American unionism came in 1886 with the formation of a group that eventually became the AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS (AFL-CIO), an association that includes nearly all of the larger U.S. unions. The U.S. labor movement gained support from such NEW DEAL laws as the Wagner Act (1935) creating the NATIONAL LABOR RELATIONS BOARD, but later was restricted by the Taft-Hartley Act of 1947 and the Landrum-Griffin Act of 1959 (see LABOR LAW). By the late 1970s some 20 states had banned the closed shop through "right-to-work" laws. In bargaining with companies in economically troubled industries in the 1980s, U.S. unions often sought to save existing jobs through concessions ("give-backs") of earlier gains, and in 1993 unions unsuccessfully fought passage of the North American Free Trade Agreement, fearing job losses if it were ratified. U.S. union membership has steadily declined from its peak of 35.5% of the nonagricultural workforce in 1945; in 1992, when U.S. unions had 16,390,000 members, it stood at 15.8%. Internationally, world trade unionism was split after 1949 between two rival organizations: the World Federation of Trade Unions (1945) and the International Confederation of Free Trade Unions (1949). The International Labor Organization is a specialized agency of the UNITED NATIONS.

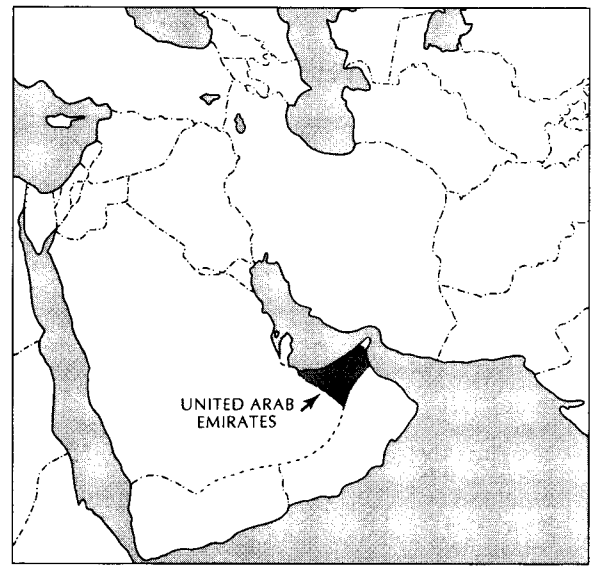
Union of Soviet Socialist Republics (USSR), Rus. *Soyuz Sovetskikh Sotsialisticheskikh Respublik,* former republic, E Europe and N Asia. Also called the Soviet Union, it was the successor to the Russian Empire and the first state based on Marxist socialism (see also MARXISM; COMMUNISM). Until 1989 the Communist party indirectly controlled all levels of government; the party's politburo effectively ruled the country, and its general secretary was the country's most powerful leader. Soviet industry was owned and managed by the state, and agricultural land was divided into state farms, COLLECTIVE FARMS, and small, privately held plots (3% of cropland). Politically the USSR was divided (from 1940 to 1991) into 15 constituent or union republics—ARMENIA, AZERBAIJAN, Belorussia (see BELARUS), ESTONIA, GEORGIA, KAZAKHSTAN, Kirghizia (see KYRGYZSTAN), LATVIA, LITHUANIA, Moldavia (see MOLDOVA), Russia, Tadzhikistan (see TAJIKISTAN), TURKMENISTAN, UKRAINE, and UZBEKISTAN—ostensibly joined in a federal union, but until the final year or so of the USSR's existence the republics had little real power. The rest of this article deals with the history of the USSR from 1920 to its collapse in 1991. For the history of the period prior to 1920 see RUSSIA; RUSSIAN REVOLUTION; and BREST-LITOVSK, TREATY OF. For events from 1991 on and for other information, see the articles on the former constituent republics and the COMMONWEALTH OF INDEPENDENT STATES.

History. In the struggle for succession after LENIN's death (1924), STALIN won out over TROTSKY. The NEW ECONOMIC POLICY (1921–28) gave way to full government control of agriculture and industry under the first Five-Year Plan (1928–32). By the late 1930s agriculture had been collectivized, largely forcibly; industrialization accelerated; and health and literacy greatly improved. State and party power over all aspects of life was enforced by the SECRET POLICE and bureaucracy; the COMINTERN guided Communist parties abroad. Stalin's purges of the 1930s claimed as victims such Soviet leaders as BUKHARIN, KAMENEV, and ZINOVIEV, and many millions of ordinary citizens. The USSR signed (1939) a nonaggression pact with Germany and, at the start of WORLD WAR II, invaded E Poland, gained a hard-earned victory in the Russo-Finnish War (1939–40), and occupied and forcibly annexed ESTONIA, LATVIA, and LITHUANIA (1940). Following their surprise attack (1941) on the USSR, the Germans

overran much of the western part of the country. However, after the Russian triumph (1943) at Stalingrad (now VOLGOGRAD), the USSR began a counteroffensive that ended in Soviet victory. The war left c.20 million Soviet citizens dead. Postwar Soviet relations with the U.S. soon deteriorated into a COLD WAR, and the USSR extended its domination over much of Eastern Europe. After Stalin's death (1953) Soviet domestic and foreign policy became more flexible under Nikita KHRUSHCHEV. In the field of technology the USSR developed (1949) atomic weapons, orbited (1957) the first artificial earth satellite, and launched (1961) the first manned orbital flight. In 1956 revolts against Soviet influence were suppressed in HUNGARY and POLAND. The USSR took part in talks on nuclear DISARMAMENT, but provoked (1962) the CUBAN MISSILE CRISIS. Khrushchev was replaced in 1964, and by 1970 Leonid BREZHNEV had emerged as the most powerful Soviet leader. After Brezhnev's death in 1982, Yuri ANDROPOV and then Konstantin CHERNENKO served briefly as head of the government. Chernenko's successor was Mikhail GORBACHEV (1985). Gorbachev initiated political and economic reforms intended to liberalize and revitalize Soviet society while preserving central state and party control. The two principles of his policy were *perestroika* (restructuring) and *glasnost* (openness). Economic *perestroika*, aimed at decentralizing the command economy and providing limited opportunities for land ownership and free enterprise, produced few discernible results. Shortages of food and consumer goods became more acute than ever. Political *perestroika*, coupled with *glasnost*, had the effect of opening the system to more rapid and radical changes. The new Congress of People's Deputies and Supreme Soviet publicly debated, criticized, and investigated government policies. The end of repressive political controls permitted nationalist and separatist movements to arise in the constituent republics, and ethnic hostilities flared. In 1991 Gorbachev reached an agreement on power sharing with the leaders of nine of the republics, but the imminent signing of this agreement provoked a coup attempt (Aug. 1991) by hard-liners in the central government. Opposition to the coup, particularly by the Russian Republic government of Boris YELTSIN, led to its collapse and a rapid shift of power to reformers and the republics. Gorbachev resigned as leader of the Communist party, and the party was stripped of its property and suspended. Constituent republics declared their independence (all had already declared their sovereignty), and a new government was formed that gave far greater power to the republics. One of its first acts was to recognize the independence of Estonia, Latvia, and Lithuania. Attempts by Gorbachev to negotiate a new, permanent economic and political union to replace the USSR failed to find a formula satisfactory to the republics. On Dec. 8, 1991, Belarus, Russia, and Ukraine agreed to form the COMMONWEALTH OF INDEPENDENT STATES, rendering the Gorbachev government superfluous, and Russia began expropriating the ministries and property of the USSR by decree. A new commonwealth agreement was signed (Dec. 21) by 11 republics and replaced the old, centralized union with an association of independent nations; Gorbachev resigned four days later. Fifteen countries and the commonwealth emerged from the collapse of the USSR, but in most respects Russia is the true successor of the Soviet Union.

Unitarianism, in general, the form of Christianity that denies the doctrine of the TRINITY, believing that God exists only in one person. Modern Unitarianism originated in the Reformation period under such leaders as Michael SERVETUS and Faustus Socinus. The latter's views took root in England under John BIDDLE. In America the movement took hold in the liberal wing of Congregationalism as early as 1785, and adherents gradually formed a new denomination. Its doctrines were stated (1819) by William Ellery CHANNING, and the American Unitarian Association was formed in 1825. The sect holds no particular profession of faith, nor has a creed been adopted. Congregational polity prevails. The Association merged (1961) with the Universalist Church of America to form the Unitarian Universalist Association. In 1991 the association reported a membership of 141,315.

Unitas, John, 1933–, American football player; b. Pittsburgh. After playing at the Univ. of Louisville, he played semiprofessional ball until signed (1956) by the Baltimore Colts. One of the game's great passers, he led them to four championships (including a Super Bowl victory in 1971) in his 17 seasons. At retirement he held lifetime records for most completions (2,830) and most yards gained passing (40,239), both since broken by Fran TARKENTON.



United Arab Emirates, federation of emirates (1992 est. pop. 2,522,000), c.30,000 sq mi (77,700 sq km), SW Asia, on the E Arabian Peninsula, bordered by the Persian Gulf (N), the Gulf of Oman (E), Oman (S), Saudi Arabia (S, W), and Qatar (NW). It comprises the emirates (in fact, sheikhdoms) of Abu Dhabi (with 80% of the area), Ajman, Dubai, Fujairah, Ras al-Khaimah, Sharjah, and Umm al-Qaiwain. The city of Abu Dhabi is the capital. The land is largely hot, dry desert; in the east is a portion of the Jabal al Akhdar Mts. The economy is dominated by oil, first exploited in the 1960s; oil exports rank among the world's largest, and oil revenues have made the per capita income one of the world's highest. There are also rich natural-gas deposits. Fishing and pearling are traditional occupations. The indigenous population, Sunni Muslim Arabs, is outnumbered by foreign-born workers, mostly from Asia, attracted by the petroleum boom. The official language is Arabic, but Farsi and English are widely used. Overall governmental authority is invested in the Supreme Council, which consists of the seven sheikhs; a majority of five (including both Abu Dhabi and Dubai) must agree to any action.

History. Formerly known as the Trucial States, Trucial Coast, or Trucial Oman, the seven constituent emirates were bound to Great Britain by truce (1820) and agreement (1892). After World War II Britain granted autonomy to the emirates, and in 1971 the independent federation was formed; neighboring QATAR and BAHRAIN, which originally were to be part of the federation, opted for separate statehood. Following a period of severe internal tensions in the late 1970s, there was progress toward political unity in the 1980s, but rivalry between Abu Dhabi and Dubai has hampered closer cooperation.

United Church of Christ, American Protestant denomination formed in 1957 by a merger of the General Council of Congregational Christian Churches and the Evangelical and Reformed Church. There are approximately 1.7 million members. See CONGREGATIONALISM.

United Empire Loyalists, Canadian settlers who remained loyal to the British crown and emigrated from the Thirteen Colonies during and immediately after the AMERICAN REVOLUTION. Numbering up to 50,000, they settled principally in NOVA SCOTIA and QUEBEC.

United Kingdom: see GREAT BRITAIN.

United Nations (UN), international organization established immediately after World War II to maintain international peace and security and to achieve cooperation in solving international economic, social, cultural, and humanitarian problems. It replaced the

LEAGUE OF NATIONS. The name was coined by Pres. F.D. ROOSEVELT in 1941 to describe the countries fighting against the Axis in WORLD WAR II. It was first used officially on Jan. 1, 1942, when 26 states joined in the Declaration by the United Nations, pledging to continue their joint war effort and not to make peace separately. The UN Charter, the organization's governing treaty, was drawn up in 1945 at a conference held in San Francisco. The principal organs, as specified in the Charter, are the General Assembly, the Security Council, the Economic and Social Council, the Trusteeship Council, the International Court of Justice, and the Secretariat (see table 2). The Secretariat, with the secretary general at its head, handles all administrative functions. Trygve LIE, the UN's first secretary general, was succeeded by Dag HAMMARSKJÖLD, U THANT, Kurt WALDHEIM, Javier PÉREZ DE CUÉLLAR, and Boutros BOUTROS-GHALI. In 1945 there were 51 members; by 1993 the number had reached 184 (see table 1). At the outset, close cooperation among the members was expected, but hopes for essential accord were soon dashed by the COLD WAR, which hampered the functioning of many UN organs. Early UN peacekeeping efforts included the establishment of armed forces to repel (1950) the North Korean attack on South Korea (see KOREAN WAR); the mobilization of troops and peacekeeping forces for the Congo (see SHABA), CYPRUS, and the Middle East (see ARAB-ISRAELI WARS). The UN has prospered as a forum for debate intended to defuse international conflict, and it has worked to aid economic and technological development in developing nations. With the end of the cold war, the UN has become increasingly important to preserving and restoring international peace, most notably in Kuwait, with the authorization of the use of force against Iraq after its invasion (see PERSIAN GULF WAR), but also in Cambodia, somewhat less succesfully in Somalia, and elsewhere. As the demand for peacekeeping forces has increased, however, the funds to pay for them have become harder to raise, and nations have not always been willing to contribute troops, particularly if the risks are high.

United Nations Children's Fund: see UNITED NATIONS (table 4).

United Nations Conference on Trade and Development: see UNITED NATIONS (table 4).

United Nations Educational, Scientific, and Cultural Organization: see UNITED NATIONS (table 3).

United Nations High Commissioner for Refugees: see UNITED NATIONS (table 4).

United Nations Industrial Development Organization: see UNITED NATIONS (table 3).

The key to pronunciation appears on page xiii.

2. BODIES DESIGNATED BY THE CHARTER OF THE UNITED NATIONS

Name	*Location*	*Purpose and Function*
General Assembly	New York	Chief deliberative body of UN. All member states represented. Annual session begins Sept. Studies political, social, economic issues; makes recommendations but no advisements on issues under Security Council consideration, unless the Council so requests. Passes UN budget; sets assessments. Work conducted in part through seven main committees (on specified issues); also procedural, and ad hoc standing, committees.
Security Council	New York	Primary responsibility to preserve peace. Compact executive organ; in theory, functions continuously. Fifteen members: five permanent "big powers" (U.S., Russia, China, France, U.K.); ten chosen (five each year) for two-year terms by General Assembly. Permanent members must vote unanimously on substantive issues, but abstentions are allowed in practice. Security Council acts after complaint by member or notification by General Assembly or Secretary General, or on own volition. Makes recommendations on "disputes," takes action (economic sanctions or military action) on "threats to peace," "acts of aggression." Council not limited by bar on UN "domestic" intervention.
Economic and Social Council	New York	Members (54) elected (18 each year) for three-year terms by General Assembly. Meets at least twice yearly; investigates economic, social questions; reports to Assembly and to other organs. Coordinates specialized agencies; arranges international consultations. Functional (e.g., on the status of women; on population) and regional commissions carry out much of the work.
Secretariat	New York	Performs all UN administrative functions. Headed by Secretary General, who customarily serves five years. Authorized to bring situations to attention of various UN organs. Impartial party in effecting conciliation. Empowered to perform functions entrusted by other UN organs. Aided by large staff.
International Court of Justice	The Hague	Superseded WORLD COURT. Fifteen judges chosen by General Assembly and Security Council for nine-year terms; five reelected every three years. Nine-judge quorum. Hears disputes between member states, issues advisory opinions on matters presented by UN organs. Limited jurisdiction in disputes between states; questions of INTERNATIONAL LAW, breaches of international obligations, reparations for breaches. Judgments not appealable, binding only for case and parties (no system of precedent).
Trusteeship Council	New York	Established for UN control of non–self-governing territories, replacing League of Nations MANDATES (see TRUSTEESHIP, TERRITORIAL). Power to administer in territory essentially complete. Consists of the administering power, other permanent Security Council members, and elected members. Only territory remaining within jurisdiction is U.S.-administered PALAU.

United Nations Relief and Works Agency for Palestinian Refugees in the Near East: see UNITED NATIONS (table 4).

United Service Organizations (USO), organization that supplies social, recreational, welfare, and spiritual facilities to members of the armed forces. Associated agencies include the YMCA, YWCA, SALVATION ARMY, and many others. Organized in 1941, the USO is supported by contributions and volunteers; it conducts programs at some 175 locations.

United States, officially United States of America, republic (1990 pop. 248,709,873; 1993 est. pop. 257,908,000), 3,618,770 sq mi (9,372,143 sq km), North America. It is the world's third largest country in population and the fourth largest country in area. The U.S. consists of 50 states and a federal district—the site of the capital, WASHINGTON, D.C. It also has numerous outlying island territories and areas. The coterminous (48-state) U.S. extends across central North America from the Atlantic Ocean (E) to the Pacific Ocean (W) and from Canada (N) to Mexico and the Gulf of Mexico (S). The state of ALASKA occupies the northwestern part of the continent between the Arctic and Pacific oceans, bounded by Canada (E). The state of HAWAII, an island chain, is situated in the central Pacific, c.2,100 mi (3,400 km) SW of San Francisco. Outlying islands include, in the West Indies, PUERTO RICO (since 1952 a commonwealth associated with the U.S.) and the U.S. VIRGIN ISLANDS and, in the Pacific, AMERICAN SAMOA, GUAM, the NORTHERN MARIANAS (since 1986 a commonwealth associated with the U.S.), PALAU (a trust territory), WAKE ISLAND, and other possessions. The largest state (586,412 sq mi/1,518,807 sq km) is Alaska, and the smallest (1,214 sq mi/3,144 sq km) is RHODE ISLAND. The most populous is CALIFORNIA (1990 pop. 29,760,021). NEW YORK, LOS ANGELES, and CHICAGO are the largest U.S. cities.

Land. The coterminous U.S. is dominated by eastern and western mountain complexes, the five GREAT LAKES in the north, and a vast central plains region, nearly all of which is drained by one of the world's major river systems, the MISSISSIPPI, with its great tributaries, the MISSOURI and the OHIO. In the east the ancient, eroded APPALACHIAN MOUNTAINS, with many differentiated ranges, extend SW from Canada to Alabama. East and south of these mountains is the Atlantic–Gulf Coastal Plain. The Atlantic and Gulf coasts are essentially coastlines of submergence, with numerous estuaries, islands, and barrier beaches backed by lagoons. The Northeast has many fine natural harbors. Stretching over 1,000 mi (1,600 km) between the eastern and western mountain systems are the Interior Plains, once covered by a great inland sea. Forming the eastern portion are the fertile central lowlands, the nation's agricultural heartland; to the west are the GREAT PLAINS, a treeless, undulating plateau area that rises gradually to the foothills of the ROCKY MOUNTAINS. The lofty, geologically young Rockies extend NW from New Mexico into Canada and Alaska. Farther west are the CASCADE RANGE, with its many volcanic peaks; the SIERRA NEVADA, which includes Mt. WHITNEY (14,491 ft/4,417 m), the highest point in the coterminous U.S.; and the COAST RANGES, abutting on the narrow Pacific Coastal Plain. Between the Rockies and the ranges of the far west is the Intermontane Region, an expanse of plateaus, basins, and lower ranges through which great rivers such as the COLUMBIA and the COLORADO have cut deep gorges (see GRAND CANYON). There are several deserts in the Southwest, in one of which (DEATH VALLEY, Calif.) is found the lowest point in the U.S. (282 ft/86 m below sea level). Alaska is largely mountainous, rising to 20,320 ft (6,194 m) at Mt. MCKINLEY, the highest point in North America. Hawaii's islands are the tops of volcanoes rising from the ocean floor. The country has a wide variety of climates, ranging from the tropical (in Florida and Hawaii) to the subarctic tundra (in Alaska), and from the moderate Mediterranean (in S California) to the humid continental (in the northeastern states). Rainfall is heaviest in the Pacific Northwest, lightest in parts of the Southwest.

People. More than half the U.S. population is urban, and the great majority is of European descent. Until the immigration law of 1924, the country was a "melting pot" of nations. The original colonists on the Atlantic coast were chiefly from the British Isles. In addition, numerous African were transported as slaves to work the planta-

3. SPECIALIZED AGENCIES OF THE UNITED NATIONS

Agency	*Date Affiliated with UN;[1] Headquarters*	*Number of Members[2]*	*Purpose and Function*
Food and Agriculture Organization (FAO)	1945; Rome	169	Improve rural conditions, agricultural production and distribution; raise nutritional levels.
General Agreement on Tariffs and Trade (GATT)	1958; Geneva	114	Work to reduce tariffs and eliminate other barriers to international trade. Slated to be replaced by the World Trade Organization in 1995.
International Atomic Energy Agency (IAEA)	1957; Vienna	130	Promote peaceful uses of atomic energy. Buy and sell fuels and materials; assist in peaceful applications.
International Bank for Reconstruction and Development (IBRD)	1945; Washington	160	Further economic development through guaranteed loans, technical advice. Train member-state officials. Also called World Bank; IFC and IDA (below) affiliated.
International Civil Aviation Organization (ICAO)	1947; Montreal	173	Encourage orderly aviation growth. Improve standards for aircraft navigation, airworthiness, pilot licensing.
International Development Association, (IDA)	1960; Washington	144	Extend credit on easier terms to nations, mainly developing, that do not qualify for IBRD loans.
International Finance Corporation (IFC)	1957; Washington	148	Aid less-developed members by promoting private enterprise in their economies. Provide risk capital.
International Fund for Agricultural Development (IFAD)	1977; Rome	147	Finance agricultural projects to introduce, expand, improve food production, raise nutritional levels.
International Labor Organization (ILO)	1946; Geneva	168	Improve labor conditions, living standards; promote social justice; protect foreign workers.
International Maritime Organization (IMO)	1948; London	147	Promote cooperation on technical matters, maritime safety, navigation; encourage antipollution measures.
International Monetary Fund (IMF)	1945; Washington	178	Promote monetary cooperation, currency stabilization, trade expansion; meet balance-of-payments difficulties.
International Telecommunication Union (ITU)	1947 (1865); Geneva	172	Regulate, standardize, plan, coordinate international telecommunications; allot radio frequencies.
Multilateral Investment Guarantee Agency (MIGA)	1988; Washington	115	Encourage foreign investment in developing members by providing insurance against noncommercial losses (e.g., government action, civil unrest, warfare).
United Nations Educational, Scientific, and Cultural Organization (UNESCO)	1946; Paris	171	Reduce social tensions by encouraging interchange of ideas, cultural achievements; improve education.
United Nations Industrial Development Organization (UNIDO)	1967; Vienna	159	Promote industrial development in developing nations; help formulate industrial-development policies.
Universal Postal Union (UPU)	1947 (1875); Bern	177	Unite countries for reciprocal exchange of correspondence; aid and advise on improving postal services.
World Health Organization (WHO)	1948; Geneva	187	Promote highest health standards; set drug and vaccine standards; health and research guidelines.
World Intellectual Property Organization (WIPO)	1974; (1883); Geneva	132	Promote protection of intellectual property, inventions, copyrights, access to patented technology.
World Meteorological Organization (IWMO)	1950 (1878); Geneva	166	Promote cooperation between world meteorological stations; standardize observations; encourage research.

Key (1) Date in parentheses is date that predecessor organization began operation.
(2) In almost all cases, agencies have member states that are not members of the UN General Assembly.

tions in the South. By the mid-19th cent., as settlement of the West was accelerating, Irish and German immigrants came in great numbers, soon to be followed by Scandinavians. After the Civil War the new arrivals were mainly from E and S Europe (notably Italy, Greece, Poland, Russia, and the Balkans), and immigration from E Asia began. Despite early resentments and conflicts, the people of

The key to pronunciation appears on page xiii.

4. SELECTED OTHER UNITED NATIONS AGENCIES	
Name	*Purpose and Function*
United Nations International Children's Emergency Fund (UNICEF)	Assist children and adolescents worldwide, particularly in devastated areas and developing countries, with educational services, health care. Nobel Peace Prize, 1965.
United Nations Conference on Trade and Development (UNCTAD)	Accelerate economic growth in developing countries. Review policies of these and industrialized countries influencing trade and development.
United Nations High Commissioner for Refugees (UNHCR)	Seek permanent solution to refugee problem; protect refugees under its mandate; coordinate voluntary agency efforts; assist most-needy groups. Nobel Peace Prize, 1954, 1981.
United Nations Relief and Works Agency for Palestinian Refugees in the Near East (UNRWA)	Provide food, health services, education, vocational training for approximately 1.8 million displaced by ARAB-ISRAELI WARS.

European origin have coalesced into a somewhat homogeneous group. This has been less true of arrivals from Africa, Asia, and Latin America and their descendants. African Americans are the principal non-European group; they constitute a substantial minority throughout the southern states and are a majority in many southern and some northern cities. Japanese and Chinese are numerous in Hawaii, and there are large Chinese communities in eastern and West Coast cities. Spanish-speaking peoples from Latin America (especially Mexico) have tended to congregate in urban areas. There are also Native Americans, many of whom live on reservations (see NORTH AMERICA, INDIGENOUS PEOPLES OF), Eskimos, and Aleuts. Since the 1980s the largest numbers of immigrants have come from Asia and Latin America. The people of the U.S. enjoy religious freedom. The great majority are Christian, with Protestants outnumbering Roman Catholics and the Orthodox Eastern Church having many adherents. Islam and Judaism are the faiths of two other substantial groups of Americans.

Economy. The U.S. is one of the principal industrial nations of the world and has tremendous agricultural and mineral resources. Although it has been virtually self-sufficient in the past, an enormous increase in consumption (especially of energy) in the late 20th cent. has made it increasingly dependent on certain imports. Nevertheless, it is the world's foremost producer of electrical power from all sources, as it is of natural gas, lead, aluminum, and several other minerals, and it is among the leaders in the production of crude oil, coal, copper, iron ore, silver, and zinc. In total value of manufactures, the U.S. leads all other nations by a substantial margin, being the principal producer of synthetic rubber, petrochemicals, and many other products. In the 1980s service industries (including banking and finance, information services, and others) became an increasingly important sector of the economy. Long considered the "breadbasket of the world," the U.S. has an agricultural sector of unparalleled efficiency. Although its relatively small farm population has been increasingly threatened by a cost-price squeeze, it has consistently produced surpluses of many crops (notably grains) for export. Major exports other than food products include motor vehicles and parts, aircraft and parts, chemicals, and computers and parts. Imports include ores, petroleum, machinery, transportation equipment, and paper. Canada, Japan, Mexico, Germany, and the United Kingdom are its leading trade partners. Since the 1970s the U.S. balance of trade has been generally unfavorable, but the nation still has a rising gross domestic product ($5.4 trillion in 1990). Development of the U.S. economy has been spurred by the growth of a complex network of transportation (rail, highway, air, and inland waterway) and communications (telephone, radio, television, computer, and fax machine) that has made possible the creation of one of the world's most sophisticated marketing mechanisms.

Government. The U.S. is a federal republic in which power is divided between a central governing authority and the individual states. The principal framework of government is the CONSTITUTION OF THE UNITED STATES, drawn up in 1787. The federal government consists of three branches: executive, legislative, and judicial. Executive power is vested in the PRESIDENT, who conducts the nation's administrative business with the aid of a CABINET consisting mainly of the secretaries (heads) of the various federal departments, e.g., the departments of STATE, TREASURY, DEFENSE, and AGRICULTURE. The CONGRESS OF THE UNITED STATES, the legislative branch, is bicameral, consisting of a Senate and a House of Representatives. The judicial branch is formed by the federal courts, the highest of which is the nine-member U.S. SUPREME COURT, which also functions as the court of last resort for the 50 state judiciary systems. Members of Congress and members of the ELECTORAL COLLEGE, which formally chooses the president and vice president, are elected by universal suffrage.

History. England, Spain, and France were the chief nations to establish colonies in what is now the U.S. The first permanent European settlement in the present U.S. was ST. AUGUSTINE, Fla., founded by the Spanish in 1565, and the first permanent English settlement was established at JAMESTOWN, Va., in 1607. The British eventually extended their rule over most of the Atlantic coast, and in the FRENCH AND INDIAN WARS they ousted the French from Canada and the Old Northwest. Increasing conflict between Britain and the American colonies led to the AMERICAN REVOLUTION, the DECLARATION OF INDEPENDENCE (1776), and the creation of the U.S. Governed from 1781 under the Articles of CONFEDERATION, the U.S. opted for a stronger national government in the Constitution, drawn up at the FEDERAL CONSTITUTIONAL CONVENTION (1787). George WASHINGTON served as the first president. Controversy over the division of power between the states and the federal government gave rise to the first political parties (see FEDERALIST PARTY; DEMOCRATIC PARTY). Settlement of the frontier added new states to the Union, and the LOUISIANA PURCHASE (1803) secured a vast new territory to the west. The violation of U.S. shipping by the British led ultimately to the WAR OF 1812. Andrew JACKSON, the seventh president, sometimes considered the incarnation of frontier democracy, was elected in 1828 and provided a strong executive attuned to popular support. The annexation (1845) of TEXAS precipitated the MEXICAN WAR, in which the U.S. defeated Mexico, acquiring California and most of the present Southwest. The Pacific Northwest was added by a peaceful settlement (1846) with Britain (see OREGON). Meanwhile, the South, with its doctrine of STATES' RIGHTS, was becoming estranged from the North over the issue of slavery. After the election (1860) of Abraham LINCOLN to the presidency, the South seceded from the Union and formed the CONFEDERACY. The CIVIL WAR that ensued ended in complete victory for the North. The RECONSTRUCTION period that followed was marked by bitter struggles, including the impeachment (1868) of Pres. Andrew JOHNSON. The remainder of the 19th cent. was marked by railroad building, the disappearance of the American frontier, and massive industrialization. The U.S. gained additional territory with the purchase of Alaska (1867); the annexation of Hawaii (1898); and the conquest of Spanish possessions, e.g., Puerto Rico, Guam, and the PHILIPPINES, in the SPANISH-AMERICAN WAR (1898). Despite the efforts of Pres. WILSON to keep the U.S. neutral, the nation entered WORLD WAR I on the Allied side in 1917, but after the war it settled into an isolationist policy. The GREAT DEPRESSION began in 1929 and reached worldwide proportions. To combat it, Pres. F.D. ROOSEVELT launched a sweeping reform program called the NEW DEAL. The U.S. entered WORLD WAR II on the Allied side after the Japanese attack (1941) on PEARL HARBOR. After the war the U.S. emerged as a world power, but relations with the USSR deteriorated into the COLD WAR. In the

Al Gore, Jr.

KOREAN WAR, during the administration of Harry S TRUMAN, the U.S. took the leading role in combating the Communist invasion of South Korea. The U.S. economy boomed after World War II, and, spurred by Soviet advances in technology, the U.S. embarked on a large SPACE EXPLORATION program. In the 1960s domestic turmoil and violence erupted as African Americans became dissatisfied with the slow progress of INTEGRATION and protesters demonstrated against U.S. involvement in the VIETNAM WAR, which had escalated during the presidencies of Lyndon B. JOHNSON and Richard M. NIXON. In 1974 Nixon resigned following the WATERGATE AFFAIR, and Gerald R. FORD became president. Pres. Jimmy CARTER (1977–81) presided over a period of stagflation, a combination of economic recession and high inflation, and this, coupled with his inability to win the release of U.S. hostages held by IRAN, contributed to his defeat (1980) by Ronald REAGAN (1981–89). Reagan cut taxes, slashed social programs, and increased defense spending. The result was eight years of economic growth (from 1982) and a tripling of the national debt. Under George BUSH, elected president in 1988, the U.S. invaded (1989) Panama to depose Manuel NORIEGA and led the coalition that ousted (1991) Iraq's army from Kuwait (see PER-

The key to pronunciation appears on page xiii.

SIAN GULF WAR). Internationally, the U.S. gained from the collapse of Communism in the former USSR and E Europe and from friendly relations with RUSSIA, but domestically it suffered from recession (1990–91) and from continuing high budget deficits. Anemic economic growth in the recession's wake and the strong independent candidacy of Ross PEROT enabled Bill CLINTON to defeat (1992) Bush and become the first Democratic president in 12 years. The economy gradually improved in 1993, and the budget deficit eased due to that and a tax increase and spending cuts. The NORTH AMERICAN FREE TRADE AGREEMENT, signed in 1992 with Canada and Mexico, was ratified (1993) and took effect on Jan. 1, 1994.

United States Air Force Academy, at Colorado Springs, Colo.; federal educational institution for training young men and women to be officers in the U.S. air force. The academy was authorized by Congress in 1954. Instruction began at Denver in 1955, and the Colorado Springs campus opened in 1958. To be considered for appointment, applicants must be nominated by elected (or certain appointed) U.S. officials. Cadets undertake a four-year course of instruction and receive full scholarships and monthly allotments to cover personal expenses.

United States Coast Guard Academy, at New London, Conn.; federal educational institution (created 1876) for training young men and women to be officers in the U.S. coast guard. Unlike the other military academies, it gains its candidates through a nationwide competition rather than through appointments by political officials. A cadet's four-year education consists of military and academic instruction, including professional training at sea. Cadets receive full scholarships as well as pay and allowances.

United States Merchant Marine Academy, at Kings Point, Long Island, N.Y.; federal educational institution for training young men and women to be merchant marine officers. The academy, dedicated in 1943, is maintained by the Dept. of Transportation. An applicant must be nominated by a U.S. senator or representative. The four-year course, emphasizing maritime and naval specialties, includes tours of service aboard a merchant vessel.

United States Military Academy, at West Point, N.Y.; federal educational institution for training young men and women to be officers in the U.S. army; founded 1802. To be considered for appointment, applicants must be nominated by elected (or certain appointed) U.S. officials. Cadets undertake a four-year course of instruction with summers devoted to practical military training. They receive full scholarships and monthly allotments to cover personal expenses.

United States Naval Academy, at Annapolis, Md.; federal educational institution for training young men and women to be officers of the U.S. navy and marine corps; founded 1845. To be considered for appointment, applicants must be nominated by elected (or certain appointed) U.S. officials. The academy's four-year course includes scientific and general studies as well as technical courses on naval subjects and practical work at sea. Midshipmen (trainees) receive full scholarships and monthly allotments to cover personal expenses.

univalve: see GASTROPOD.

universal gas constant: see GAS LAWS.

universalism, religious doctrine that holds that it is God's purpose to save every individual from sin through divine grace. The doctrine is old, but it did not become an organized movement until modern times. In 1779 John Murray became pastor of the first Universalist church in the U.S., and in 1790 a convention decided on a congregational polity. Initially Calvinistic, the group later moved toward UNITARIANISM. In 1961 the Universalist Church of America merged with the Unitarians to form the Unitarian Universalist Association.

Universal Postal Union: see UNITED NATIONS (table 3).

University of California Regents v. Bakke, case decided in 1978 by the U.S. SUPREME COURT, which held in a closely divided decision that race could be a factor—considered in choosing a diverse student body—in university admissions decisions. The Court also held, however, that the use of quotas in such AFFIRMATIVE-ACTION programs was not permissible; thus, the Univ. of California, Davis, medical school had, by maintaining a 16% minority quota, discriminated against Bakke, a white applicant. The legal implications of the decision were clouded by the Court's division.

Universal Product Code: see BAR CODE.

unnilennium (Une): see MEITNERIUM.

unnilhexium (Unh), artificial radioactive TRANSURANIUM ELEMENT. Claims for its production have been made by a Soviet group at Dubna, who in 1974 bombarded lead with chromium ions to obtain the Unh^{259} and Unh^{260} isotopes, and groups in California at the Lawrence Berkeley and Lawrence Livermore Laboratories, who, also in 1974, bombarded californium with oxygen ions to obtain the Unh^{263} isotope. See ELEMENT (table); PERIODIC TABLE.

unniloctium (Uno): see HASSIUM.

unnilpentium (Unp): see HAHNIUM.

unnilquadium (Unq): see RUTHERFORDIUM.

unnilseptium (Uns): see NIELSBOHRIUM.

Upanishads, speculative and mystical scriptures of HINDUISM, composed beginning c.900 B.C., forming the final section of the VEDA. A heterogeneous compilation of material from various sources that together are regarded as the wellspring of Hindu religion and philosophy, the Upanishads (112 are extant) form the basis for the later philosophical schools of VEDANTA. The principal early Upanishads expound the doctrine of BRAHMAN, the universal self or soul, and its identity with the *atman,* or individual self or soul. The scriptures also contain information on Vedic sacrifice and YOGA.

Updike, John, 1932–, American author; b. Shillington, Pa. His elegantly written fiction usually deals with the tensions and tragedies of contemporary middle-class life, as in the quartet of novels covering the life of Harry Angstrom: *Rabbit, Run* (1960), *Rabbit Redux* (1971), *Rabbit Is Rich* (1981; Pulitzer Prize), and *Rabbit at Rest* (1990; Pulitzer Prize). His other novels include *Couples* (1970), *The Witches of Eastwick* (1984), and *Memories of the Ford Administration* (1992), and he also writes short stories, literary criticism, and poetry.

Upper Volta: see BURKINA FASO.

Uppsala, city (1988 pop. 159,998), capital of Uppsala co., E Sweden. Once the coronation place of Swedish kings, it is now a cultural and industrial center producing machinery, clothing, and other manufactures. Its 13th-cent. Gothic cathedral is the burial place of GUSTAVUS I, LINNAEUS, and SWEDENBORG. Its university (est. 1477) is the oldest in Sweden.

Ur, ancient city of SUMER, S Mesopotamia, on the Euphrates. Also called Ur of the Chaldees, it was flourishing by 3500 B.C. In the Bible it is identified as the home of ABRAHAM. Captured (c.2340 B.C.) by Sargon, it later became independent. Ur, however, declined after the 6th cent. B.C. and never recovered. C. Leonard Woolley led the excavation of the city in the 1920s.

Uralic and Altaic languages [yo͝orăl'ĭk, ăltā'ĭk], two groups of related languages thought by many scholars to form a single Uralic and Altaic linguistic family. However, other authorities hold that the Uralic and Altaic groups constitute two unconnected and separate language families. Uralic includes Finnish and Hungarian; Altaic includes Turkish and Mongolian. See LANGUAGE (table).

Urals or **Ural Mountains,** mountain system extending north-south c.1,500 mi (2,400 km) across W Russia into N Kazakhstan, part of the traditional border between Europe and Asia. Naroda (6,212 ft/1,893 m), in the north, is the highest point. Except in the polar and northern sections, the mountains are densely forested, with lumbering an important industry. They are also enormously rich in minerals, including coal, iron ore, aluminum, copper, manganese, potash, and oil. Huge industrial centers, part of the Urals industrial area (c.290,000 sq mi/751,500 sq km), are located at YEKATERINBURG (Sverdlovsk), Magnitogorsk, CHELYABINSK, Nizhni Tagil, and PERM. During World War II entire industries were transferred to the Urals from the W USSR.

Urania: see MUSES.

uraninite: see PITCHBLENDE.

uranium (U), radioactive metallic element, discovered in oxide form in PITCHBLENDE by M.H. Klaproth in 1789. A silver-white, hard, dense, malleable, ductile, highly reactive metal in the ACTINIDE SERIES, it occurs naturally as a mixture of three ISOTOPES. Because of a constant decay rate, the age of uranium samples can be estimated (see DATING). The rare uranium-235 isotope is the only naturally occurring fission fuel for NUCLEAR ENERGY. Breeder reactors convert the abundant but nonfissionable uranium-238 into fissionable plutonium-239. Uranium-235 and plutonium-239 are also prac-

ticable fissionable nuclei for ATOMIC BOMBS. See ELEMENT (table); NUCLEAR REACTOR; PERIODIC TABLE; RADIOACTIVITY.

Uranus, in astronomy, 7th PLANET from the sun, at a mean distance of 1.7832 billion mi (2.8696 billion km). It has a diameter of 32,490 mi (52,290 km) and a solid core with a thick atmosphere composed mostly of hydrogen, helium, methane, and ammonia. Detected on Mar. 13, 1781, by Sir William HERSCHEL, it was the first planet discovered in modern times with the aid of a telescope. The extreme (98°) inclination of Uranus's equatorial plane with respect to its orbital plane gives the planet a retrograde rotation, i.e., a rotation opposite to the direction of revolution. Prior to 1986, Uranus was known to have five natural satellites: **Titania,** the largest, with a diameter of 650 mi (1,040 km), and **Oberon** were discovered by Herschel in 1787; **Ariel** and **Umbriel,** by William Lassell in 1851; and **Miranda,** by Gerard Kuiper in 1948. In 1977 astronomers detected a system of narrow rings of small, dark particles orbiting around the planet. When the *Voyager 2* SPACE PROBE flew by Uranus in 1986, it discovered ten more moons and confirmed the existence of ten rings.

Uranus, in Greek mythology, the heavens, first ruler of the universe; son and husband of GAEA; father of TITANS, CYCLOPS, and Hundred-handed Ones. Uranus was castrated and dethroned by CRONUS. His blood, falling onto Earth, produced the vengeful FURIES; from his discarded flesh and the sea APHRODITE arose.

Urban II, c.1042–1099, pope (1088–99), a Frenchman named Odo (or Eudes) of Lagery. A Cluniac monk, he worked closely with GREGORY VII and as pope furthered Gregory's reforms. His sermon at Clermont (1095) brought about the First CRUSADE.

Urban VI, 1318?–1389, pope (1378–89), a Neapolitan named Bartolomeo Prignano. Chosen as successor to Gregory XI, he proved violent and unruly, whereupon the cardinals went to Anagni and elected Robert of Geneva as antipope, thus beginning the Great SCHISM. Urban probably murdered five cardinals who opposed him; many believe he was insane.

urban enterprise zone: see ENTERPRISE ZONE.

Urdu [o͝or'do͞o], language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. It is the official tongue of Pakistan. See LANGUAGE (table).

urea, organic compound, formula $CO(NH_2)_2$, that is the principal end product of nitrogen metabolism in most mammals. Most of the nitrogen in protein eventually appears in urea, which is concentrated by the KIDNEYS and excreted in urine.

ureter: see URINARY SYSTEM.

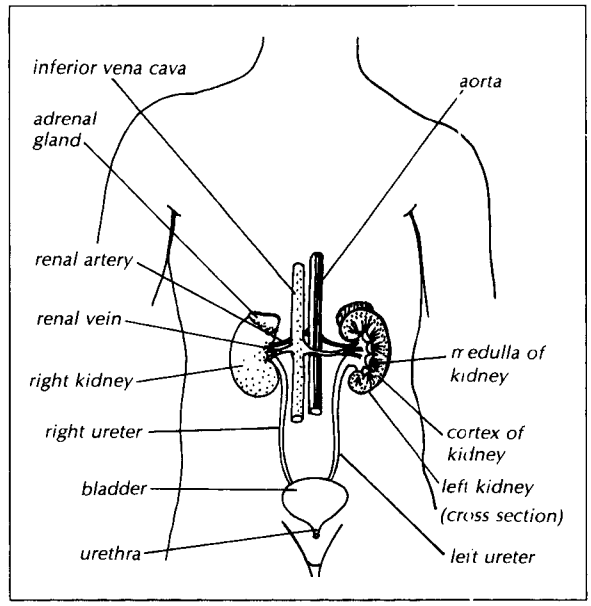
urethra: see URINARY SYSTEM.

Urey, Harold Clayton [yo͝or'ē], 1893–1981, American chemist. He taught at Johns Hopkins, Columbia, the Univ. of Chicago, and the Univ. of California. For his isolation of deuterium (heavy hydrogen) he won the 1934 Nobel Prize in chemistry; he later isolated heavy isotopes of oxygen, nitrogen, carbon, and sulfur. During World War II, in connection with the atomic bomb project, he worked on methods of separating uranium isotopes and on the production of heavy water.

urinary system, group of organs of the body concerned with excretion of urine. In humans, the urinary system includes the kidneys, ureters, bladder, and urethra. Blood containing waste products enters the KIDNEYS through the renal artery. The kidneys purify the blood by filtering out waste products, which, together with water, form URINE. From the kidneys, urine passes through thick-walled tubes called ureters into the bladder, a muscular sac that temporarily stores the urine and contracts to expel it. Urine released from the bladder flows into the urethra, the canal carrying it to the outside of the body.

urine, clear, amber-colored fluid formed by the KIDNEYS and carrying waste products of METABOLISM out of the body. Urine is 95% water, in which urea, uric acid, mineral salts, toxins, and other waste products are dissolved. It may also contain ordinary substances used by the body but excreted by the kidneys when excessive amounts are present in the bloodstream. Analysis of urine is important in detecting diseases. See also URINARY SYSTEM.

Ursa Major and **Ursa Minor** [Lat., = the great bear; the little bear], two conspicuous northern CONSTELLATIONS. In the U.S., part of Ursa Major is called the Big Dipper (or the Drinking Gourd) and part of Ursa Minor, the Little Dipper. POLARIS is at the extreme end of the Little Dipper.



Urinary system

Uruguay [yo͝o'rəgwā, –gwī], officially Eastern Republic of Uruguay, republic (1992 est. pop. 3,142,000), 68,536 sq mi (177,508 sq km), SE South America, the continent's second smallest country (after Suriname); bordered by Argentina (W), Brazil (N), the Atlantic Ocean (E), and the Río de la Plata (S). The capital is MONTEVIDEO, where over 40% of the people live. An alluvial plain, known as the Banda Oriental, occupies the south, while to the north is a region of grasslands and low hills. Uruguay's economy is based on sheep and cattle. Grains for cattle and human consumption make up the bulk of the crops, and manufacturing is led by the processing of animal and agricultural products; meat, wool, hides, and skins are the leading exports. The country has abundant fisheries. Most of the population is of Spanish and Italian descent; about 10% is mestizo. Spanish is the principal language, and Roman Catholicism the chief religion.

History. The first permanent European settlement in present-day Uruguay was established in 1624 by the Spanish, who controlled the Banda Oriental until the 1800s. Uruguay declared for independence with its neighbor Argentina in 1810, but in 1814, led by José ARTIGAS, determined to fight for a separate existence. In 1820 Uruguay's other neighbor, Brazil, occupied Montevideo, and it was not until 1828, after Brazil had been defeated at Ituzaingó, that an independent Uruguay was achieved. Immediately thereafter, a civil war broke out, which, becoming entwined with an uprising in Argentina, resulted in a long siege of Montevideo and did not end until 1851. In 1864 Uruguay again became involved with her neighbors, this time in a war with Brazil and Argentina against Paraguay (see TRIPLE ALLIANCE, WAR OF THE). Revolutions and counterrevolutions followed, and it was not until the regime of José Battle y Ordóñez in the early 20th cent. that Uruguay began the social and material progress that made it one of the more stable and prosperous nations of South America. However, economic problems and social unrest in the 1960s and 1970s, heightened by the terrorism of the Tupamaros, a Marxist guerrilla group, led to the installation of a repressive military regime in 1973. The ruling generals initiated moves that gradually returned the nation to democracy and political liberty, and in 1985 Julio Sanguinetti became president. Luis Alberto Lacalle succeeded him in 1990. Lacalle has attempted to reduce state programs and the state's role in the economy but has had only modest success.

Ussher or **Usher, James** [both: ŭsh'ər], 1581–1656, Irish Protestant prelate and scholar. By 1605 he was chancellor of St. Patrick's Cathedral, Dublin, and later became bishop of Meath (1620 or

1621) and archbishop of Armagh (1625). He was greatly admired for his learning and established a chronology that set the date of creation at 4004 B.C. and was long used in some editions of the King James Version of the Bible.

Ussuri [o͞osoo͞'rē], river, c.365 mi (590 km) long, Far Eastern Russia. It flows N to the Amur R. at Khabarovsk, forming part of the China-Russia border. Border clashes between Chinese and Soviet forces occurred along the river in 1969 and 1972.

usury: see INTEREST.

Utah, state in the W U.S.; bordered by Idaho and Wyoming (N), Colorado (E), Arizona (S), and Nevada (W).

Area, 84,916 sq mi (219,932 sq km). *Pop.* (1990) 1,722,850, a 17.9% increase over 1980 pop. *Capital,* Salt Lake City. *Statehood,* Jan. 4, 1896 (45th state). *Highest pt.,* Kings Peak, 13,528 ft (4,126 m); *lowest pt.,* Beaverdam Creek, 2,000 ft (610 m). *Nickname,* Beehive State. *Motto,* Industry. *State bird,* seagull. *State flower,* sego lily. *State tree,* blue spruce. *Abbr.,* UT.

Land and People. The Wasatch Range of the ROCKY MOUNTAINS runs north to south through the center of largely arid Utah, with the COLORADO PLATEAU to the east and the GREAT BASIN to the west. GREAT SALT LAKE and Bonneville Salt Flats are the remnants of Pleistocene-era Lake Bonneville. The generally dry climate is characterized by abundant sunshine and high temperatures in the southwestern desert, in contrast to the cooler weather and lower temperatures of the high plateaus and mountains. Often spectacularly scenic, Utah is the site of Glen Canyon National Recreation Area; Bryce Canyon, Arches, Canyonlands, and Zion national parks (see NATIONAL PARKS; table); and several national monuments. Over 60% of the land is controlled by the federal government. MORMONS constitute over two thirds of the population, of which more than 85% lives in urban areas, including those of SALT LAKE CITY, Utah's largest city, PROVO, and OGDEN. In 1990 the state was 94% white.

Economy. Much of the workforce is directly or indirectly involved in mining, and Utah extracts significant quantities of copper, oil, gold, magnesium, molybdenum, beryllium, coal, asphalt, silver, lead, tin, and other minerals. The major crops, which are heavily dependent on irrigation, are hay, wheat, apples, barley, alfalfa seed, and corn, although the bulk of agricultural income is derived from cattle and dairy products. Utah is a center of aerospace and military-related industries and also produces nonelectrical machinery, processed foods, transportation equipment, and computer-related items. The tourism industry is also important.

Government. The constitution (adopted 1895) provides for a governor serving a four-year term. The legislature consists of a senate with 30 members elected for four years and a house with 75 members elected to two-year terms. Utah is represented in the U.S. Congress by three representatives and two senators and has five electoral votes.

History. The remains of cliff-dwellers are preserved at Capitol Reef National Park (see NATIONAL PARKS, table). The UTE, PAIUTE, Goshiute, and NAVAHO inhabited the region when Spanish missionaries arrived (1776). The area passed (1848) to the U.S., and wagon trains on the OREGON TRAIL began passing through. In 1847 Mormons under the leadership of Brigham YOUNG began to settle Utah. Their subsequent petitions for statehood were denied because of the Mormon practice of polygamy. This dispute escalated (1857) into the Utah War, which briefly pitted settlers against U.S. army troops. In 1890 the church repudiated polygamy, and statehood was subsequently granted. Mining accelerated after the discovery of new mineral deposits in the early 20th cent. The extension of the COLORADO R. and other water projects and the growth of defense-related and high-technology industries since World War II have gradually provided Utah with a diversified economy.

Utamaro (Kitagawa Utamaro), 1753–1806, Japanese color-print artist, the first of the great masters of the *ukiyo-e* school (see JAPANESE ART). His were the first Japanese prints to become familiar in the West. His idealized, sensuous women and his book of *Insects* (1788) reveal a keen observation of nature.

Ute, Native Americans speaking a Shoshonean language of the Uto-Aztecan branch of the Aztec-Tanoan stock (see NATIVE AMERICAN LANGUAGES) and having a culture typical of the western Plains (see NORTH AMERICA, INDIGENOUS PEOPLES OF). They were nomadic people who celebrated the SUN DANCE. Fierce warriors, they ranged southward from their homeland in W Colorado and E Utah to menace the villages of the PUEBLO, selling captives into slavery. Some Utes fought with Kit CARSON against the NAVAHO in the CIVIL WAR. In 1868 they were placed on a Colorado reservation, but in 1880 they were moved to less desirable land. Most Utes still live in Utah and Colorado, with those on reservations deriving income from oil and gas leases, farming, cattle-raising, and tourism. In 1990 there were 7,273 Utes in the U.S.

uterus: see REPRODUCTIVE SYSTEM.

Uthman ibn al-Affan, d. 656, 3d Muslim caliph. A wealthy Meccan merchant, he converted to Islam and became caliph after the death of UMAR IBN AL-KHATTAB. He pursued Umar's policy of conquest, though less successfully, and built an administrative system of fiefdoms based on nepotism and the adoption of an official version of the Koran. Factional disputes escalated after his murder, at Medina, in 656.

Utica [yo͞o'tĭkə], ancient N African city, NW of Carthage. Supposedly founded by Phoenicians from TYRE (c.1100 B.C.), it joined Rome against CARTHAGE in the Third PUNIC WAR. Later it was the capital of the Roman province of Africa. It was destroyed by the Arabs A.D. c.700.

utilitarianism, in ethics, the theory that the rightness or wrongness of an action is determined by the goodness or badness of its consequences. Jeremy BENTHAM, founder of the theory, held that the greatest happiness of the greatest number is the fundamental and self-evident principle of morality. His student John Stuart MILL used the principles of utilitarianism to advocate political and social reform, increased democracy, and the emancipation of women. Herbert SPENCER developed a utilitarian ethics based on evolutionary changes.

Uto-Aztecan [yo͞o'tō-ăztĕk'ən], branch of the Aztec-Tanoan linguistic stock. The languages belonging to this stock are spoken in North and Central America. See NATIVE AMERICAN LANGUAGES (table).

Utopia [Gr., = no place], influential book by Sir Thomas MORE (1516) depicting an ideal state that has given its name to all such visions. Utopian writers criticize present conditions and outline vast revolutionary schemes without, however, describing the concrete steps necessary to realize them. The term is applied retrospectively to PLATO's *Republic* and St. AUGUSTINE's *City of God,* as well as to the more worldly Renaissance Utopias of RABELAIS and Francis BACON. ROUSSEAU's promotion of the idea of a primitive Golden Age and of man's innate goodness in turn influenced the

Utopian socialist communities envisioned by Claude, duc de SAINT-SIMON, Charles FOURIER, P.J. PROUDHON, and others. Utopian experiments, however, generally proved short-lived. The Utopian romance became a popular form of literature in the 19th cent., e.g., Samuel BUTLER's *Erewhon* (1872) and Edward BELLAMY's *Looking Backward* (1888), as did the satiric anti-Utopian novel in the 20th cent., e.g., Aldous HUXLEY's *Brave New World* (1932) and George ORWELL's *1984* (1949).

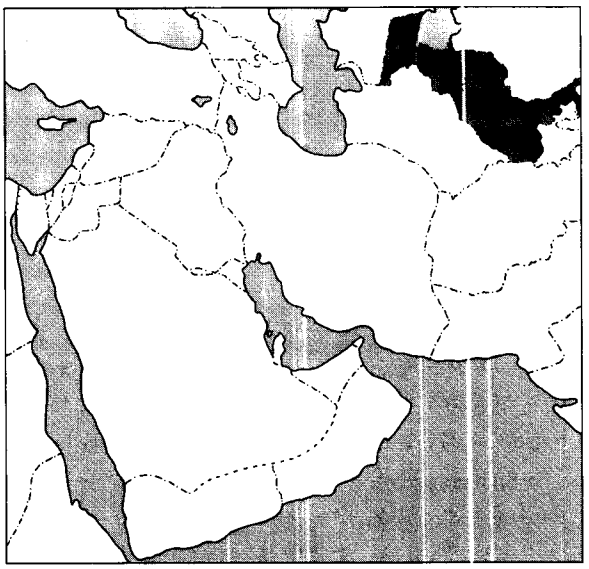
Utrecht, city (1991 est. pop. 232,000), capital of Utrecht prov., central Netherlands. It is an industrial center, with such manufactures as machinery, cement, and food. Founded by Rome, it became (7th cent.) an episcopal see. It was a major medieval center of commerce and was ruled by bishops until ceded (1527) to Emperor Charles V. In 1713 it was the site of the signing of the Peace of Utrecht ending the war of the SPANISH SUCCESSION. It is noted for its 14th-cent. cathedral and its university (est. 1636).

Utrillo, Maurice, 1883–1955, French painter; son of the painter Suzanne Valadon. His favorite theme was street scenes of Paris. His personal style was based on a modified CUBISM and a fine sense of atmosphere and composition.

Uxmal [ōōshmäl'], ancient city, N Yucatán peninsula, Mexico. A Late Classic period MAYA center, Uxmal flourished between 600 and 900. The site has several fine examples of Mayan architecture, including the Nunnery, with elaborate stone mosaic friezes; the Governor's Palace, with some 20,000 carved stone elements in its facade; and the Pyramid of the Magician. The Maya abandoned Uxmal shortly after 950.

Uzbekistan, officially Republic of Uzbekistan, republic (1992 est. pop. 21,627,000), 173,552 sq mi (449,500 sq km), central Asia, formerly a constituent republic of the USSR. It borders Afghanistan (S); Turkmenistan (SW); Kazakhstan (W, N); and Kyrgyzstan and Tajikistan (E). TOSHKENT, the capital, and SAMARKAND are the chief cities. The northwest is largely part of the KYZYL KUM desert and borders the Aral Sea in the extreme north; the southeast has fertile loess soil and touches on the Tian Shan mountains. The Amu Darya and Syr Darya pass through the country, providing irrigation for its farms. Major economic activities include the growing of cotton and rice; stock-raising; and machine building, textile manufacturing, metallurgy, and food processing. Oil, natural gas, and coal are the major resources; there are also zinc, copper, tungsten, and other ores. The Uzbek, a Turkic-speaking people, make up the majority of the population; other groups include Russians, Tajiks, Kazakhs, and Tatars. Sunni Islam is the predominant religion, and the Orthodox church is the largest non-Islamic faith. Uzbek is the official language, but Russian and other ethnic languages are also spoken.

History. The ancient Persian province of Sogdiana, the region was



ruled (4th–15th cent.) by ALEXANDER THE GREAT, Arabs, the Seljuk Turks of KHOREZM, JENGHIZ KHAN, TIMUR, and the TIMURIDS. The cities of Samarkand, Bukhara, and Toshkent, situated on trade routes to China, India, Persia, and Europe, were centers of prosperity, culture, and luxury. In the early 16th cent., the Uzbek invaded from the northwest. A remnant of the empire of the GOLDEN HORDE, they took their name from Uzbeg Khan (d. 1340), from whom their rulers claimed descent. Later in the 16th cent., the Uzbek domain was extended over parts of Persia, Afghanistan, and Chinese Turkistan, but the empire soon broke into separate principalities. These fell under Russian control largely between 1865 and 1873. In 1918, after a failed attempt to form a Western-style democratic republic, the region became part of the USSR; the Uzbek Soviet Socialist Republic was established in 1924. Following the failed hard-line coup against Soviet Pres. Gorbachev, Uzbekistan declared (1991) its independence from the USSR and later joined the COMMONWEALTH OF INDEPENDENT STATES. The former Communist party retained its hold on power. In 1991 Islam Karimov, in power since 1990, was elected president, but major opposition parties were not allowed to run candidates in the election. Opposition groups have since been suppressed.

V

V, chemical symbol of the element VANADIUM.

Vaca, Cabeza de: see CABEZA DE VACA, ÁLVAR NÚÑEZ.

vaccination, means of producing active IMMUNITY against disease by the introduction of weakened live or killed microorganisms that stimulate the body to produce antibodies against more dangerous forms of the microorganism. Vaccination was used in ancient times in China, India, and Persia, and was introduced in the West in the late 18th cent. by E. JENNER. Vaccination has eradicated SMALLPOX and prevents such diseases as DIPHTHERIA, POLIOMYELITIS, RABIES, and TYPHOID. Experimental vaccines are being tested for certain cancers. Vaccines also control animal pests by conferring temporary infertility.

vacuum, theoretically, space devoid of matter. A perfect vacuum has never been obtained; the best artificial vacuums contain less than 10^5 gas molecules per cc, compared with about 30×10^{18} molecules per cc for air at sea level. In intergalactic space, the regions with the highest vacuum are estimated to contain less than one molecule per cc. Several kinds of **vacuum pumps** have been devised, e.g., the ion pump, which ionizes gas molecules and draws them to a charged collector, and the cryogenic pump, which condenses gas molecules on an extremely cold surface of a container.

vagina: see REPRODUCTIVE SYSTEM.

Vaillant, George Clapp [văl'yănt], 1901–45, American archaeologist; b. Boston, known for his syntheses of early Mexican culture and AZTEC history. He worked in the Southwest, Egypt and Cen-

The key to pronunciation appears on page xiii.

tral America. His works include *Indian Arts in North America* (1939).

Valdivia, Pedro de [väldē'vyä], c.1500–1554, Spanish CONQUISTADOR, conqueror of CHILE. Accompanying Francisco PIZARRO during the conquest of PERU, he received Pizarro's permission to subdue Chile in 1540. The capital, SANTIAGO, was founded in 1541, but the colony did not prosper because of the scarcity of gold and the ferocity of the ARAUCANIANS. Valdivia returned to Peru for further aid in 1547 and helped quell the rebellion of Gonzalo PIZARRO. Governor of Chile from 1549, he founded CONCEPCIÓN (1550) and Valdivia (1552). He was killed in the Araucanian rebellion of 1553.

valence or **oxidation state,** combining capacity of an ATOM expressed as the number of single bonds the atom can form or the number of electrons an ELEMENT gives up or accepts when reacting to form a compound. The valence of an atom is determined by the number of electrons in the outermost, or valence, electron shell. An atom exists in its most stable configuration when its outermost shell is completely filled; in combining with other atoms, it thus tends to gain or lose valence electrons in order to attain a stable configuration. The valence of many elements is determined from their ability to combine with hydrogen or to replace it in compounds.

Valencia, autonomous region and former kingdom (1987 est. pop. 3,754,000), E Spain, on the Mediterranean Sea. Largely mountainous, with a fertile coastal plain, Valencia is the "garden of Spain." Citrus and other fruits, rice, and wine grapes are among its crops. Manufactures include ceramics and metal products. The area was conquered (8th cent.) by the MOORS, became (1022) an independent emirate, and was ruled (1094–99) by the CID. It was conquered (1238) by ARAGÓN but preserved its political identity within Aragón and, later, in the Spanish state.

Valencia, city (1988 est. pop. 744,000), capital of Valencia prov., E Spain. A picturesque winter resort, it lies in a fertile region near its Mediterranean port, El Grao. It has shipyards and produces textiles, metal products, and chemicals. A Roman colony, it was held (8th–13th cent.) by the MOORS. Conquered by James I of Aragón (1238), it gained commercial and cultural importance; intellectual eminence followed. Landmarks include the cathedral (13th–15 cent.), 14th-cent. fortified towers built on Roman foundations, and the Gothic silk exchange.

Valens, c.328–378, Roman emperor of the East (364–78). Unlike his brother and coruler of the West, VALENTINIAN I, he embraced ARIANISM. He was killed in a disastrous defeat by the VISIGOTHS at Adrianople. THEODOSIUS I succeeded him.

Valentine, Saint, d. c.270, Roman martyr-priest. Possibly because his feast, Feb. 14, was close to a pagan love festival, Valentine became known as a patron of lovers. The lovers' greeting cards sent on this day are called valentines. His feast was dropped from the liturgical calendar in 1969.

Valentine's Day: see SAINT VALENTINE'S DAY.

Valentinian, Roman emperors of the West. **Valentinian I,** 321–75 (r.364–75), was coruler of the East with his brother VALENS. He reduced taxes and allowed religious freedom. His son, **Valentinian II,** 371?–392, (r.375–392), ruled jointly until 383 with his brother Gratian, who made THEODOSIUS I emperor of the East. He was expelled (387) from Italy by Maximus but restored (388) by Theodosius. Later he was murdered, probably by the Frankish general Arbogast. **Valentinian III,** 419–55 (r.425–55), was at first under the regency of his mother, Galla Placidia. The Vandals and HUNS invaded the empire during his reign. An ineffectual monarch, he allowed the general Aetius to rule (433–54). Valentinian murdered Aetius (454) and was himself murdered.

Valentino, Rudolph, 1895–1926, American film actor; b. Italy. He became one of the screen's first sex symbols in such silent films as *The Sheik* (1921) and *Blood and Sand* (1922).

Valera, Eamon de: see DE VALERA, EAMON.

Valéry, Paul [välārē'], 1871–1945, French poet and critic. A follower of the SYMBOLISTS, he was one of the greatest French poets of the 20th cent. His masterpiece, *The Young Fate* (1917), long and somewhat obscure, and *Graveyard by the Sea* (1920) offer the best examples of Valéry's poetics. His prose works include five collections of essays, all called *Variety* (1924–44), and four dialogues on subjects ranging from the arts to mathematics. He received many honors.

Valkyries [välkēr'ēz], in Germanic myth, Odin's warrior maidens. They presided over battles, chose those who were to die, and bore heroes' souls to Valhalla, hall of heroes in ASGARD. Chief among them was BRUNHILD. They are prominent in Richard WAGNER's *Die Walküre.*

Valla, Lorenzo, c.1407–1457, Italian humanist. At 26 he wrote *On Pleasure,* an analysis of pleasure and a humanistic condemnation of SCHOLASTICISM. His masterpiece is *On the Elegance of the Latin Language* (1435–44), a brilliant and influential philological defense of classical Latin.

Vallandigham, Clement Laird, 1820–71, American political leader, leader of the COPPERHEADS in the CIVIL WAR; b. New Lisbon (now Lisbon), Ohio. A lawyer and former Democratic congressman (1858–63), Vallandigham was briefly imprisoned in 1863 for maintaining in a speech that the war was being fought to free African-American slaves and enslave whites. The 1864 Democratic platform reflected his pro-Southern views.

Valle Inclán, Ramón del [vä'lyā ēnklän'], 1866?–1936, Spanish writer. His most notorious works, the erotic tales in *Femeninas* (1895) and the semiautobiographical *Sonata* novels (1902–5; tr. *The Pleasant Memoirs of the Marquis de Bradomín*), show the influence of MODERNISMO, while such poetic works as *The Aroma of Legends* (1907) express a symbolist aesthetic. His originality is most marked in his *esperpentos,* grotesque caricatures of Spanish life, particularly of aristocratic and military brutality, reminiscent of the nightmare etchings of GOYA; they include the play *Bohemian Lights* (1920) and the novel *The Tyrant* (1926).

Vallejo, César [väyā'hō], 1895–1938, Peruvian poet. Of indigenous and European ancestry, he was dedicated to social justice. After 1923 he lived in Europe, where he became a Marxist and supported the Republicans in the SPANISH CIVIL WAR. His poetry includes *Black Heralds* (1918), *Human Poems* (1939), and *Spain, Let This Cup Pass from Me* (1940).

Vallejo [vəlā'hō, -ō], city (1990 pop. 109,199), Solano co., W Calif., on San Pablo Bay at the mouth of the Napa R.; inc. 1866. A rapidly growing port city, it has numerous dry dock and shipbuilding facilities. The U.S. naval shipyard on Mare Island, west of Vallejo, was established (1854) by Adm. David Farragut. The city is also a trade and processing center for farm products. Founded (1851) to be the state capital, it was the nominal capital from 1852 to 1853.

valley fever or **coccidioidomycosis,** systemic disease endemic to the SW U.S. and other arid regions of the Americas, contracted by inhaling dust containing spores of the fungus *Coccidioides immits.* From the respiratory tract, it can spread to the skin, bones, and central nervous system. Manifestations range from complete absence of symptoms to systemic infection and death.

Valley Forge, on the Schuylkill R., NE Pa. During the AMERICAN REVOLUTION it was the encampment of the Continental Army, Dec. 1777–June 1778. The winter was severe but the suffering troops were held together by loyalty to Gen. WASHINGTON and the patriotic cause.

Valois, Dame Ninette de [väl'wä], 1898–, English BALLET dancer, choreographer, and director; b. Ireland. She was choreographic director of the Abbey (Dublin) and Old Vic (London) theaters. In 1931 she established the Sadler's Wells Ballet School, London, and later she became director of the Vic-Wells Ballet (now the ROYAL Ballet).

Valois [välwä'], royal house of France that ruled from 1328 to 1589. It succeeded the CAPETIANS when PHILIP VI, son of Charles of Valois and grandson of PHILIP III, became king. The direct Valois line ended (1498) with CHARLES VIII; the dynasty was continued by LOUIS XII (Valois-Orléans) and by FRANCIS I (Valois-Angoulême). At the death of HENRY III (1589), HENRY IV of the house of BOURBON succeeded to the throne.

Valparaiso, city (1990 est. pop. 277,000), central Chile, capital of Valparaiso dept., on a bay of the Pacific Ocean. Chile's chief port, it is a major industrial center and the terminus of a trans-Andean railroad. Its setting is a natural amphitheater. The business district, crowded onto a narrow waterfront terrace, is connected by cable

railways to residential areas on the surrounding slopes. Founded in 1536, Valparaiso grew rapidly in the late 19th cent.

value-added tax, levy imposed on businesses at all levels of production of a good or service, and based on the increase in price, or value, added to the good or service by each level. Because all stages of a value-added tax are ultimately passed on to the consumer in the form of higher prices, it has been described as a hidden sales tax. Originally introduced in France (1954), it is now used by most W European countries. See also TAXATION.

vampire, in folklore, animated corpse that sucks the blood of humans, usually enslaving its victims and making them vampires. Vampires could be warded off with charms and killed by a stake driven through the heart. Literature's most famous vampire is Bram STOKER's *Dracula* (1897).

vanadium (V), metallic element, discovered in 1801 by A.M. del Rio. It is a soft, silver-gray metal that adds strength, toughness, and heat resistance to STEEL alloys. Vanadium compounds, especially the pentoxide, are used in ceramics, glass, and dyes and are important as catalysts in the chemical industry. See ELEMENT (table); PERIODIC TABLE.

Van Allen radiation belts, two belts of RADIATION outside the earth's atmosphere, extending from c.400 to c.40,000 mi (c.650 to c.65,000 km). The region of the belts is called the magnetosphere. The high-energy protons and electrons that compose the belts circulate along the earth's magnetic lines of force. These particles are probably emitted by the sun in its periodic solar flares and, after traveling across space, are captured by the earth's magnetic field. The belts were discovered by detectors (developed by American physicist James Van Allen and colleagues) aboard *Explorer I*, the first U.S. artificial satellite. A belt of high-energy oxygen, nitrogen, and neon ions located within the inner Van Allen radiation belt was detected in the late 1980s and identified in 1993.

Vanbrugh, Sir John, 1664–1726, English dramatist and architect. His best-known plays, *The Relapse* (1696) and *The Provoked Wife* (1697), are imbued with Restoration wit and cynicism. As his repute as an architect grew, he turned away from the stage, becoming WREN's principal colleague. He is especially noted for Blenheim Palace (the culmination of English BAROQUE) and Castle Howard.

Van Buren, Martin, 1782–1862, 8th president of the U.S. (1837–41); b. Kinderhook, N.Y. A lawyer, he became active in New York State Democratic politics and one of the leaders of the Albany Regency. He served (1821–28) in the U.S. Senate. Elected governor of NEW YORK in 1828, he became one of Andrew Jackson's supporters and resigned (1829) to become Jackson's secretary of state (1829–31). He was Jackson's running mate in the 1832 presidential election and was elected vice president. Largely through Jackson's influence, he was the Democratic candidate for president in 1836 and won. He intended to continue Jackson's policies, but the Panic of 1837 and the hard times that followed made him very unpopular. To meet the economic crisis, he proposed (1837) the INDEPENDENT TREASURY SYSTEM. In foreign affairs, he attempted to mediate the differences with Great Britain that arose from the CAROLINE AFFAIR and the AROOSTOOK WAR. He was defeated for reelection in 1840 by William Henry HARRISON, the WHIG PARTY candidate. He remained a power in Democratic politics, but in 1848 he ran for president as the candidate of the FREE-SOIL PARTY and managed to throw the election to Zachary TAYLOR. He supported Abraham LINCOLN in the secessionist crisis.

Vancouver, George, 1757–98, English navigator and explorer. He commanded an expedition (1791–94) to take over Nootka Sound, assigned to England by the Nootka Convention, and thoroughly explored the NW coast of America. He also circumnavigated the island now called VANCOUVER ISLAND.

Vancouver, city (1991 pop. 471,844), SW British Columbia, W Canada, on Burrard Inlet of the Strait of Georgia. The city, known for its mild climate and spectacular backdrop of mountains (part of the COAST RANGE), is Canada's third largest (and largest western) city, its principal Pacific port, and the chief western terminus of the trans-Canadian railroads, highways, and airways. Oil refining, fish processing, and the manufacture of textiles dominate a diversified industrial economy. Notable attractions include Stanley Park, an anthropology museum, and aquarium. Originally called Granville, it was settled before 1875 and renamed for Capt. George VANCOUVER in 1886. It was the site of an international exposition in 1986.

Vancouver Island, island, 12,408 sq mi (32,137 sq km), SW British Columbia, Canada, separated from the mainland by Juan de Fuca, Georgia, and Queen Charlotte straits. It is c.285 mi (460 km) long and c.30–80 mi (50–130 km) wide, and reaches a high point of 7,219 ft (2,200 m) at Golden Hinde Mt. Victoria is the largest city. The island was first sighted (1774) by Juan Pérez, explored (1778) by Capt. James COOK, and circumnavigated (1792) by Capt. George VANCOUVER. It was a separate colony (1849–1866) before becoming part of British Columbia.

Vanderbilt, Cornelius, 1794–1877, American railroad magnate; b. Staten Island, N.Y. After working on ferries around New York City as a boy, he gained control of the ferry lines, expanded his shipping interests, and came to be known as Commodore Vanderbilt. During the California gold rush he opened (1851) a shipping line from the East Coast to California via Nicaragua. He entered the railroad field during the Civil War; by 1867 he had gained control of the New York Central RR and by 1873 had connected Chicago with New York City by rail. From the large fortune amassed by his railroad empire he founded Vanderbilt Univ. (Nashville, Tenn.). A son, **William Henry Vanderbilt,** 1821–85, b. New Brunswick, N.J., succeeded his father as president of the New York Central, and gave liberally to Vanderbilt Univ. and other institutions. William's son **Cornelius Vanderbilt,** 1843–99, b. Staten Island, N.Y., helped establish the Vanderbilt Clinic and the Cathedral of ST. JOHN THE DIVINE (both: N.Y.C.). Another son, **George Washington Vanderbilt,** 1862–1914, b. Staten Island, N.Y., donated land for Teachers College, Columbia Univ., and built the estate "Biltmore" near Asheville, N.C. **Harold Sterling Vanderbilt,** 1884–1970, b. Suffolk co., N.Y., grandson of William, won the America's Cup yachting races three times in the 1930s and largely developed (1925) the modern game of contract bridge.

Van der Goes, Hugo: see GOES, HUGO VAN DER.

van der Meer, Simon, 1925–, Dutch physical engineer. He worked with Carlo RUBBIA at CERN, where they discovered the W AND Z PARTICLES, the subatomic particles that convey the WEAK INTERACTION. In 1984 they were awarded the Nobel Prize in physics.

van der Waals, Johannes Diderik [van dər vals], 1837–1923, Dutch physicist. His theory of corresponding states (1880) contained an equation of state (now named for him) for homogeneous substances in terms of pressure, volume, and temperature (see GAS LAWS); unlike the ideal gas law, his equation contains constant factors (different for each real substance) to account for the fact that molecules are of finite size and experience weak forces of mutual attraction (van der Waals forces). For this work and for the discovery of the law of binary mixtures he won the 1910 Nobel Prize in physics.

van der Waals equation: see GAS LAWS.

Van der Weyden, Roger: see WEYDEN, ROGER VAN DER.

Van Diemen's Land: see TASMANIA.

Van Dyck or **Vandyke, Sir Anthony,** 1599–1641, Flemish portrait and religious painter and etcher. Born in Antwerp, Belgium, he was the assistant and collaborator of RUBENS. In 1620 he traveled to England and then to Italy, where he painted portraits of the Genoese nobility. An outstanding example is the portrait of Marchesa Elena Grimaldi (National Gall., Wash., D.C.). When he returned to Antwerp in 1627, where he rivaled Rubens in popularity, he painted a famous series of religious pictures. In his portraits, Van Dyck conferred upon his sitters elegance, dignity, and refinement, qualities pleasing to royalty and aristocracy. In 1632 he was invited to England by CHARLES I, and his portraits of Charles are in the Louvre and Buckingham Palace. He became court painter and was overwhelmed with commissions. From 1634 to 1635 he was in Antwerp, where he painted his masterly *Lamentation.* Although similar in technique to that of Rubens, his work has more restrained color and refined form. The patrician image of English aristocrats that he created greatly influenced the direction of English portraiture. Examples of his portraits include those of James Stuart and of the Marchesa Durazzo (both: Metropolitan Mus.).

Vandyke, Sir Anthony: see VAN DYCK, SIR ANTHONY.

Vane, Sir Henry, 1613–62, English statesman. A Puritan, he emigrated to America in 1635 and was elected (1636) governor of

Massachusetts. His support of Anne HUTCHINSON cost him reelection in 1637, and he returned to England. He sat in the Short and Long Parliaments and secured (1643) the Solemn League and Covenant with Scotland. He was influential under Oliver CROMWELL until the two quarreled in 1653. After the RESTORATION, Vane was executed for treason.

Van Gogh, Vincent [vän gō], 1853–90, Dutch postimpressionist painter. His works are perhaps better known generally than those of any other painter. The great majority were produced in 29 months of frenzied activity interspersed with epileptoid seizures and despair that finally ended in suicide. His early work, the Dutch period (1880–85), consists of dark, greenish-brown, heavily painted studies of peasants and miners, e.g., *The Potato Eaters* (1885; Municipal Mus., Amsterdam). After moving from the Netherlands to Paris, he met PISSARRO, who encouraged him to adopt a colorful palette, e.g., *Père Tanguy* (1887; Niarchos Coll., Paris). His work from his last months at Arles is characterized by the heavy impasto and rhythmic linear style so identified with him; it includes the incomparable series of sunflowers (1888). His last works include the swirling, climactic *Starry Night* (Mus. Mod. Art, N.Y.C.) and the ominously distressed *Wheatfield with Crows* (Van Gogh Foundation, Amsterdam).

vanilla, vine (genus *Vanilla*) of the ORCHID family, native to hot damp climates of Central America but now cultivated in other tropical regions. The fruits yield vanilla, a popular flavoring usually marketed as an alcoholic extract. The commercial plant is usually *V. fragrans;* the source of the flavor is an aromatic essence, vanillin. Vanilla flavoring, now usually artificially synthesized, is also obtained from the tonka bean, which contains coumarin, a substance with a vanilla-like aroma.

Vannucci, Pietro: see PERUGINO.

Van Ostade, Adriaen: see OSTADE, ADRIAEN VAN.

Van Rensselaer, Stephen, 1764–1839, American politician, called the Patroon; b. N.Y.C. As the largest landholder in New York, he was long involved in state affairs and served in Congress (1822–29). In the WAR OF 1812, his troops were defeated in the battle of Queenston. His vote in the House assured the 1825 election of J.Q. ADAMS as president.

van't Hoff, Jacobus Hendricus [vänt hôf], 1852–1911, Dutch physical chemist. His studies in molecular structure laid the foundation of stereochemistry. For his work in chemical dynamics and osmotic electrical conductivity he won (1901) the first Nobel Prize in chemistry.

Vanuatu, officially Republic of Vanuatu, republic (1992 est. pop. 175,000), 5,570 sq mi (14,426 sq km), comprising a 450-mi (724-km) chain of islands in the South Pacific Ocean E of Australia, formerly called the New Hebrides. Espiritu Santo and Efâte, site of Vila (the capital), are the two largest islands. The group is forested and mountainous. The chief industries are copra production, tuna fishing, manganese mining, and cattle raising. Additional revenues derive from a growing tourist industry and the development of Vila as a corporate tax haven. The population is predominantly Melanesian. English and French are the official languages, but Bislama, a pidgin, is widely spoken.

History. The islands were visited in 1606 by the Portuguese and were systematically explored in 1774 by Capt. James COOK. In 1887 they were placed under an Anglo-French naval commission, which was replaced (1906) by a condominium. In 1980 they became independent as Vanuatu, and a secession movement on Espiritu Santo was put down with aid from Papua New Guinea and Britain. A member of the Commonwealth, Vanuatu has a president, a prime minister and council, and a unicameral parliament. A coalition led by Prime Min. Maxime Carlot has governed Vanuatu since 1991. See PACIFIC OCEAN map.

Van Vechten, Carl, 1880–1964, American author; b. Cedar Rapids, Iowa. A leading music critic and distinguished photographer, he was also a novelist whose sophisticated 1920s works include *Nigger Heaven* (1926) and *Spider Boy* (1928).

vaporization: see STATES OF MATTER.

Varanasi, formerly **Benares,** city (1991 pop. 1,026,467), Uttar Pradesh state, N central India, on the Ganges R. The holiest Hindu city, it has c.1,500 temples, palaces, and shrines. Steps lead to the sacred GANGES, where Hindus bathe. About 1 million pilgrims visit the city annually. BUDDHA is said to have begun preaching nearby. The mosque of AURANGZEB, on the city's highest ground, is the most notable building of India's MOGUL period. The city is also known for its silk brocades and brassware.

Varèse, Edgard [värĕz'], 1885–1965, French-American composer. A bold innovator, he achieved dissonant effects by using extreme registers of orchestral instruments combined with ELECTRONIC MUSIC. His works include *Hyperprism* (1923), *Ionisation* (1931), and *Poème Electronique* (1958).

Vargas, Getúlio Dornelles [vär'gəs], 1883–1954, president of BRAZIL (1930–45, 1951–54). He led a revolt and established a dictatorship (1930), and introduced (1937) a corporate state. Ousted (1945) by an army coup, he was again elected president (1950); he resigned (1954) under army pressure and committed suicide.

Vargas Llosa, Mario [vär'gäs yō'sä], 1936–, Peruvian novelist. Technically innovative, his novels are penetrating studies of Peruvian life. They include *The Time of the Hero* (1962), *The Green House* (1966), *Conversations in the Cathedral* (1969), *Aunt Julia and the Scriptwriter* (tr. 1982), and *The War of the End of the World* (tr. 1984). In 1990 Vargas Llosa was an unsuccessful candidate for president of Peru.

variable star, star that varies, either periodically or irregularly, in the intensity of its light. Variable stars are grouped into three broad classes: the pulsating variables, the eruptive variables, and the eclipsing variables. In **pulsating variables,** which account for more than half of the known variable stars, slight instabilities cause the star alternatively to expand and to contract, resulting in changes in absolute luminosity and temperature. The pulsating variables can be subdivided into short-term, long-term, semiregular, and irregular variables. *Short-term variables* have periods ranging from less than one day to more than 50 days; among them are the important but rare CEPHEID VARIABLES. Commoner short-term variables are the RR Lyrae stars; about 2,500 of this type are known in our galaxy. They have periods of less than one day, and all have roughly the same intrinsic brightness, which makes them another useful distance indicator. The *long-term variables* are the most numerous of the pulsating stars. They are red giant and supergiant stars with periods ranging from 80 to 300 days. *Semiregular variables* are stars whose periodic variations are occasionally interrupted by sudden bursts of light. *Irregular variables* show no periodicity in their variations in brightness. The **eruptive variables** are highly unstable stars that suddenly and unpredictably increase in brightness. *T Tauri stars* are the least violent of these explosive stars. *Novas* are small, very hot stars that suddenly increase thousands of times in luminosity; their decline in luminosity is much slower, taking months or years. SUPERNOVAS, upon exploding, increase millions of times in brightness and are totally disrupted. **Eclipsing variables** are not true (intrinsic) variables but rather are BINARY STAR systems.

varicose vein, superficial vessel that is abnormally twisted, lengthened, or dilated, seen most often on the legs and thighs and usually attributed to inefficient valves within the vein. Conditions such as PREGNANCY or obesity, or increased pressure from prolonged standing, reduce the support of tissues surrounding the veins, causing them to dilate. Treatment includes use of support hosiery and, if necessary, surgical removal.

Varna, city (1989 est. pop. 311,000), E Bulgaria, on the Black Sea. A major port, it has shipyards, produces chemicals and other manufactures, and is a summer resort. Founded by the Greeks (580 B.C.), it was held (1st–14th cent.) by Rome, Byzantium, and the second Bulgarian kingdom. After 1391 it was ruled by the Turks. It was ceded to independent Bulgaria in 1878.

varnish, solution of gum or of natural or synthetic RESINS that dries to a thin, hard, usually glossy film; it may be transparent, translucent, or tinted. Oil varnishes are made from hard gum or resin dissolved in oil. Spirit varnishes, e.g., SHELLAC, are usually made of soft gums or resins dissolved in a volatile solvent. Enamel is varnish with added pigments. Lacquer may be either a synthetic or natural varnish. As a decorative or protective coating, varnish has been used for oil paintings, for string instruments, and, by the ancient Egyptians, for mummy cases.

Varro, Marcus Terentius, 116 B.C.–21? B.C., Roman writer. A legate and soldier, he was also known as one of the most erudite

people of his day. He wrote an estimated 620 volumes in almost every field of knowledge. The only work to survive intact is *De re rustica libri III* [three books on farming], an important source for VERGIL'S *Georgics*.

Vasa [vä'zə], Pol. *Waza*, royal dynasty of Sweden (1523–1654) and Poland (1587–1668). GUSTAVUS I founded the dynasty in Sweden. His grandson, the Catholic SIGISMUND III of Poland, lost the Swedish throne (1599) to his uncle CHARLES IX, and thereafter the Protestant and Catholic lines warred with each other. CHRISTINA, daughter of GUSTAVUS II, was the last of the Swedish Vasa line. Sigismund's son LADISLAUS IV was succeeded by his brother JOHN II, the last of the Polish line.

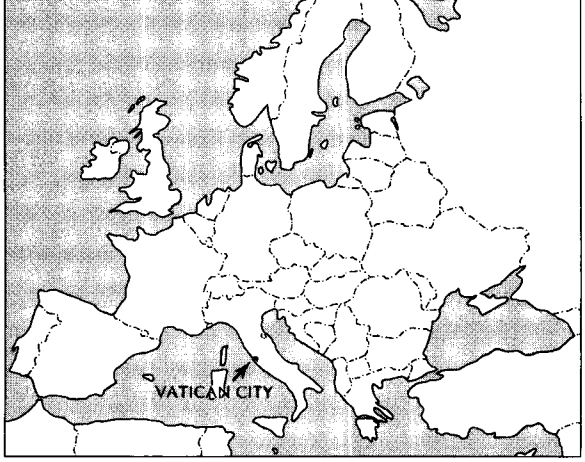
Vasari, Giorgio, 1511–74, Italian architect, writer, and painter. He is best known for his entertaining biographies of artists, *Lives of the Artists* (1550), the basic source of knowledge of Renaissance and mannerist artists. He painted portraits of the Medici and designed the UFFIZI as well as churches and palaces in Arezzo and in Pisa.

Vasco da Gama: see GAMA, VASCO DA.

vasectomy, minor surgical procedure for sterilization of the male, involving excision of the vas deferens, the thin duct that carries sperm cells away from the testicles (see REPRODUCTION). It is performed as a permanent method of BIRTH CONTROL.

vassal: see FEUDALISM.

Vatican City, officially State of the Vatican City, independent state, (1992 est. pop. 800), 108.7 acres (44 hectares), in Rome, Italy. It is the seat of the central government of the ROMAN CATHOLIC CHURCH and the pope is its absolute ruler. It includes the papal palace, SAINT PETER'S CHURCH, the SISTINE CHAPEL, many museums housing some of the world's finest art treasures, the Vatican Library (see LIBRARY, table), the Vatican Gardens, and Belvedere Park. The state, which issues its own currency and postage stamps, has its own citizenship, flag, diplomatic corps, newspaper (*L'Osservatore Romano*), railroad station, and broadcasting facility. The SWISS GUARD is the pope's personal bodyguard. The Vatican palace has been the residence of the pope since the late 14th cent., when the papal court was restored from AVIGNON, France, to Rome. The sovereignty of Vatican City was officially established in 1929 by the LATERAN TREATY between the PAPACY and the Italian government.



Vatican Councils, two ecumenical councils of the Roman Catholic Church. The first council (1869–70) was convened by Pope PIUS IX and enunciated the dogma of papal infallibility. It ended when Italian troops seized Rome for the new kingdom of Italy. The second council (1962–65), popularly called Vatican II, was convened by Pope JOHN XXIII and continued by PAUL VI. It sought to renew the church spiritually and to reconsider its place in the modern world. The council made wide-ranging changes in the liturgy (including vernacularization), moved toward greater lay participation, and encouraged the ECUMENICAL MOVEMENT.

vaudeville, stage entertainment consisting of unrelated songs, dances, acrobatic and magic acts, and humorous skits and sketches. From its beginnings in barrooms, vaudeville in the 1880s was an attraction in hundreds of theaters in the U.S. The rise of radio and movies brought its decline, but the vaudeville revue was revived on television. Such entertainers as George M. COHAN, Harry HOUDINI, Eddie Cantor, and W.C. FIELDS began their careers in vaudeville.

Vaudreuil-Cavagnal, Pierre de Rigaud, marquis de [vōdrö'yə-kävänyäl'], 1698–1765, last French governor of New France (1755–60). Although devoted to the interests of native-born Canadians, he failed to check government corruption and hampered Gen. MONTCALM'S conduct of military operations, thus contributing to France's loss (1760) of Canada to the British.

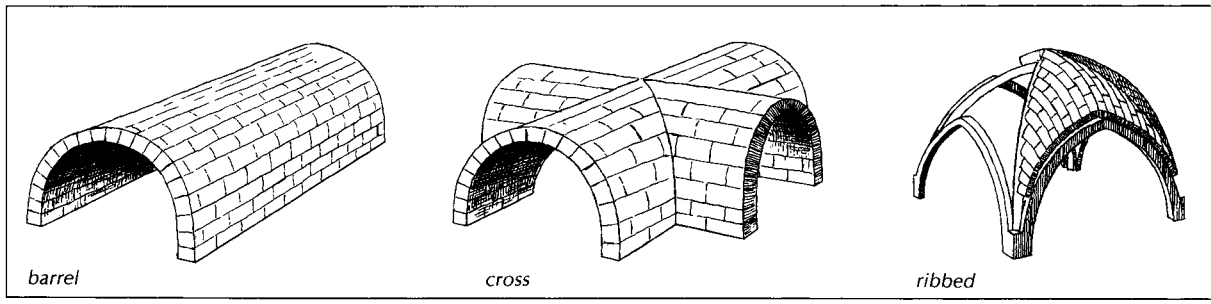
Vaughan, Henry, 1622–95, English metaphysical poet; b. Wales. He signed himself Silurist after the ancient inhabitants of Wales. His greatest poems, in *Silex Scintillans* (1650, 1655), focus on mystical communion with nature and include "Ascension Hymn," "The World," and "The Retreat."

Vaughan Williams, Ralph, 1872–1958, English composer. He is noted for his use of English FOLK SONG, as in *Norfolk Rhapsodies* (1905–7) and arrangements of "Greensleeves." Among his compositions are nine symphonies, e.g., *A London Symphony* (1914, rev. 1920); the *Fantasia on a Theme by Thomas Tallis* (1910); operas; choral music; CONCERTOS; and songs, e.g., *Five Mystical Songs* (1911).

vault, curved ceiling over a room. It is generally composed of separate units of a material such as bricks, tiles, or blocks, so shaped that when assembled their weight can be concentrated on the proper supports. (Vaults may also be formed of homogeneous material, e.g., concrete.) These separate units exert not only the downward pressure of their weight, but also side thrusts that must be met with resistance in the form of thickened walls or of BUTTRESSES, as in Romanesque and Gothic architecture. Vaults may also be designed so that their thrusts oppose or counteract. The Egyptians used brick vaulting for drains. The Chaldeans and Assyrians appear to have made use of high domes and barrel vaults. The Greeks used no vaults. Etruscan technique was absorbed by the Romans, who, using concrete (see ROMAN ARCHITECTURE), developed a mature system. Roman vaults were perfectly rigid, devoid of external thrust, and required no buttresses. Thus they could be placed over vast spaces. Medieval systems developed from Roman vaulting. The tunnel, or barrel vault, spans two walls like a continuous arch. The cross, or groined vault, at the intersection of two barrel vaults, forms four arched openings. Ribs to strengthen the groins and sides of a vault appeared in the 11th cent., and became gradually the organic supporting skeleton of Gothic architecture. The pointed ARCH was used in vaulting oblong compartments. In England these developments culminated in the 15th cent. in the perpendicular style. Renaissance architects returned to the basic Roman forms. Modern vaulting is largely accomplished with reinforced concrete. See also GOTHIC ARCHITECTURE AND ART.

Vavilov, Nikolai Ivanovich, 1887–1943?, Russian botanist and geneticist. Trying to trace the origins of various crops by locating areas with the greatest number and diversity of their species, he reported (1936) Ethiopia and Afghanistan as the birthplaces of agriculture and hence of civilization. He divided cultivated plants into those domesticated from wild forms, e.g., oats and rye, and those known only in cultivation, e.g., corn. He reportedly died in a Soviet concentration camp after losing favor to Trofim LYSENKO, whose theories he opposed.

Veblen, Thorstein, 1857–1929, American economist and social critic; b. Cato Township, Wis., of Norwegian parents. In his writings Veblen was able to dissect American social and economic institutions and analyze their psychological bases, thus laying the foundations for the school of institutional economics. He pioneered in interpreting the role of technicians in modern society and described a basic conflict between the processes of technology (or "industry"), which tend toward maximum efficiency of production, and those of "business," which, in his view, restrict output

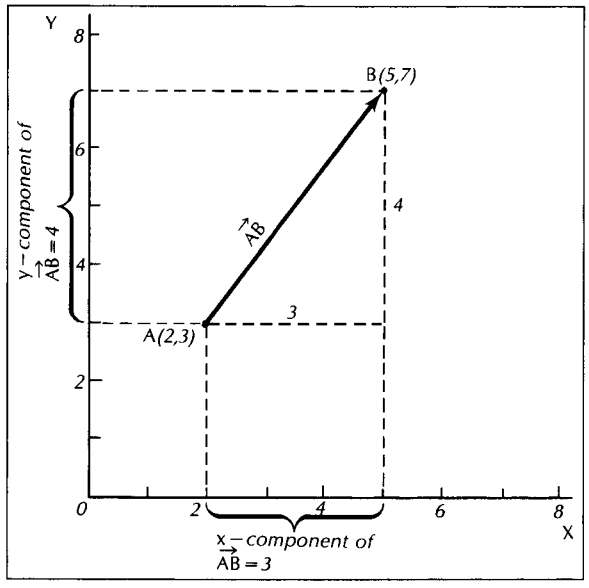


Vaults

and manipulate prices to maximize profit. His major work was *The Theory of the Leisure Class* (1899), in which he coined the famous phrase "conspicuous consumption." Other books included *The Theory of Business Enterprise* (1904) and *The Engineers and the Price System* (1921).

Vecellio: see TITIAN.

vector, quantity having both magnitude and direction. Many physical quantities are vectors, e.g., force, velocity, and momentum. The simplest representation of a vector is an arrow connecting two points: $\overrightarrow{AB}$ designates the vector represented by an arrow from point *A* to point *B*, whereas $\overrightarrow{BA}$ designates the vector of equal magnitude from *B* to *A*. In order to compare vectors and to operate on them mathematically, it is necessary to have some reference system that determines scale and direction, such as CARTESIAN COORDINATES. A vector is frequently symbolized by its components with respect to the coordinate axes. Suppose, for example, that the point *A* has coordinates (2,3) and the point *B* has coordinates (5,7). The *x*-component of $\overrightarrow{AB}$, i.e., its size with respect to the *x*-axis, is the difference between the *x*-coordinates of the points *A* and *B*, or $5 - 2 = 3$; the *y*-component is $7 - 3 = 4$. Thus $\overrightarrow{AB}$ becomes [3,4]. Knowledge of the components of a vector enables one to compute its magnitude—in this case, 5, by the Pythagorean theorem $[(3^2 + 4^2)^{1/2} = 5]$—and its direction (from TRIGONOMETRY). There are an infinite number of vectors with the components [3,4], all of which have the same magnitude and direction; they are considered equal. The concept of a vector can be extended to three or more dimensions. To add two vectors **U** and **V**, one can add their corresponding components to find the resultant vector **R**, or one can graph **U** and **V** on a set of coordinate axes and complete the parallelogram formed with **U** and **V** as adjacent sides to obtain **R** as the diagonal from the common vertex of **U** and **V**. The scalar, or dot, product of two vectors **A** and **B** is a nondirectional (scalar) quantity with a magnitude of $\mathbf{A}\cdot\mathbf{B} = |A|B| \cos\theta$, where θ is the angle between **A** and **B**. The vector, or cross, product of **A** and **B** is a vector whose magnitude $\mathbf{A} \times \mathbf{B} = A|B| \sin\theta$ and whose direction is perpendicular to both **A** and **B** and pointing in the direction in which a right-hand screw would advance if turned from **A** to **B** through the angle θ.



Vector: The components of the vector AB are given by its projections on each of the coordinate axes.

Veda [Skt., = knowledge], oldest scriptures of HINDUISM and the most ancient religious texts in an Indo-European language, still accepted to some extent by all Hindus as the authoritative statement of the essential truths of Hinduism. It is the literature of the Aryans who invaded NW India c.1500 B.C. Influenced by indigenous religious ideas, it was compiled from c.1000 to c.500 B.C. The Veda consists of four types of literature. The *Samhita,* the basic compilation of prayers and hymns, ascribed to inspired seer-poets, includes a threefold canonical body of hymns—the *Rig-Veda, Sama-Veda,* and *Yajur-Veda*—and the *Atharva-Veda,* a collection of magic spells. The *Brahmanas* are prose explanations of the sacrifice. The *Aranyakas* contain instructions for meditation as the mental performance of sacrifice. The UPANISHADS are works of mysticism and speculation. Vedic writings expressed the idea of a single underlying reality embodied in Brahman, the absolute Self. The Vedic sacrifice, with its invocation of any of 33 Vedic gods through MANTRAS or hymns, became increasingly elaborate with the passage of time, and the sacrifice came to be regarded as the fundamental agency of creation.

Vedanta [Skt., = the end of the Veda], one of the six classical systems of INDIAN PHILOSOPHY. The term refers to the teaching of the UPANISHADS (the last section of the VEDA) and also to the knowledge of its ultimate meaning. By extension the term refers to schools based on the Brahma Sutras of Badarayana (early centuries A.D.), which summarize Upanishadic doctrine. Most important is the nondualist (*advaita*) Vedanta of Shankara (A.D. 788–820), who taught that spiritual liberation is achieved not by ritual action but by eradication of ignorance—e.g., the belief that the illusory multiplicity of the world is real—and by attainment of the knowledge of BRAHMAN, the absolute Self. The qualified nondualist Ramanuja (1017?–1137?) advocated devotion as the means of salvation, and held that the world and souls are real but depend on God. The dualist Vedanta of Madhva (1197–1276) asserted the permanently separate reality of the world, souls, and God. Vedanta is a living tradition, with profound influence on the intellectual and religious life of India. Modern Vedantists include Swami Vivekananda, Aurobindo GHOSE, and Sarvepalli Radhakrishnan.

vegetable, popular name for many food plants and for their edible parts. No clear distinction exists between a vegetable and a FRUIT. Vegetables are valuable sources of vitamins, minerals, starches, and proteins.

vegetable sulfur: see CLUB MOSS.

vegetarianism, theory and practice of eating only fruits, vegetables, cereal grains, nuts, and seeds, and excluding meat, fish, or fowl, and often eggs and dairy products. The basis of the practice may be religious, ethical, economic, or nutritional, and its followers differ in strictness of observance. Practiced since ancient times by

religious groups. vegetarianism as a separate movement developed in the mid-19th cent., particularly in England and the U.S.

Veil, Simone, 1927–, French politician. A lawyer, she served (1974–79) as minister of health under GISCARD D'ESTAING, sponsoring (1974) a liberalized abortion law. Elected to the European Parliament (see EUROPEAN UNION) in 1979, 1984, and 1989, she served (1979–82) as its president. In 1993 she became French housing and urban and social affairs minister.

Velasco, José María, 1840–1912, Mexican painter. He is noted for landscapes, employing a variety of hues and minutely observed detail, e.g., *The Bridge of Metlac* (1881). A teacher of Diego RIVERA, Velasco was rejected by Mexican academics, but his reputation was restored after his death.

Velasco, Luis de, d. 1564, Spanish viceroy (1550–64) of New Spain, now MEXICO. A humanitarian ruler, he helped the indigenous people and fostered exploration. The Univ. of Mexico was founded during his administration. His son, **Luis de Velasco,** 1534–1617, was also viceroy of New Spain (1590–95, 1607–11) and of Peru (1595–1604).

Velasco Alvarado, Juan [väläs'kō älvärä'thō], 1910–, president of PERU (1968–75). As army commander in chief, he led the junta that deposed (1968) Pres. Belaúnde Terry. He expropriated U.S.-owned oil companies, instigated land reform, and nationalized large industries. He was deposed (1975) in a bloodless coup.

Velasco Ibarra, José María [väläs'kō ēbä'rä], 1893–1979, president of ECUADOR. He served five times as president between 1934 and 1972, but was deposed by the military four times. In his last term (1968–72), he established a dictatorship to cope with political chaos and terrorism.

Velázquez, Diego de [välä'kā], 1460–1524?, Spanish CONQUISTADOR, first governor of CUBA. He sailed on Christopher Columbus's second voyage to Hispaniola (1493) and was sent to conquer Cuba by Diego Columbus in 1511. By 1514, with the aid of Pánfilo de NARVÁEZ, the conquest was complete. He disassociated himself from Diego Columbus and declared himself governor of Cuba. In 1519 he sent Hernán CORTÉS to conquer MEXICO. Distrusting him, Velázquez sent Narváez to compel Cortés's return to Cuba, but was defeated.

Velázquez, Diego Rodríguez de Silva y, 1599–1660, the most celebrated painter of the Spanish school. Born in Seville, he was apprenticed at 11 to Francisco de Herrera and then to Francisco Pacheco. His earliest paintings, e.g., *Christ and the Pilgrims of Emmaus* (Metropolitan Mus.), show a strong naturalistic tendency. He was introduced to the court, and his equestrian portrait of PHILIP IV won him recognition. At 25 he was made court painter. During his first years there he painted the celebrated *Borrachos* [the drunkards] (Prado). During a trip to Italy (1629–31) Velázquez painted two large figure compositions, *The Forge of Vulcan* (Prado) and *Joseph's Coat* (Escorial). To his second period (1631–49) belong *Christ on the Cross,* the series of dwarfs and buffoons of the court, and the *Menippus* (all: Prado). His only nude, *Venus and Cupid,* also called the *Rokeby Venus* (1650; National Gall., London), emphasizes the vanity of the goddess. To his last period (1651–60) belong the *Coronation of the Virgin,* the famous full-length portraits of Mariana of Austria and the Infanta Margarita, and *The Maids of Honor* (all: Prado). Velázquez's development as an artist was extraordinarily steady. His first forms were monumental, and enveloped in strong chiaroscuro (high-contrast effects). He slowly evolved a subtle, intellectual art based on exquisite color values, with a consummate use of silver tones reminiscent of EL GRECO. However, in his worldliness and compassion he is far removed from El Greco. He imbued each subject, from dwarf to king, with a sense of dignity and individual worth.

veld or **veldt,** grassy, undulating PLATEAUS of South Africa and Zimbabwe, ranging in elevation from c.500 to c.6,000 ft (150 to 1,830 m). Abundant crops of potatoes and corn are grown, and large cattle herds are grazed; the area also has industrial and mining centers.

velvet worm: see ONYCHOPHORAN.

velocity: see MOTION.

Venda, former black South African homeland, or BANTUSTAN, (1990 est. pop. 600,000), 2,861 sq mi (7,410 sq km), proclaimed independent (1979) by South Africa but not recognized by other nations. It comprised connected areas in NE TRANSVAAL, near the Zimbabwe border. The capital was Thohoyandou. The population consists largely of Luvenda-speaking ethnic groups. Venda was reabsorbed into South Africa in 1994.

Venera, in space exploration: see SPACE PROBE, table.

venereal disease: see SEXUALLY TRANSMITTED DISEASE.

Veneziano, Domenico: see DOMENICO VENEZIANO.

Venezuela [vĕnəzwā'lə], officially Republic of Venezuela, republic (1992 est. pop. 20,676,000), 352,143 sq mi (912,050 sq km), N South America, bordered by Brazil (S), Colombia (*N* and SW), Guyana (E), and the Caribbean Sea (N). Principal cities include CARACAS (the capital) and MARACAIBO. A land of vivid contrasts, Venezuela has four major geographical regions: the oil-rich coastal lowlands; the ORINOCO R. basin, whose vast plains (LLANOS) support a great cattle industry; the Guiana Highlands, a largely unexplored wilderness occupying more than half the nation's territory and noted for scenic wonders such as ANGEL FALLS; and the densely populated Venezuelan highlands, a spur of the ANDES that rises to 16,427 ft (5,007 m) in the Sierra Nevada de Mérida and that is the nation's political and commercial hub. Venezuela enjoys the highest per capita income in Latin America because of its astonishing oil wealth, first exploited in 1918, which accounts for over 80% of its export earnings. Coffee, the mainstay of the economy before the oil boom, is still produced; other leading crops are cocoa, sugarcane, bananas, corn, sorghum, and rice. Manufactures include food products, building materials, textiles, chemicals, and automobiles. The country established a customs union with Colombia in 1991. The population is 67% mixed descent, 21% European descent, 10% African descent, and 2% indigenous peoples. The principal language is Spanish; the main religion is Roman Catholicism.

History. COLUMBUS discovered the mouths of the Orinoco in 1498, and Spanish settlements were established on the coast in the 1520s, but the major task of conquest was accomplished by German adventurers, notably Nikolaus Federmann. For a time an adjunct of NEW GRANADA, from the 16th to 18th cent. Venezuela was frequently raided by British buccaneers. The war for independence from Spain, begun in 1810 under Francisco de MIRANDA, was completed in 1821 by Simón BOLÍVAR (born in Venezuela), who made the area part of the federal republic of Greater Colombia. A separatist movement led by José Antonio PÁEZ succeeded (1830) in

The key to pronunciation appears on page xiii.

making Venezuela an independent state. During much of its history the nation has been dominated by *caudillos* (military dictators) from the landholding class, notably Juan Vicente GÓMEZ, who came to power in 1908 and ruled for 27 years as an absolute tyrant until his death in 1935; he did, however, force the state (with the help of foreign oil concessions) into national solvency and material prosperity. A military junta, headed by Rómulo BETANCOURT and committed to democracy and social reform, gained power in 1945, but a coup three years later once again established a repressive military dictatorship, led from 1952 by Col. Marcos Pérez Jiménez. A popular revolt in 1958 restored democratic rule under President Betancourt, and since that time free elections have been held. In 1976, the oil industry was nationalized. Pres. Carlos Andrés Pérez (1974–79, 1989–93) survived two coup attempts in 1992, but in 1993 he was removed from office on corruption charges. Rafael Caldera Rodríguez became president in 1994; he had previously held the office from 1969 to 1974.

Venezuela Boundary Dispute, over the demarcation between VENEZUELA and British Guiana (now GUYANA), which caused tension between Great Britain and the U.S. in the 19th cent. The dispute was intensified in 1841, when gold was discovered in the border area, but the British refused arbitration. In 1887, Venezuela cut diplomatic ties with Great Britain. In 1895, Pres. CLEVELAND declared that the United States had a duty to determine the boundary and would resist British aggression beyond that line. The British recognized this broad interpretation of the MONROE DOCTRINE, and the boundary, generally favorable to Britain, was finally drawn in 1899.

Venice, Ital. *Venezia,* city (1992 est. pop. 73,000), capital of Venetia, NE Italy. Built on 118 alluvial islets within a lagoon in the Gulf of Venice, it is joined to the mainland by bridges and is politically united with the mainland city of Mestre. Canals and bridges give access among islands; gondolas and other boats are the only conveyances. There are many lanes, squares, and a few streets, and the houses are built on piles. Tourism is important. Manufactures include ships, lace, and glass. Refugees fleeing the Lombards settled (5th cent.) the islands and organized (687) under a doge. The communities formed (9th cent.) a city that came to dominate the Adriatic and became Europe's leading sea power. Marco POLO symbolized its spirit of enterprise in the 13th cent. Serving as the main link between Europe and Asia, Venice reached the height of its power in the 15th cent. and began to decline at the century's end. It fell (1797) without resistance to NAPOLEON I, who delivered it to Austrian rule. It became part of Italy in 1866. Venice reached artistic glory during the Renaissace, with TITIAN and TINTORETTO the giants of the Venetian school. It was also the most original artistic city of 18th-cent. Italy, as represented by such painters as TIEPOLO and CANALETTO. Architecturally, Venice is marked by Byzantine influences, felt most strongly in the famous SAINT MARK'S CHURCH. Later architecture is a graceful baroque style, e.g., the churches of San Giorgio Maggiore and Santa Maria della Salute. Other landmarks include the Gothic Doges' Palaces, the Grand Canal, and the Bridge of Sighs.

ventricular assist device: see HEART, ARTIFICIAL.

Ventris, Michael George Francis, 1922–56, English linguist. With John Chadwick he deciphered and published *Documents in Mycenaean Greek* (1956). His theory indicates that Linear B, a Mycenaean script found at Knossos, Pylos, and other sites, was an archaic form of the Greek language.

Venturi, Robert, 1925–, American architect; b. Philadelphia. A prominent figure in postmodernism, he advocated an unorthodox, mannered, eclectic, and humorous architecture and emphasized the validity and vitality of American roadside strip buildings and advertising. His influential books include *Complexity and Contradiction in Modern Architecture* (1966) and (with Stephen Izenour and Denise Scott-Brown) *Learning from Las Vegas* (1972). A more restrained, historical approach often characterizes his later work, as in the Sainsbury wing of the National Gallery, London, (1991) and several buildings at Princeton Univ.

Venus, in astronomy, 2d PLANET from the sun, at a mean distance of 67.2 million mi (108.2 million km). It has a diameter of 7,519 mi (12,100 km); terrains that can be subdivided into lowland plains (20%), rolling uplands (70%), and highlands (10%), and are marked by extensive volcanism and the apparent effects of subduction (see PLATE TECTONICS); and an atmosphere whose chief gas is carbon dioxide. The entire surface of Venus is opaquely covered by a dense cloud layer, a primary component of which is sulfuric acid. The atmospheric pressure at the surface of the planet is 90 times that of earth. Because its greatest ELONGATION is 47°, Venus can never be seen much longer than 3 hr after sunset or 3 hr before sunrise. It has no known satellites. SPACE PROBES that have encountered Venus include *Mariner 2, 5,* and *10* (1962, 1967, and 1974); *Pioneer-Venus 1* and *2* (1978); and numerous Soviet Venera spacecraft. The U.S. *Magellan* space probe made (1990–92) a radar survey of Venus, mapping 99% of the planet.

Venus, in Roman religion, goddess of vegetation; identified from the 3d cent. B.C. with the Greek APHRODITE, goddess of love and of beauty. In imperial times she was worshiped as Venus Genetrix, mother of AENEAS; Venus Felix, bringer of good fortune; Venus Victrix, bringer of victory; and Venus Verticordia, protector of feminine chastity. Among the famous sculptures of the goddess are the *Venus of Milo* (*LOUVRE*) and the *Venus of Medici* (UFFIZI, Florence).

Venus's-flytrap, insectivorous or carnivorous bog plant (*Dionaea muscipula*) native to the Carolina savannas, now widely cultivated as a novelty. The leaves, borne in a low rosette, resemble bear traps. They are hinged at the midrib, each half bearing sensitive bristles; when a bristle is touched by an insect, the halves snap shut and the marginal teeth interlock to imprison the insect until it is digested.

Veracruz, city (1990 pop. 327,522), E central Mexico, on the Gulf of Mexico. Rivaling TAMPICO as the nation's main port, it is the industrial center of a major oil region and is popular with tourists because of its scenery and beaches. Founded c.1600, it has been a frequent landing site for foreign invasions, notably by the U.S. (1847) and France (1862). A 17th–18th-cent. fortress guards the harbor.

verbena: see VERVAIN.

Vercingetorix [vûr"sĭnjĕt'ərĭks], d. 46 B.C., leader of the Gauls in a revolt against Rome that was put down by Julius CAESAR. He was captured when Caesar besieged and took the fort of Alesia (52 B.C.). After gracing Caesar's triumph, Vercingetorix was put to death.

Verdi, Giuseppe [vâr'dē], 1813–1901, foremost Italian operatic composer. He is famous for such dramatic and superbly melodic operas as *Rigoletto* (1851), *Il Trovatore* (1853), *La Traviata* (1853), *La forza del destino* (1862), and *Aïda* (1871), in which the elements of his earlier style reach maturity. Three operas are based on plays by Shakespeare: *Macbeth* (1847, rev. 1865) and the two masterpieces of his old age, *Otello* (1887) and *Falstaff* (1893). Verdi is also known for his magnificent *Requiem* (1874).

Verdun, town (1982 pop. 21,516), NE France. A transportation center with varied industry, it was a commercial center under Rome and the CAROLINGIANS (9th cent.) and a free city of the HOLY ROMAN EMPIRE until seized (1552) by HENRY II. Almost destroyed in a famous WORLD WAR I battle (Feb.–Dec. 1916), it was rebuilt. The battlefield and cemeteries form a national shrine.

Vere, Edward de: see OXFORD, EDWARD DE VERE, 17TH EARL OF.

Vérendrye, Pierre Gaultier de Varennes, sieur de la [vāräNdrē'], 1685–1749, explorer in W Canada and the U.S.; b. Quebec. After serving in the French army in Canada and then in Europe, he returned to New France. From 1731, when he obtained a monopoly on the western fur trade, to 1744, he played an important role in the extension of the western frontiers of New France. With his sons, he established trading posts and forts in what is now W Ontario and Manitoba and sought an overland passage to the Western Sea (Pacific Ocean). The various expeditions that Vérendrye either undertook or commissioned also traversed the Dakotas and may have entered Wyoming.

Verga, Giovanni, 1840–1922, Italian novelist; b. Sicily. His early novels of passion are in the style of the French realists. Later works, marked by simplicity and strict accuracy, gave rise to the term *verismo.* A novella, *Cavalleria rusticana* (1880), was the basis for MASCAGNI's 1890 opera. Major works are *The House by the Medlar Tree* (1881), *Little Novels of Sicily* (1883), and *Mastro-Don Gesualdo* (1889).

Vergennes, Charles Gravier, comte de [vĕrzhĕn], 1717–87,

French statesman. As foreign minister of LOUIS XVI, he signed (1778) France's alliance with the Americans in the AMERICAN REVOLUTION and helped negotiate the Treaty of PARIS (1783).

Vergil or **Virgil** (Publius Vergilius Maro), 70–19 B.C., greatest of Roman poets; b. near Mantua; a resident of Rome from 41 B.C. Early life on his father's farm was central to his education. The *Eclogues* or *Bucolics* (37 B.C.) idealized rural life in the manner of THEOCRITUS. Vergil then turned to realistic and didactic rural poetry in the *Georgics* (30 B.C.), seeking, like HESIOD, to convey the charm of real life and work on the farm. He spent the rest of his life working on his national epic, the *Aeneid*, one of the greatest long poems in world literature. Vergil's AENEAS is a paragon of Roman virtues—familial devotion, loyalty to the state, and piety. The 12 books follow Aeneas from TROY's fall through his affair with the Carthaginian queen, DIDO, to the founding of the Roman state. The poem, in dactylic hexameters of striking regularity, is central to all Latin literature. A favorite of AUGUSTUS, Vergil influenced poets from DANTE on.

Verhaeren, Émile [vărărĕn'], 1855–1916, Belgian poet and critic who wrote in French. His passion for social reform found expression successively in works that display a disgust with humanity, pessimism over industrialization, and finally an optimistic glorification of human energy. These include *Flemish Women* (1883), *The Hallucinated Countrysides* (1893), and *The Manifold Splendor* (1906).

Veríssimo, Érico Lopes [vərēs'sēmōō], 1905–75, Brazilian writer. His novels include *Crossroads* (1935), *The Rest Is Silence* (1943), and the trilogy *Time and the Wind* (1949–62). His lectures in the U.S. were published as *Brazilian Literature* (1945). From 1953 to 1956 he was director of the Dept. of Cultural Affairs of the Pan American Union.

Verlaine, Paul [vĕrlĕn'], 1844–96, French poet. While still a young man, Verlaine formed a tempestuous liaison with a young poet, Arthur RIMBAUD. The relationship ended tragically when Verlaine shot and wounded Rimbaud. Imprisoned for two years, he returned to the Catholic faith, but his later life was marked by drunkenness and debauchery. His poetry, possessing a rare musicality, includes such early PARNASSIAN works as *Saturnian Poems* (1866); some noble religious verse from his prison years (in *Wisdom*, 1881); and *Romances without Words* (1874), establishing him as an early SYMBOLIST. His only important prose work is *The Accursed Poets* (1884), about his fellow symbolists.

Vermeer, Jan or **Johannes,** 1632–75, Dutch genre and landscape painter. He spent all his life in Delft. Although admitted to the painters' guild and twice its dean, he enjoyed slight recognition in his lifetime. Today he is ranked among the greatest Dutch masters and the foremost of all colorists. His most frequent subjects were intimate interiors, often with the solitary figure of a woman, exquisitely depicted with luminous blues and yellows, pearly highlights, and subtle gradations of reflected light. Only about 35 paintings can be attributed to him with certainty; they include *The Letter* (Rijks Mus., Amsterdam), *View of Delft* (The Hague), *Soldier and Laughing Girl* (Frick Coll., N.Y.C.), and *Young Woman with a Water Jug* (Metropolitan Mus.).

Vermigli, Pietro Martire [vărmē'lyē], 1500–1562, Italian Protestant reformer, also known as Peter Martyr. An honored Augustinian scholar and preacher, he became a Protestant and fled to Switzerland, Strasbourg, and, at the invitation of Archbishop Cranmer, to England, where he taught at Oxford (1547–53). Under Mary I he left England and returned to Strasbourg and then went to Zürich as a professor. He had some influence on the episcopal changes in the Church of England and on the revision of the Book of Common Prayer.

Vermont, New England state of the NE U.S.; bordered by the Connecticut R., across which lies New Hampshire (E), Massachusetts (S), New York, with Lake Champlain forming almost half the border (W), and the Canadian province of Quebec (N).

Area, 9,609 sq mi (24,887 sq km). *Pop.* (1990) 562,758, a 10% increase over 1980 pop. *Capital,* Montpelier. *Statehood,* Mar. 4, 1791 (14th state). *Highest pt.,* Mt. Mansfield, 4,393 ft (1,340 m); *lowest pt.,* Lake Champlain, 95 ft (29 m). *Nickname,* Green Mountain State. *Motto,* Freedom and Unity. *State bird,* hermit thrush. *State flower,* red clover. *State tree,* sugar maple. *Abbr.,* Vt.; VT.

Land and People. The forested Green Mts., which traverse the state in a generally north-to-south direction, constitute the dominant physiographical feature. The slate- and granite rich Taconic Mts. are located in the southwest. Vermont has a variable temperate climate with abundant rainfall. The small rural village is a more characteristic feature of the Vermont landscape than large urban areas; only 32% of the population lives in urban areas, the lowest percentage in the U.S. BURLINGTON is the largest city followed by RUTLAND and MONTPELIER. In 1990 the state was nearly 98% white.

Economy. Manufacturing is the state's largest source of income, with machine tools, furniture, nonelectrical machinery, computer components, processed foods, and pulp and paper among the leading products. Dairy farming has long dominated the agriculture of this, the most rural U.S. state; Vermont ships milk in huge quantities to metropolitan Boston and New York. The chief crops are apples, maple syrup, silage corn, and hay. Stone, including Vermont's famous marble, granite, and slate; asbestos; talc; and sand and gravel are extracted. Year-round tourism is vital to the economy.

Government. The amended constitution of 1793 provides for a governor serving a two-year term. The general assembly consists of a 30-seat senate and 150-seat house, with members of both bodies elected for two years. Vermont is represented in the U.S. Congress by one representative and two senators and has three electoral votes.

History. Iroquois (see IROQUOIS CONFEDERACY) and ALGONQUIAN groups inhabited the area when Samuel de CHAMPLAIN explored (1609) the lake that bears his name. In 1741 the colony of New Hampshire claimed the area; a dispute later arose with New York, which also claimed it. Vermont's settlers resisted New York's claims, and Ethan ALLEN and his GREEN MOUNTAIN BOYS were active in the cause until 1775, when their armed violence was diverted to fighting the British in the AMERICAN REVOLUTION. From 1781 to 1791 Vermont functioned as a sovereign state, before joining the Union. During the 19th cent. manufacturing became more prevalent, and the rural population declined as farmers migrated west to more fertile farmlands. Rapid population growth began after World War II and continued into the 1990s, with most of the increase occurring in the southern part of the state, where new industries have arisen.

vernal equinox: see EQUINOX.

Verne, Jules [vûrn, vĕn'], 1828–1905, French novelist, father of modern SCIENCE FICTION. His enormously popular romances include the prophetic *Journey to the Center of the Earth* (1864), *Twenty Thousand Leagues Under the Sea* (1870), and *Around the World in Eighty Days* (1873).

Verner, Karl Adolf [vûr'nər], 1846–96, Danish philologist. His fame rests on **Verner's law,** a linguistic formulation showing that certain consonantal alternations in Germanic languages are the result of patterns of alternation in the position of word accent in the parent language.

Verona, city (1990 pop. 263,589), in Venetia, NE Italy. On a road to central Europe, it has had commercial and strategic importance from Roman times. A barbarian base (5th–6th cent.), it became a free commune (12th cent.) and the site (13th–14th cent.) of GUELPH AND GHIBELLINE strife. It was ruled by Venice (1404–1797) and Austria (1797–1805, 1814–66) until union with Italy. Many monuments survived damage in World War II, e.g., a large Roman amphitheater and the Gothic Scaligeri tombs.

Veronese, Paolo [vărōnā'zā], 1528–88, Italian painter of the Venetian school; b. Verona as Paolo Caliari. He was particularly influenced by TITIAN. Both his characteristic opulent use of color and many figures arranged in a sinuous spatial pattern can be seen in *Age and Youth* and *Hera Presenting Gifts to Venice* (Ducal Palace, Venice). Complex mannerist devices are evident in the Giustiniani Altarpiece (San Francesco della Vigna, Venice). Veronese is known chiefly for his religious feast scenes, which he interpreted in a notably secular manner. The *Supper at Emmaus* (Louvre) and the *Marriage at Cana* (1562; Louvre) depict fashionable courtiers, horses, dogs, apes, and lavish accessories. His *Rape of Europa* (1576; Ducal Palace, Venice), one of his most famous works, reveals his harmonious tonalities and rich textures. Veronese ranks

among the greatest of Venetian decorative painters and among the best colorists.

Verrazano, Giovanni da [dä vĕr"rät'sänō], c.1480–1527, Italian navigator and explorer. Exploring the coast of NORTH AMERICA for France, he may have been the first European to enter New York Bay. He was killed by natives in the WEST INDIES.

Verrazano-Narrows Bridge, New York City, the longest vehicular suspension bridge in the U.S., spanning the Narrows at the entrance to New York harbor. Designed by O.H. Ammann and completed in 1964, it has a main span of 4,260 ft (1,298 m).

Verrocchio, Andrea del [vär-rôk'kyō], 1435–88, Florentine sculptor and painter; b. Andrea di Michele di Francesco di Cioni. He was a leading figure in the early RENAISSANCE. Many of his paintings are lost, but his hand is evident in the *Baptism of Christ* (Uffizi), assisted by LEONARDO DA VINCI. A virtuoso sculptor in metal, he was primarily concerned with spirited movement and the elaboration of detail, e.g., his graceful *Boy with Dolphin* and lithe *David* (Bargello). His awesome figure for the equestrian monument of the condottiere Bartolomeo Colleoni (Venice) was not cast until after his death.

Versailles, city (1982 pop. 95,240), capital of Yvelines dept., N central France. It is the site of the elaborate palace and gardens built (mid-17th cent.) for LOUIS XIV, which represent the height of the French classical style. The FRENCH REVOLUTION forced Louis XVI to move (1790) from there to Paris. Under Louis Philippe, Versailles became a national monument.

Versailles, Treaty of, any of several treaties signed at Versailles, France. **1** For the treaty of 1783, see PARIS, TREATY OF. **2** The Treaty of 1871, signed at the end of the Franco-Prussian War by BISMARCK for Germany and THIERS for France and ratified in the Treaty of Frankfurt (1871). France was forced to give up most of Alsace and Lorraine, pay a large indemnity, and accept a German army of occupation. **3** The Versailles Treaty of 1919 is the most famous of the treaties because it was the chief one ending World War I. The "Big Four" negotiating it were Pres. WILSON (U.S.), Premier CLEMENCEAU (France), Prime Min. LLOYD GEORGE (Britain), and Premier ORLANDO (Italy). The treaty called for the creation of the LEAGUE OF NATIONS. It forced on Germany the burden of reparations and placed limits on German armed forces. It restored Alsace and Lorraine to France, gave Prussian Poland and most of West Prussia to Poland, made Danzig a free city, put Germany's colonies under the League of Nations, placed the Saar under French administration, called for plebiscites in various territories newly freed from the Central Powers, and called for the demilitarization of the RHINELAND. American opposition to the League of Nations resulted in the refusal of the U.S. Senate to ratify the treaty. In 1935, HITLER unilaterally abrogated most of the terms of the Treaty of Versailles.

vertebrate, any animal having a backbone or spinal column. All vertebrates belong to the subphylum Vertebrata of the phylum CHORDATA. The five classes of vertebrates are FISH, AMPHIBIANS, REPTILES, BIRDS, and MAMMALS. Vertebrates are comparatively large, have a high degree of specialization of their parts, and are bilaterally symmetrical. All have an interior skeleton, a brain enclosed in a cranium, a closed circulatory system, and a heart divided into two, three, or four chambers; most have two pairs of appendages modified as fins, limbs, or wings in the different classes. Animals without backbones are called INVERTEBRATES.

vertical circle, the great circle on the celestial sphere that passes from the observer's zenith through a given celestial body or a specified celestial point. See also ASTRONOMICAL COORDINATE SYSTEMS.

vertical takeoff and landing aircraft (VTOL), craft capable of rising and descending vertically from and to the ground, thus requiring no runway. Some examples are the AIRSHIP and the BALLOON, which are very inefficient in their forward motion, and the HELICOPTER, which has very limited performance. Convertiplanes are VTOL craft that can fly horizontally with the same effectiveness as a conventional airplane. Their vertical lift during takeoff is provided by a rigid rotor that spins about a vertical axis, by tilted propellers, or, as in some jet VTOL craft, such as the British-built Harrier, by vanes that can direct the engine thrust upward or forward.

vervain, common name for some members of the family Verbenaceae, herbs, shrubs, and trees of warmer regions of the world. Well-known wild and cultivated members of the family include species of *Lantana* and *Verbena.* Many cultivated verbenas (herbs and shrubs) have fragrant blossoms and leaves that are sometimes used for distillation of oils and for tea, as are those of the similar lemon verbena (*Lippia citriodora*). Wild American species are usually called vervains. Economically, the most important member of the family is TEAK.

Verwoerd, Hendrik Frensch [fərvōōrt'], 1901–66, South African prime minister (1958–66). A harsh proponent of white supremacy, he intensified the Nationalist policy of APARTHEID. When South Africa became (1961) a republic, he severed its connections with the British Commonwealth. He was assassinated.

Vesalius, Andreas, 1514–64, Flemish anatomist. At the Univ. of Padua he produced his chief work, the notably illustrated *De humani corporis fabrica* (1543), based on studies made by dissecting human cadavers. His discoveries in anatomy overthrew many hitherto uncontested doctrines of GALEN and caused criticism to be directed against himself. He was physician to Emperor Charles V and his son Philip II.

Vespasian (Titus Flavius Vespasianus), A.D. 9–79, Roman emperor (A.D. 69–79), founder of the Flavian dynasty. Vespasian was proclaimed emperor by the soldiers and erected the Colosseum. His reign was noted for its order and prosperity. The warfare he waged against the Jewish rebels was completed by his son TITUS.

vespers, in the Christian church, principal evening office. In the Roman rite it consists of prayers, psalms, a lesson, the *Magnificat,* and an antiphon. The similar Anglican evening prayer, evensong, is often called vespers.

Vespucci, Amerigo [vāspōōt'chē], 1454–1512, Italian navigator in whose honor America is named. In 1499 he sailed to the WEST INDIES and discovered the mouth of the AMAZON. Later he sailed (1501) along the N coast of SOUTH AMERICA. Vespucci evolved a system for computing nearly exact longitude. His acceptance of South America as a separate continent altered Europeans' understanding of the world.

Vesta, in Roman religion, goddess of hearth and home; identified with the Greek HESTIA. Her priestesses, the **vestals,** were chosen in childhood from prominent Roman families. Serving for 30 years, they were sworn to chastity. Their duties included preparing sacrifices and tending the sacred fire. The vestals were very influential in Roman society.

Vestris, Gaetan [vĕs'trēs], 1729–1808, Italian-French classical dancer. He joined the Paris Opéra and became dancing master to Louis XVI of France. He was the first dancer to discard the mask and to use his face in mime. His son **Auguste Vestris,** 1760–1842?, debuted with the Paris Opéra at 12 and was its leading dancer for 36 years.

Vestris, Lucia Elizabeth (Bartolozzi), 1797–1856, English actress-manager. Known as Mme Vestris, she was the first woman to lease a theater (1831). She produced Shakespearean comedy as well as BURLESQUES and FARCES, and was known for her realistic stage settings and props.

Vesuvius, active volcano, SE Italy, overlooking the Bay of Naples. The height of the main cone changes with each eruption, varying within a few hundred feet of the 4,000-ft (1,219-m) level. Often surmounted by a faint plume of smoke, the volcano erupts frequently and is occasionally destructive. The earliest recorded eruption (A.D. 79) buried the Roman cities of POMPEII, HERCULANEUM, and Stabiae.

Veterans Administration: see VETERANS AFFAIRS, UNITED STATES DEPARTMENT OF.

Veterans Affairs, United States Department of, federal executive department established in 1989; formerly the Veterans Administration (est. 1930), an independent U.S. government agency. It provides medical and rehabilitation services, including medical centers, clinics, and nursing homes, for eligible veterans and offers pensions, educational assistance, loan guarantees, insurance, burial costs, and other benefits to qualifying veterans and their dependents. The National Cemetery System is operated by the department.

Veterans' Day (Nov. 11), U.S. holiday, formerly called Armistice Day in commemoration of the armistice ending WORLD WAR I. Since 1954 the day has honored all who have fought for the U.S.

veterinary medicine, prevention, diagnosis, and treatment of ani-

mal diseases. The first veterinary school opened in France in 1761; veterinary schools arose in the U.S. about the time of the Civil War. Veterinarians complete a four-year postgraduate program before becoming licensed. They usually specialize in either small animals such as pets, or large animals, such as horses and farm animals. Veterinary research has made important contributions to medicine in general; for example, forms of VACCINATION devised for animals were found to be effective for humans. Since World War II the development of live- and modified live-virus vaccines, ANTIBIOTICS, and sulfonamides has led to the prevention and control of once incurable animal diseases.

veto, power of the chief executive to disallow laws passed by the legislature. In the U.S. the president's veto can be overridden by a two-thirds vote of Congress. The president cannot veto only a portion of a bill, nor can he veto Constitutional amendments. The governors of the states also have veto power, and most also have a line-item veto, which enables them to veto specific items in an appropriations bill without vetoing the entire bill. In the Security Council of the UNITED NATIONS, the five permanent members have a veto power to block any action.

Viaud, Julien: see LOTI, PIERRE.

Vicente, Gil [Port. vēsĕnt'ə, Span. vēthĕn'tā], 1470?–1536?, Portuguese dramatist and poet. A major figure of the Iberian Renaissance, he is ranked second only to CAMÕES. A humanist, he created plays for court presentation varying from farcical interludes to tragicomedies. Some religious, some satirical, they attack the corrupt clergy and the superficial glory of empire belied by increasing national poverty; they also include songs of his own composition. He wrote in Portuguese, in Spanish, and in a combination of the two.

Vichy, city (1982 pop. 30,527), central France. Hot springs have made it a foremost spa. The **Vichy government** was the regime set up (1940) by Marshal PÉTAIN during WORLD WAR II, after the Franco-German armistice. It controlled unoccupied France and its colonies. A truncated parliament replaced the Third Republic with an authoritarian state. Vichy became a German tool in the hands of LAVAL, DARLAN, and others. When the Allies invaded Africa in 1942, Hitler seized all of France. The Vichy regime fled before the Allied advance and fell at war's end.

Vicksburg campaign, in the U.S. CIVIL WAR, the fighting (Nov. 1862–July 4, 1863) for control of the Mississippi R. By late 1862, the Union controlled all of the river except for the 200 miles below Vicksburg, Miss. Impregnable on its bluff overlooking the river, Vicksburg repulsed all efforts to storm it by troops under the overall command of Gen. Ulysses S. GRANT. In May 1863 Grant opened siege, and after six weeks of defense the Confederates surrendered. Vicksburg's fall completed the encirclement of the CONFEDERACY.

Vico, Giovanni Battista or **Giambattista,** 1688–1744, Italian philosopher and historian. Vico's philosophy of history, little known until the 19th cent., is regarded as the precursor of modern theories of history. For Vico, history was the account of the birth, development, and decay of human societies and institutions. He urged the study of language and mythology as a means of understanding earlier societies. He thus departed from previous systems of writing history either as the biographies of great individuals or as the unfolding of God's will. His cyclical theory of history was an important influence on the DIALECTICAL MATERIALISM of Karl MARX. Vico's major work was *New Science* (1725), which he completely revised in 1730 and 1744.

victims' rights, rights of victims to have a role in the prosecution of the perpetrators of crimes against them. Nearly all U.S. states have enacted some victims' rights legislation. Such laws typically ensure that victims receive respectful and compassionate treatment, that they are informed at critical stages of the criminal prosecution, and that their courtroom attendance and comments are invited when appropriate. Some critics have voiced the fear that such laws influence the outcome of trials by assuming the accused is guilty.

Victor Amadeus II, 1666–1732, duke of Savoy (1675–1713), king of Sicily (1713–20), and king of Sardinia (1720–30). In the War of the SPANISH SUCCESSION (1701–13), he and his cousin, EUGENE OF SAVOY, defeated the French in 1706. The Peace of Utrecht gave (1713) Victor Amadeus a kingdom in Sicily, which was seized (1718) by Spain. In 1720 he ceded his claim to Sicily in exchange for Sardinia and became its king. He abdicated in 1730.

Victor Emmanuel, Italian kings. **Victor Emmanuel I,** 1759–1824, king of Sardinia (1802–21), recovered Sardinia's mainland territories after Napoleon's fall. His reactionary rule led to an uprising, and he abdicated. **Victor Emmanuel II,** 1820–78, king of Sardinia (1849–61), was the first king of united Italy (1861–78) Aided by his minister, the conte di CAVOUR, he continued the wars of the RISORGIMENTO, and in 1861 the kingdom of Italy was proclaimed with Victor Emmanuel asking. His grandson, **Victor Emmanuel III,** 1869–1947, king of Italy (1900–46), joined (1915) the Allies in WORLD WAR I. During MUSSOLINI's Fascist regime he was king in name only, although he gained the titles emperor of Ethiopia (1936) and king of Albania (1939). He abdicated (1946) after WORLD WAR II. See also SAVOY, HOUSE OF.

Victoria, 1819–1901, queen of Great Britain and Ireland (1837–1901) and empress of India; daughter of Edward, duke of Kent (fourth son of GEORGE III), and Princess Mary Louise Victoria of Saxe-Coburg-Saalfeld. She succeeded WILLIAM IV. As a woman, she was barred from succession in Hanover, so her accession in Britain ended the connection between the British and Hanoverian thrones. In 1840 she married her first cousin Prince ALBERT, and the marriages of their nine children linked the British royal house to the royalty of Russia, Germany, Greece, Denmark, and Romania. Victoria's first prime minister, Lord MELBOURNE, became a friend, but her interest in foreign affairs caused friction with Lord PALMERSTON. In 1861, Prince Albert died; the queen's extreme grief led to her seclusion for three years. Her emergence was largely due to Benjamin DISRAELI, who with William GLADSTONE dominated politics in the latter part of her reign. Disraeli secured for her the title of empress of India. Victoria's Diamond Jubilee (1897) proved her to be enormously popular. Although not highly intelligent, she was of high moral character and extremely conscientious. Her reign, the longest in English history, saw the rise of industrialism at home and imperialism abroad.

Victoria, state (1992 est. pop. 4,452,000), 87,884 sq mi (227,620 sq km), SE Australia, on the Indian Ocean and the Tasman Sea. MELBOURNE, the capital, and GEELONG are among the major cities. The second-smallest and most densely populated Australian state, Victoria is highly industrialized. Manufactures include automobiles, pharmaceuticals, textiles, and processed food. Despite its small size, it is also one of Australia's leading agricultural states, producing wheat and other grains, dairy products, and lamb and mutton. Lignite, oil, and natural gas are important resources. The first permanent settlements were established at Portland Bay in 1834 and at Melbourne in 1835. Originally part of NEW SOUTH WALES, Victoria became a separate colony in 1851 and was federated as a state of Australia in 1901.

Victoria, city (1991 pop. 71,228), provincial capital, SW British Columbia, part of the Capital Regional District (1991 pop. 299,550), on VANCOUVER ISLAND and Juan de Fuca Strait. Known for its mild winters (freezing temperatures are rare) and many parks, it is the largest city on the island and the second largest in the province. Victoria was founded (1843) as Fort Camosun, a HUDSON'S BAY COMPANY post. The city was laid out and settled (beginning in 1851) as the capital of the crown colony of Vancouver Island. It became the capital of all of British Columbia in 1871.

Victoria, city (1985 est. pop. 23,000), capital of the SEYCHELLES.

Victoria, Lake, or **Victoria Nyanza,** lake, E Africa, c.26,830 sq mi (69,490 sq km), largest freshwater lake in Africa and second largest in the world. One of the chief sources of the NILE R., it occupies a shallow depression at an altitude of 3,725 ft (1,135 m).

Victoria and Albert Museum, South Kensington, London. It opened in 1852 as the Museum of Manufacturers, at Marlborough House. The name was soon changed to Museum of Ornamental Art, and the collection included objects of all styles and periods. The present building, designed by Sir Aston Webb, was given its name in 1899 by Queen Victoria. It opened in 1909 as purely an art museum, embracing the Royal College of Art, an art library, and the collections of the India Museum. Its paintings and sculptures, especially early Italian works, are celebrated. RAPHAEL's cartoons for the SISTINE CHAPEL tapestries are among its great treasures, which also include glass, jewelry, textiles, and medieval enamels.

The key to pronunciation appears on page xiii.

Victoria Falls, famous waterfall, S central Africa, on the Zambia-Zimbabwe border. The falls are c.1 mi (1.6 km) wide, with a maximum drop of 420 ft (128 m), and are formed as the ZAMBEZI R. plummets into a narrow gorge, now partially flooded by KARIBA DAM.

Victorian style, in architecture, an eclectic fashion based on revivals of older styles. The promoter of taste in VICTORIA's reign (1837–1901) was Prince ALBERT. He sponsored the forward-looking CRYSTAL PALACE, but also a dry Tuscan Renaissance revival, e.g., at Osborne House, Isle of Wight. A romantic return to Gothic is seen in the rebuilding of WESTMINSTER PALACE (1840–60). See also GOTHIC REVIVAL.

Victory of Samothrace: see NIKE.

Vidal, Gore, 1925–, American novelist, playwright, and critic; b. West Point, N.Y. An acute and acerbic observer of the American scene, he brilliantly satirized U.S. history and life in the novels *Myra Breckinridge* (1968), *Burr* (1973), *1876* (1976), *Lincoln* (1988), and *Hollywood* (1990). His other works include the plays *Visit to a Small Planet* (1955) and *The Best Man* (1960); the historical novels *Julian* (1964) and *Creation* (1981); and the essay collections *The Second American Revolution* (1982) and *United States: Essays 1952–1992* (1993).

videocassette recorder (VCR), device that can record television programs or the images from a video camera on magnetic tape (see TAPE RECORDER); it can also play pre-recorded tapes. The VCR converts the separate audio and video portions of a television or video camera signal to magnetic flux variations to magnetize the tape. The video recording heads move in a direction almost perpendicular to the tape movement, resulting in tracks that run diagonally across the tape width and increasing tape capacity. A **camcorder** combines a video camera and VCR in a single handheld machine.

videodisc or **videodisk,** disk used with a special player and television to reproduce both pictures and sound. A videodisc player cannot record television programs off the air for later playback, unlike a VIDEOCASSETTE RECORDER (VCR). Videodiscs, however, generally produce pictures that are clearer in detail and truer in color than those produced by VCR tapes, and they also offer better sound quality. Two quite different videodisc systems have been developed. One operates much like a PHONOGRAPH, using a mechanical stylus that senses varying patterns of electrical capacitance imprinted in grooves on the disc surface. This format has largely fallen into disuse. The other, known as a laser disc system, uses a LASER to read a track cut in a spiral pattern on the inside surface of the disc. On a laser disc, video is recorded as an analog signal and the soundtrack is either an analog or, in more recent versions, a digital signal.

video game: see ELECTRONIC GAME.

videotex, communications service that is linked to an adapted TELEVISION receiver or a PERSONAL COMPUTER by telephone lines, CABLE TELEVISION facilities, or the like, and that allows a user to retrieve and display alphanumeric and pictorial information at home. There are two forms of videotex systems. One-way *teletext* systems permit the selection and display of such general information as airline schedules, traffic conditions, and traditional newspaper content. *Viewdata* systems are more specific and provide for two-way, or interactive, communication. Specific questions may be researched by accessing the appropriate database: e.g., bank balances can be verified and bills paid, and travel and hotel reservations can be made. In Japan and Europe, government-operated videotex systems—Captain in Japan, Prestel in Britain, Bildschirmtext in Germany, and Minitel in France—are well established. In North America, systems have been developed by newspaper publishers (called electronic news) and banks. With the growing popularity of the personal computer, database services are becoming more significant; these make the home user part of an interactive NETWORK, provide electronic mail and bulletin board facilities in addition to traditional videotex services, and provide additional computing power and data-storage facilities.

Vienna, Ger. *Wien,* city and prov. (1991 pop. 1,533,176), capital of Austria, NE Austria, on the Danube R. It is a cultural, commercial, industrial, and transportation center; tourism is also economically important. Settled by Celts, Vienna became a Roman military center. It was the residence of the Holy Roman emperors and, after 1806, of the emperors of Austria. In 1529 and 1683 it was besieged by the Turks. In the 18th cent. HAYDN, MOZART, BEETHOVEN, and SCHUBERT lived there, and many magnificent buildings were erected, including the Hofburg (imperial residence), the Schönbrunn palace, and St. Peter's Church. In the late 19th cent., with BRAHMS, MAHLER, SCHOENBERG, FREUD, and SCHNITZLER in residence, the city continued to flourish, raising splendid cultural and administrative edifices around the famous boulevard the Ringstrasse. After Austria was annexed (1938) to Nazi Germany, the city's Jewish population (c.115,000) was reduced to 6,000 by the end of the war. The city itself was heavily damaged in WORLD WAR II. Captured (1945) by the Russians, it was divided into four Allied occupation zones until 1955, when Austria was reunited as a neutral state.

Vienna, Congress of, 1814–15, international conference to remake Europe after the downfall of NAPOLEON I. All the European states that had existed before the Napoleonic upheaval were represented; however, the major powers (Austria, Russia, Prussia, and Britain) made the decisions, although France quickly won an equal voice. The problems confronting the congress were extremely thorny and complex. Its main purpose was to create a balance of power that would preserve the peace. The Concert of Europe that ensued attests to the fact that it generally succeeded. The congress opened with a series of glittering balls, and then the delegates settled down to hard bargaining. The unexpected return (1815) of Napoleon from Elba shocked the congress into burying its differences long enough to reach important agreements. The Final Act of Vienna was issued only nine days before Napoleon's defeat at Waterloo. The many accomplishments of the Congress of Vienna include the following: The Confederation of the Rhine was created to replace the defunct Holy Roman Empire. Louis XVIII of France and Ferdinand VII of Spain were restored. The various Italian states went to the major powers. Britain acquired several strategic colonial territories. The Netherlands were united. Russia got Finland and effective control over the new kingdom of Poland. Prussia was given much of Saxony and important parts of Westphalia and the Rhine Province. Sweden got Norway. The peace terms for France were contained in a separate treaty (see PARIS, TREATY OF). An auxiliary accomplishment of the Congress of Vienna was the formulation of the rules of diplomacy that are still are in effect.

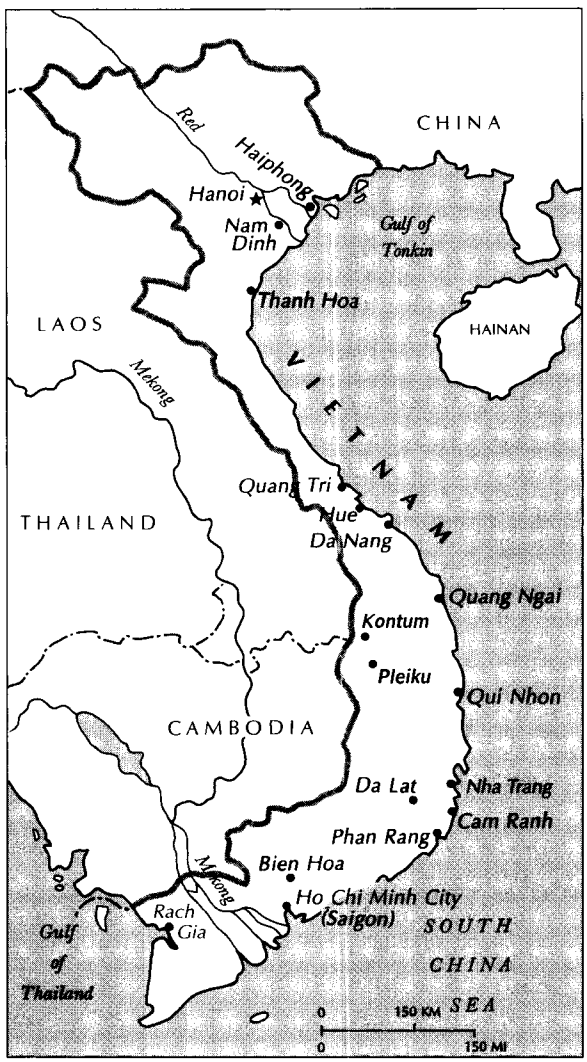
Vientiane, city (1985 est. pop. 377,000), administrative capital and largest city of Laos, N central Laos, on the Mekong R. The city has light industries and is a trading center for forest products, textiles, and hides. It is noted for its canals, its houses built on stilts, and its many pagodas. It was the capital of a Lao kingdom from 1707, was sacked by the Siamese in 1827, and passed to the French in 1899. The population is about half that of 1975, the result of the flight of many Laotians after a Communist takeover that year and of the government's relocation program (see LAOS).

Viet Cong, officially *Viet Nam Cong San* [Vietnamese Communists], Communist insurgents in South Vietnam. Some 10,000 Communist troops remained in hiding in South Vietnam when the Communists withdrew to North Vietnam after the 1954 GENEVA CONFERENCE. They resorted to open warfare to overthrow the U.S.-supported South Vietnamese regime (see VIETNAM WAR) and were later reinforced by North Vietnamese troops. The political organization of the Viet Cong, the National Liberation Front (NLF), was established in 1960.

Viet Minh, officially *Viet Nam Doc Lap Dong Minh* [League for the Independence of Vietnam], coalition of Communist and nationalist groups that fought the Japanese (during WORLD WAR II) and the French (see DIENBIENPHU). The Communists within the coalition became dominant and were absorbed (1951) by the Communist party of North Vietnam. See also VIETNAM WAR.

Vietnam, officially Socialist Republic of Vietnam, republic (1992 est. pop. 68,964,000), 128,401 sq mi (332,559 sq km), SE Asia, bordered by Cambodia and Laos (W), China (N), and the South China Sea (E, S). Major cities are HANOI (the capital) and HO CHI MINH CITY (formerly Saigon). The terrain is generally rugged; the two principal regions, the Red R. delta in the north and the Mekong R. delta in the south, are linked by a narrow, mountainous strip. Agriculture, primarily the growing of rice, is the basis of the economy, engaging more than 80% of the work force; Vietnam is a major rice exporter. Peanuts, corn, sweet potatoes, and beans are also grown for sub-

sistence; cash crops include cotton, jute, coffee, and tea. Fishing is also important. Mining, particularly of coal, heavy industry, and most of the timber resources are concentrated in the north. Offshore petroleum deposits have been developed, and crude oil is exported. About 80% of the population are Vietnamese. Significant minorities include highland tribal peoples such as the Nungs and Meos and Cambodians and Thais. Large numbers of ethnic Chinese fled the country after a border clash with China in 1979. Buddhism and Roman Catholicism are practiced, but religion is discouraged by the government.



History. The area that is now Vietnam is composed of the historic regions of TONKIN, ANNAM, and COCHIN CHINA. European traders arrived in the early 16th cent. The French captured Saigon in 1859, organized the colony of Cochin China in 1867, and declared protectorates over Tonkin and Annam in 1884. The three were merged with Cambodia in 1887 to form French INDOCHINA. A nationalist movement arose in the early 20th cent., gaining momentum during the Japanese occupation in WORLD WAR II. After the Japanese withdrew in 1945 the VIET MINH, a coalition of nationalists and Communists, established a republic headed by HO CHI MINH. French attempts to reassert control and establish Bao Dai as emperor resulted in the French Indochina War (1946–54), which ended with the French defeat at DIENBIENPHU. At the Geneva Conference of 1954 Vietnam was provisionally divided, pending nationwide free elections, into Communist North Vietnam and nationalist South Vietnam. Fearing a Communist victory, the regime of Ngo Dinh DIEM refused to hold the scheduled elections and declared the south an independent republic in 1955. The VIETNAM WAR ensued, with the U.S. aiding South Vietnam. A cease-fire was signed and U.S. troops withdrawn in 1973, but the Communists overran the south in 1975, reunifying (1976) the country. The regime launched a large-scale resettlement and reeducation program to suppress continued opposition in the south. In 1978–79 it invaded Cambodia, overthrowing the regime of POL POT and provoking a brief invasion of N Vietnam by China. Continued political and social upheaval took its toll on the economy and also prompted the flight of great numbers of refugee boat people. In the late 1980s economic failure and food shortages, both exacerbated by a U.S. economic embargo, led to decentralization and limited free enterprise; the party retained tight political control. In 1994 the U.S. ended the embargo in response to Vietnam's cooperation in the search for missing American servicemen. Since 1991 the Communist party has been led by Do Muoi; Vo Van Kiet, an economic reformer, is premier.

Vietnam Veterans Memorial, war memorial in Washington, D.C., built 1982. Designed by American sculptor and architect Maya Ying Lin, it is a sloping, V-shaped, 493-ft (150-m) black granite wall that descends 10 feet (3.05 meters) below grade level at its vertex; the wall is inscribed with names of the more than 58,000 Americans killed or missing during the VIETNAM WAR. Nearby are sculptures of three soldiers by Frederick E. Hart (erected 1984) and of three nurses and a wounded soldier by Glenna Goodacre (erected 1993).

Vietnam War (1954–75), war in Southeast Asia between the government of South VIETNAM, aided by the U.S., and Communist insurgents, aided by North Vietnam. Following France's defeat in the French Indochina war (1946–54), Vietnam was divided into North and South Vietnam by the Geneva Conference (1954). War soon broke out in South Vietnam as Communist-led guerrillas (the Viet Cong) tried to overthrow the South Vietnamese government. From 1961 the U.S. supplied support troops to South Vietnam, and following the TONKIN GULF RESOLUTION (1964) the war quickly escalated (U.S. troops numbered c.550,000 by 1969). Although historians now view the Tet Offensive (1968) as a major defeat for the Viet Cong, its immediate impact in the U.S. was to increase opposition to the war. Under Pres. NIXON the U.S. began a policy of increased bombing and troop withdrawals. In 1973 a cease-fire agreement was signed at Paris that allowed U.S. troops to withdraw, but it solved few problems. The war finally ended in a Communist victory in 1975, when the North Vietnamese launched their final offensive and routed the South Vietnamese army.

viewdata: see VIDEOTEX.

Vigée-Lebrun, Élisabeth [vēzhā'-ləbröN'], 1755–1842, French portrait painter. Painter and friend to MARIE ANTOINETTE, she is known for two portraits of the Queen (Versailles) and one of Mme de STAËL (Louvre).

Vignola, Giacomo da [vēnyō'lä], 1507–73, leading late Renaissance Italian architect, papal architect (after 1550) to Julius III. He succeeded MICHELANGELO in charge of work at St. Peter's (1564). His finest productions are the Villa Caprorola, near Viterbo, and the Villa Giulia, Rome, as well as the interior for the Church of the Gesù, Rome (1568), which greatly influenced ecclesiastical architecture. He wrote (1562) a universally known treatise on the ORDERS OF ARCHITECTURE.

Vigny, Alfred Victor, comte de [vēnyē'], 1797–1863, French author. Stressing the lonely struggle of the individual in a hostile universe, he expressed the philosophy of ROMANTICISM. His best-known poems are in *Poems Ancient and Modern* (1826) and *Destinées* (1864). Prose works include the novel *The Spider and the Fly* (1826) and *Chatterton* (1835), a play.

Viking, in space exploration: see SPACE PROBE, table.

Vikings, Scandinavian warriors who raided the coasts of Europe and the British Isles from the 9th to 11th cent. The world's best shipbuilders, they were driven as far as Greenland and North America by overpopulation, internal dissension, quest for trade and thirst for adventure. Many Vikings settled where they had raided (see NORSEMEN). The Viking Age ended with the introduction of Christianity into Scandinavia; the emergence of the kingdoms of Norway, Denmark, and Sweden; and the rise of European states strong enough to repel invasion.

The key to pronunciation appears on page xiii.

Vila, town (1989 est. pop. 19,400), capital of VANUATU, on Efâte island.

Villa, Pancho (Francisco Villa) [vē'yä], c.1877–1923, Mexican revolutionary; b. Doroteo Arango. A bandit in N Mexico, he joined (1910) the rebels and fought vigorously for Pres. MADERO and later against Gen. HUERTA and Pres. CARRANZA. He and ZAPATA occupied (1914–15) Mexico City, but he was decisively defeated (1915) by Gen. OBREGÓN. After Villa's forces killed (1916) some American citizens at Columbus, N.Mex., a U.S. army expedition pursued Villa in Mexico for 11 months without success. At times a rebel against injustice, but always an undirected, destructive force, Villa became a national hero.

Villa-Lobos, Heitor [vē'lä-lô'bôs], 1887–1959, Brazilian composer. He is known for his use of Brazilian folk music, as in his series *Chôros.* His compositions include symphonies, operas, concertos, chamber music, and songs.

Villanovan culture, the culture of a people of N Italy in the early Iron Age (c.1100–700 B.C.). The Villanovans are believed to have come into Italy from Central Europe, and they lived over much of central Italy. They had a reasonably advanced IRON AGE culture.

villein, a peasant under the medieval MANORIAL SYSTEM. By the 13th cent. in England, SERFS came to be called villeins. The villein was attached to the manor and paid dues to and performed servile labor for the lord. A number of factors caused **villeinage** to disappear in England in the 14th cent. Growing towns weakened the manorial system, and money rents began to replace labor dues. Moreover, the PLAGUE of 1349, by greatly reducing the population, improved the bargaining power of labor.

Villella, Edward, 1936–, American ballet dancer; b. Long Island, N.Y. He studied with BALANCHINE and joined the NEW YORK CITY BALLET in 1957. He had a vigorous, dynamic style and a large repertoire that included *The Prodigal Son.* He served as artistic coordinator of the Eglevsky Ballet (1979–84) and director of the Oklahoma Ballet (1983–85) before founding the Miami City Ballet in 1986.

Villon, François [vēyôN'], 1431–1463?, French poet. Confessedly a vagabond and rogue from his student days, Villon was banished from Paris after killing a man in 1455. He fell in with the *coquillards,* a band of thieves, and for them he composed his ballads in thieves' jargon. Besides these, his chief works are the *Lais* or *Little Testament* (1456) and *Testament* (1461), each of which is a series of facetious bequests to family, friends, and, especially, enemies. Interspersed in the *Testament* are ballads such as "Ballade des dames du temps jadis," with the famous refrain, "But where are the snows of yesteryear?" Other poems include "Ballad of the Hanged," written during the author's anticipation of that fate. Alternately compassionate, ironic, ribald, penitent, and rebellious, Villon is one of the great medieval poets, but with an intensely personal message that ranks him with the moderns.

Villon, Jacques, 1875–1963, French painter; brother of Marcel DUCHAMP and Raymond DUCHAMP-VILLON. An exponent of CUBISM, he is known for his refinement of the cubist style.

Vilnius, city (1989 pop. 582,000), capital of LITHUANIA, N central Europe, on the Neris R. Its industries include machine building and food processing. Lithuania's capital from 1323, and the site of one of Europe's oldest universities, Vilnius declined after Lithuania and Poland were merged (16th cent.). After 1795 it was ruled by Russia (see POLAND, PARTITIONS OF). The city was disputed by Poland and Lithuania from 1918 to 1938; in 1939 it was restored to Lithuania, which was forcibly annexed by the USSR (1940–91). During WORLD WAR II Vilnius was occupied (1941–44) by the Germans, whose virtual extermination of the Jewish population ended its long tradition as a leading E European center of Jewish learning.

Viña del Mar, city (1992 est. pop. 317,000), central Chile, on the Pacific Ocean, near VALPARAISO. Founded in 1874, it is now one of the most popular resort cities in South America, with luxurious hotels, a gambling center, and fine beaches. There are also some industries and a naval base.

Vincent de Paul, Saint, 1580?–1660, French priest renowned for charitable work. His activism and holiness brought about a revival of French Catholicism. In 1625 he founded an order of secular priests (Lazarists or Vincentians); he also founded the Sisters of Charity. Feast: Sept. 27.

Vinci, Leonardo da: see LEONARDO DA VINCI.

vinegar, sour liquid consisting mainly of acetic acid and water, produced by the action of bacteria on dilute solutions of ETHANOL derived from previous yeast FERMENTATION. The alcoholic liquor used, e.g., cider or wine, determines the characteristic color and flavor. Acetic fermentation may be impeded by an excessive growth of mother of vinegar, a slimy mass of bacteria, or of the parasitic vinegar eel, a minute, threadlike worm. Vinegar is used as a salad dressing, as a preservative, as a mild disinfectant, and, in cooking, as a fiber softener.

Vinson, Frederick Moore, 1890–1953, 13th chief justice of the U.S. SUPREME COURT (1946–53); b. Louisa, Ky.; LL.B., Centre College (1911). He served in the U.S. House of Representatives (1923–29, 1931–38), on the U.S. Court of Appeals (1938–43), and as secretary of the treasury (1945–46). As chief justice, he upheld the powers of the federal government in opposition to claims of individual rights.

Vinson Massif, peak, 16,066 ft (4,897 m), highest point in Antarctica, located in the Ellsworth Mts. Named for Carl Vinson, a U.S. politician, it was first climbed in 1966 by an American expedition led by Nicholas B. Clinch.

viol, family of bowed STRINGED INSTRUMENTS, the most important ensemble instruments from the 15th to the 17th cent., when they lost their position to the VIOLIN family and became virtually extinct until the revival of interest in early music in the 20th cent. The viol, a chamber instrument with a soft, sweet tone, differs from the dynamically more brilliant violin. It usually has sloping shoulders, a flat back, and deeper ribs than the violin, is tuned in fourths rather than fifths, and usually is played upright, resting on or between the knees, the bow held with the palm upward. The viol was built in four principal sizes—treble, alto, tenor, and bass—which were used in ensemble, or "consort." The double-bass viol, or *violone,* survived all other viols to become (with some modifications) the modern double bass.

viola: see VIOLIN.

viola da gamba [Ital., = knee viol], term for the bass viol, originally the name of the whole VIOL family.

violet, common name for some members of the family Violaceae, chiefly perennial herbs (and sometimes shrubs) found on all continents. Violets (genus *Viola* and similar related species) are popular florists', garden, and wild flowers. Violets have fragrant, deep purple to yellow or white blossoms. Various species, especially the sweet, or English, violet (*V. odorata*), have been used in perfumes, dyes, and medicines, and have been candied. The common pansy was derived from the Old World *V. tricolor.* Its irregularly shaped, variously colored flowers have five velvety petals. A violet is the floral emblem of three states (New Jersey, Rhode Island, and Wisconsin). Some unrelated plants are also called violets, e.g., the AFRICAN VIOLET of the GESNERIA family.

violin, family of STRINGED INSTRUMENTS having wooden bodies whose backs and fronts are slightly convex, the fronts pierced by two *f*-shaped resonance holes. There are four strings, tuned in fifths, across which the player draws a horsehair bow; a variety of sounds may be produced by different bowing techniques. The fingers of the left hand are used to stop the strings against the fingerboard, thus changing the pitch by shortening the vibrating length of the strings. With their versatility, brilliance, and wide dynamic range, the instruments of the violin family have long dominated the ORCHESTRA. The first instrument of this type appeared about 1510 as the *viola da bracchio* (arm viol). The present-day violin was developed toward the end of the 16th cent., and the peak of violin-making was reached over the following century by such master craftsmen as the Amati, Guarneri, and STRADIVARI families of Cremona, Italy. The violin, the smallest and most agile member of the family, has from the beginning been a major solo instrument and the principal orchestral instrument. The viola is about one-seventh larger than the violin and is tuned a fifth lower. It is used mainly in the orchestra and chamber music, but recently has become more popular as a solo instrument. Both violin and viola are supported by the shoulder and held firm under the chin. The violoncello, often called cello, is about twice as wide and twice as long as the violin, and is tuned an octave lower. Because of its size, it is played between the knees, like members of the VIOL family. The double-bass violin was superseded in the 18th cent. by the double-

bass viol or *violone*, which with some modifications became the modern double bass, the lowest-pitched instrument of the orchestral string section.

Viollet-le-Duc, Eugène Emmanuel [vyôlā'-lə-dük], 1814–79, French architect and writer. He was the most prominent exponent of the GOTHIC REVIVAL in France, celebrated for his restoration work. His efforts included restoration of the Sainte Chapelle and work on NÔTRE-DAME DE PARIS. His other restorations include the cathedrals of Amiens, Chartres, and Rheims; the château of Pierrefonds; and the city of Carcassonne. His writings, which he illustrated himself, emphasize the organic quality of Gothic structures.

violoncello: see VIOLIN.

viper, poisonous SNAKE of the family Viperidae, found in Eurasia and Africa. Characterized by erectile, hypodermic fangs, vipers range in size from under 1 ft (30 cm) to nearly 6 ft (2 m) and often have zigzag or diamond markings. Best known are the European asp (*Vipera aspis*), native to S Europe, and the common European viper, or adder (*V. berus*), found throughout Europe and N Asia. The PIT VIPERS of the Americas belong to a different family.

Virchow, Rudolf [fĭr'khō], 1821–1902, German pathologist. He taught at the Univ. of Würzburg and then directed the Pathological Inst. in Berlin. A founder of cellular pathology, he contributed to nearly every branch of medicine and to anthropology, and introduced sanitary reforms in Berlin. Elected a member of the Prussian lower house and later of the Reichstag, he was a leader of the liberal Progressive party opposed to BISMARCK.

Virgil: see VERGIL.

Virginia, state of the south-central U.S.; bordered by the Atlantic Ocean (E), North Carolina and Tennessee (S), Kentucky and West Virginia (W), and Maryland and the District of Columbia (N and NE).

Area, 40,817 sq mi (105,716 sq km). *Pop.* (1990) 6,187,358, an 15.7% increase over 1980 pop. *Capital,* Richmond. *Statehood,* June 25, 1788 (10th of original 13 states to ratify the Constitution). *Highest pt.,* Mt. Rogers, 5,729 ft (1,747 m); *lowest pt.,* sea level. *Nickname,* Old Dominion. *Motto, Sic Semper Tyrannis* [Thus Always to Tyrants]. *State bird,* cardinal. *State flower,* dogwood. *State tree,* dogwood. *Abbr.,* Va.; VA.

Land and People. The coastal plain, or tidewater region, is generally flat and partly swampy. At the FALL LINE it gives way to the generally rolling, fertile Piedmont Plateau. Farther west, the BLUE RIDGE Mts. are separated by the Valley of Virginia from the Allegheny Mts. The overall climate is mild; rainfall is well distributed. Almost 70% of the population lives in urban areas. VIRGINIA BEACH is the largest city. NORFOLK, the center of the huge port industry of the HAMPTON ROADS, is the second largest city, followed by RICHMOND, NEWPORT NEWS, and CHESAPEAKE. In 1990 the state was 77% white and 19% African American.

Economy. By the early 1990s service industries had displaced manufacturing as the chief source of income and employment. Manufacturing continues to be important, however, with textiles; transportation, electric, and electronic equipment; processed foods; and chemicals among the leading products. The principal agricultural commodities are dairy products, cattle, soybeans, tobacco, broiler chickens, peanuts, and corn. Coastal fisheries yield a large annual catch, especially of oysters and crabs. Tourists are attracted to the state's mountain areas, including Shenandoah National Park (see NATIONAL PARKS, table) and the Skyline Drive, and historic sites, including Colonial WILLIAMSBURG.

Government. The constitution (adopted 1970) provides for a governor elected to a four-year term. The general assembly consists of a senate with 40 members serving four-year terms and a house with 100 members elected for two years. Virginia sends 2 senators and 11 representatives to the U.S. Congress and has 13 electoral votes.

History. In 1607 JAMESTOWN, the first permanent English settlement in North America, was founded in Virginia. A prosperous economy developed, based on shipping and tobacco cultivation and utilizing slaves. Virginia was a leader in the movement culminating in the AMERICAN REVOLUTION and was the first of the Thirteen Colonies to declare its independence from Great Britain. Among Virginia's native sons were George WASHINGTON, commander of the Continental Army, and Thomas JEFFERSON, drafter of the Declaration of Independence, both of whom subsequently served as presidents of the new nation. Virginia seceded (1861) from the Union, and Richmond became the capital of the CONFEDERACY. The state was the chief battleground of the CIVIL WAR. Virginia was readmitted to the Union in 1870, and during the postwar period the economy was diversified. After the 1954 Supreme Court school desegregation decision, attempts to integrate Virginia's schools proceeded slowly, but integration had been generally accepted by 1970. The nation's energy shortage brought a sudden boom to the coal-mining industry, in the southwestern part of the state, during the late 1970s and early 1980s. From 1989 to 1993 L. Douglas WILDER served as Virginia's, and the nation's, first elected African-American governor.

Virginia, in Roman legend, daughter of the centurion Virginius, who stabbed her to save her from the lust of Appius Claudius Crassus (see CLAUDIUS, Roman gens), a decemvir. This precipitated the fall of the decemvirs.

Virginia Beach, city (1990 pop. 393,069), SE Va., on the Atlantic coast. Formed by the merger (1963) of the town of Virginia Beach and Princess Anne co., it encompasses 302 sq mi (782 sq km), reaching 28 mi (45 km) to the North Carolina border. A tourist center with miles of beautiful beaches, it also has several large military bases. In its southern section horses and dairy cows are raised. The Chesapeake Bay Bridge-Tunnel links the city with DELMARVA. The Cape Henry Cross marks the site of the first landing of colonists (1607).

Virginia City, village (1990 est. pop. 900), seat of Storey co. W Nevada; settled 1859. Now a tourist center, it was the site of the COMSTOCK LODE and a major hub for the mining of silver and gold.

Virginia Company, name of two English colonization companies chartered by King JAMES I in 1606. One founded the PLYMOUTH COLONY; the other, later known as the London Company, founded colonies in the South, notably JAMESTOWN, Va.

Virginia creeper, woody vine (*Parthenocissus quinquefolia*) of the GRAPE family, popular as a wall covering. It has blue-black berries and clings by disk-tipped tendrils, with some branches hanging free. The five-fingered leaves are sometimes confused with the three-fingered POISON IVY.

Virginia Resolutions: see KENTUCKY AND VIRGINIA RESOLUTIONS.

Virgin Islands, group of about 100 small islands, WEST INDIES, E of Puerto Rico, owned by the U.S. and Great Britain, constituting the westernmost part of the Lesser Antilles. Their tropical climate and picturesque quality, enhanced by Old World architecture, make them a popular tourist destination. However, the population, mostly of African descent, remains poor. Columbus discovered and named the islands in 1493. The **Virgin Islands of the United States** (1990 pop. 101,809), 133 sq mi (344 sq km), a U.S. territory, encompasses the southern and western islands. The capital is Charlotte Amalie on St. Thomas. The group is composed of 68 islands, but only three are important: St. Croix (1990 pop. 50,139), St. Thomas (1990 pop. 48,166), and St. John (1990 pop. 3,504). St. Thomas (32 sq mi/83 sq km) is mountainous and has fine harbors. St. Croix (80 sq mi/207 sq km) is flatter; manufacturing, tourism, and agriculture dominate its economy. Christiansted is the chief town. Much of St. John (20 sq mi/52 sq km) is occupied by the Virgin Islands National Park (see NATIONAL PARKS, table). The Danish settled St. Thomas in 1672, acquired St. John in 1683, and bought St. Croix from France in 1733. The islands were purchased from Denmark in 1917; the islanders became U.S. citizens in 1927. The Dept. of the Interior administers the islands, which have a locally elected governor and senate.

British Virgin Islands. The **British Virgin Islands,** a British dependency (1991 pop. 16,644), 59 sq mi (153 sq km), are to the northeast. Of more than 30 islands, the most important are Tortola, Anegada, and Virgin Gorda. Road Town, the capital, is on Tortola. Tourism, farming, and fishing are the chief economic activities. Britain acquired the islands from the Dutch in 1666.

Virgin Islands National Park: see NATIONAL PARKS (table).

Viriatus, d. 139 B.C., leader of the Lusitani, group of Iberian tribes. He headed a successful rebellion (147 B.C.) against Roman rule, inflicted defeats on Roman armies, and maintained an independent state until some of his followers accepted Roman bribes and killed him.

The key to pronunciation appears on page xiii.

viroid, microscopic infectious agent, much smaller than a VIRUS, that infects higher plants such as potatoes, tomatoes, and cucumbers, causing stunted or distorted growth and sometimes death. It can be transmitted by pollen, seed, or farm implements. Some scientists believe viroids, which consist of a short strand of RNA, are parts of normal RNA that have gone awry.

virtual reality (VR), computer-generated environment with and within which people can interact. VR encompasses a range of interactive computer environments, from text-oriented on-line forums and multiplayer games to complex simulations that combine audio; video, animation, or three-dimensional graphics; and scent. Some of the more realistic effects are achieved using a helmetlike apparatus with tiny computer screens, one in front of each eye and each giving a slightly different view so as to mimic stereoscopic vision. Sensors attached to the participant (e.g., gloves, bodysuit, footwear) pass on his or her movements to the computer, which changes the graphics accordingly to give the participant the feeling of movement through the scene. Computer-generated physical feedback adds a "feel" to the visual illusion, and computer-controlled sounds and odors reinforce the virtual environment. Other VR systems, such as FLIGHT SIMULATORS, use larger displays and enclosed environments to create an illusion. Less complicated systems for PERSONAL COMPUTERS manipulate an image of three-dimensional space on a computer screen. VR is used in some ELECTRONIC GAMES, in amusement-park attractions, and to simulate construction designs. Experimental and envisioned uses include education, industrial design, surgical training, and art.

virus, infectious agent composed mainly of NUCLEIC ACID within a protein coat (capsid), ranging in size from 10 to 200 nanometers; they can be seen only with an electron microscope. During the stage of their life cycle in which they are free and infectious, viruses do not carry out the usual functions of living cells, such as RESPIRATION and growth; when they enter a living plant, animal, or bacterial cell, they make use of the host cell's chemical energy and protein- and nucleic-acid-synthesizing ability to replicate themselves. Some, like the BACTERIOPHAGES, have protein tails used for infecting the host. Each virus attacks a specific type of cell, for example, cold viruses attack cells of the lungs and the AIDS virus attacks T4 cells of the immune system. Viral nucleic acids are single- or double-stranded and may be DNA or RNA. After viral components are made by the infected host cell, virus particles are released. Often, the virus alters the intracellular environment enough to damage or kill the cell; if enough cells are destroyed, disease results. Some viruses do not kill cells but transform them into a cancerous state (see CANCER); some can remain latent for a long time. Viruses cause measles, mumps, yellow fever, poliomyelitis, influenza, and several costly plant diseases. Some viral infections can be treated with drugs called ANTIVIRALS, and VACCINATION is useful in effecting immunization against many viruses. See also RETROVIRUS.

virus, computer: see COMPUTER VIRUS.

Visconti [vēskôn'tē], Italian family that ruled MILAN from the 13th cent. until 1447. **Ottone Visconti,** 1207–95, archbishop of Milan, was recognized as lord of the city in 1277. **Matteo I Visconti,** 1255–1322, supported the imperial or Ghibelline faction (see GUELPHS AND GHIBELLINES) and became imperial vicar of Milan. Later Viscontis increased and consolidated Milanese territory. **Gian Galeazzo Visconti,** 1351?–1402, embarked on a systematic program of conquest, first in Venetia, then in central Italy. He bought (1395) the hereditary title of duke of Milan from Holy Roman Emperor WENCESLAUS and defeated (1401) the German king Rupert, when Rupert tried to assert his rule in Italy. Gian Galeazzo sought to establish an Italian kingdom, but he died of the plague while preparing an attack on Florence, his chief enemy. His daughter, Valentina, married Louis d'ORLÉANS; it was through her that LOUIS XII and FRANCIS I of France derived their claims to Milan in the ITALIAN WARS. The dukedom passed to Gian Galeazzo's sons, first to **Giovanni Maria Visconti,** 1389–1412, a cruel ruler who was assassinated, and then to **Filippo Maria Visconti,** 1392–1447. Filippo Maria's daughter and heir, Bianca Maria, married Francesco I SFORZA, who became duke of Milan after the fall of the short-lived Ambrosian Republic (1447–50).

Visconti, Luchino, 1906–76, Italian film and stage director. His neorealist *Ossessione* (1943) and *La terra trema* (1948) were followed by such films as *The Leopard* (1962), *Death in Venice* (1970), and *Conversation Piece* (1975).

viscosity, resistance of a fluid to flow. This resistance acts against the motion of any solid object through the fluid, and also against motion of the fluid itself past stationary obstacles. Viscosity also acts internally on the fluid between slower- and faster-moving adjacent layers. All fluids exhibit viscosity to some degree.

Vishniac, Roman [vĭsh'nēăk], 1897–1990, Russian-American biologist, photographer, linguist, art historian, and philosopher; b. Russia. From 1933 to 1939 he recorded the life of Central European Jews in photographs. He was a pioneer of time-lapse and light-interruption photography, and became renowned for his photomicroscopy of living organisms.

Vishnu, one of the great gods of HINDUISM; in the Hindu trinity he is the preserver (see also BRAHMA; SHIVA).

Visigoths or **West Goths,** a division of the Goths, one of the chief groups of ancient GERMANS. Separated from the OSTROGOTHS, or East Goths, they moved (376) into Roman territory under pressure of the HUNS. They routed the East Roman emperor VALENS at Adrianople (378), and their kings, ALARIC I and Ataulf, led them across Italy, sacking Rome in 410. The Visigoths expanded N to the Loire, made Toulouse their capital, and took Vandal lands in Spain. King Euric (r.466–c.484) brought them to their peak of power. After Alaric II lost (507) lands N of the Pyrenees to the Franks under CLOVIS, the Visigoths were essentially restricted to Spain. They became Christians and merged with the Spanish population. Anarchy followed the death (672) of King Recceswinth. Their last king, Roderick, was defeated (711) by the MOORS, who thus ended the Visigothic kingdom.

vision: see EYE.

vitamin, organic compound required in the diet of animals, including humans, for normal growth and maintenance of life. Vitamins provide the only source of certain COENZYMES necessary for METABOLISM, the biochemical processes that support life. Since vitamins differ widely in chemical structure, there is no common chemical grouping. They were originally classified as fat-soluble or water-soluble, but as more were discovered, they were also classified alphabetically. The fat-soluble vitamins are stored in body fat and may therefore accumulate in quantities that can be toxic; vitamins A, D, E, and K are fat-soluble. Most water-soluble vitamins are rapidly excreted in the urine and thus rarely cause toxicity, even when ingested in excessive amounts; the B-complex vitamins and vitamin C are water-soluble. A well-balanced diet—including sufficient amounts of fruit and vegetables as well as eggs, meat, fish, or fowl (that is, a good source of protein)—usually satisfies the minimum vitamin requirement of human beings. An inadequate vitamin intake can lead to deficiency diseases, but there is growing evidence that vitamins have roles in health beyond the prevention of deficiency diseases. Vitamins C and E act as ANTIOXIDANTS and may prevent LDL CHOLESTEROL from clogging arteries, and vitamin K inhibits loss of bone calcium in post-menopausal women. See table of vitamins accompanying this article.

Vitruvius, c.90–c.20 B.C., Roman architect. He wrote the oldest extant Western treatise on architecture, *De Architectura* or the "Ten Books." An invaluable document of Roman and Greek architectural history and building practices, its rediscovery in the early 15th cent. ushered in the revival of the classical orders in Italian Renaissance architecture.

Vivaldi, Antonio, c.1675–1741, Italian composer, the greatest master of the Italian BAROQUE. His style is characterized by driving RHYTHM, clarity, and lyrical melody. He is known chiefly for his instrumental music—SONATAS, CONCERTOS (of which he wrote 447), and concerti grossi, e.g., *The Four Seasons.* He helped standardize the three-movement concerto form and influenced J.S. BACH, who arranged 10 of his concertos.

vivisection, use of living animals for scientific research. Rats, mice, guinea pigs, and rabbits are those used most frequently. The practice of vivisection dates back to ancient times and has contributed to progress in understanding ANATOMY, PHYSIOLOGY, disease processes, and GENETICS. Antivivisectionists and animal rights activists have actively opposed vivisection, sometimes pressuring researchers with vandalism and harassment. Guidelines of the National

VITAMINS

Vitamin	*Important Sources*	*Function*	*Deficiency Disease(s)*
A	Green leafy or yellow vegetables, fish-liver oils, egg yolk, milk, butter	Essential to skeletal growth, skin, epithelial tissue, visual process; ANTIOXIDANT	Night blindness, xerophthalmia, skin abnormalities. *Overdose* may cause skin, hair, bone abnormalities
B_1(thiamine)	Whole grains, liver, lean pork, yeast, legumes, nuts	Important in METABOLISM of CARBOHYDRATES	Beriberi (neurological, gastrointestinal disorders; heart affected in severe cases)
B_2(riboflavin)	Milk, green leafy vegetables, liver and organs, eggs	Synthesis of COENZYMES; biochemical OXIDATIONS AND OXIDATION AND REDUCTIONS	Lesions of skin, mouth, eyes
Niacin	Liver, lean meat, yeast, fish, wheat germ, peanuts	Component of coenzymes in oxidations and reductions	Pellagra (skin disease, diarrhea, dementia, ultimately death)
B_6(pyridoxine)	Lean meat, liver, seeds, milk, whole grains, egg yolk	Coenzyme in metabolism of AMINO ACIDS, PROTEINS	Decreased hemoglobin production, ANEMIA; in infants, convulsions
Biotin	Synthesized by intestinal bacteria; also found in liver, egg yolk, yeast, kidney	Coenzyme in metabolism of carbohydrates, fats, amino acids	(Deficiency produced by large doses of raw egg white and antibiotics; symptoms include dry skin, anemia)
Pantothenic acid	Liver, kidney, egg yolk, yeast	Part of coenzyme A, major metabolic agent	(Deficiency produced only in laboratory animals)
Folic acid	Green leafy vegetables, liver, yeast	Involved in synthesis of nucleic acids, rapidly synthesizing (e.g., intestinal) cells, red blood cells	Forms of anemia
B_{12}(cobalamin)	Liver, kidney, lean meat, bivalves, fish, eggs, cheese	Amino, fatty acid metabolism; production of proteins	Associated with pernicious anemia caused by lack of "intrinsic factor" that B_{12} dosage can cure
C (ascorbic acid)	Citrus fruits, tomatoes, peppers, cabbage, potatoes, berries	Important in collagen (connective tissue) synthesis, resistance to infection and stress; ANTIOXIDANT	Scurvy (weakened capillaries, internal hemorrhaging, anemia, general debility, ultimately death)
D	Exists in human skin and is activated by exposure to sunlight; also found in fish liver oils, fortified milk, yeast, egg yolk	Regulates utilization of calcium, phosphorus in bone formation	Lack of sunlight causes rickets: in children, bowlegs, knock-knees; in adults, softening of bones (osteomalacia). *Overdose* may cause kidney damage, calcium deposits
E (tocopherol)	Peanut, vegetable oils; wheat germ, fortified cereals, green leafy vegetables, eggs	ANTIOXIDANT; important in pregnancy and for newborns	Anemia in newborns
K	Liver, green leafy vegetables; also synthesized by intestinal bacteria	Essential to blood clotting; role in liver production of the protein prothrombin	Abnormally long clotting time. Deficiency not of dietary origin. K does not treat HEMOPHILIA.

Institutes of Health, the Agriculture Dept., and other public and private organizations try to ensure ethical and sensitive use of animals.

Vladimir I or **Saint Vladimir** [vlăd'əmēr], d. 1015, first Christian grand duke of Kiev (980–1015). To succeed his father, Sviatoslav, as ruler of KIEVAN RUSSIA he defeated his two brothers. In about 988 he became a Christian and married Anna, sister of Byzantine Emperor BASIL II.

Vladivostok, city (1990 est. pop. 642,000), Far Eastern Russia, on a peninsula between two bays of the Sea of Japan. It is the chief Russian port and naval base in the Pacific (kept open in winter by icebreakers), the terminus of the Trans-Siberian RR and the Northern Sea Route, and a base for fishing and whaling fleets. Its industries include shipbuilding, chemicals, and food processing. Founded in 1860, it was an outpost for Russian expansion in East Asia. It was occupied by Allied armies in 1917 after the Bolshevik Revolution; the Japanese remained until 1922. The city was a major port for World War II LEND-LEASE supplies.

Vlaminck, Maurice de [vlămăNk'], 1876–1958, French painter, writer, and printmaker. Influenced by VAN GOGH and African sculpture, he was associated with FAUVISM. He is best known for *Village in the Snow* (Philadelphia Mus. Art).

voice, in music. Singing voices are classified by ranges as soprano and contralto (or alto), the high and low female voices, with mezzo-soprano as an intermediate classification; and as tenor and bass, the high and low male voices, with baritone as intermediate classification. The sound of the castrato (a male singer with an artificially high voice, the result of castration in boyhood), for which many 17th- and 18th-cent. soprano and alto roles were intended, is approached today by the countertenor. Choral music generally requires a range of about an octave and a half for each voice; a solo singer must have at least two octaves. Over the centuries great changes have taken place in the art of singing within Western musical culture, and modern singers can only approximate the timbre of earlier eras. Gregorian chant may have been sung with a nasal timbre resembling Asian technique. Bel canto,

The key to pronunciation appears on page xiii.

the virtuosic art of vocal technique that flourished from the 17th to 19th cent., has been revived in the 20th cent.

Voice of America (VOA), a broadcasting service of the U.S. Information Agency, a U.S. government body. Founded in 1942, the VOA produces and broadcasts English- and foreign-language radio programs in many parts of the world to promote a favorable impression of the U.S. It features news reports and entertainment.

volcano, aperture in the crust of a planet or natural satellite through which gases, LAVA, and solid fragments are discharged. The term is also applied to the conical MOUNTAIN (cone) built up around the vent by ejected matter. Volcanoes are described as active, dormant, or extinct. On earth about 500 are known to be active. Belts of volcanoes are found along the crest of the mid-ocean ridge system under the OCEAN and at converging crustal plate boundaries (see PLATE TECTONICS). There are also isolated volcanoes not associated with crustal movements (e.g., the Hawaiian Islands; see HAWAII), which may form from rising magma regions called hot spots. Eruptions range from the quiet type (Hawaiian) to the violently explosive (e.g., PELÉE and KRAKATOA). In 1971 the *Mariner 9* SPACE PROBE revealed that the planet MARS also has volcanoes, including the largest in the solar system, Olympus Mons. *Voyager 1* photographed (1979) at least eight active volcanoes on Io, a satellite of JUPITER, and *Magellan* provided (1991) evidence of widespread volcanism on VENUS.

Volcker, Paul, 1927–, American economist; b. Cape May, N.J. After working as an undersecretary in the Treasury Department (1969–74) and president of the New York Federal Reserve Bank (1975–79), he was head of the FEDERAL RESERVE SYSTEM (1979–87). He pursued a restrictive monetary policy to combat inflation, but was forced by a stagnant economy and high unemployment to support increased monetary growth during the mid-1980s.

vole, mouselike RODENT (called field or meadow mouse in North America) related to the LEMMING. Found in Eurasia, N Africa, and North America, most voles are from 3½ to 7 in. (9 to 18 cm) long and have gray or brown coats and short tails. They eat mainly grasses but also feed on seeds and insects; they nest in dense growth or shallow burrows.

Volga, river, c.2,300 mi (3,700 km) long, W Russia, longest river in Europe (as the continent is traditionally defined). It rises at an elevation of only 742 ft (226 m) in the Valday Hills near Moscow and winds east past Nizhny Novgorod and Kazan, then south past Samara and Volgograd to enter the CASPIAN SEA below sea level in a wide delta near Astrakhan. Canals connect the river with the Baltic Sea (N), with Moscow, and with the Don R. and the Black Sea (S). The Volga carries about half of all river freight in Russia. Numerous dams (bypassed by locks) provide hydroelectricity along much of its course and water for irrigation of the southern STEPPES. The river, known in Russian folklore as "Mother Volga," has played an incalculable part in the life of the Russian people.

Volgograd, formerly **Stalingrad,** city (1990 est. pop. 1,006,000), SE European Russia, a port on the Volga R. and the eastern terminus of the Volga-Don Canal. Its industries include shipyards, oil refineries, and steel and aluminum mills. Nearby is one of the world's largest hydroelectric power dams. Founded in 1569 as Tsaritsyn, the city fell to the Cossack rebel armies of Stenka Razin (1670) and PUGACHEV (1774). It was renamed Stalingrad in 1925. In WORLD WAR II it was virtually destroyed and thousands were killed (Sept. 1942–Feb. 1943) before German forces surrendered. After the turning point at Stalingrad, Soviet forces took the offensive on the eastern front. The city was renamed Volgograd in 1961.

volleyball, indoor or outdoor game in which opposing teams of six players bat a large, inflated ball back and forth across a net. The court, 60 ft (18.29 m) by 30 ft (9.14 m), is divided by a net 8 ft (2.44 m) high at the top. Any part of the body may be used to bat the ball. Points are scored by the serving team when its opponent allows the ball to touch the ground. Volleyball originated (1895) in Holyoke, Mass., and became an Olympic event in 1964.

Volsted Act, in U.S. history, the law passed in 1919 to enforce the Eighteenth Amendment, which prohibited the sale, manufacture, and transportation of all alcoholic beverages. The law was sponsored by Rep. Andrew Volsted of Minnesota. It became void after the repeal of the amendment in 1933.

Volsungasaga [vôl'sŏŏng-gəsä'gə] [Icelandic, = saga of the Volsungs], Icelandic prose SAGA based on earlier poetic materials and probably assembled late in the 13th cent. (Its German counterpart is the Nibelungenlied: see under NIBELUNGEN.) Its heroine, GUDRUN, accomplishes the ruin of the Volsungs, who are led by Sigurd (see SIEGFRIED). Brynhild (see BRUNHILD) is Sigurd's beloved, whom he betrays.

volt (V), unit of voltage or, more technically, of electric POTENTIAL and ELECTROMOTIVE FORCE. It is defined as the difference of electric potential existing across the ends of a conductor having a resistance of 1 OHM when the conductor is carrying a current of 1 AMPERE.

Volta, Alessandro, Conte, 1745–1827, Italian physicist. He invented the so-called Volta's pile (or voltaic pile), the electrophorus (a device to generate static electric charges), and the voltaic CELL. The VOLT, a unit of electrical measurement, is named for him.

Volta, river of Ghana, W Africa, flowing south to the Gulf of Guinea at Ada. Akosombo Dam (completed 1965), c.60 mi (97 km) from the river's mouth, impounds Lake Volta, one of the world's largest artificial lakes (c.3,275 sq mi/8,480 sq km). The lake now extends more than 250 mi (400 km) upstream into N Ghana, beyond the point at which the Volta is formed by the confluence of the White Volta and Black Volta rivers.

voltage: see ELECTROMOTIVE FORCE; POTENTIAL, ELECTRIC.

voltage divider: see POTENTIOMETER.

Voltaire, François Marie Arouet de [vôltēr'], 1694–1778, French philosopher and author; b. François Marie Arouet. He was a leading figure of the ENLIGHTENMENT. Twice unjustly imprisoned (1717–18, 1726) and then banished to England (1726–29), he developed a hatred of judicial arbitrariness coupled with an admiration of English liberalism. Returning to France, he resided at Cirey, in Lorraine, with Mme Du Châtelet, who exerted an important intellectual influence on him. Upon her death in 1749, he went to live at the court of Prussia, but his relationship with FREDERICK II was stormy, and Voltaire left in 1753. He settled on an estate near Geneva. His triumphal return to Paris in 1778 proved too much for him, and he died soon after. Voltaire's work is immense; and his influence, enormous. His *Letters concerning the English Nation* (1733) initiated the vogue for English philosophy and science (especially for Locke and Newton) that characterized the French Enlightenment. The *Philosophical Dictionary* (1764) distilled his political and religious biases. He wrote many tragedies, among them *Brutus* (1730) and *Zaïre* (1732). His great historical works—*The Age of Louis XIV* (1751) and the *Essay on Manners* (1756)—pioneered a new approach, emphasizing culture and commerce as much as politics and war. Most widely read today is his satirical masterpiece, *Candide* (1759).

voltmeter, instrument used to measure, in VOLTS, differences in electric POTENTIAL, or voltage, between two points in a circuit. Most voltmeters are based on the d'Arsonval GALVANOMETER and are of the analog type, i.e., they give voltage readings that can vary over a continuous range, as indicated by a scale and pointer. Digital voltmeters, which provide voltage readings represented by groups of digits, are, however, becoming increasingly common. A voltmeter is often combined with an AMMETER and an OHMMETER in a multipurpose instrument.

Von. For some German names beginning thus, see under the proper name; e.g., for Von Bismarck, see BISMARCK, OTTO VON.

von Braun, Wernher [vôn broun], 1912–77, German-American ROCKET engineer. He was technical director (1937–45) of the German rocket research center at Peenemünde, where the V-2 rocket and other weapons were developed. In 1945, von Braun and many members of his team were brought to the U.S., where he worked on guided missiles for the army and later, as director of NASA's Marshall Space Flight Center, led the development of the Saturn rockets used in the Apollo manned lunar-landing missions. He became (1970) deputy associate administrator of NASA.

Vondel, Joost van den, 1587–1679, Dutch poet and dramatist; b. Germany. Considered the greatest Dutch writer, he produced verse that is melodious, sonorous, and seemingly effortless. Of his highly baroque Christian dramas, the most famous are *Gysbrecht van Aemstel* (1637) and *Lucifer* (1654).

Vonnegut, Kurt, Jr., 1922–, American novelist; b. Indianapolis, Ind. With wry charm, dark humor, and plots that sometimes resemble

science fiction he protests the horrors of the 20th cent. Vonnegut's novels include *Player Piano* (1951), *Slaughterhouse Five* (1969), *Deadeye Dick* (1982), and *Hocus Pocus* (1990).

von Neumann, John [noi'män], 1903–57, American mathematician; b. Hungary; came to U.S., 1930. He was associated with the Inst. for Advanced Study after 1933 and was appointed (1954) a member of the U.S. Atomic Energy Commission. A founder of the theory of games (see GAMES, THEORY OF), he also made fundamental contributions to quantum theory and to the development of the atomic bomb. Von Neumann was a leader in the design and development of high-speed electronic computers.

Von Sternberg, Josef, 1894–1969, American film director; b. Austria as Jo Sternberg. His visually striking films include *The Blue Angel* (1930), *Morocco* (1930), *Shanghai Express* (1932), and *The Scarlet Empress* (1934), all of which star Marlene DIETRICH.

voodoo, religious beliefs and practices, W African in origin but with Roman Catholic and West Indian accretions, found in the New World, principally in Haiti. Voodooistic ritual is characterized by ecstatic trances and magical practices. Despite opposition, voodoo continues to flourish.

Voroshilov, Kliment Yefremovich [vərəshē'ləf], 1881–1969, Soviet military leader and public official. He was a Red Army commander in the civil war (1918–20), commissar for defense (1925–40), and commander in WORLD WAR II. A member of the Supreme Soviet from 1937, he became president of the USSR when STALIN died (1953). Ousted by KHRUSHCHEV in 1960, he was reelected to the party central committee in 1966.

Vörösmarty, Mihály [vö'röshmŏr''tē], 1800–1855, Hungarian poet, the leading figure of Hungarian ROMANTICISM. He is best known for his patriotic lyrics, e.g., *The Call* (1837), and his splendid national epics, e.g., *Zolan's Flight* (1825).

Vorster, Balthazar Johannes [fôr'stər], 1915–83, South African political leader. Elected to parliament in 1953 as a member of the Nationalist party, he later served as minister of justice (1961–66), repressing opponents of APARTHEID. After the assassination of Hendrik VERWOERD in 1966 he became prime minister. He pursued a somewhat conciliatory foreign policy while maintaining apartheid at home. He resigned for reasons of health in 1978 but served in the ceremonial position of president until a financial scandal forced his resignation in 1979.

vorticism, short-lived 20th-cent. art movement related to FUTURISM. Its members sought to simplify forms into machine like angularity. Its major exponent was GAUDIER-BRZESKA, a French sculptor, and its largest following was in England, where Ezra POUND and Wyndham LEWIS wrote about it.

Voskhod: see SPACE EXPLORATION, table.

Vostok: see SPACE EXPLORATION, table.

Voyager, in space exploration: see SPACE PROBE, table.

Voyageurs National Park: see NATIONAL PARKS (table).

Voznesensky, Andrei Andreyevich [vəznyəsyān'skē], 1933–, Russian poet. Trained as an architect, he first published his poems, e.g., "Fire in the Architectural Institute," in 1958. He became popular and gave readings in the USSR and abroad. English translations of his work by AUDEN and other poets appear in such collections as *Antiworlds* (1967).

Vries, Hugo de: see DE VRIES, HUGO.

VTOL aircraft: see VERTICAL TAKEOFF AND LANDING AIRCRAFT.

Vuillard, Édouard [vüēyär'], 1868–1940, French painter and lithographer. A member of the NABIS, he is known for his scenes of Montmartre and especially for his canvases that evoke the intimacy of home life.

Vulcan, in Roman religion, fire god. Originally a god of volcanoes, he was later identified with the Greek HEPHAESTUS.

vulcanization: see RUBBER; THERMOSET.

Vulgate: see BIBLE.

vulture, large BIRD of prey of temperate and tropical regions, also called BUZZARD. Old World vultures, of the family Accipitridae, are allied to HAWKS and EAGLES; the American vultures and CONDORS belong to the family Cathartidae. American vultures have no syrinx and are thus voiceless, emitting only weak hisses. They feed mainly on carrion. Most have dark plumage and small, naked heads. Normally solitary, they gather in crowds to feed.

W

W, chemical symbol of the element TUNGSTEN.

Waals, Johannes Diderik van der: see VAN DER WAALS.

WAC: see WOMEN'S ARMY CORPS.

Waco, city (1990 pop. 103,590), seat of McLennan co., east-central Tex., on the Brazos R.; inc. 1856. Located in the rich blacklands prairie area, it is an agricultural and shipping center. Diversified manufactures include tires, glass, machinery, and clothing. Baylor Univ. is in Waco. In 1993 a deadly shootout near Waco between federal officers and a religious cult headed by David Koresh led to a 51-day siege that ended in a blaze that killed 83 people.

Wade, Benjamin Franklin, 1800–78, U.S. senator from Ohio (1851–69); b. near Springfield, Mass. One of the radical Republicans, Wade was instrumental in forming the RECONSTRUCTION policies after the Civil War. As president pro tempore of the Senate, he would have become president if Andrew JOHNSON had been convicted of impeachment charges.

Wafd, Egyptian political party founded in 1919 and dominant from 1924 to 1952. It called for independence and extensive reforms, and was frequently at odds with the monarch. The party was dissolved after NASSER set up a one-party system in 1956. It reemerged in 1983 as the New Wafd party, becoming one of the larger permitted opposition parties.

Wages and Hours Act, legislation passed by the U.S. Congress (1938) to establish employment standards for workers engaged directly or indirectly in interstate commerce; also called Fair Labor Standards Act. The measure initially provided for a MINIMUM WAGE of 25¢ per hour and a maximum work week of 44 hours, and the Wage and Labor Division was created in the Dept. of Labor to oversee its enforcement. Since that time, coverage under the law has been extended to additional categories of workers. Congress has also periodically raised the minimum wage, which by 1991 had reached $4.25 per hour.

Wagner, Honus (John Peter Wagner), 1874–1955, American baseball player; b. Mansfield (now Carnegie), Pa. He began (1897) his major-league career with Louisville and joined Pittsburgh in 1900. Hans, as he was also known, subsequently starred at shortstop for the Pirates until retiring in 1917. He led the league in batting eight times, compiled a lifetime average of .329, and had 3,430 hits.

Wagner, Richard, 1813–83, German composer. His OPERAS represent the fullest musical and theatrical expression of German ROMANTICISM and exerted a profound influence on later composers. He used a continuous flow of melody instead of sharply differentiated RECITATIVE and ARIA, and called his operas "mus c-dramas" to signify their fusion of text and music. Wagner achieved remarkable dramatic unity in his works, due in part to his development of the leitmotif, a brief passage of music used to characterize an episode, person, or idea. His librettos, which he wrote himself, are drawn

chiefly from German mythology. His operas include *Rienzi* (1838–40), *The Flying Dutchman* (1841), *Tannhäuser* (1843–44), and *Lohengrin* (1846–48), which brought the German romantic opera to its culmination. Wagner participated in the REVOLUTION OF 1848 and was forced to flee Dresden, where he had held a conducting post. Aided by LISZT, he escaped to Switzerland, staying there 10 years and writing essays, notably *Oper und Drama* (1851), that define his aesthetics. Wagner's *Der Ring des Nibelungen* (1853–74), a tetralogy that embodies most completely his aesthetic principles, comprises *Das Rheingold* (1853–54), *Die Walküre* (1854–56), *Siegfried* (1856–69), and *Götterdämmerung* (1874). In 1872 Wagner moved to Bayreuth, Bavaria, where he completed the Ring cycle and built a theater, the Festspielhaus, adequate for the performance of his works; the complete *Ring* was presented there in 1876. Wagner's other later compositions are *Tristan und Isolde* (1857–59); *Die Meistersinger von Nürnberg* (1862–67), his only comic opera; and his last work, *Parsifal* (1877–82), a sacred festival drama. His second wife, **Cosima Wagner,** 1837–1930, the daughter of Liszt, was closely involved with his work. After his death, she was largely responsible for the continuing fame of the Bayreuth festivals.

Richard Wagner

Wagner, Robert Ferdinand, 1877–1953, American legislator; b. Germany. A longtime Democratic senator (1927–49) from New York, he was one of F.D. ROOSEVELT's most effective allies in Congress during the early NEW DEAL days. The National Labor Relations Act (1935) is known as the Wagner Act. His son, **Robert Ferdinand Wagner, Jr.,** 1910–91, b. N.Y.C., was mayor of New York City from 1954 to 1966.

Wagram, town, NE Austria. NAPOLEON I forced (1809) Archduke Charles of Austria to concede defeat at Wagram, under the heaviest artillery attack recorded as of that time.

Wahhabi or **Wahabi,** reform movement in ISLAM; the ruling family of SAUDI ARABIA are among its adherents. It was founded in Arabia by Muhammad ibn Abd al-Wahhab (c.1703–1791), who converted the Saud tribe. He taught that all accretions to Islam after the 3d cent. of the Muslim era—i.e., after c.950—were spurious and must be expunged. This view involved essentially a purification of the SUNNI sect. The Wahhabis advocated austerity in worship and in living, but their code is less strict today. The movement, although centered in Arabia, has also spread eastward to India and Sumatra and westward to North Africa and the Sudan.

Wainwright, Jonathan Mayhew, 1883–1953, American general; b. Walla Walla, Wash. In WORLD WAR II, Wainwright assumed command in the Philippines (1942) and led the gallant but hopeless fight (Mar.–May 1942) that ended with the surrender of Bataan and Corregidor. He was a prisoner of the Japanese until 1945.

Waite, Morrison Remick, 1816–88, 7th chief justice of the U.S. SUPREME COURT (1874–88); b. Lyme, Conn. He gained prominence as counsel for the U.S. in the ALABAMA CLAIMS. As chief justice, his most influential rulings concerned STATES' RIGHTS and the due process clause of the 14th amendment to the CONSTITUTION.

Waite, Terry (Terence Waite), 1939–, British church official. An adviser to Robert RUNCIE, the Archbishop of Canterbury, he successfully negotiated the release of British hostages in Iran (1981) and Libya (1985). His later efforts to free U.S. hostages in Beirut were unsuccessful and were compromised by his association with Lt. Col. Oliver North (see IRAN-CONTRA AFFAIR), and he was kidnapped (Jan. 1987) by Shiite Muslims during talks there. Waite was released in Nov. 1991.

Wajda, Andrzej [vī'dä], 1926–, Polish film director. His films are often studies of Poland's history and contemporary politics. They include *Canal* (1956), *Ashes and Diamonds* (1958), *Man of Marble* (1977), *Man of Iron* (1981), *Danton* (1982), and *Korczak* (1990).

Wakashan [wäkăsh'ən], branch of the Algonquian-Wakashan linguistic family of North America. See NATIVE AMERICAN LANGUAGES (table).

Wakefield, Edward Gibbon, 1796–1862, British colonial statesman. His influential ideas led to the founding (1836) of a colony of free settlers (instead of convicts) in South Australia and to the colonization of New Zealand.

Wake Island, atoll with three islets (Wake, Wilkes, and Peale), 3 sq mi (7.8 sq km), central Pacific, between Hawaii and Guam. There is no indigenous population; it is a U.S. military and commercial base. Wake Island, which is administered by the U.S. Air Force, was annexed from the Spanish in 1898 and held by the Japanese, 1941–45.

wake-robin: see TRILLIUM.

Waksman, Selman Abraham, 1888–1973, American microbiologist; b. Russia; came to U.S., 1910. As a microbiologist (1918–54) at the New Jersey Agricultural Experiment station, he studied with his colleagues the role of microorganisms in the decomposition of organic matter, the origin and nature of humus, and the production of substances detrimental to some bacteria. For his discovery of streptomycin and of its value in treating tuberculosis he won the 1952 Nobel Prize in physiology or medicine.

Walachia or **Wallachia,** historic region (29,568 sq mi/76,581 sq km), S Romania, separated from Transylvania and the Banat region by the Transylvanian Alps (NW); from Yugoslavia (W) and Bulgaria (S) by the Danube R.; and adjoining Moldavia (NE). BUCHAREST, Romania's capital, is the chief city. Walachia contains the rich Ploeşti oil fields and is Romania's main industrial area, producing chemicals, heavy machinery, and other manufactures. It is also a rich agricultural region. Part of the Roman province of Dacia, it became a principality c.1290 and came under Turkish suzerainty in the 14th cent. Prince MICHAEL THE BRAVE (r.1593–1601) ended foreign domination, but on his death Walachia again fell to the Turks. In the 19th cent. Russia occupied the area repeatedly; in 1856 Walachia and Moldavia became virtually independent. The accession (1859) of Prince Alexander John CUZA in both principalities began the history of modern ROMANIA.

Walcott, Derek, 1930–, West Indian poet; b. Saint Lucia. His poetry eloquently explores the richness and contradictions of the mixed racial and cultural heritage of the West Indies. His volumes include *In a Green Night* (1962), the autobiographical *Another Life* (1973), and *Omeros* (1990), which echoes the *Iliad* and *Odyssey* as it examines the past and present of Saint Lucia and the Caribbean. He has also written plays based on West Indian folk traditions, including *Dream on Monkey Mountain* (1970). Walcott was awarded the Nobel Prize for literature in 1992.

Waldemar, kings of Denmark. **Waldemar I** (the Great), 1131–82 (r.1157–82), gained his domain in wars with CANUTE and Sweyn III. He increased his prestige by marrying his daughters to the sons of FREDERICK I, PHILIP II of France, and Eric X of Sweden. His son, Canute VI, succeeded him. **Waldemar II,** 1170–1241 (r.1202–41), was the second son of Waldemar I. He conquered much of Estonia

but lost Schwerin, in Germany. His son, Eric IV, succeeded him. **Waldemar IV** (Valdemar Atterdag), c.1320–1375 (r.1340–75), by 1361 had united Denmark, which foreign rulers had dismembered. He defeated (1362) the HANSEATIC LEAGUE but was forced (1370) to grant it free trade in Denmark. He was succeeded by Olaf, son of his daughter, MARGARET I, and Haakon VI of Norway.

Waldenses or **Waldensians,** Protestant religious sect of medieval origin. They originated in the late 12th cent. as the Poor Men of Lyons, a band organized by Peter Waldo. As lay preachers, they stressed poverty and proclaimed the Bible as the sole rule of faith and life. The group was declared heretical in 1184 and 1215, and persecution persisted until the 18th cent. After the REFORMATION they adapted their views to those of the Reformed Church. A group of Waldensians settled in the U.S. at Valdese, N.C.

Waldheim, Kurt, 1918–, Austrian diplomat, secretary general (1972–81) of the UNITED NATIONS and president of Austria (1986–92). When Austria entered the UN (1958), Waldheim joined its delegation and served (1965–68) as its permanent representative. After failing (1971) to win the Austrian presidency, he returned to the UN and was elected secretary general. In 1986, he was elected president of Austria despite reports of his activities as a German intelligence officer during World War II.

Waldstein, Albrecht von: see WALLENSTEIN.

Wales, Welsh *Cymru,* political division (principality) of the United Kingdom of Great Britain and Northern Ireland (1991 pop. 2,811,865), 8,016 sq mi (20,761 sq km), on the western peninsula of the island of Great Britain; bordered by the Irish Sea (N), the Bristol Channel (S), England (E), and Cardigan Bay and St. George's Channel (W). Physically, it is dominated by the Cambrian Mts., which rise to 3,500 ft (1,085 m) at Mt. Snowdon. Principal cities are CARDIFF, the capital and largest city, and Swansea. Rivers include the Severn, Wye, Teifi, and Dee. The great coalfields and major industries are concentrated in the south, as is most of the population. About one quarter of the population speaks Welsh. Wales united politically with England in 1536.

History. Celtic-speaking Welsh clans, in Wales since prehistory, were little affected by either the Roman or the Anglo-Saxon occupations of Great Britain, although they were converted to Christianity by Celtic monks. The disparate clans gradually coalesced, and border wars with England were constant. In the 11th cent. WILLIAM I of England set up earldoms along the Welsh border, but for 200 years Welsh soldiers resisted the English threat to their independence. Following a brief relaxation of English pressure in the 12th cent., during which Welsh medieval culture flowered, English conquest of Wales was finally accomplished in 1282 by EDWARD I, who, to placate Welsh sentiment, initiated the English custom of entitling the king's eldest son prince of Wales. Welsh antagonism toward the English overlords persisted, and in the 15th cent. OWEN GLENDOWER led a brief revolt. In 1485 a Welshman became the first Tudor king of England, Henry VII. The process of administrative assimilation of Wales begun during his reign was completed under HENRY VIII, who signed the Act of Union (1536); Welsh representatives entered the English parliament, Welsh law was abolished, and English was established as the official language of legal proceedings. Welsh political history became that of GREAT BRITAIN. The Industrial Revolution tapped the mineral wealth of Wales, and S Wales was soon the chief coal-exporting region of the world. Industrialization brought poverty and unemployment, however, especially in the 1920s and 30s. Following the boom of World War II, the government undertook a full-scale program of industrial redevelopment, including nationalization of the mines. Political nationalism survives as an issue; in 1979 Welsh voters decisively defeated a British proposal for limited home rule.

Walesa, Lech [väwĕnz'ə], 1943?–, Polish labor and politcal leader, president of POLAND (1990–). In 1980 he assumed leadership of the independent trade union SOLIDARITY. A moderate, he gained numerous concessions from the authorities before his arrest and internment in the military crackdown of 1981. Released in Nov. 1982, he was awarded the 1983 Nobel Peace Prize. A leader in Poland's peaceful change from Communist rule to pluralistic democracy in 1989, Walesa became increasingly critical of the Solidarity-led government of Premier Tadeusz Mazowiecki. In 1990 Walesa was elected president of Poland, defeating Mazowiecki, and resigned his Solidarity post.

Walker, Alice, 1944–, African-American novelist and poet; b. Eatonton, Ga. She brings her travel experience in Africa and memories of the CIVIL-RIGHTS movement to an examination of the experiences of African Americans in the South. Among her books are *Revolutionary Petunias and Other Poems* (1973), *The Color Purple* (1982; Pulitzer), and *Possessing the Secret of Joy* (1992).

Walker, James John, 1881–1946, American politician; b. N.Y.C. A TAMMANY Democrat, Jimmy Walker was mayor of New York (1925–32). He was immensely popular until evidence of corruption forced his resignation.

walking stick or **stick insect,** extremely long-bodied, slow-moving, herbivorous INSECT, principally Asian and tropical in distribution. Walking sticks have green, gray, or brown bodies that closely resemble twigs or grass stems, camouflaging them against predators. Most are wingless and have long antennae. Some species, the longest insects in the world, achieve a length of over 1 ft (33 cm).

wallaby: see KANGAROO.

Wallace, Alfred Russel, 1823–1913, English naturalist. From his study of comparative biology in Brazil and the East Indies, he evolved a concept of EVOLUTION similar to that of Charles DARWIN. His special contribution to the evidence for evolution was in biogeography; he systematized the science and wrote *The Geographical Distribution of Animals* (2 vol., 1876) and a supplement, *Island Life* (1881).

Wallace, George Corley, 1919–, U.S. public official, governor of Alabama (1963–67, 1971–79, 1983–87); b. Clio, Ala. An avowed segregationist, he led an unsuccessful attempt to block integration of the Alabama public schools in the early 1960s. Prevented by law from succeeding himself as governor, he had his wife, **Lurleen Burns Wallace** (1926–68), run (1966) successfully in his place. Wallace ran unsuccessfully for president as a third-party candidate in 1968. In 1972, while campaigning for the Democratic presidential nomination, he was shot and paralyzed by a would-be assassin. In 1982 he was again elected governor, this time with the support of Alabama's African Americans. He retired in 1986.

Wallace, Henry Agard, 1888–1960, vice president of the U.S. (1941–45); b. Adair co., Iowa. As Pres. F.D. ROOSEVELT's secretary of agriculture (1933–41) he administered the NEW DEAL agricultural programs. He was Roosevelt's third-term vice president but in 1944 was replaced on the ticket by Harry S TRUMAN. An opponent of U.S. COLD WAR policies, he ran against Truman in 1948 on the Progressive party ticket but won no electoral votes. His father, **Henry Cantwell Wallace,** 1866–1924, was a founder of the journal *Wallaces' Farmer* and served (1921–24) as secretary of agriculture in the administrations of Presidents HARDING and COOLIDGE.

Wallace, Lew(is), 1827–1905, American novelist; b. Brookville, Ind. A lawyer, territorial governor, and diplomat, he is remembered as author of the novel *Ben Hur* (1880).

Wallenberg, Raoul, 1912–47, Swedish diplomat. Assigned to Budapest during World War II, he is credited with saving as many as 20,000 Hungarian Jews from being deported to NAZI death camps, e.g., by supplying them with Swedish passports. He was arrested when the Soviet army entered Budapest. His death in prison was reported (1957) by Soviet authorities but there were recurring stories that he had been seen alive. In 1991 Soviet authorities released KGB records that, although they did not contain proof that Wallenberg was dead, appeared to confirm that he had died in 1947.

Wallenstein or **Waldstein, Albrecht Wenzel Eusebius von** [wäl'ənstīn], 1583–1634, Bohemian general in the THIRTY YEARS WAR. The owner of vast estates in Bohemia, he raised an army (1625) for Emperor FERDINAND II and became chief imperial general. He won important victories, but the enmity of the German princes led to his dismissal in 1630. Although he was recalled in 1632, Wallenstein conducted (1634) secret peace negotiations, which led to charges of treason, and he was murdered, probably at the emperor's instigation.

Waller, Edmund, 1606–87, English poet and member of Parliament. "Waller's Plot" (1643) attempted to secure the city of London for CHARLES I. His polished verse, including "Go, lovely rose" (pub. 1645), is important for its contribution to the development of the heroic couplet.

The key to pronunciation appears on page xiii.

Waller, Fats (Thomas Wright Waller), 1904–43, African-American pianist, singer, and composer; b. N.Y.C. His songs and humor made him popular, and his piano style influenced many. "Ain't Misbehavin' " and "Honeysuckle Rose" are among his best-known songs.

walleye or **walleyed pike:** see PERCH.

Wallis and Futuna Islands, French overseas territory (1992 est. pop. 17,000), South Pacific, consisting of two small groups of volcanic islands. Matautu is the chief town. Timber is exported. Under French control from 1842, they became a territory in 1961.

Wall Street, lower Manhattan, N.Y.C., center of the city's great financial district. The area is the site of major U.S. stock exchanges and other important institutions. By extension, the term "Wall Street" has come to designate U.S. financial interests.

walnut, common name for some members of the family Juglandaceae, chiefly deciduous trees of the north temperate zone, typified by large, aromatic compound leaves. Several species are commercially important for their lumber and edible nuts (usually encased in leathery or woody hulls). The family includes the HICKORY and pecan, and the walnuts (genus *Juglans*). The dark-colored wood of the black walnut (*J. nigra*) of E North America, and the English, or Persian, walnut (*J. regia*), native to W Asia, is unusually hard and durable; it is valued for furniture, paneling, musical instruments, and other uses. The nut of the English walnut is usually the walnut sold commercially. The butternut, or white walnut (*J. cinerea*), also of E North America, is valued for its timber; its sweet, oily nut is not commercially important.

Walpole, Horace or **Horatio,** 4th **earl of Orford,** 1717–97, English author; son of Sir Robert WALPOLE. An admirer of the medieval, he built a pseudo-Gothic showplace castle at Strawberry Hill, near Twickenham, and in 1757 started a press there, publishing Thomas GRAY's Pindaric odes and his own works. His reputation rests on more than 3,000 letters (1732–97) that give an invaluable picture of Georgian England. His gothic romance, *The Castle of Otranto* (1765), anticipated ROMANTICISM.

Walpole, Sir Hugh (Seymour), 1884–1941, English novelist; b. New Zealand. He gained fame with *Fortitude* (1913) and wrote historical novels like *Rogue Herries* (1930), autobiographical fiction, stories, biographies, and plays.

Walpole, Robert, 1st **earl of Orford,** 1676–1745, English statesman. His successful handling of the financial wreckage of the SOUTH SEA BUBBLE led to his appointment (1721) as first lord of the treasury and chancellor of the exchequer. A WHIG, he shared power with Viscount TOWNSHEND until 1730, but thereafter his ascendancy was complete until 1742. He enjoyed the confidence of GEORGE I and GEORGE II, promoted trade, and mollified the largely Tory gentry by reducing the land tax. In foreign affairs he favored friendship with France, but was drawn into a war with Spain. Military reverses then enabled a growing opposition to force his resignation (1742). He is usually described as the first prime minister.

walrus, marine MAMMAL (*Odobenus rosmarus*) found in arctic seas. Largest of the fin-footed mammals, it has long tusks, light-brown wrinkled hide, and bristly cheek pads; an adult male may weigh up to 3,000 lb (1,400 kg). Walruses live on beaches near shallow water in herds of about a hundred animals and eat mainly shellfish. Hunted for blubber, hides, and ivory, they are now endangered.

Walter, Bruno, 1876–1962, German-American conductor; b. Bruno Walter Schlesinger. He was a conductor in Germany and Austria until the NAZIS forced him to leave. In the U.S. he led the Metropolitan Opera, NBC Symphony, and New York Philharmonic.

Walter, Thomas Ustick, 1804–87, American architect; b. Philadelphia. His main building of Girard College, Philadelphia (1833–47), was one of the most ambitious works of the CLASSIC REVIVAL. In 1851 he was hired to design extensions of the CAPITOL. He added the Senate and House wings as well as the cast iron dome, and rebuilt the west front.

Walton, Izaak, 1593–1683, English writer. His *Compleat Angler; or, the Contemplative Man's Recreation* (1653), a treatise on fishing and a picture of peace and simple virtue, is one of the most famous books in English. He also wrote biographies of his friends John DONNE (1640) and George HERBERT (1670).

Walton, Sam(uel Moore), 1918–92, American retailing executive, b. Kingfisher, Okla. After 17 years of operating franchise retail stores, he opened the first Wal-Mart Discount City in 1962. The company flourished, went public (1970), and became (1991) America's largest retailer—a multibillion dollar business that made him one of the world's richest people.

Walton, Sir William Turner, 1902–83, English composer. His works include *Façade* (1923), settings of poems by Edith SITWELL; *Portsmouth Point* (1925), an overture; two symphonies (1935, 1961); *Belshazzar's Feast* (1931), an ORATORIO; *Troilus and Cressida* (1954), an opera; concertos; chamber works; and scores for films, e.g., *Hamlet* (1947).

waltz, romantic dance in triple time. It evolved from the German *Ländler* and became popular in the 18th cent. The Viennese waltz was made famous by the two Johann STRAUSSES. The waltz was introduced into the U.S. in the 19th cent.

Walvis Bay, city (1985 pop. 9,687), W central Namibia, on an arm of the Atlantic Ocean. The chief port for Namibia, it is a railway center and has a fishing fleet. It was annexed by Britain and incorporated into the Cape Colony in 1878. The Walvis Bay exclave (c.430 sq mi/1,110 sq km) was retained by South Africa at Namibia's independence (1990) but was relinquished in 1994.

wampum, beads or disks made by Native Americans from mollusk shells, used for money, ornaments, or ceremonial exchange during treaties. Wampum is Algonquian for "white string of beads," but there is also a more valuable purple variety. It was especially prized in the Eastern Woodlands and Plains areas, reaching inland tribes through trade. Wampum belts often had pictographic designs.

Wandering Jew, legendary Jew who mocked or mistreated Jesus on his way to the cross and who was condemned to wander on earth until Judgment Day. Common in Western European literature, the story first appeared in 13th-cent. chronicles, but the wanderer was not identified as a Jew until the 17th cent.

W and Z particles, ELEMENTARY PARTICLES that mediate, or carry, the fundamental force associated with WEAK INTERACTIONS. Their discovery, at CERN in Geneva, Switzerland, in the early 1980s, was an important confirmation of the ELECTROWEAK THEORY, which unified the electromagnetic and weak forces and predicted the existence of the particles. Quite massive for elementary particles, the *W* and *Z* particles have roughly 100 times the mass of the proton. *W* particles have a charge of 1 or −1; *Z* particles have a charge of 0.

Wang Ching-wei [wäng jĭng-wā], 1883–1944, Chinese political leader. A disciple of SUN YAT-SEN, he led the left wing of the KUOMINTANG party. In the Second SINO-JAPANESE WAR he left (1938) the Kuomintang and became (1940) premier of the Japanese puppet government at Nanjing.

Wankel engine: see INTERNAL-COMBUSTION ENGINE.

wapiti, large North American DEER (*Cervus canadensis*), called ELK in America. Males stand up to 5 ft (150 cm) at the shoulder and weigh up to 1,000 lb (450 kg). The coat is grayish brown, with a chestnut mane and a yellowish rump. Once abundant, the wapiti now lives in small numbers under protection in NATIONAL PARKS and refuges.

Warbeck, Perkin, 1474?–1499, pretender to the English throne. Persuaded by Yorkist adherents to impersonate the son of EDWARD IV, he landed (1497) in Cornwall and proclaimed himself Richard IV. Captured by HENRY VII, he was hanged.

warbler, name applied in the New World to BIRDS of the wood warbler family (Parulidae) and in the Old World to a family (Sylviidae) of small songsters. American warbler species are brightly plumed in the spring, usually yellow marked with black, gray, olive green, or white. Some crawl on trees and are called creepers. Best known are the yellow warbler, which often nests in gardens, and the redstart. Warblers are of great value as destroyers of insects that damage forest trees.

war crimes, violations of the laws of war. After WORLD WAR II three classes of offenses were recognized as war crimes: crimes against peace, e.g., planning or waging a war of aggression; conventional war crimes, or violations of the accepted laws or customs of warfare; and crimes against humanity, including extermination, enslavement, deportation, and other inhumane acts. From Nov. 1945 to Oct. 1946 a tribunal at Nuremberg, Germany, established by Britain, France, the USSR, and the U.S., tried Nazi leaders for war crimes (see CONCENTRATION CAMP; HOLOCAUST) and sentenced some

of them to death. Another war tribunal, conducted (1946–47) in Tokyo by 11 nations, tried and sentenced alleged Japanese war criminals. Critics questioned the legal basis of some of the charges at these trials, and some view such trials as violations of sovereignty and as acts of vengeance by the victors. In the early 1990s, in reaction to war crimes committed by various parties during the breakup of YUGOSLAVIA, the UN established a war crimes commission and attempted to gather evidence for prosecutions. See also INTERNATIONAL LAW; MY LAI INCIDENT.

Ward, Artemus, pseud. of **Charles Farrar Browne,** 1834–67, American humorist; b. Waterford, Me. He began in 1858 a famous series of "Artemus Ward's Letters," supposedly written by a carnival manager who commented on current events in a New England dialect. He wrote for the *Cleveland Plain Dealer* and *Vanity Fair.*

Ward, Mrs. Humphry, 1851–1920, English novelist and social worker; b. Mary Augusta Arnold; granddaughter of English educator Thomas Arnold. *Robert Elsemere* (1888) and other novels dramatize her views on the social application of religion.

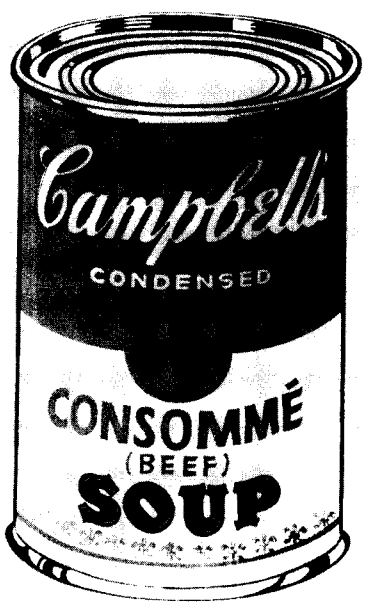
Ward, Lester Frank, 1841–1913, paleontologist and a founder of American SOCIOLOGY; b. Joliet, Ill. In *Dynamic Sociology* (1883), *Applied Sociology* (1906), and other works he developed the theory of telesis, or planned social evolution.

War Department, United States, former federal executive department organized (1789) to administer the military establishment. During the 19th cent. it also had many quasi-military functions, such as supervising RECONSTRUCTION in the South. With the creation (1947) of the National Military Establishment, which later became (1949) the Dept. of DEFENSE, it was reconstituted as the Dept. of the Army, a division within the Dept. of Defense.

Ware, Henry, 1764–1845, American clergyman, instrumental in the founding of UNITARIANISM in the U.S.; b. Sherborn, Mass. His appointment (1805) as Hollis professor of divinity at Harvard aroused opposition and hastened the separation of the Unitarians from the Congregationalists. His son **Henry Ware,** 1794–1843, b. Hingham, Mass., was also a clergyman and a Harvard professor. He edited (1819–22) the first Unitarian organ, the *Christian Disciple.*

warfare: see FORTIFICATION; MILITARY SCIENCE; PSYCHOLOGICAL WARFARE.

Warhol, Andy, 1930?–87, American artist; b. Philadelphia? A leading figure in the POP ART movement, he is known for multi-image silk-screen paintings that make use of monotony and repetition. His imagery often comes from commonplace objects such as dollar bills and soup cans. Warhol made a number of idiosyncratic films, e.g., *The Chelsea Girls* (1966).



Andy Warhol's Campbell's Soup, *1962*

Warner, Charles Dudley, 1829–1900, American editor and author; b. Plainfield, Mass. Publisher of the Hartford *Courant* and editor of two major literary series, he collaborated with Mark TWAIN on the novel *The Gilded Age* (1873).

Warner, Seth, 1743–84, hero of the AMERICAN REVOLUTION; b. Roxbury, Conn. He was one of the leaders of the GREEN MOUNTAIN BOYS, and in 1775 he captured Crown Point, N.Y. He shared with John STARK the victory at Bennington in 1777.

Warner, William Lloyd, 1898–1970, U.S. social anthropologist. After studying the Australian aborigines, he applied the research methods of cultural anthropology to class structure and status in contemporary American society. His works include *A Black Civilization* (1937), *Social Class in America* (1949), and with others, the Yankee City series (1941–59).

War of 1812, armed conflict between the U.S. and Great Britain, 1812–15. It was partly occasioned by U.S. insistence on neutral shipping rights during the Franco-British hostilities of the FRENCH REVOLUTIONARY WARS and the wars of NAPOLEON I. British impressment of sailors and confiscation of U.S. ships were causes of strong anti-British sentiment. The outbreak of hostilities stemmed from clashes in the West between American frontiersmen and the British and their indigenous allies over American encroachment onto land claimed by the British. The battle of Tippecanoe (Nov. 7, 1811) was an outstanding example. The "war hawks" in the U.S. Congress prevailed, and war was declared on June 18, 1812. The early land confrontations—at Detroit, on the Niagara R., and in Queenston Heights—proved how ill-prepared the U.S. forces were. The small American navy fared better; the early victories of Isaac Hull, commanding the *Constitution,* and Stephen DECATUR were notable. In 1813, however, British naval superiority prevailed until the victory of Capt. Oliver Perry (see under PERRY, M.C.) on Lake Erie in September. The low point of the war for the U.S. was the British capture of Washington, D.C., in Aug. 1814. But the Americans were successful at the battle of the Thames, Plattsburgh, and FORT MCHENRY, and the British entered into serious negotiations to end the hostilities. The Treaty of GHENT (signed Dec. 24, 1814) brought the war to an indecisive end. But the Americans had a final triumph. On Jan. 14, 1815, after the treaty had been signed, Andrew JACKSON's troops defeated the British decisively at the battle of NEW ORLEANS. The war ushered in a period of great American nationalism and increasing isolation from European affairs.

Warren, Earl, 1891–1974, 14th chief justice of the U.S. SUPREME COURT (1953–69); b. Los Angeles; B.L., Univ. of California (1912). He was attorney general (1939–43) and governor (1943–53) of California, and an unsuccessful vice-presidential candidate in 1948. One of the most dynamic chief justices, Warren guided the Court in a number of landmark civil-rights and individual-liberties decisions. Most notable was BROWN V. BOARD OF EDUCATION (1954), in which public-school segregation was ruled unconstitutional (see INTEGRATION). While chief justice, Warren headed the commission that investigated the assassination of Pres. KENNEDY (see WARREN COMMISSION).

Warren, Mercy Otis, 1728–1814, American writer; b Barnstable, Mass. A patriot, she wrote two satirical plays against the Tories, *The Adulateur* (1773) and *The Group* (1775), and later composed a history of the AMERICAN REVOLUTION (3 vol., 1805).

Warren, Robert Penn, 1905–89, American man of letters; b. Guthrie, Ky. One of the Southern agrarian poets associated with the *Fugitive* magazine (1922–25), he won early acclaim for verse that was influenced by the METAPHYSICAL POETS. His later poems were simpler and more regional. Volumes of his poetry include *Brother to Dragons* (1953), *Promises* (1957; Pulitzer), and *Now and Then* (1979; Pulitzer). Also an important novelist concerned with the moral dilemmas of the modern world, he wrote *All the King's Men* (1946; Pulitzer), about a political demagogue resembling Huey LONG; and *Wilderness* (1961). With Cleanth Brooks he compiled the textbooks *Understanding Poetry* (1938) and *Modern Rhetoric* (1949). In 1986 he was named the first official U.S. POET-LAUREATE.

Warren, city (1990 pop. 144,864), SE Mich., a suburb of DETROIT; est. 1837, inc. as a city 1957. It manufactures tools and dies, automobile parts, and processed steel. A General Motors technical center is located there, and the Detroit Arsenal makes military vehicles.

Warren Commission, official inquiry into the assassination of U.S.

Pres. John F. KENNEDY. Established by Pres. Lyndon JOHNSON on Nov. 29, 1963, it was headed by Chief Justice Earl WARREN. After holding exhaustive private hearings and conducting its own investigations, the commission issued its report on Sept. 24, 1964. It found no evidence of a conspiracy and concluded that Lee Harvey Oswald, acting alone, had killed Kennedy; it also found that Jack Ruby, the Dallas restaurant owner who shot and killed Oswald, had also acted alone. In ensuing years, the report was subjected to close examination and widespread criticism. In 1979 a congressional committee concluded, on the basis of acoustical evidence, that two people had shot at Kennedy, but that interpretation was later criticized as flawed. Sealed government files containing the evidence reviewed by the commission were opened to the public in 1993. The details of the assassination and the commission's report continue to spark often contentious debate.

Warsaw, city (1989 est. pop. 1,651,000), capital of Poland, central Poland, on both banks of the Vistula R. It is an industrial center with manufactures such as machinery, automobiles, and chemicals. Warsaw is one of Europe's great historic cities. Settled by the 11th cent., it became Poland's capital (1596); passed (1795) to Prussia; was the capital of the grand duchy of Warsaw (see POLAND); and later, under Russian rule, was the scene of nationalist uprisings (1830, 1863). In 1918 the city became the capital of the restored Polish state. During the German occupation (1939–45) in WORLD WAR II, a Jewish ghetto was isolated that contained (1942) c.500,000 persons; virtually all perished, either in CONCENTRATION CAMPS or after the armed Jewish uprising (Feb. 1943). In 1944 Polish nationalists tried unsuccessfully to oust the Germans while the Soviet army remained inactive across the Vistula. After 1945 large-scale reconstruction began that included the medieval Stare Miasto [old town], with its marketplace and 14th-cent. cathedral.

Warsaw Pact: see WARSAW TREATY ORGANIZATION.

Warsaw Treaty Organization or **Warsaw Pact,** former mutual defense alliance among Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the USSR during the COLD WAR. Established in 1955, it was Communist Eastern Europe's equivalent of the NORTH ATLANTIC TREATY ORGANIZATION. Its unified command had headquarters in Moscow, and its forces were used to suppress democratic movements, e.g., in 1968 in Czechoslovakia. Albania withdrew in 1968, and East Germany ceased to be a member prior to German reunification (1990). The alliance was dissolved in 1991.

wart, circumscribed outgrowth of the skin caused by a virus, usually a papillomavirus. Warts may appear anywhere on the skin but are most common on the hands. The sexually transmitted HUMAN PAPILLOMAVIRUS produces warts in the genital area, certain types of which may develop into cancer. Some warts disappear spontaneously; others persist for many years.

Washington, Booker T(aliaferro), 1856–1915, African-American educator; b. Franklin co., Va. The son of a slave, he worked in salt furnaces and coal mines after the Civil War, until he entered the Hampton Institute (Va.). He became (1879) an instructor there and developed the night school. In 1881 he was chosen to organize a normal and industrial school for African Americans at Tuskegee, Ala., and under his direction Tuskegee Institute became one of the leading African-American educational institutions, emphasizing industrial training as a means to self-respect and economic independence. He was an able orator but drew opposition from many African-American leaders, including W.E.B. DU BOIS, for maintaining that it was pointless for African Americans to demand social equality before attaining economic independence. His many published works include his autobiography, *Up from Slavery* (1901).

Washington, George, 1732–99, 1st president of the U.S., commander in chief of the Continental Army in the AMERICAN REVOLUTION, called the "Father of his Country"; b. Feb. 22, 1732 (Feb. 11, 1731, O.S.), Westmoreland co., Va., into a wealthy family. He became a surveyor as a young man and was one of the principals of the OHIO COMPANY, whose purpose was the exploitation of Western lands. An officer in the militia, he fought in the last of the FRENCH AND INDIAN WARS and was named (1755) commander in chief of the Virginia militia with the rank of colonel. He resigned in 1759, married, and turned his attention to his plantation, MOUNT VERNON. He was a delegate (1774–75) to the CONTINENTAL CONGRESS, which named him commander of the Continental forces after the outbreak of hostilities with the British. He assumed command (July 3, 1775) in Cambridge, Mass., and succeeded in capturing Boston from the British (Mar. 17, 1776). Unable to defend New York City (see LONG ISLAND, BATTLE OF), he was forced to retreat successively to Westchester co., New Jersey, and Pennsylvania. He developed his military skill by trial and error as he went along. On Christmas night, 1776, with morale at its lowest ebb, he and his troops crossed the Delaware R. and defeated the British at Trenton and Princeton, N.J. Less successful in his attempts to defend Philadelphia at BRANDYWINE and Germantown, he spent the winter of 1777–78 at VALLEY FORGE in great misery and deprivation. But he emerged with increased powers from Congress and a well-trained, totally loyal army. After the battle of MONMOUTH (June 28, 1778), his fortunes improved and subsequent victories preceded the surrender of Gen. Cornwallis on Oct. 19, 1781 (see YORKTOWN CAMPAIGN). Washington retired to Mount Vernon, but his dissatisfaction with the new government (see CONFEDERATION, ARTICLES OF) led him back into public life. He presided over the second FEDERAL CONSTITUTIONAL CONVENTION (1787), where his prestige and reputation were incalculable in the adoption of the CONSTITUTION OF THE UNITED STATES. He was chosen unanimously as the first president and took office on Apr. 30, 1789. His efforts to remain aloof from partisan politics were unsuccessful, and the influence of Alexander HAMILTON moved him increasingly toward conservatism. His second term, openly Federalist, was bitterly criticized by the Jeffersonians. Sickened by the partisan struggles, he refused a third term and retired for the last time to Mount Vernon in 1797. He died two years later, universally regarded as the one without whom the American Revolution and the new republic could not have succeeded. His wife, **Martha Washington,** 1731–1802, was born Martha Dandridge in New Kent co., Va. Her first husband, by whom she had two children, was Daniel Parke Custis, who died in 1757, leaving her one of the wealthiest women in Virginia. She and Washington had no children.

Washington, one of the U.S. states of the Pacific Northwest; bordered by Idaho (E), Oregon (S), the Pacific Ocean (W), and the Canadian province of British Columbia (N).

Area, 68,192 sq mi (176,617 sq km). *Pop.* (1990) 4,866,692, an 17.8% increase over 1980 pop. *Capital,* Olympia. *Statehood,* Nov. 11, 1889 (42d state). *Highest pt.,* Mt. Rainier, 14,410 ft (4,395 m); *lowest pt.,* sea level. *Nickname,* Evergreen State. *Motto, Alki* [By and By]. *State bird,* willow goldfinch. *State flower,* Western rhododendron. *State tree,* Western hemlock. *Abbr.,* Wash., WA.

Land and People. PUGET SOUND, in the northwest, separates the bulk of the state from the Olympic Peninsula, which receives the highest average rainfall of any region in the U.S. Farther inland, the CASCADE RANGE runs north to south across the state, and east of it the land is largely dry. Temperatures are generally moderate. One of the peaks in the Cascades, Mount SAINT HELENS, an active volcano, erupted in a violent, destructive explosion in 1980. The ROCKY MOUNTAINS traverse the northwest, and the COLUMBIA PLATEAU is located in the south. The principal river is the COLUMBIA, one of the world's greatest sources of hydroelectric power. Over 76% of the population lives in urban areas. SEATTLE is the largest city, followed by SPOKANE and TACOMA. In 1990 the state was over 88% white, with the minority population about equally divided among African Americans, Asian Americans, and Hispanics.

Economy. Washington is the country's leading manufacturer of jet aircraft and also produces missiles and spacecraft. Other leading industries are lumbering; the production of pulp and paper, chemicals, and primary metals; and the processing of agricultural goods. The major farm products are cattle, dairy commodities, hops, spearmint oil, wine grapes, wheat, raspberries, and apples (Washington is the leading U.S. producer). The state's chief minerals are sand and gravel, cement, stone, and diatomite. Fishing, especially for salmon, is important. Tourists are attracted year-round to such scenic areas as Olympic, North Cascades, and Mt. Rainier national parks (see NATIONAL PARKS, table) and the Coulee Dam National Recreation Area.

Government. According to the constitution of 1889, the governor is elected to a four-year term. The legislature consists of a senate with 49 members serving four-year terms and a house of 98 mem-

bers elected for two years. Washington is represented in the U.S. Congress by two senators and nine representatives and has 11 electoral votes.

History. Washington was the home of the Chinook, NEZ PERCÉ, Yakima, and other tribes when Capt. James COOK explored (1778) the area and the British explorer George VANCOUVER sailed (1792) into Puget Sound. Britain and the United States subsequently contested the region, and "Fifty-four forty or fight"—referring to a proposed U.S. northern boundary set at lat. 54°40′N—became a slogan of the 1844 presidential campaign; war was finally averted by setting the boundary at lat. 49°N in 1846. The first great influx of settlers came in the 1880s, when rail transport became possible. During the early 20th cent. Washington was a center of radical labor activity, including that of the INDUSTRIAL WORKERS OF THE WORLD, which often resulted in violent strikes. Aircraft manufacturing boomed during World War II and has continued to provide the state's industrial base. In addition, Washington has recently attracted many firms moving from California.

Washington, D.C., capital of the U.S. (1990 pop. 606,900; met. area 3,923,574), coextensive with the District of Columbia, on the Potomac R.; inc. 1802. The legislative, administrative, and judicial center of the U.S., it has little industry; federal employees dominate the labor force. The city is a center of business and finance, and houses many professional and trade associations. It is also a major tourist attraction. Its location (1790) was a compromise between northern and southern interests. George WASHINGTON selected the exact site, and the "Federal City" was designed by L'ENFANT. Congress first met there in 1800. The British sacked the city during the WAR OF 1812. It developed slowly, assuming its present gracious aspect, with wide avenues and many parks, only in the 20th cent. Its many imposing government buildings are built of white or gray stone in the classical style. The CAPITOL, WHITE HOUSE, Supreme Court Building, National Archives, Constitution Hall, and Library of Congress (see LIBRARY, table) are well known. Ford's Theater, where Pres. LINCOLN was shot, is a museum. Best known of the city's monuments are the WASHINGTON MONUMENT, LINCOLN MEMORIAL, JEFFERSON MEMORIAL, and VIETNAM VETERANS MEMORIAL. Its academic institutions include American Univ., the Catholic Univ. of America, Georgetown Univ., George Washington Univ., and Howard Univ. Cultural attractions include the NATIONAL GALLERY OF ART, the SMITHSONIAN INSTITUTION, and the John F. Kennedy Center for the Performing Arts. The Walter Reed Army Medical Center is one of many medical and research facilities. The city's downtown area has undergone substantial urban redevelopment. Washington has through its history been a focus of national political activity, e.g., the Bonus Marchers of 1932 and civil-rights and antiwar demonstrations of the 1960s and 70s. For the city's political status, see DISTRICT OF COLUMBIA.

Washington, Treaty of, May 1871, between the U.S. and Great Britain. It settled the ALABAMA CLAIMS, which had arisen during the U.S. CIVIL WAR, and provided for arbitration of Canadian-American boundary and fisheries disputes.

Washington Monument, white marble obelisk in Washington, D.C., honoring George WASHINGTON. Completed in 1884 and opened to the public in 1888, it is 555 ft 5⅛ in. (169.3 m) high.

wasp, winged INSECT of the same order (Hymenoptera) as the ANT and BEE. Wasps have biting mouthparts and a thin stalk attaching the thorax to the abdomen ("wasp waist"); females have a sting, which they can use repeatedly, for paralyzing prey. Most species are solitary, but paper wasps, hornets, and yellow jackets are social. Social wasps usually are divided into three castes: egg-laying queens, workers (sexually undeveloped females), and drones (males). They build papery nests consisting of either a single comb (paper wasps) or a large group of combs inside a papery sheath (hornets and yellow jackets). The nest may be underground. In all solitary wasps the female seals a single egg in a nest with paralyzed prey for food; potter, or mason, wasps and mud-dauber wasps are solitary wasps that build nests of mud.

Wassermann, August von, 1866–1925, German physician and bacteriologist. He directed experimental therapy and serum research (1906–13) at the Koch Inst. and experimental therapy (from 1913) at the Kaiser Wilhelm Inst. He developed inoculations against cholera, typhoid, and tetanus, and devised (1906) the **Wassermann test** for diagnosing syphilis. Positive reaction when blood or spinal fluid is tested indicates the presence of antibodies formed as a result of syphilis infection.

waste disposal, generally, the disposal of waste products resulting from human activity. Once a routine concern, the disposal of waste has become a pressing problem in the 20th cent. because of the growth of population and industry and the toxicity of many new industrial byproducts. Traditionally, waste was often dumped into nearby streams. Sewer systems, which date back at least to the 6th cent. B.C. in Rome, were widely introduced in U.S. cities in the mid-19th cent. In the absence of sewerage, waste has often been stored in underground cesspools, which leach liquids into the soil but retain solids, or in simple sewage tanks, e.g., septic tanks, in which organic matter disintegrates. Raw sewage is now commonly treated before being discharged as effluent, usually by reducing solid components to a semiliquid sludge. Although sludge can be processed, e.g., as fertilizer, it has often been buried or dumped at sea, a practice outlawed in the U.S. since 1992. Some recent systems have employed artificial wetlands to treat waste water. Most *solid waste* in the U.S., such as municipal refuse, is deposited in open dumps. More sophisticated methods of disposal include the sanitary landfill, where waste is spread thin and separated by layers of tamped earth, and special incinerators that burn combustible waste while generating steam (for heating) and/or gases (to run turbines). The recycling of noncombustible products such as glass and metals, e.g., aluminum cans, is growing and offers long-range hope for disposal. *Toxic wastes* include many chemicals, some generated in substantial quantities as common industrial byproducts, e.g., heavy metals (notably mercury, lead, and cadmium), certain hydrocarbons, and some poisonous organic solvents. Although detoxification using bacteria, irradiation, and chemical systems is now being performed with more frequency, such substances have traditionally been sealed in metal drums and deposited underground or in the ocean. The containers have often corroded and leaked their contents, polluting the land and water supply (see POLLUTION) and prompting the U.S. Congress to pass the 1980 "Superfund" act, which assigned broad financial responsibility for toxic waste cleanup. One of the greatest modern hazards is *radioactive waste,* produced in increasing amounts as byproducts of research, nuclear weaponry, and nuclear-power generation and particularly dangerous because many kinds remain lethal for thousands of years. In the U.S., these materials are now stored in temporary sites; permanent storage solutions have encountered many technical difficulties and public objections to specific sites. A process to solidify nuclear waste and reduce its potential danger as a contaminant is one option. Highly radioactive waste is expected to be stored permanently underground at Yucca Mt., Nev., but the site will not be ready until 2010. See also ECOLOGY; ENVIRONMENTALISM.

Watauga Association, government (1772–75) of settlers along the Watauga R., E Tenn. It joined NORTH CAROLINA in 1775, tried to form another independent state (see FRANKLIN, STATE OF) in 1784, and became part of TENNESSEE in 1796.

water, odorless, tasteless, transparent liquid that is colorless in small amounts but exhibits a bluish tinge in large quantities. It is the most abundant liquid on earth. In solid form (ice) and liquid form it covers about 70% of the earth's surface. Chemically, water is a compound of hydrogen and oxygen whose formula is H_2O. The two H—O bonds form an angle of about 105°—an arrangement that results in a polar molecule, because there is a net negative charge toward the oxygen end (the apex) of the V-shaped molecule and a net positive charge at the hydrogen ends. Consequently, each oxygen atom is able to attract two nearby hydrogen atoms of two other water molecules. These hydrogen bondings keep water liquid at ordinary temperatures. Because water is a polar compound, it is a good solvent. Because of the hydrogen bondings between molecules, the latent heats of fusion and of evaporation and the HEAT CAPACITY of water are all unusually high. For these reasons water serves both as a heat-transfer medium (e.g., ice for cooling and steam for heating) and as a temperature regulator (the water in lakes and oceans helps regulate the climate). Water is chemically active, reacting with certain metals and metal oxides to form bases, and with certain oxides of nonmetals to form acids.

Although completely pure water is a poor conductor of electricity, it is a much better conductor than most pure liquids because of its self-ionization, i.e., the ability of two water molecules to react to form a hydroxyl ion (OH^-) and a hydronium ion (H_3O^+).

water buffalo: see BUFFALO.

water bug, air-breathing aquatic BUG, with a sharp sucking beak. Waterbugs are usually found on or below the surface of quiet streams and ponds. Giant water bugs are the largest bugs and among the largest insects; one South American form attains a length of over 4 in. (10 cm). Other water bugs include the water boatmen, backswimmers, water scorpions, and water striders.

Waterbury, city (1990 pop. 108,961), W Conn., on the Naugatuck R.; settled 1674, inc. 1853. Its brass industry began in the 18th cent.; clocks and watches, tools, precision instruments, and plastics are important industries.

water chestnut: see SEDGE.

watercolor painting, in its wider sense, all pigments mixed with water rather than oil, including FRESCO and TEMPERA as well as aquarelle (the process now commonly called watercolor). Gouache and distemper are also watercolors, but prepared with gluey bases. The earliest existing paintings, found in Egypt, are watercolors. Gouache was used by Byzantine and Romanesque artists, and the illuminated manuscripts of the Middle Ages were produced with watercolor. The medium was used during and after the RENAISSANCE by DÜRER, REMBRANDT, VAN DYCK, and others to tint and shade drawings and woodcuts. In the 18th cent. the modern aquarelle grew into a complete painting technique. Quick and easy to apply, the aquarelle's colors are at once brilliant, transparent, and delicate. The medium was popular in England, where its masters were CONSTABLE and J.M.W. TURNER. Many 19th-cent. painters used watercolor extensively, largely for landscapes. In France they included DAUMIER, DELACROIX, and GERICAULT, and later, CÉZANNE and DUFY. Among notable American watercolorists are J.S. SARGENT, Winslow HOMER, PRENDERGAST, MARIN, and SHEELER.

watercress, hardy perennial European herb (*Nasturtium of ficinale*) of the MUSTARD family, widely naturalized in North America, found in or around water. It is cultivated commercially for its small, pungent leaflets, used as a peppery salad green or garnish. The ornamental plant whose common name is NASTURTIUM is unrelated.

waterfall, sudden drop in a stream formed where it passes over a layer of harder rock to an area of softer, more easily eroded rock. As a stream grows older, the waterfall, by undercutting and erosion, normally moves upstream and loses height until it becomes a series of rapids and finally disappears. Because of the waterpower that waterfalls can provide, many cities are located near them. Notable examples are NIAGARA FALLS and VICTORIA FALLS.

water gas, colorless, poisonous gas that burns with an intensely hot, bluish flame. It is mainly a mixture of carbon monoxide and hydrogen and is almost entirely combustible. The gas is made by treating white-hot, hard coal or coke with a blast of steam, forming carbon monoxide and hydrogen. It is important in the preparation of hydrogen, as a fuel in the making of steel, and in other industrial processes, e.g., the FISCHER-TROPSCH PROCESS.

Watergate affair, in U.S. history, series of scandals involving Pres. Richard NIXON. In July 1972 agents of Nixon's reelection committee were arrested in Democratic party headquarters, in the Watergate apartment building in Washington, D.C., after an attempt to tap telephones there. They were tried and convicted in 1973, but District Court Judge John Sirica suspected a high-echelon conspiracy, and when one of the convicted burglars, James McCord, wrote a letter to Sirica charging a massive cover-up, the affair erupted into a national scandal. A special Senate committee, headed by Sen. Sam ERVIN, held televised hearings (1973) in which John Dean, the former White House counsel, stated that members of the Nixon administration, notably Attorney General John MITCHELL, had known of the Watergate burglary. The hearings also revealed that Nixon had taped conversations in the Oval Office, and when the special prosecutor appointed to investigate the affair, Archibald Cox, requested these tapes, Nixon fired him. Cox had begun to uncover widespread evidence of political espionage by the Nixon reelection committee, illegal wiretapping of citizens by the administration, and corporate contributions to the Republican party in return for political favors. His successor as special prosecutor, Leon Jaworski, succeeded in getting the tapes and subsequently obtained indictments and convictions of several high-ranking administration officials, including Mitchell and Dean. Public confidence in the president waned. In July 1974 the House Judiciary Committee adopted three articles of impeachment against him, the first for obstruction of justice. On Aug. 9, 1974, Nixon became the first U.S. president to resign from office. One month later his successor, Gerald FORD, pardoned him.

water lily, common name for some members of the family Nymphaeaceae, freshwater perennials found throughout most of the world. Often having large shield-shaped leaves and showy blossoms of various colors, the family includes water lilies, lotuses, and pond lilies (genera *Nymphaea, Nelumbo,* and *Nuphar,* respectively). Well-known species include the blue or white Egyptian lotus of the genus *Nymphaea,* the national emblem of Egypt, and the Indian lotus of the genus *Nelumbo,* sacred to several Asian religions. Many members of the family have edible seeds or TUBERS.

Waterloo campaign, June 1815, last action of the Napoleonic Wars, ending with the battle of Waterloo (June 18), fought near Brussels, Belgium. NAPOLEON I, returned from exile, faced the allied armies of Britain, Prussia, Austria, and Russia. He defeated a Prussian force at Ligny, then turned his attention to the British, under WELLINGTON. The British took up a strong position S of Waterloo; resisted successfully; and, after being joined by BLÜCHER'S Prussian forces, routed the French. Napoleon abdicated on June 22. Wellington's victory was a triumph, but the campaign itself was marked by confusion and miscalculation on both sides.

watermelon, plant (*Citrullis vulgaris*) of the GOURD family, native to Africa. The fleshy, juicy fruit, which can be red to pink, yellow, or white, is eaten fresh; the rind is pickled; and the seeds are also eaten. One white-fleshed variety, the citron melon, is used like citron in preserving. There are also hybrid seedless varieties.

water moccasin or **cottonmouth,** venomous SNAKE (*Ancistrodon piscivorus*) of the swamps and bayous of the S U.S. A PIT VIPER, it has a heat-sensitive organ for detecting warm-blooded prey. The average length is 3 to 4 ft (90 to 120 cm). If startled it raises its head and shows the white interior of its mouth—hence the name *cottonmouth.*

water pollution: see POLLUTION.

water polo, swimming game played in a pool by teams of seven players each, including a goalie. The object is to maneuver—by head, feet, or one hand—a large leather ball into net-enclosed goals at opposite ends of the pool. Rough defensive techniques are permitted, including ducking (holding a player under water). The game, played by club and college teams, was developed in England in the 1870s and later became popular in the U.S. It has been an Olympic event since 1900.

waters, territorial: see SEA, LAW OF THE.

watershed, elevation or divide separating the CATCHMENT AREA, or drainage basin, of one river system from another. The Rocky Mts. and the Andes form a watershed between westward-flowing and eastward-flowing streams. The term is also often synonymous with drainage basin.

water skiing, sport of riding on skis along the water's surface while being towed by a motorboat. Competitive water skiing consists of the slalom, in which skiers maneuver around a series of buoys; jumping, from an inclined ramp 6 ft (1.8 m) high; and trick riding, involving intricate routines. The sport probably originated on the French Riviera in the early 1920s.

waterspout: see TORNADO.

water table, the top zone of soil and rock that is saturated with water. Its level varies with topography and rainfall. Natural springs are formed when the water table meets the ground's surface, and water wells operate by penetrating into the water table.

water wheel, ancient device for utilizing the power of flowing or falling water. The oldest known wheel, probably first used in the Middle East, was essentially a grindstone mounted atop a vertical shaft whose vaned or paddled lower end dipped into a swift stream. In the 1st cent. B.C. a horizontal shaft came into use; the wheel attached to it had radial vanes around its edge. Today the water wheel has been largely replaced by the TURBINE.

Watson, James Dewey, 1928–, American biologist and educator; b. Chicago. For their work in establishing the molecular structure of

DNA, he and Francis CRICK shared the 1962 Nobel Prize in physiology or medicine with Maurice Wilkins. Watson's *Double Helix* (1968) is an account of their work. He was head of the U.S. human genome research program from 1989 to 1992.

Watson, John Broadus, 1878–1958, American psychologist; b. Greenville, S.C. He originated the school of psychology called BEHAVIORISM, in which behavior is described in terms of physiological responses to stimuli; the concept of conscious or unconscious mental activity is rejected. His best-known books are *Psychology from the Standpoint of a Behaviorist* (1919) and *Behaviorism* (1925).

Watson, Thomas John, 1874–1956, American industrialist and philanthropist; b. Campbell, N.Y. After rising from clerk to sales executive in the National Cash Register Co., he became (1914) president of the Computing-Tabulating-Recording Co., renamed International Business Machines Corp. (IBM) in 1924. He became chairman in 1949. Pushed by his son (see below), he widened IBM's line in the 1950s to include electronic COMPUTERS, and at his death IBM had assets of over $600 million and a world market of 82 countries. His son, **Thomas John Watson, Jr.,** 1914–93, b. Dayton, Ohio, was president of IBM (1952–61), chairman (1961–71), and chairman of the executive board (1972–79). He early recognized the importance of computers and maintained IBM's dominance in that and other advanced technologies. He was (1979–81) U.S. ambassador to the USSR.

Watson, Tom (Thomas Sturges Watson), 1949–, American golfer; b. Kansas City, Mo. Considered the successor to Jack NICKLAUS as the game's foremost player during the late 1970s and early 80s, Watson won the British Open in 1975, 1977, 1980, and 1982–83, the Masters in 1977 and 1981, and the U.S. Open in 1982.

Watt, James, 1736–1819, Scottish inventor. Repairing a Newcomen STEAM ENGINE, he devised improvements that resulted in a new type of engine (patented 1769) with a separate condensing chamber, an air pump to bring steam into the chamber, and insulated engine parts. He also perfected a rotary engine. Watt coined the term *horsepower*.

watt: see POWER.

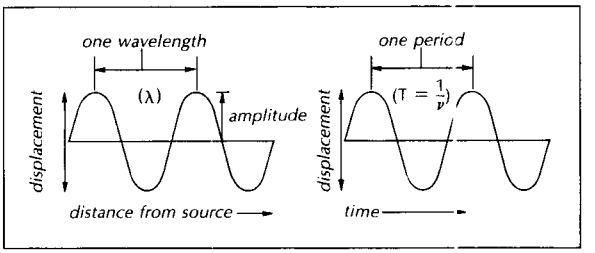
Watteau, Jean-Antoine [wätō], 1684–1721, French painter of Flemish descent. He studied (1704–8) in the studio of Claude Gillot, a painter of theatrical life, which later became the subject of some of Watteau's finest paintings, e.g., *Love in the French Theatre* (Berlin). One of the great colorists of all time, Watteau executed gay and sensuous scenes in shimmering pastel tones, influencing fashion and garden design in the 18th cent. *The Embarkation for Cythera* (1717; Louvre) is a characteristic work.

Watts Towers, group of towers built (1921–54) by Simon Rodilla (or Rodia), 1879–1965, in Watts, Los Angeles. Unique, fanciful structures reminiscent of GAUDÍ's work, they incorporate stone, steel, cement, and discarded elements, e.g., bottle caps.

Watutsi: see TUTSI.

Waugh, Evelyn (Arthur St. John), 1903–66, English novelist. The foremost social satirist of his generation, he gained fame with *Decline and Fall* (1928) and *Vile Bodies* (1930). In *Black Mischief* (1932) and *Scoop* (1938), he satirized Ethiopia; and in *The Loved One* (1948), Hollywood mortuary customs. A conservative moralist, he is best known for *Brideshead Revisited* (1945), about the spiritual regeneration of an aristocratic Catholic family. Equally serious is his World War II trilogy (1952–61).

wave, in physics, the transfer of ENERGY by some form of regular vibration, or oscillatory motion, either of some material medium (see SOUND) or by the variation of intensity of the field vectors of an electromagnetic field (see ELECTROMAGNETIC RADIATION). In longitudinal, or compressional, waves the vibration is in the same direction as the transfer of energy; in transverse waves the vibration is at right angles to the transfer of energy. The amplitude of a wave is its maximum displacement. The distance between successive crests or successive troughs is the wavelength λof a wave. One full wavelength of a wave represents one complete cycle, that is, one complete vibration in each direction. All waves are referenced to an imaginary synchronous motion in a circle; thus one complete cycle is divided into 360 degrees. The phase is that part of the cycle, expressed in degrees, that is completed at a certain time. The various phase relationships (see diagram) between combining waves determine the type of interference that takes place. The frequency ν of a wave is equal to the number of crests (or troughs) that pass a given fixed point per unit of time. The period T of a wave is the time lapse between the passage of successive crests (or troughs). The speed v of a wave is determined by its wavelength and its frequency according to the equation $v = \lambda\nu$. Because the frequency is inversely related to the period T, this equation also takes the form $v = \lambda/T$.



Wave diagrams showing the displacement of a wave plotted against distance from source and atainst time. A wave travels one wavelength during one period.

Wavell, Archibald Percival Wavell, 1st Earl, 1883–1950, British field marshal and viceroy of India (1943–47). In WORLD WAR II he routed (1940–41) Italian forces in N Africa, but was forced back by the Germans. He then held command in India. As viceroy, he tried to prepare India for self-rule.

wax, substance secreted by glands on the abdomen of the bee and known commonly as beeswax; also various substances resembling beeswax. Chemically, waxes are complex mixtures of esters, fatty acids, free alcohols, and higher hydrocarbons. They are usually harder and less greasy than fats, but like fats they are less dense than water and insoluble in it. Waxes can be obtained from plants (e.g., carnauba wax from palm leaves) or animals (e.g., lanolin from wool fibers and spermaceti from sperm whales). PARAFFIN and ozocerite are mineral waxes composed of hydrocarbons. Japan wax and Bayberry wax are composed chiefly of fats.

wax painting: see ENCAUSTIC.

waxwing, any of three species (genus *Bombycilla*) of perching songbirds of the Northern Hemisphere. Waxwings have crests (raised only in alarm) and brownish-gray plumage with flecks of red pigment resembling sealing wax on the wings. The species are the cedar waxwing; the Bohemian, or greater, waxwing; and the Japanese waxwing, found only in NE Asia.

Wayne, Anthony, 1745–96, American general; b. Chester co., Pa. He is most famous for the capture (1779) of Stony Point, N.Y., during the AMERICAN REVOLUTION. After the war, he fought in the INDIAN WARS in the West and won a notable victory at the battle of Fallen Timbers (1794). He was known as "mad Anthony Wayne."

Wayne, John, 1906–79, American film actor; b. Winterset, Iowa, as Marion Michael Morrison. Extremely popular, he often played tough heroes. His films include *Stagecoach* (1939), *The Quiet Man* (1952), and *True Grit* (1969; Academy Award).

weak interaction or **weak nuclear force,** force that is associated with radioactivity and particle decay and is mediated, or carried, by the W AND Z PARTICLES. The weak interaction is one of four fundamental forces of nature; the others are GRAVITATION, electromagnetism, and STRONG INTERACTION.

weasel, small, lithe, carnivorous MAMMAL of the family Mustelidae, which also includes the MINK, FERRET, WOLVERINE, SKUNK, BADGER, and OTTER. All members of the family have scent glands, used chiefly for territorial marking but sometimes for defense. Found in Eurasia, N Africa, and the Americas, weasels are characterized by long bodies and necks, short legs, small ears, and dense, lustrous fur (usually brown with white underparts). They hunt small animals at night, often killing more than they can eat.

weather, state of the atmosphere at a given time and place with regard to temperature, air pressure, humidity, wind, cloudiness, and precipitation. The term *weather* is restricted to conditions over short periods of time; conditions over long periods are referred to

as climate. The study of weather and its forecasting is called METEOROLOGY.

weather balloon, BALLOON, usually helium-inflated, used in the measurement and evaluation of atmospheric conditions. Atmospheric-pressure and other meteorological information may be sent by radio from the balloon (see RADIOSONDE); monitoring of its movement (see THEODOLITE) provides information about winds at its flight level.

weathering, term for the processes by which ROCK at the surface of the earth is disintegrated and decomposed by the action of atmospheric agents, water, and living things. Some of the processes are mechanical, e.g., the impact of running water. Others are chemical, e.g., oxidation, hydration, or carbonization. Weathering aids in the formation of soil and prepares materials for EROSION.

weather satellite, artificial SATELLITE used to gather data on a global basis for improvement of weather forecasting. Information is provided about cloud cover, storm location, temperature, and heat balance in the earth's atmosphere. Satellite instruments may also be used to locate sea- and aircraft and track the movement of marine life and pollution. The first experimental weather satellite was *Tiros I,* launched by the U.S. in 1960. The U.S. National Operational Meterological System consists of both polar-orbiting and geostationary satellites. The U.S. Dept. of Defense also operates sun-synchronous polar-orbiting satellites that provide global meteorological data for military purposes. Russia, India, Japan, and the European Space Agency also operate weather satellites.

Weaver, James Baird, 1833–1912, American politician; b. Dayton, Ohio. He was a U.S. representative from Iowa (1879–81, 1885–89). A free-silver advocate, he was the presidential candidate of the GREENBACK PARTY in 1880 and of the POPULIST PARTY in 1892.

Weaver, Robert Clifton, 1907–, U.S. secretary of housing and urban development (1966–68); b. Washington, D.C. Pres. Lyndon B. JOHNSON named him to head the newly created housing department in 1966, making Weaver the first African American to serve in a presidential cabinet.

Webb, Beatrice Potter, 1858–1943, English socialist economist. In 1892 she married **Sidney James Webb,** 1859–1947, and they worked together as leaders of the FABIAN SOCIETY, in the building of the LABOUR PARTY, and in the creation (1895) of the London School of Economics. In 1913 they founded the *New Statesman.* Sidney Webb was elected to Parliament in 1922 and became Baron Passfield in 1929. Co-authors of *The History of Trade Unionism* (1894), *Industrial Democracy* (1897), *Soviet Communism* (2 vol., 1935), and other works, the Webbs made major contributions to most of the political and social reforms of their time.

Webb, Philip Speakman, 1831–1915, English architect. He was influential in the mid-19th-cent. revival of residential architecture based on Queen Anne and GEORGIAN STYLES. A friend and supporter of William MORRIS, he built for him (1859) the Red House, Bexley Heath, and collaborated with him afterwards. He also designed furniture, tiles, and stained glass.

Webb, Sidney James: see under WEBB, BEATRICE POTTER.

Webber, Andrew Lloyd: see LLOYD WEBBER, ANDREW.

Weber, Carl Maria Friedrich Ernst von [fən vā'bər], 1786–1826, German composer. Considered the founder of German romantic OPERA, he wrote 10 operas, including *Der Freischütz* [the marksman] (1821) and *Oberon* (1826). Among his instrumental works is the popular *Invitation to the Dance* (1819).

Weber, Max, 1864–1920, German sociologist and political economist who greatly influenced sociological theory. His concept of "ideal types," or generalized models of real situations, provided a basis for comparing societies. Opposing the Marxian view of the preeminence of economic causation, he emphasized the role of religious values, ideologies, and charismatic leaders in shaping societies. His famous *Protestant Ethic and the Spirit of Capitalism* (1904–5) related Calvinist ideals to the rise of capitalism.

Weber, Max, 1881–1961, American painter; b. Russia; emigrated to the U.S. at age 10. His early work was influenced by CUBISM, e.g., *Chinese Restaurant* (Whitney Mus., N.Y.C.). He explored Jewish subject matter, beginning c.1917, and in the 1930s he handled social themes. Energetic in line, Weber's later paintings were increasingly abstract.

Webern, Anton von [fən vā'bərn], 1883–1945, Austrian composer. A pupil of Arnold SCHOENBERG, he wrote TWELVE-TONE MUSIC. His music is characterized by unusual combinations of instruments, a broken melodic line, and extreme brevity. Written mainly for small orchestral groups or voice, his compositions include *Six Bagatelles* (1913) and *Variations* (1940).

Webster, Daniel, 1782–1852, American politician; b. Salisbury (now in Franklin), N.H. A lawyer famous for his oratory, Webster won national recognition in the Dartmouth College case and MCCULLOCH V. MARYLAND (both 1819). A Federalist, he represented New Hampshire in the House of Representatives (1813–17). After moving to Boston, he again served in the House (1823–27) and was senator from Massachusetts (1827–41, 1845–50). A leader in the new WHIG PARTY, he was the presidential candidate of one of its factions in 1836. As secretary of state (1841–43) under Pres. W.H. HARRISON, he was responsible for the WEBSTER-ASHBURTON TREATY. Reelected to the Senate, he placed the union above all other issues, and his support of the COMPROMISE OF 1850 greatly diminished his political influence. He was again secretary of state (1850–52) in Pres. Millard FILLMORE's administration.

Webster, John, 1580?–1634, English dramatist. His reputation rests on two tragedies, *The White Devil* (c.1608) and *The Duchess of Malfi* (c.1614), somber revenge dramas that reveal a profound understanding of human suffering.

Webster, Margaret, 1905–72, American actress, producer, and director; b. N.Y.C. With Eva LE GALLIENNE she founded (1946) and managed the American Repertory Theatre. From 1948 to 1951 she directed the Margaret Webster Shakespeare Company.

Webster, Noah, 1758–1843, American lexicographer and philologist; b. West Hartford, Conn. A graduate of Yale, he fought in the American Revolution and then practiced law in Hartford. His *Grammatical Institute of the English Language,* in three parts—speller, grammar, and reader (1783–85)—was the first of the books that made him for many years the chief American authority on English. The first part, the *Elementary Spelling Book,* helped standardize American spelling. It was a basic text in schools, and frontier children learned to read from it. By 1850, when the population was under 23 million, about 1 million copies of the book were sold annually. Webster's efforts contributed to passage of a national copyright law (1790). A Federalist, he proposed the adoption of a constitution in *Sketches of American Policy* (1785). In 1793 he began the *American Minerva* newspaper in New York City. Later he was among the first trustees of Amherst College. His *Compendious Dictionary* (1806) was followed by his greatest work, *The American Dictionary of the English Language* (1812); 12,000 of its 70,000 words had not appeared in such a work before. He completed the 1840 revision; through many revisions since then the dictionary has retained its popularity.

Webster-Ashburton Treaty, 1842, between the U.S., represented by Secy. of State Daniel WEBSTER, and Great Britain, represented by Lord Ashburton. It settled various boundary disputes between Canada and the U.S., including those in the Northeast that had led to the AROOSTOOK WAR and others in the GREAT LAKES area, and served as an important precedent for future peaceful settlements of disputes between Canada and the U.S.

Weddell Sea, arm of the Atlantic Ocean, bordered by the Antarctic Peninsula and Coats Land; named for James Weddell, who claimed to have discovered it in 1823. The vast Ronne and Filchner ice shelves are at the head of the sea.

Wedekind, Frank [vā'dəkĭnt], 1864–1918, German dramatist. A forerunner of EXPRESSIONISM, he stressed man's primal instincts, as in *The Awakening of Spring* (1909). His plays *Earth Spirit* (1895) and *Pandora's Box* (1903) were the source for the libretto of Alban BERG's opera *Lulu.*

Wedgwood, Josiah, 1730–95, English potter. He built a factory and model village near Stoke-on-Trent in 1769, eventually transforming pottery from a minor industry to one of great importance. He developed a cream-colored earthenware, a veined ware resembling granite, and a black ware called Egyptian stoneware. For his jasper ware, in blue or other colors with white Greek figures in cameolike relief, he used designs by artists such as John FLAXMAN. Wedgwood also helped improve roads, schools, and living conditions for his workers.

Wednesday: see WEEK.

COMMON WEIGHTS AND MEASURES

LENGTH

American and British units	*Metric system*	*Conversion factors*
1 inch (in.) = 1/36 yard = 1/12 foot 1 foot (ft) = 1/3 yard 1 yard (yd; basic unit of length) 1 rod (rd) = 5½ yards 1 furlong (fur.) = 220 yards = 1/8 mile 1 mile (mi) = 1,760 yards = 5,280 feet 1 fathom (fath) = 6 feet 1 nautical mile = 6,076.1 feet	1 millimeter (mm) = 1/1,000 meter 1 centimeter (cm) = 1/100 meter 1 decimeter (dm) = 1/10 meter 1 meter (m; basic unit of length) 1 dekameter (dkm) = 10 meters 1 kilometer (km) = 1,000 meters	1 inch = 2.54 centimeters 1 foot = 0.305 meter 1 yard = 0.914 meter 1 mile = 1.609 kilometers 1 nautical mile = 1.852 kilometers 1 centimeter = 0.39 inch 1 meter = 39.37 inches = 3.28 feet = 1.094 yards 1 kilometer = 0.62 mile

AREA

American and British units	*Metric System*	*Conversion factors*
1 square inch (sq in.) = 1/1,296 square yard = 1/144 square foot 1 square foot (sq ft) = 1/9 square yard = 144 square inches 1 square yard (sq yd; basic unit of area) = 9 square feet 1 square rod (sq rd) = 30¼ square yards 1 acre = 4,840 square yards = 160 square rods 1 square mile (sq mi) = 3,097,600 square yards = 640 acres	1 square centimeter (sq cm) = 1/10,000 square meter 1 square decimeter (sq dm) = 1/100 square meter 1 square meter (sq m; basic unit of area) 1 are (a) = 100 square meters 1 hectare (ha) = 10,000 square meters = 100 ares 1 square kilometer (sq km) = 1,000,000 square meters	1 square inch = 6.45 square centimeters 1 square foot = 0.093 square meter 1 square yard = 0.84 square meter 1 acre = 0.405 hectare 1 square mile = 2.59 square kilometers 1 square centimeter = 0.155 square inch 1 square meter = 1.2 square yards = 10.8 square feet 1 hectare = 2.47 acres 1 square kilometer = 0.386 square mile

VOLUME AND CAPACITY (*liquid and dry*)

American and British units	*Metric system*	*Conversion factors*
1 cubic inch (cu in.) = 1/46,656 cubic yard = 1/1,728 cubic foot 1 cubic foot (cu ft) = 1/27 cubic yard = 1,728 cubic inches 1 cubic yard (cu yd; basic unit of volume) = 27 cubic feet 1 U.S. fluid ounce (fl oz) = 1/128 U.S. gallon = 1/16 U.S. pint 1 gill (gi) = 1/32 gallon = 4 fluid ounces 1 cup = ¼ quart = ½ pint = 8 fluid ounces 1 pint (pt) = 1/8 gallon = ½ quart = 16 fluid ounces 1 quart (qt) = ¼ gallon = 32 fluid ounces 1 U.S. gallon (gal; basic unit of liquid capacity in the U.S.) = 231 cu in. 1 dry pint (dry pt) = 1/64 bushel = ½ dry quart 1 peck (pk) = ¼ bushel 1 U.S. bushel (bu; basic unit of dry capacity in the U.S.) = 2,150.4 cubic inches 1 British imperial fluid ounce (fl oz) = 1/160 imperial gallon 1 imperial gallon (gal; basic unit of liquid capacity in some Commonwealth nations) = 277.4 cubic inches 1 imperial bushel (bu; basic unit of dry capacity in some Commonwealth nations) = 2,219.4 cubic inches	1 cubic centimeter (cc) = 1/1,000,000 cubic meter 1 cubic decimeter (cu dm) = 1/1,000 cubic meter = 1,000 cubic centimeters 1 cubic meter (cu m) = 1 stere (s; basic unit of volume) 1 milliliter (ml) = 1/1,000 liter = 1 cubic centimeter 1 centiliter (cl) = 1/100 liter = 10 milliliters 1 deciliter (dl) = 1/10 liter 1 liter = 1 cubic decimeter (basic unit of capacity) 1 dekaliter (dkl) = 10 liters 1 hectoliter (hl) = 100 liters = 1/10 cubic meter 1 kiloliter (kl) = 1,000 liters	1 cubic inch = 16.4 cubic centimeters 1 cubic foot = 0.0283 cubic meter 1 cubic yard = 0.765 cubic meter 1 fluid ounce = 29.6 milliliters 1 U.S. pint = 0.473 liter 1 U.S. quart = 0.946 liter 1 U.S. gallon = 3.8 liters 1 imperial gallon = 1.2 U.S. gallons = 4.5 liters 1 dry pint = 0.55 liter 1 dry quart = 1.1 liters 1 U.S. bushel = 0.97 imperial bushel = 35.24 liters 1 imperial bushel = 1.03 U.S. bushels = 36.37 liters 1 cubic centimeter = 0.06 cubic inch 1 cubic meter = 1.3 cubic yards 1 milliliter = 0.034 fluid ounce 1 liter = 1.06 U.S.quarts 1 dry liter = 0.9 dry quart 1 dekaliter = 0.28 U.S. bushel

week, period of time shorter than the month, commonly seven days. The seven-day week is said to have originated in ancient times in W Asia, probably in Mesopotamia. It is thought to have been a planetary week predicated on the concept of the influence of the planets: the sun, the moon, and five bodies recognized today as PLANETS—Mars, Mercury, Jupiter, Venus, and Saturn. The Hebrew week is based chiefly on the SABBATH, which comes every seventh day. In the Roman Empire the planetary week was at first preeminent, and the use of planetary names, based on the names of pagan deities, continued even after CONSTANTINE I made (c.321) the Christian week, beginning on Sunday, official. The Roman names for the days pervaded Europe; in most languages the forms are translations from Latin or attempts to assign corresponding names of divinities. The Latin names, their translations, the English equiv-

The key to pronunciation appears on page xiii.

COMMON WEIGHTS AND MEASURES *(Continued)*

WEIGHT OR MASS

American and British units: avoirdupois

1 grain= $\frac{1}{7,000}$ pound = $\frac{1}{437.5}$ ounce
1 dram (dr) = $\frac{1}{256}$ pound = $\frac{1}{16}$ ounce
1 ounce (oz) = $\frac{1}{16}$ pound
1 pound (lb; basic unit of weight or mass)
1 short hundredweight =100 pounds
1 long hundredweight = 112 pounds
1 short ton = 2,000 pounds
1 long ton = 2,240 pounds

American and British units: troy and apothecaries'

1 grain = $\frac{1}{7,000}$ avoirdupois pound = $\frac{1}{480}$ troy ounce
1 pennyweight (dwt) = 24 grains = $\frac{1}{20}$ troy ounce
1 apothecaries' dram (dr ap) = 60 grains = $\frac{1}{8}$ apothecaries' ounce
1 troy or apothecaries' ounce (oz t or oz ap) = 480 grains = $\frac{1}{12}$ troy or apothecaries' pound
1 troy or apothecaries' pound (lb t or lb ap) = 5,760 grains= 12 troy or apothecaries' ounces

Metric system

1 milligram (mg) = $\frac{1}{1,000,000}$ kilogram = $\frac{1}{1,000}$ gram
1 centigram (cg) = $\frac{1}{100,000}$ kilogram = $\frac{1}{100}$ gram
1 decigram (dg) = $\frac{1}{10,000}$ kilogram = $\frac{1}{10}$ gram
1 gram (g) = $\frac{1}{1,000}$ kilogram
1 dekagram (dkg) = $\frac{1}{100}$ kilogram = 10 grams
1 hectogram (hg) = $\frac{1}{10}$ kilogram = 100 grams
1 kilogram (kg; basic unit of weight or mass)
1 metric ton (t) = 1,000 kilograms

Conversion factors

1 grain = 64 milligrams
1 avoirdupois ounce = 28.35 grams
1 troy or avoirdupois' pound = 0.82 avoirdupois pound = 0.37 kilogram
1 avoirdupois pound = 1.2 troy or apothecaries' pounds = 0.45 kilogram
1 short ton = 0.9 metric ton
1 milligram = 0.015 grain
1 gram = 0.035 avoirdupois ounce
1 kilogram = 2.205 avoirdupois pounds
1 metric ton = 1.1 short tons

alents, and their derivations follow: *dies solis* [sun's day], Sunday; *dies lunae* [moon's day], Monday; *dies Martis* [MARS' day], Tuesday [Tiw's day]; *dies Mercurii* [MERCURY's day], Wednesday [Woden's day]; *dies Jovis* [Jove's or JUPITER's day], Thursday [THOR's day]; *dies Veneris* [VENUS' day], Friday [Frigg's day]; and *dies Saturni* [SATURN's day], Saturday.

Weems, Mason Locke, 1759–1825, American author; b. Anne Arundel co., Md. An Anglican preacher and traveling bookseller, Parson Weems is chiefly remembered for his biography (c.1800) of George WASHINGTON, which contains the apocryphal story of the cherry tree.

Wegener, Alfred Lothar, 1880–1930, German geologist, meteorologist, and arctic explorer. He is known for his theory of CONTINENTAL DRIFT, set forth in his *The Origin of Continents and Oceans* (1915), and for his expeditions to Greenland, where he eventually lost his life.

Weidman, Charles, 1901–75, American modern dancer and choreographer; b. Lincoln, Neb. He danced (1920–27) with the Denishawn companies, before forming (1927) a company with Doris HUMPHREY. His MODERN DANCES combined abstract movement with gestures based on his own mime technique. In 1945 he founded his own company and school. In 1960 he established the Expression of the Two Arts Theater (N.Y.C.).

Weierstrass, Karl Wilhelm Theodor [vī'ərshträs], 1815–97, German mathematician. He developed the modern theory of functions. An advocate of the modern, rigorous approach to analysis and number theory, he did much to clarify the foundations of these subjects.

weight, measure, expressed in pounds or grams, of the force of gravity on a body (see GRAVITATION). Because the weights of different bodies at the same location are proportional to their masses, weight is often used as a measure of MASS. Unlike the mass, the weight of a body depends on its location in the gravitational field of the earth or of some other astronomical body.

weightlessness, the absence of any observable effects of GRAVITATION. Apparent weightlessness is encountered by astronauts in a spacecraft orbiting the earth. The gravitational force acting on the astronauts and other objects in the spacecraft is exactly canceled by the centrifugal force arising from the common accelerated motion of the spacecraft, astronauts, and spacecraft objects.

weight lifting, competitive sport and training technique for athletes. Meets are conducted according to weight classes, ranging from flyweight to super heavyweight. The contestant raising the greatest total of weights in three standard lifts—two-hand or military press, clean-and-jerk, and snatch—is declared the winner. Weight lifting has long been popular in Europe, Egypt, Turkey, and Japan. The E European nations have excelled in Olympic competition.

weights and measures, units and standards for expressing the amount of some quantity, such as length, capacity, or weight; the science of measurement standards and methods is known as metrology. Crude systems of weights and measures probably date from prehistoric times. Early units were commonly based on body measurements and on plant seeds or other agricultural objects. As civilization progressed, technological and commercial requirements led to increased standardization. Units were usually fixed by edict of local or national rulers and were subdivided and multiplied or otherwise arranged into systems of measurement. Today the chief systems are the ENGLISH UNITS OF MEASUREMENT and the METRIC SYSTEM. The United States is one of the few countries still using the former system.

Weil, Simone [vāy], 1909–43, French philosopher and mystic. Intellectually outstanding from childhood, she became a secondary-school teacher, wrote for socialist and Communist journals, and worked in Spain during the Civil War. After an intense mystical experience in 1938 she became a practicing Roman Catholic, subordinating all activity to an inward spiritual attendance upon a God whose presence is absolute but not manifest. Her spiritual and social-philosophic writings were collected posthumously, notably in *Waiting for God* (1951) and *The Need for Roots* (1952).

Weill, Kurt [vīl], 1900–50, German-American composer. In Europe he was best known for the satirical operas *The Threepenny Opera* (1928) and *The Rise and Fall of the City of Mahagonny* (1927, rev. 1930), both with librettos by BRECHT. Condemned as decadent by the NAZIS, he came to the U.S. in 1935. There he wrote such sophisticated MUSICALS as *Knickerbocker Holiday* (1938, with Maxwell ANDERSON) and *Lady in the Dark* (1941). Among his last, more serious works is *Street Scene* (1947). He was married to Lotte LENYA.

Weimar [vī'mär], city (1989 est. pop. 63,400), capital of THURINGIA, central Germany, on the Ilm R. It is a cultural and industrial center with such manufactures as farm machinery and chemicals. Known in the 10th cent., it became (16th cent.) the capital of the duchy of

Saxe-Weimar. The presence (18th–19th cent.) of GOETHE and SCHILLER made Weimar the literary center of Europe; later LISZT and NIETZSCHE lived there. In 1919 the city was the scene of the national assembly that established the republican government known as the "Weimar Republic." Landmarks include the parish church, which has an altarpiece by CRANACH, and the Goethe National Museum. The CONCENTRATION CAMP Buchenwald was located (1937–45) near the city.

Weimaraner, large, muscular SPORTING DOG; shoulder height, 23–27 in. (58.4–68.6 cm); weight, 55–85 lb (25–38.6 kg). Its short, smooth coat is gray; its tail is docked. Developed in Germany in the early 19th cent., it was first bred to hunt large game and later used for upland bird hunting.

Weinberg, Steven, 1933–, American nuclear physicist; b. N.Y.C. He helped develop the ELECTROWEAK THEORY, which unified ELECTROMAGNETISM and the WEAK INTERACTION. The theory was verified when the W AND Z PARTICLES were discovered by RUBBIA and VAN DER MEER. In 1979 he shared the Nobel Prize in physics with Abdus Salam and Lee Glashow. His writings include *Dreams of a Final Theory* (1992).

Weir, Julian Alden [wēr], 1852–1919, American painter; b. West Point, N.Y.; son of Robert Walter Weir, a HUDSON RIVER SCHOOL painter. Connected with early American IMPRESSIONISM, he used subtle gradations of light and tone in his works, e.g., *Autumn* (Corcoran Gall., Wash., D.C.).

Weir, Peter, 1944–, Australian film director. His work, which helped to bring Australian film to world attention, includes *Picnic at Hanging Rock* (1975), *Gallipoli* (1981), and *The Year of Living Dangerously* (1983).

Weismann, August, 1834–1914, German biologist. A professor at the Univ. of Freiburg (1866–1912), he originated the germ-plasm theory of heredity, which stresses the unbroken continuity of the germ plasm and the nonheritability of ACQUIRED CHARACTERISTICS.

Weiss, Peter, 1916–82, German-Swedish writer, film director, and painter. His philosophical drama on the nature of revolution, *The Persecution and Assassination of Jean Paul Marat as Performed by the Inmates of the Asylum of Charenton Under the Direction of the Marquis de Sade* (1964), and his play *The Investigation* (1965) were international successes. He was a Marxist from the mid-1960s; his social and political views are expressed in the dramas *Vietnam Discourse* (1968), *Trotsky in Exile* (1970), and *Hölderlin* (1971).

Weizmann, Chaim, 1874–1952, scientist and Zionist leader, first president (1948–52) of ISRAEL; b. Russia. A British subject from 1910, he combined a life of science with efforts toward the creation of a Jewish state. During World War I he developed a synthetic acetone for the production of explosives. In 1917 he helped procure from the British government the pro-Zionist Balfour Declaration (see BALFOUR, ARTHUR JAMES). A longtime leader of the World Zionist Organization, he was named president of Israel in 1948. His nephew, **Ezer Weizman,** 1924–, helped found and served (1948–66) in the Israeli air force, rising to the rank of general and commanding officer before entering politics. He was minister of transport (1969–70), defense (1977–80), communications (1984–88), and science (1988–92). He was elected president of Israel in 1993.

Weld, Theodore Dwight, 1803–95, American abolitionist; b. Hampton, Conn. A disciple of the evangelist Charles G. Finney, Weld trained other Finney converts at Lane Seminary, in Cincinnati, and helped select (1834) the "Seventy"—agents for the American Anti-Slavery Society who spread the ABOLITIONIST gospel throughout the North. Weld married (1838) the abolitionist Angelina GRIMKÉ and was an editor of the *Emancipator.* His *American Slavery as It Is* (1839) was a source for Harriet Beecher STOWE's *Uncle Tom's Cabin* and was considered second only to Stowe's book in its influence on the antislavery movement.

welding, process for joining separate pieces of metal in a continuous metallic bond. In cold-pressure welding, high pressure is applied at room temperature. Forge welding (or forging) is done by means of hammering, with the addition of heat. In most processes, the points to be joined are melted, additional molten metal is added as a filler, and the bond is allowed to cool. In the Thomson process, melting is caused by resistance to an applied electric current. Another process is that of the atomic hydrogen flame, in which hydrogen molecules passing through an electric arc are broken into atoms by absorbing energy. Outside the arc the molecules reunite, yielding heat to weld the material in the process.

welfare: see SOCIAL WELFARE.

Welland Ship Canal, canal, SE Ont., Canada, W of Buffalo, N.Y., linking lakes Erie and Ontario. It is 27.6 mi (44.4 km) long, with a minimum depth of 30 ft (9 m), and forms a vital part of the St. Lawrence & Great Lakes Waterway. Eight locks (each 859 ft/262 m long, 80 ft/24 m wide, and 30 ft/9 m deep) overcome the 326-ft (99-m) difference in elevation between the lakes and bypass NIAGARA FALLS. The canal was built (1914–32) to replace a canal opened in 1829, and was modernized and enlarged in 1972.

Welles, Gideon, 1802–78, American politician; b. Glastonbury, Conn. A Jacksonian Democrat, he left the party over the slavery issue and helped found (1856) the REPUBLICAN PARTY. A staunch supporter of Abraham LINCOLN, he was secretary of the navy during the CIVIL WAR and later supported Pres. Johnson's RECONSTRUCTION policy.

Welles, Orson, 1915–85, American film director and actor; b. Kenosha, Wis. *Citizen Kane* (1940), considered his masterpiece, is noted for its technical brilliance and structural complexity. His other films include *The Lady from Shanghai* (1947) and *Touch of Evil* (1962).

Scene from Citizen Kane, *directed by Orson Welles, 1940*

Wellesley, Richard Colley Wellesley, Marquess, 1760–1842, British colonial administrator. As governor general of India (1797–1805), he extended British influence, wiped out French power, and, aided by his brother Arthur (later duke of WELLINGTON), checked the power of the native rulers. He was foreign secretary (1810–12), lord lieutenant of Ireland (1821–28; 1833–34), and a supporter of CATHOLIC EMANCIPATION.

Wellington, Arthur Wellesley, 1st duke of, 1769–1852, British soldier and statesman. Stationed in India (1796–1805), he assisted his brother Richard WELLESLEY by defeating the MAHRATTA chiefs. He brilliantly directed (1809–13) the PENINSULAR WAR that drove the French out of Spain and defeated (1815) NAPOLEON I in the WATERLOO CAMPAIGN. As prime minister (1828–30) he secured passage of the CATHOLIC EMANCIPATION bill (which he had previously opposed). Wellington later served as foreign secretary (1834–35) and minister without portfolio (1841–46) under Sir Robert PEEL.

Wellington, city (1991 pop. 150,301), capital of New Zealand, at the southern tip of North Island, on an inlet of Cook Strait. It is New Zealand's second largest city, its chief administrative and transportation center, and a major port. Manufactures include clothing, transportation equipment, processed food, and textiles. Founded in 1840, it became the capital in 1865. It has a symphony orchestra, ballet and opera companies, and several museums.

Wells, H(erbert) G(eorge), 1866–1946, English author and social thinker. Having taught biology, he wrote fantastic and pseudoscientific novels like *The Time Machine* (1895) and *The War of the Worlds* (1898). He turned to realism in *Kipps* (1905) and *Tono-*

Bungay (1909), and finally to increasing pessimism in *The Shape of Things to Come* (1933). He also wrote the famous *Outline of History* (1920).

Welsh language, member of the Brythonic group of the Celtic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Welty, Eudora, 1909–, American author; b. Jackson, Miss. A regional writer with a gift for dialect, she peoples her fiction with the eccentric, comic, but vital inhabitants of rural Mississippi. Her novels include *The Ponder Heart* (1954), *Losing Battles* (1970), and *The Optimist's Daughter* (1972; Pulitzer). Her collected stories were published in 1980, and she also published the autobiographical *One Writer's Beginnings* in 1984.

Wenceslaus, Saint, d. 929, duke of Bohemia. A pious Christian, he made peace with HENRY I (Henry the Fowler) of Germany. He engendered enmity among the nobles and was assassinated by his brother Boleslav I, who succeeded him. The patron saint of Bohemia, he is the "good King Wenceslaus" of the English Christmas carol. Feast: Sept. 28.

Wenceslaus, 1361–1419, Holy Roman emperor (uncrowned) and German king (1378–1400), king of Bohemia (1378–1419) as Wenceslaus IV, elector of Brandenburg (1373–76); son and successor of Emperor CHARLES IV. His main interest was always Bohemia, and he was ultimately deposed (1400) as German king by the ELECTORS. He never accepted his successor, Rupert, but in 1411 he agreed to the election of his half brother, SIGISMUND, as emperor. Wenceslaus was popular with the common people of Bohemia, but quarreled with the nobles and clergy. He supported John HUSS and tried to prevent his burning, which was carried out at the instigation of Sigismund. Wenceslaus's death and the succession of Sigismund as king of Bohemia led to the Hussite Wars (see HUSSITES).

Wenceslaus IV, king of Bohemia: see WENCESLAUS, Holy Roman emperor.

werewolf: see LYCANTHROPY.

Werfel, Franz [vĕr'fəl], 1890–1945, Austrian writer; b. Prague. His belief in human brotherhood is expressed in his lyric verse, in expressionist and conventional plays, and in such internationally known novels as *The Forty Days of Musa Dagh* (1933), *The Song of Bernadette* (1941), and the comedy *Jacobowsky and the Colonel* (1944). In 1938, Werfel fled Nazi-occupied Austria, later settling in the U.S.

Wergeland, Henrik [vĕr'gəlän], 1808–45, Norwegian poet and patriot, the leading Norwegian literary figure of his era. His greatest work was the verse drama *Creation, Man, and Messiah* (1830). He worked zealously for the causes of liberty, democracy, tolerance, and international cooperation; and his *English Pilot* (1844) voiced his ultimate goal: the liberation of the human mind.

Werner, Abraham Gottlob, 1750–1815, German geologist. He was the first to classify minerals systematically. Although his theory of neptunism (that the earth's lands precipitated out of an original world ocean) is now rejected, geology is indebted to him for applying chronology to rock formations and for his precise definitions.

Wertheimer, Max: see GESTALT.

Wertmuller, Lina, 1926?–, Italian film director; b. Archangela Felice Assunta Wertmüller von Elgg Spanol von Braucich. Her surreal comedies include *The Seduction of Mimi* (1972), *Love and Anarchy* (1973), *Swept Away* (1974), and *Seven Beauties* (1976).

Wesley, John, 1703–91, English evangelical preacher and founder of METHODISM, was ordained (1728) a priest in the Church of England and led a group of students at Oxford, including his brother Charles and George WHITEFIELD. They were derisively called "methodists" for their methodical devotion to study and religious duties. In 1735 the Wesleys accompanied James OGLETHORPE to Georgia, where John was deeply influenced by Moravian missionaries. On May 24, 1738, at a religious meeting in London, he experienced an assurance of salvation through faith in Jesus alone, which was his message for the rest of his life. In his evangelistic work, he is said to have preached 40,000 sermons and, on the advice of Whitefield, he preached in the open air. Because of his Arminianism and belief in Christian perfection, he repudiated (c.1740) the Calvinist doctrine of election, which led to a break with Whitefield. In 1784 he established the legal status of Methodist societies, and although he did not form a separate church, he did make plans for the societies to continue after his death. His brother, **Charles Wesley,** 1707–88, was also a priest of the Church of England and a Methodist evangelical preacher. He wrote some 6,500 hymns, including "Hark! The Herald Angels Sing" and "Jesus, Lover of My Soul."

Wessex, one of the Anglo-Saxon kingdoms of England. It may have been settled as early as 495 by the Saxons. King Ceawlin (560–93) consolidated the area between the upper Thames R. valley and the lower Severn, but until the end of the 8th cent. Wessex was overshadowed successively by KENT, NORTHUMBRIA, and MERCIA. EGBERT (802–39) became overlord of all England, but the kingdom then declined in the face of Danish invasions. The Danes were halted by ALFRED (r.871–99), and thereafter the history of Wessex becomes that of England. After a period of Danish rule (1016–42), EDWARD THE CONFESSOR (1042–66), last of the Wessex line of Alfred, succeeded to the English throne.

West, Benjamin, 1738–1820, American painter; b. Springfield, Pa. In 1760 he went to live in Europe, where he settled in London, espoused neoclassicism, and was appointed historical painter to GEORGE III in 1772. West executed more than 400 canvases, chiefly historical, mythological, and religious subjects on a heroic scale. He had many students, particularly American painters studying abroad, such as ALLSTON, S.F.B. MORSE, Gilbert STUART, and J.S. COPLEY. Among his best-known works are *Death of General Wolfe* (Grosvenor Gall., London) and *Penn's Treaty with the Indians* (Pennsylvania Acad. Fine Arts, Philadelphia).

West, Nathanael, 1903–40, American novelist; b. N.Y.C. as Nathan Weinstein. An innovative and original writer, he revealed the sterility and grotesqueness underlying the American dream. His bitter and influential novels are: *The Dream Life of Balso Snell* (1931), *A Cool Million* (1934), and *The Day of the Locust* (1939).

West, Dame Rebecca, 1892–1983, English writer; b. Ireland, as Cicily Fairfield. The author of such psychological novels as *The Return of the Soldier* (1918) and *Birds Fall Down* (1966), she is best known for a historical study of Yugoslavia, *Black Lamb and Grey Falcon* (1942), and an insightful look at traitors and spies, *The New Meaning of Treason* (1964).

West Bank, territory between Israel and Jordan, located W of the Jordan R. and the Dead Sea (1992 est. pop. 1,362,000), c.2,165 sq mi (5,607 sq km), occupied by Israel since the ARAB-ISRAELI WAR of 1967. Many Israelis refer to it as JUDAEA and SAMARIA. It includes the cities of HEBRON, JERICHO, and NABLUS, and the Old City of JERUSALEM. The north is fertile; the south largely barren. Olives, fruit, and citrus products are produced; small-scale industries manufacture goods such as cement and textiles. The inhabitants are mostly Muslim Arab Palestinians; there are about 120,000 Israeli Jewish settlers. After the partition of PALESTINE and the formation (1948) of Israel, the territory was annexed (1950) by Jordan. Following the 1967 war, the UN Security Council called for Israel's withdrawal from the West Bank. The CAMP DAVID ACCORDS (1978) incorporated plans for Arab self-rule in the region. A peaceful resolution, however, was impeded by the establishment of Israeli settlements in the area and by Israeli-PLO hostility (Arab states, including Jordan, recognized the PALESTINE LIBERATION ORGANIZATION [PLO] as the sole representative of the West Bank Arabs in 1974). A 1993 accord between Israel and the PLO called for limited Palestinian self-rule in Jericho and the GAZA STRIP by mid-1994.

Western Australia, state (1992 est. pop. 1,658,000), 975,290 sq mi (2,527,633 sq km). It is the largest state in Australia, comprising the entire western part of the continent. Only the southwest corner is fertile. Half of the population lives in metropolitan PERTH, the capital. Wheat, wool, and meat are the chief agricultural products. The inland and northern areas are rich in minerals, notably iron ore, nickel, and gold. Principal manufactures are industrial metals, machinery, and transportation equipment. A penal colony was established at Albany in 1826, and a colony of free settlers arrived in the Perth-Fremantle area in 1829. Governed at first by NEW SOUTH WALES, Western Australia received its own governor in 1831. It became a separate colony in 1890 and a federated state of Australia in 1901.

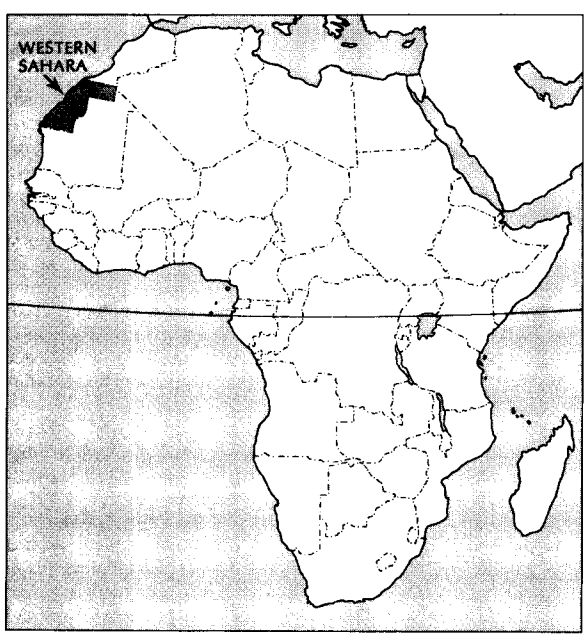
Western European Union (WEU), organization founded (1955) for defensive, economic, social, and cultural purposes by Belgium, France, West Germany (now Germany), Great Britain, Italy, Lux-

embourg, and the Netherlands. Portugal and Spain (1988) and Greece (1992) later joined. Initially its primary function proved to be the supervision of German rearmament under the PARIS PACTS; since 1960 it has been concerned mainly with military affairs. Under the Maastricht treaty (1992), the WEU is envisioned as the future military arm of the EUROPEAN UNION. In 1993 the WEU established the Eurocorps, a joint force drawn from some of its members.

Western Reserve, region in NE Ohio. Territory retained (1786) by Connecticut when that state ceded claims to other western lands, much of it was given to those of its citizens whose property was burned in the American Revolution. It became part of the NORTHWEST TERRITORY in 1800.

Western Sahara, formerly **Spanish Sahara,** territory (1992 est. pop. 201,000), 102,703 sq mi (266,000 sq km), occupied by Morocco, NW Africa, bordered by the Atlantic Ocean (W), Morocco (N), Algeria (NE), and Mauritania (E and S). Part of the SAHARA Desert, the land is extremely arid and is covered with stones and sand. The main towns are El Aaiún (or Laayoun; the former capital), Dakhlah (formerly Villa Cisneros), and Semara. The traditional economy is based on the raising of goats, camels, and sheep and the cultivation of date palms. There is some fishing. Rich deposits of phosphates were first exploited in the 1970s; potash and iron have also been found. The people are Arabs and Berbers, most of whom are Sunni Muslim. Arabic is the chief language.

History. Although visited by the Portuguese in 1434, the area that is now Western Sahara had little contact with Europeans until the 19th cent. In 1884 Spain proclaimed a protectorate over the coast, and a Spanish province, known as Spanish Sahara, was established in 1958. In 1976 Spain transferred the territory to Morocco and Mauritania, but following guerrilla action by the Polisario Front, a nationalist group based in Algeria and seeking self-government for the Saharans, Mauritania withdrew in 1979. Morocco then occupied the Mauritanian portion. The guerrillas continued attempts to liberate Western Sahara, renaming it the Saharan Arab Democratic Republic. A temporary truce signed in 1990 was made permanent (1991), but a referendum on the area's status has been delayed by disputes over who could vote.



Western Samoa, officially Independent State of Western Samoa, constitutional monarchy (1992 est. pop. 195,000), 1,133 sq mi (2,934 sq km), comprising nine islands in the SW Pacific Ocean, of which the largest are Savai'i and Upolu. Most of the population live on Upolu, where Apia, the capital, is located. The main islands are crossed by extinct volcanic ranges and have a tropical climate. Subsistence farming and fishing are mainstays of the economy, with tourism contributing significantly to local prosperity. Some timber is exported. The predominantly Polynesian population is almost entirely Christian, mainly Protestant. Samoan and English are the official languages.

History. Samoa was visited by the Dutch in 1722. It granted trading privileges to the U.S. in 1878 and to Germany and Britain in 1879. In 1899, the U.S. annexed eastern Samoa (see AMERICAN SAMOA) and the western islands passed to German control. New Zealand occupied the German islands in 1914 during World War I and subsequently administered them as a League of Nations mandate and a UN Trust Territory. They gained independence as Western Samoa in 1962. Executive power rests in a chief of state, chosen by the legislative assembly from among the royal families, and the vast majority of the members of the legislature are chosen by the Samoan clan chiefs. Chief Susuga Malietoa Tanumafili II has been chief of state since 1962. See PACIFIC OCEAN map.

West Germany: see GERMANY.

West Highland white terrier, sturdy, compact TERRIER; shoulder height, c.11 in. (27.9 cm); weight, 13–20 lb (5.9–9.1 kg). It has a dense, white, water-resistant double coat. It was developed in Scotland in the early 19th cent. to hunt small game both on land and in the water.

West Indies, archipelago, sometimes called the Antilles, extending c.2,500 mi (4,020 km) in a wide arc E and S from Florida to Venezuela, and separating the Atlantic Ocean from the Gulf of Mexico and the CARIBBEAN SEA. The four main island groups are the BAHAMAS; the Greater Antilles (CUBA, JAMAICA, HISPANIOLA, PUERTO RICO); the Lesser Antilles (the Leeward and Windward islands, BARBADOS, and TRINIDAD AND TOBAGO); and the Dutch West Indies, or Netherlands Antilles (ARUBA, CURAÇAO, Bonaire). The warm climate and clear tropical seas of the islands support a large tourist industry, and there are some exports, notably bauxite and sugar. People of African descent predominate. The **West Indies Federation,** established (1959) by ten former British possessions broke up in 1962 because of economic disparities between its members. Some of the participants later formed (1967) the **West Indies Associated States,** a British-sponsored confederation, but they left it one by one as they achieved full independence during the 1970s and early 80s.

Westinghouse, George, 1846–1914, American inventor and manufacturer; b. Central Bridge, N.Y. His railroad inventions included the air BRAKE (1868) and automatic signal devices. He formed companies in 1869 and 1882 to manufacture them. He also pioneered in introducing into the U.S. the high-tension alternating-current system for transmission of electricity. Over 400 patents were credited to Westinghouse.

Westminster Abbey, originally the abbey church of a Benedictine monastery in London. A major English Gothic structure, it is a national shrine. In 1245 Henry III demolished a Norman church and began a new eastern portion, inaugurating centuries of development. The chapter house was built in 1250, the cloisters and main monastic buildings in the 14th cent. The nave was completed in the 16th cent., as was Henry VIII's Lady Chapel with its noted fan vaulting. Christopher WREN and Nicholas HAWKSMOOR built (1722–40) the western towers. French influence is seen in the nave, the highest in England, and in the flying buttresses. Almost all English monarchs since William I have been crowned in the Abbey, and noted English subjects are buried there, e.g., Chaucer and Robert Browning in the Poets' Corner.

Westminster Palace or **Houses of Parliament,** in London. The present Gothic structure was built (1840–60) by Sir Charles Barry to replace ancient buildings largely destroyed by fire in 834. Edward the Confessor built the original palace, a royal abode until the 16th cent., when it became the meeting place for Parliament. The Great Hall (late 11th cent.), the finest example of medieval open-timber work, was destroyed by fire bombs in 1941. Westminster Hall, the only original portion intact, serves as an entrance hall.

Westmoreland, William Childs, 1914–, U.S. general; b. Spartanburg co., S.C. A career army officer, he commanded (1964–68) U.S. troops in the VIETNAM WAR.

Weston, Edward, 1886–1958, American photographer; b. Highland

The key to pronunciation appears on page xiii.

Park, Ill. Famed for stark, superbly printed images of Western landscapes, nudes, and natural formations, Weston greatly influenced photographic art.

Westphalia, Peace of, 1648, general settlement of the THIRTY YEARS WAR. It marked the end of the HOLY ROMAN EMPIRE as an effective institution and inaugurated the modern European state system. It also marked the end of the era of religious warfare, with a genuine effort being made toward religious toleration. The chief participants were France and Sweden on one side and Spain and the Holy Roman Empire on the other. Although he had died before it met, the Peace of Westphalia represents a triumph of the policies of the duc de RICHELIEU. The sovereignty of the German states was recognized, as was that of the Netherlands and the Swiss Confederation. The empire was continued in name only. Sweden and France won important territories, and France emerged as the dominant European power.

West Point, U.S. military post on the Hudson R. N of New York City. An important fort during the AMERICAN REVOLUTION, since 1802 it has been the site of the UNITED STATES MILITARY ACADEMY.

West Virginia, E central state of the U.S.; bordered by Pennsylvania and Maryland (N), Virginia (E), and Kentucky and Ohio, which lies across the Ohio R. (W).

Area, 24,181 sq mi (62,629 sq km). *Pop.* (1990) 1,793,477, an 8% decrease from 1980 pop. *Capital,* Charleston. *Statehood,* June 20, 1863 (35th state). *Highest pt.,* Spruce Knob, 4,863 ft (1,483 m); *lowest pt.,* Potomac R., 240 ft (73 m). *Nickname,* Mountain State. *Motto, Montani Semper Liberi* [Mountaineers Are Always Free]. *State bird,* cardinal. *State flower, Rhododendron maximum,* or "Big Laurel." *State tree,* sugar maple. *Abbr.,* W.Va.; WV.

Land and People. West Virginia is very hilly and rugged. Nearly the entire state is in the Allegheny Plateau, except for the eastern panhandle, which is part of the Appalachian Plateau. The climate is generally humid, with hot summers (except in the high mountains) and cool-to-cold winters. Only about 36% of the population lives in urban areas, making West Virginia the nation's second most rural state (after Vermont). CHARLESTON is the largest city, followed by HUNTINGTON and WHEELING. In 1990 the state was over 96% white.

Economy. Because of the rugged terrain, farming is not extensive in most of the state. The leading agricultural commodities are cattle, dairy products, apples, turkeys, peaches, hay, and tobacco. The state has extensive mineral resources—only Kentucky produces more coal—and is the leading extractor of natural gas E of the Mississippi. These mineral resources are utilized by the state's industries, which manufacture machinery, chemicals, primary and fabricated metals (especially steel), and stone, clay, plastic, and glass products. About 65% of West Virginia is forested in valuable hardwoods, which support a major lumber industry. Tourism is growing, and White Sulphur Springs is a particularly popular destination.

Government. The constitution of 1872 provides for a governor elected to a four-year term. The legislature consists of a senate with 34 members elected to four-year terms and a house with 100 members elected for two years. The state is represented in the U.S. Congress by two senators and three representatives and has five electoral votes.

History. Among the remains of early MOUND BUILDERS, West Virginia's earliest inhabitants, are those preserved at Moundsville. Explorers and fur traders reached the area in the 1670s, and German families established (c.1730) the first European settlement. As additional settlers crossed the mountains to live in the area they eventually came into conflict with the French, a struggle which resulted in the last FRENCH AND INDIAN WAR (1754–63). Industrial development during the early 19th cent. was spurred by river traffic on the MISSISSIPPI and OHIO and by completion of the NATIONAL ROAD at Wheeling. Largely opposed to slavery, the residents of this portion of Virginia established (1863) a separate state after Virginia had seceded from the Union. During the early 20th cent. West Virginia experienced considerable industrial expansion, but also serious labor strife, especially in the coal mines. The economy declined severely by the 1960s. By the late 1970s West Virginia's mining sector boomed with the increased demand for coal, but during the 1980s energy prices and mine employment plummeted. The state saw a modest recovery by the early 1990s, however, as foreign investment, tourism, and the service sector grew.

wetlands, ecosystems in which the WATER TABLE is at or near the surface. They are divided into estuarine and freshwater systems and subdivided into bogs, SWAMPS, and marshes. Their sluggish water often creates a rich habitat for plants and wildlife, and they are spawning and feeding grounds for numerous animal species. Many wetlands were destroyed by urban growth and farming before their value was recognized, but environmental regulations and groups now attempt to protect or restore them.

Wettin [vĕt'ĭn], [German dynasty], the various branches of which ruled in Saxony, Thuringia, Poland, Great Britain, Belgium, and Bulgaria. The Wettins were margraves of Meissen from c.1100 and soon expanded into Saxony and Thuringia. In 1485 the dynasty split into the Albertine and Ernestine lines, various branches of which ruled until the 20th cent. From one of the Ernestine branches (Saxe-Coburg-Gotha) are descended the royal houses of Great Britain (through Prince Albert) and Belgium (through Leopold I).

Weyden, Roger van der [vī'dən], c.1400–1464, early Flemish master, known also as Roger de la Pasture. Believed to have studied with Robert CAMPIN, he was also influenced by Jan van EYCK. His portrayal of piety and of intangible emotions, e.g., in his *Descent from the Cross* (c.1435; Prado), is unsurpassed. His sculptural treatment of figures in the *Entombment* (Uffizi) and *Virgin and Child with Saints* (Frankfurt) bears a strong resemblance to Italian religious art of the time. His religious paintings and his portraits, e.g., of Francesco d'Este (Metropolitan Mus.), have simplicity and psychological penetration blended with the monumental. He had a highly individual style. His tradition was carried on by such painters as Dierick Bouts and Hans MEMLING.

whale, aquatic MAMMAL of the order Cetacea, found in oceans worldwide. Adapted to an entirely aquatic life, they have a fishlike shape, nearly hairless skin, an insulating layer of blubber, and flipperlike forelimbs; the tail is flattened horizontally and used for propulsion. Surfacing to breathe, whales expel air through a dorsal blowhole. They have good vision and excellent hearing, and many species use echolocation for underwater navigation. Most whales travel in schools, often migrating thousands of miles. There are two major groups of whales, the toothed, including the sperm whale (which DNA studies suggest is more closely related to baleen whales), killer whale, beluga (or white whale), and narwhal; and the toothless, or baleen, including the blue, finback, gray, right, humpback, and minke whales. Species vary greatly in size and include the largest animal that has ever lived, the blue whale, up to 100 ft (30 m) long and 150 tons. Commercial whaling has reduced all large species to endangered status. The intelligence and communication systems of the whale are subjects of scientific investigation.

whale shark: see SHARK; FISH.

Wharton, Edith (Newbold Jones), 1862–1937, American author; b. N.Y.C.; settled in France, 1913. Her works range widely, but she is particularly known for her subtle, ironic, and superbly crafted fictional studies of turn-of-the-century New York society, as in her best and most characteristic novels, *The House of Mirth* (1905) and *The Age of Innocence* (1920; Pulitzer). Wharton's many other novels include *The Valley of Decision* (1902), *The Custom of the Country* (1913), and *Hudson River Bracketed* (1929). Least characteristic, but most successful, of her works is the starkly tragic novella of New England, *Ethan Frome* (1911). Among Wharton's short-story collections are *Crucial Instances* (1901), *Certain People* (1930), and *Ghosts* (1937). She also wrote travel books, literary criticism, and poetry.

wheat, cereal plant (genus *Triticum*) of the GRASS family, a major food and an important commodity of the world GRAIN market. The plant is an annual (probably derived from a perennial) that grows best where the weather is cool during its early growth. Modern wheat varieties are usually classified as winter wheats (fall-planted and unusually winter-hardy) and spring wheats (spring-planted). Hard-kerneled varieties (hard wheats) yield flour with a high gluten content, used to make breads; soft-kerneled ones (soft wheats) are starchier, and their flour is used to make cakes and biscuits. Durum wheat is a very hard-kerneled wheat used in PASTA products. Wheat is also used in the manufacture of BEER and WHISKEY, and

the grain, the BRAN (the residue from milling), and the rest of the plant are valuable livestock feed. Wheat was one of the first grains to be cultivated: bread wheat was grown in the Nile R. valley by 5000 B.C. Major modern wheat-producing areas include the U.S., Canada, China, W Europe, Ukraine, Kazakhstan, Russia, India, Pakistan, and Australia.

Wheatley, Phillis, 1753?–84, American poet; brought from Africa, 1761. The first important African-American writer in America, she was the slave of a Boston merchant, who educated her. Her work includes *Poems on Various Subjects* (1773).

Wheatstone, Sir Charles, 1802–75, English physicist and inventor. He was coinventor of an electric telegraph and also invented an automatic transmitter, an electric recording device, and an automatic telegraph. Wheatstone is credited with inventing the concertina, improving the stereoscope and dynamo, and popularizing a method for the measurement of electric resistance using a network now known as the Wheatstone bridge.

wheel and axle: see MACHINE.

Wheeling, city (1990 pop. 34,882), seat of Ohio co., W.Va., in the Northern Panhandle, on the Ohio R.; settled 1769, inc. as a city 1836. It is a manufacturing and commercial center in a coal and natural-gas area. Industrial products include steel, chemicals, ceramics, glass, and textiles. Located on the site of a 1774 fort, Wheeling became the western terminus of the NATIONAL ROAD in 1818. It was the scene of the Wheeling Conventions (1861–62), which led to the creation of the state of West Virginia.

whelk, large marine SNAIL having a thick-lipped spiral shell with many protuberances, found in temperate waters. Whelks are scavengers and carnivores, feeding on crabs, lobsters, and other shellfish. The largest species, the knobbed whelk, grows up to 16 in. (40.6 cm).

Whig, English political party. The name was probably derived from *whiggamor* [cattle driver], a 17th-cent. term of abuse for Scottish Presbyterians. The party upheld the power of Parliament against the crown and was supported by the landed gentry and merchants against the aristocratic TORY group. The accession (1714) of GEORGE I began a long period of Whig control. The dominant figure until 1742 was Sir Robert WALPOLE, who gave the party political power and shaped modern British cabinet government. After the accession (1760) of GEORGE III, the Whigs were largely in opposition, and under the leadership of Charles James FOX became identified with dissent, industry, and social and parliamentary reform. Whig ministries under the 2d Earl GREY and Lord MELBOURNE were in power from 1830 to 1841 and passed the REFORM BILL of 1832. Thereafter the Whigs became part of the Liberal party.

Whig party, one of the two dominant political parties in the U.S. in the second quarter of the 19th cent. It grew out of the NATIONAL REPUBLICAN PARTY and several smaller groups, notably the ANTIMASONIC PARTY. Created primarily to oppose Andrew Jackson's DEMOCRATIC PARTY, it was beset by factions from the beginning and was never able to forge a unified, positive party position. Daniel WEBSTER and Henry CLAY were its great leaders, representing, respectively, the "Northern Whigs" and the Southern "Cotton Whigs." In 1840 they were able to unify behind a popular military hero, W.H. HARRISON, as a presidential candidate. He was elected but died after only a month in office. His successor, John TYLER, quickly alienated the Whig leaders in Congress and was read out of the party. In 1848 the Whigs elected another military hero, Zachary TAYLOR. He too died in office but his successor, Millard FILLMORE, remained a loyal party man. The party was already disintegrating, however, chiefly over the SLAVERY issue. The FREE-SOIL PARTY and its successor, the REPUBLICAN PARTY, absorbed most of the Northern Whigs. The Cotton Whigs went into the Democratic party. In 1852 Gen. Winfield SCOTT was the last Whig presidential candidate.

whippet, small, slender HOUND; shoulder height, 18–22 in. (45.7–55.8 cm); weight, c.20 lb (9 kg). Its smooth coat is usually white, tan, or gray. It was developed in England in the mid-18th cent. and used for coursing hares in an enclosed area. Today it is a race dog and a pet.

whippoorwill: see GOATSUCKER.

whiskey, spirituous liquor distilled from a fermented mash of grains, usually rye, barley, oats, wheat, or corn, and matured in wood casks, usually for three or more years. Inferior grades are made from potatoes, beets, or other roots. Scotch whisky, usually a blend, takes its dry, somewhat smoky flavor from the barley malt, cured with peat, used in its preparation. The somewhat similar Irish whiskey, for which no peat is used, has a full sweet taste. American whiskeys, classified as rye or as bourbon (a corn liquor), are higher in flavor and deeper in color than Scotch or Irish whiskeys. Canadian whiskey, characteristically light, is produced from cereal grain only. First distilled in monasteries in 11th-cent. England, whiskey has been manufactured commercially since the 16th cent.

Whiskey Rebellion, 1794, uprising by settlers W of the Alleghenies who opposed Alexander HAMILTON'S excise tax of 1791. The settlers regarded the tax as discriminatory and rioted against the tax collectors. Pres. WASHINGTON sent troops; they put down the rebellion easily and many arrests were made. Two rebels were convicted of treason, but the president pardoned them. The government's power to enforce its laws had been proved, but the FEDERALIST PARTY suffered politically.

Whiskey Ring, group of distillers and public officials who defrauded the U.S. government of liquor taxes. Soon after the Civil War, large distillers bribed government officials in order to retain tax proceeds. Only after the ring became a public scandal did the Treasury Dept. act. The distilleries were seized (May 1875), over $3 million in taxes was recovered, and eventually 110 persons were convicted. Pres. GRANT intervened to gain the acquittal of his personal secretary, O.E. Babcock.

Whistler, James Abbott McNeill, 1834–1903, American painter; b. Lowell, Mass. In 1855 he went to Paris, where he acquired an appreciation of works by VELÁZQUEZ and Japanese prints, both of which influenced the color and design of much of his work. He settled in London in 1859 and became known as an etcher, wit, and dandy. To publicize his credo of art for art's sake, he resorted to elaborate exhibits, polemics, and lawsuits. Toward the end of his life, he won recognition for his admirable drafts manship, exquisite color, and great technical proficiency. In order to deemphasize the subjective content of his paintings, he called them by abstract titles, e.g., *Arrangement in Gray and Black* (the famed portrait of his mother, 1872; Louvre). A superb etcher, Whistler also excelled in lithography, watercolor, and pastel. In addition, he wrote brilliant critical essays and influenced art theory in works like *Ten O'Clock* (1888). The most representative collection of his work is in the Freer Gallery of Art (Wash., D.C.), which contains his "Peacock Room."

James Whistler's Arrangement in Gray and Black, *1872*

Whitby, Synod of: see CELTIC CHURCH.

White, Andrew Dickson, 1832–1918, American educator and diplomat; b. Homer, N.Y. As chairman (1864–67) of the New York state

senate education committee, he founded, with Ezra CORNELL, Cornell Univ., devoted to practical higher education, including agriculture and the mechanical arts. Desiring an institution free of attachments to all sects and parties, White endorsed a system of free elective studies at Cornell. His writings include *History of the Warfare of Science with Theology in Christendom* (1896).

White, Edward Douglass, 1845–1921, associate justice (1894–1910) and 9th chief justice (1910–21) of the U.S. SUPREME COURT; b. Lafourche parish, La. He was judge of the Louisiana supreme court (1879–80) and a U.S. senator (1891–94). On the U.S. Supreme Court he was generally conservative in his decisions, and he is best known for his "rule of reason" opinions in the antitrust cases against the Standard Oil and American Tobacco companies in 1911.

White, Edward Higgins, II, 1930–67, American astronaut; b. San Antonio. While serving as pilot of *Gemini 4* (June 3–7, 1965), he became the first American to perform extravehicular activity. He had been selected to be command-module pilot for the first manned Apollo flight, but was killed with crewmates Virgil Grissom and Roger Chaffee on Jan. 27, 1967, when a fire occurred in the spacecraft during a preflight ground test.

White, E(lywn) B(rooks), 1899–1985, American writer; b. Mt. Vernon, N.Y. A witty, satiric observer of contemporary society, he wrote for the *New Yorker.* In addition to light, humorous verse, his works include *Is Sex Necessary?* (with James THURBER, 1929), *One Man's Meat* (1942), and *Here Is New York* (1949). Among White's children's books are *Stuart Little* (1945) and *Charlotte's Web* (1952).

White, Patrick, 1912–90, Australian novelist; b. London. He spent a life farming in the Australian outback and writing in a hypnotically descriptive style about the suffering of extraordinary people. His novels include *The Happy Valley* (1939), *Voss* (1957), *The Eye of the Storm* (1974), *A Fringe of Leaves* (1977), and *The Twyborn Affair* (1980). He was awarded the 1973 Nobel Prize in literature.

White, Stanford, 1853–1906, American architect; b. N.Y.C. In 1879 he entered with C.F. MCKIM and William R. Mead into a partnership that influenced architecture over a long period. White's special talent was in interior design and furnishing, and the decorative aspects of a building. His two surviving New York City works, the Washington Arch and the Century Club, reveal his interest in Renaissance ornament. White was shot and killed in Madison Square Garden by Harry K. Thaw because of his affair with Thaw's wife, Evelyn Nesbit Thaw.

White, T(erence) H(anbury), 1906–64, English author; b. India. His tetralogy *The Once and Future King* (1939–58) is a dramatic, idiosyncratic retelling of the ARTHURIAN LEGEND. He also wrote *The Goshawk* (1951) and *A Book of Beasts* (1954).

White, William Allen, 1868–1944, American author; b. Emporia, Kans. As editor of the Emporia *Gazette* (1895–1944) he was a spokesman for grass-roots liberal Republicanism. White also wrote fiction, biographies of Woodrow WILSON and Calvin COOLIDGE, and an autobiography (1946).

white dwarf, in astronomy, star that is abnormally faint for its white-hot temperature. It has the mass of the sun, the radius of the earth, and a central density about one million times that of water. White dwarfs have exhausted their nuclear fuel and represent one of the final stages of STELLAR EVOLUTION (see also GRAVITATIONAL COLLAPSE).

Whitefield, George, 1714–70, English evangelistic preacher, leader of the Calvinistic Methodist church. At Oxford he joined the Methodist group led by John and Charles WESLEY. Beginning in 1738 he made seven trips to America, where he was influential in the GREAT AWAKENING. After becoming an Anglican priest, he adopted (c.1741) Calvinistic views, especially concerning predestination. He broke with the Wesleys and led the Calvinistic Methodists, who were numerous in Wales. Whitefield continued to draw great throngs on his evangelistic tours. He died in Newburyport, Mass.

Whitehead, Alfred North, 1861–1947, English mathematician and philosopher. He taught mathematics at the Univ. of London (1911–24) and philosophy at Harvard Univ. (after 1924). *Principia Mathematica* (3 vol., 1910–13), which he wrote with Bertrand Russell, is a landmark in the study of logic. His inquiries into the structure of science provided the background for his metaphysical work. His "philosophy of organism" (for which he developed a special vocabulary) viewed the universe as consisting of processes of becoming, and God as interdependent with the world and developing from it. His many works include *Science and the Modern World* (1925) and *Process and Reality* (1929).

Whitehorse, city (1991 pop. 17,925), capital of Yukon Territory, NW Canada, on the Yukon R. Developed as an important supply center during the KLONDIKE gold rush (1897–98), it is now chiefly an administrative and tourist center for surrounding mining, fur-trading, and hunting areas. Whitehorse replaced DAWSON as the territorial capital in 1952.

White House, official name of the mansion of the president of the U.S., on Pennsylvania Ave., Washington, D.C. It was designed by James HOBAN on a site chosen by George WASHINGTON and begun in 1792. John ADAMS was the first president to live there. After it was burned (1814) by the British, it was restored and painted white. It had, however, been called the "White House" earlier. Theodore Roosevelt made the name official. Of Virginia freestone, it is simple and stately, four stories high and about 170 ft (52 m) long by 85 ft (26 m) wide. On the north front, forming the main entrance, is a portico of Ionic columns reaching from ground to roof pediment. It is balanced by a semicircular colonnaded balcony on the south. The east and west terraces, executive office (1902), and east wing (1942) have been added. Large receptions are usually held in the East Room. The elliptical Blue Room is the scene of many social and official receptions. The grounds cover about 18 acres (7 hectares).

Whiteman, Paul, 1891–1967, American conductor; b. Denver. In 1924 he inaugurated "symphonic jazz" by introducing GERSHWIN's *Rhapsody in Blue.* He also encouraged the writing of concert JAZZ.

White Russia: see BELARUS.

White Sands, desert area, S central N.Mex., site of a major U.S. missile-testing range. On July 16, 1945, the first atomic bomb was exploded there at Holloman Air Force (formerly Alamogordo Air) Base. The area includes a national monument and a wildlife refuge.

white shark: see SHARK.

Whitlam, (Edward) Gough, 1916–, Australian prime minister (1972–75). His Labor government was plagued by economic problems and in 1975, during a budget crisis, he was dismissed by Governor General Sir John Kerr. Defeated (1975, 1977) at the polls, he retired from politics in 1978.

Whitman, Marcus, 1802–47, American Protestant missionary in the Oregon country; b. Federal Hollow (later Rushville), N.Y. A physician, he founded (1836) a mission at Waiilaptu. He returned East but in 1843 was part of the "great emigration" over the OREGON TRAIL. He was killed by the Cayuse.

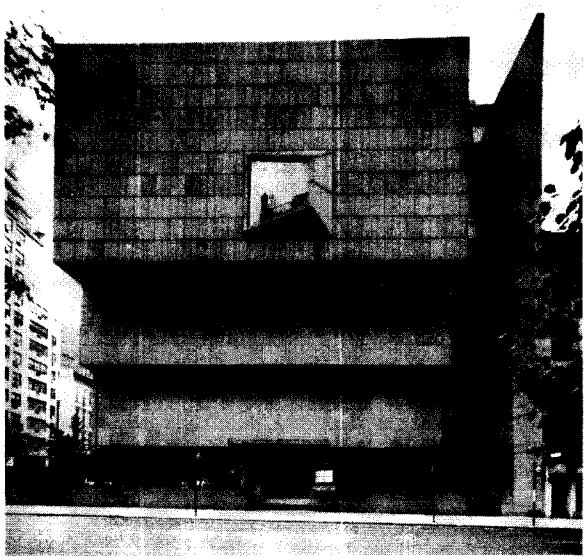
Whitman, Walt(er), 1819–92, one of the greatest American poets; b. West Hills, N.Y. Early in his life he worked as a printer, teacher, newspaper editor, and carpenter. In 1855 he published the volume that was to make his reputation, *Leaves of Grass* (containing the emblematic "Song of Myself"), which the poet continued to enlarge and revise through a number of editions until his death. Innovative in its use of rhythmical free verse and its celebration of sexuality, the book in time proved the single most influential volume of poems in American literary history. In its own day, however, only a few, notably EMERSON, recognized its genius. Whitman worked as a Civil War nurse (1862–65), publishing war poetry in *Drum-Taps* (1865) and *Sequel to Drum-Taps* (1865–66). His later works include the prose collections *Democratic Vistas* (1871). A semi-invalid after a stroke in 1873, he lived in Camden, N.J. Whitman, who inspired later poets to experimentation in both prosody and subject matter, was the preeminent celebrator of individual freedom and dignity, democracy, and human brotherhood.

Whitney, Eli, 1765–1825, American inventor of the COTTON GIN; b. Westboro, Mass. He completed (1793) a model gin that rapidly separated the fiber of short-staple cotton from the seed. Whitney was unable to meet the demand for the machine, and his 1794 patent received legal protection only from 1807 to 1812. Thus the invention, which created great wealth for others who copied his model, gained him little. In 1798 he began producing the first firearms with standardized, interchangeable parts.

Whitney, Mount, second highest peak in the U.S. (after Mt. McK-

inley, Alaska), in the Sierra Nevada, central Calif. It is 14,491 ft (4,417 m) high and was named for the U.S. geologist Josiah D. Whitney, who surveyed it in 1864.

Whitney Museum of American Art, N.Y.C., founded 1930 by Gertrude Vanderbilt Whitney; opened 1931. The museum actively supports American art through the purchase and exhibition of work by living artists. Its extensive collection is housed in a building designed by Marcel BREUER and opened in 1966.



The Whitney Museum of American Art

Whittier, John Greenleaf, 1807–92, American poet; b. near Haverhill, Mass. A Quaker, he was a vigorous and politically powerful abolitionist editor and writer, especially from 1833 to 1840. After the Civil War he devoted himself completely to poetry. Although he often celebrated the common people, as in *Songs of Labor* (1850), his best work, e.g., *Moll Pitcher* (1832), *Snow-bound* (1866), and *Maud Muller* (1867), pictures the life, history, and legends of New England. Such poems as "Barbara Frietchie," "Marguerite," and "The Barefoot Boy," as well as his nearly 100 hymns, made Whittier one of the most popular poets of his time.

Whittington, Richard, 1358–1423, English merchant and three-time lord mayor of London. He made his fortune as a mercer and supplied large loans to HENRY IV and HENRY V. A legend later arose that Whittington gained his fortune when his cat was sold to the ruler of Morocco.

whooping cough or **pertussis,** highly communicable, infectious disease, predominantly of childhood. The early stage is manifested by symptoms of an upper respiratory infection; after about two weeks, a series of paroxysmal coughs are followed by a characteristic high-pitched "whoop" as a breath is taken. A serious disease, whooping cough may give rise to such complications as PNEUMONIA, convulsions, and brain damage; infants should be immunized against the disease as early as possible.

Whorf, Benjamin Lee, 1897–1941, American linguist and anthropologist; b. Winthrop, Mass. A significant figure in Mayan and Aztec LINGUISTICS, he also collaborated with Edward SAPIR to develop the Sapir-Whorf hypothesis, or linguistic relativity principle. It posits language as an array of formal categories that group experiences into usable classes, vary across cultures, and influence thought.

Wichita, indigenous people of the Plains (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with a Caddoan language of the Hokan-Siouan stock (see NATIVE AMERICAN LANGUAGES). They once lived in Kansas, ranging into Oklahoma and Texas. Distinctive features of their culture were conical grass houses and a horn dance for land fertility. By 1765 they had been forced into Oklahoma by hostile tribes; later, reduced by smallpox to 2,500, they occupied the site of Wichita, Kansas. After ceding their lands to the U.S (1872), they were settled on an Oklahoma reservation. In 1990 there were 1,275 Wichitas in the U.S.

Wichita, city (1990 pop. 304,011), seat of Sedgwick co., south-central Kans., on the Arkansas and Little Arkansas rivers; inc. 1870. The largest city in the state, it is the commercial and industrial center of S Kansas. Besides its huge aircraft industry, it has railroad shops, flour mills, meat-packing houses, and various manufactures. Founded (1868) on the site of a WICHITA village, it boomed as a cow town in the 1870s; oil was discovered nearby in 1915.

wickiup: see TEPEE, WICKIUP, AND WIGWAM.

Wickliffe, John: see WYCLIF, JOHN.

Wiclif, John: see WYCLIF, JOHN.

Wieland, Christoph Martin [vē'länt], 1733–1813, German poet and novelist. In an elegant rococo style, he treated themes from antiquity and fairy tales, e.g., *Oberon* (1780). His political satires include *The Golden Mirror* (1772) and *The Republic of Fools* (1774). Wieland also edited the influential literary journal *Teutsche Merkur* (1773–1810) and translated SHAKESPEARE.

Wiener, Norbert, 1894–1964, American mathematician and educator; b. Columbia, Mo. Known for his theory of CYBERNETICS and his contributions to the development of computers and calculators, Wiener also did research in probability theory and the foundations of mathematics.

Wiesel, Elie, 1928–, Romanian-American writer; b. Sighet, Romania. At 16 he was imprisoned in Nazi concentration camps at Auschwitz and Buchenwald, where his family perished. After the war, he studied at the Sorbonne. In the 1950s he was a correspondent for Israeli, American, and French newspapers. He became a U.S. citizen in 1963. The autobiographical novel *Night* (1958) recounts the horrors he witnessed as a death camp inmate. His novels, plays, retellings of biblical stories, and collections of Hasidic tales have focused on the importance of remembering the Holocaust. He was awarded the Nobel Peace Prize in 1986.

Wiggin, Kate Douglas (Smith), 1856–1923, American author; b. Philadelphia. An organizer of the kindergarten movement, she wrote such popular children's books as *Timothy's Quest* (1890) and *Rebecca of Sunnybrook Farm* (1903).

Wigglesworth, Michael, 1631–1705, American poet; b. England; came to New England, 1638. A Puritan clergyman, he wrote didactic verse, e.g., *Day of Doom* (1662), that reflects his dedication to his austere faith.

Wight, Isle of [wīt], island county (1991 pop. 126,600), 147 sq mi (381 sq km), S England. The island, which is a popular summer resort, is 23 mi (37 km) long and 13 mi (21 km) wide. The chief towns are Newport, the capital, and Cowes, a famous yachting center. Conquered (A.D. 43) by the Romans, it was (10th cent.) the Danish headquarters, and was taken by the English crown in 1293.

wigwam: see TEPEE, WICKIUP, AND WIGWAM.

Wilberforce, William, 1759–1833, British statesman and humanitarian. A friend of the younger William PITT, he secured passage (1807) of a bill abolishing the slave trade, and worked to suppress slavery in the British Empire. His son, **Samuel Wilberforce,** 1805–73, was bishop of Oxford from 1845 and of Winchester from 1869. He was influential in restoring ecclesiastical authority to English church conventions.

Wilbur, Richard, 1921–, American poet; b. N.Y.C. His skillfully crafted, original, and often wittily intellectual verse is collected in such volumes as *Things of This World* (1956; Pulitzer) and *The Mind-Reader* (1976).

wild carrot: see QUEEN ANNE'S LACE.

Wilde, Oscar (Oscar Fingall O'Flahertie Wills Wilde), 1854–1900, Irish writer. A follower of PATER and RUSKIN, he glorified beauty for itself alone. His genius was best expressed in his superbly witty plays, particularly *The Importance of Being Earnest* (1895). In his only novel, *The Picture of Dorian Gray* (1891), a young man is corrupted by sensual indulgence and moral indifference. Wilde's poems *The Ballad of Reading Gaol* (1898) and *De Profundis* (1905) were inspired by the prison term (1895–97) he served because of his homosexuality. He also wrote short stories, fairy tales, and essays.

wildebeest: see GNU.

Wilder, Billy, 1906–, American film director, producer, and writer;

b. Austria. He won Academy Awards for *The Lost Weekend* (1945), *Sunset Boulevard* (1950), and *The Apartment* (1960). Among his other films are *Stalag 17* (1953), *Some Like It Hot* (1959), and *Fedora* (1979).

Wilder, L(awrence) Douglas, 1931–, African-American political leader; b. Richmond, Va. In 1969 he won election (as a state senator) to the Virginia legislature, the first African American to do so since RECONSTRUCTION. He later served as Virginia's lieutenant governor (1986–90) and governor (1990–94); in the latter post he became the first elected African-American governor in the U.S.

Wilder, Thornton (Niven), 1897–1975, American author; b. Madison, Wis. His plays and novels maintain that true meaning and beauty are found in ordinary experience. His first important work was the novel *The Bridge of San Luis Rey* (1927; Pulitzer). Among his other novels are *The Cabala* (1926), *The Woman of Andros* (1930), and *Theophilus North* (1973). A serious and original dramatist who often used nonrealistic theatrical techniques, Wilder achieved critical recognition with the classic play *Our Town* (1938; Pulitzer). His other plays include *The Skin of Our Teeth* (1942; Pulitzer) and *The Matchmaker* (1954).

Wilderness campaign, in the U.S. CIVIL WAR, a series of engagements (May–June 1864) fought in the Wilderness region W of Fredericksburg, Va. Union Gen. U.S. GRANT attempted to clear the wild woodland prior to his planned attack on the main Confederate army of Gen. R.E. LEE. But Lee attacked first and a series of bloody encounters resulted, especially at Spotsylvania Courthouse (May 8–19). Grant then assaulted a strongly entrenched Confederate force at Cold Harbor and was repulsed with horrible slaughter. After losing 60,000 soldiers, Grant withdrew and moved against Petersburg.

Wilderness Road, principal route of westward U.S. migration, c.1790–1840. Running from Virginia through the CUMBERLAND GAP to the OHIO R., it was blazed in 1775 by Daniel BOONE. Abandoned after the building of the NATIONAL ROAD, its route is traced by part of U.S. 25, the Dixie Highway.

wildlife refuge, haven or sanctuary for animals in an area of land or land and water set aside and maintained for their preservation and protection. In the U.S. game laws were passed in various states as early as the late 17th cent. Modern wildlife-conservation policy began with a conference called by Pres. Theodore ROOSEVELT in 1908 to inventory the nation's natural resources. Recent legislation includes the Endangered Species Acts of 1966, 1969, and 1973. Today the U.S. Wildlife Refuge System, administered by the Fish and Wildlife Service, comprises 503 areas nationwide to protect big game (e.g., bison, bighorn sheep, and elk); small game; waterfowl; and colonial nongame birds such as pelicans, terns, and gulls. Most numerous are waterfowl refuges, which supply areas for breeding, wintering, resting, and feeding along major flyways during MIGRATION. Refuges have also been established by private individuals and societies such as the Nature Conservancy and National Audubon Society. Other countries also maintain parks, refuges, and game preserves. See also INTERNATIONAL UNION FOR THE CONSERVATION OF NATURE AND NATURAL RESOURCES.

wild rice, tall aquatic plant (*Zizania aquatica*) of the GRASS family, of a genus separate from common RICE (*Oryza*). Wild rice is a hardy annual with broad blades, reedy stems, and large terminal panicles. It grows in shallow water along the margins of ponds and lakes in the N U.S. and S Canada; certain varieties also grow in the South. The seed was long harvested from the wild by primitive methods, but newer strains have permitted cultivation. It was an important food of some Native Americans, especially in the Great Lakes region.

Wilhelmina, 1880–1962, queen of the NETHERLANDS (1890–1948), daughter of WILLIAM III. Her mother, Emma of Waldeck-Pyrmont, was regent until 1898. Wilhelmina married (1901) Prince Henry of Mecklenburg-Schwerin (d. 1934). When the Germans invaded the Netherlands (1940) in World War II she and her government fled to England. She returned in 1945, later abdicating in favor of her daughter, JULIANA.

Wilkes, Charles, 1798–1877, American naval officer and explorer; b. N.Y.C. In command of a government exploring expedition, he circled the globe (1838–42) with a group of scientists. They did research in the S PACIFIC and explored the Antarctic. As commander of the *San Jacinto* during the CIVIL WAR, he removed two Confederate officials from the British ship *Trent,* which almost caused the U.S. and Britain to go to war (see TRENT AFFAIR).

Wilkes, John, 1727–97, English politician and journalist. Entering Parliament in 1757, Wilkes attacked GEORGE III in his periodical the *North Briton,* and was expelled (1764) and imprisoned. Although repeatedly reelected, he was not allowed to take his seat until 1774. He then defended the liberties of the American colonies. Although a demagogue, Wilkes is remembered as a champion of freedom.

Wilkins, Sir George Hubert, 1888–1958, British explorer; b. Australia. After several arctic expeditions, he was the first to explore the region by air (1928), traveling from ALASKA to Spitsbergen. He was knighted that same year. In 1931 he headed an arctic submarine expedition.

Wilkins, Roy, 1901–81, African-American social reformer and civil-rights leader; b. St. Louis, Mo. As leader (1931–77) of the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE, Wilkins tirelessly advanced the cause of racial equality achieved through constitutional means, opposing both white supremacy and African-American separatism. He is credited by many as the principal architect of school desegregation and the 1964 Civil Rights Act.

Wilkinson, James, 1757–1825, American general; b. Calvert co., Md. He served in the AMERICAN REVOLUTION and was implicated in the Conway Cabal to remove WASHINGTON as commander in chief. Later he was a key figure in the conspiracy to split off the Southwest as a separate republic allied to Spain. Although in the pay of Spain himself, he was the chief government witness (1807) at the treason trial of Aaron BURR, and narrowly missed indictment.

will, in philosophy and psychology, term used to describe the faculty of mind that is alleged to stimulate motivation of purposeful activity. The concept has been variously interpreted by philosophers, some accepting will as a personal faculty or function (e.g., PLATO, ARISTOTLE, THOMAS AQUINAS, DESCARTES, and KANT) and others seeing it as the externalized result of the interaction of conflicting elements (e.g., SPINOZA, LEIBNIZ, and HUME). Still others describe will as the manifestation of personality (e.g., HOBBES, SCHOPENHAUER, and NIETZSCHE). The reality of individual will is denied altogether by the theological doctrine of determinism (see FREE WILL). Modern psychology considers the concept unscientific and has looked to other factors, such as unconscious motivation or physiological influence, to explain human actions.

Willard, Emma, 1787–1870, American educator, pioneer in women's education; b. Emma Hart, in Berlin, Conn. She founded (1821) Troy Female Seminary to offer collegiate education to women and new opportunity to women teachers. She published history textbooks and worked to improve common schools and women's education.

Willard, Frances, 1838–1898, American educator and temperance leader; b. Churchville, N.Y. She believed women could gain political power through the temperance crusade. As president of the Women's Christian Temperance Union, she supported women's suffrage. She helped found the Prohibition party (1882) and wrote *Women and Temperance* (1883).

William, emperors of Germany. **William I,** 1797–1888, emperor of Germany (1871–88) and king of Prussia (1861–88), was an essentially conservative ruler. Upon assuming the crown he set about reorganizing the army. When this met with opposition from parliament, he appointed (1862) Otto von BISMARCK prime minister. and was thereafter guided almost completely by Bismarck, who suppressed all opposition to the king and himself. Prussia began its series of military triumphs: the Danish war over SCHLESWIG-HOLSTEIN (1864), the Austro-Prussian War (1866), and the Franco-Prussian War (1870–71). Upon the surrender of NAPOLEON III, Bismarck had William crowned emperor of a unified Germany. William's rule was crucial in modern history, for it saw the rise of Germany as a great European power. **William II,** 1859–1941, emperor of Germany and king of Prussia (1888–1918), son and successor of Frederick III (r. March–June 1888), was the grandson of William I of Germany and Queen Victoria of England. His overbearing character soon clashed with that of Bismarck, whom he dismissed in 1890. Thereafter he was the dominant force in German affairs. His naval, colonial, and commercial aspirations an-

tagonized Great Britain, France, Russia, and the United States, however, and his support of Austria's Balkan policy was a direct cause of WORLD WAR I. The Allies insisted on his abdication (1918) after the defeat of Germany. He lived in exile in the Netherlands.

William, kings of England. **William I** or **William the Conqueror,** 1027?–1087 (r.1066–1087), was the illegitimate son of Robert I, duke of Normandy, and succeeded to the dukedom in 1035. While visiting (1051) England, he was probably named by his cousin EDWARD THE CONFESSOR as successor to the throne, and in 1064 he extracted a promise of support from HAROLD, then earl of WESSEX. In 1066, hearing that Harold had been crowned king of England, William raised an army and crossed the Channel. He defeated and slew Harold at HASTINGS and was crowned king. William immediately built castles and harshly put down the rebellions that broke out; by 1072 the military part of the NORMAN CONQUEST was virtually complete. He substituted foreign prelates for many English bishops, and land titles were redistributed on a feudal basis (see FEUDALISM) to his Norman followers. After 1075 he dealt frequently with continental quarrels. William ordered a survey (1085–86) of England, the results of which were compiled as the DOOMSDAY BOOK. He was one of the greatest English monarchs and a pivotal figure in European history. His son Robert II succeeded him in Normandy, while another son, **William II** or **William Rufus,** d. 1100 (r.1087–1100), succeeded him in England. William II had utter contempt for the English church and extorted large sums of money from it. He occupied Normandy when Robert II left on a crusade, and gained control (1097) of the Scottish throne. He was killed while hunting, and his death may not have been an accident. His brother HENRY I succeeded him. **William III,** 1650–1702, king of England, Scotland, and Ireland (1689–1702), was the son of William II, prince of Orange. He became stadtholder of the Netherlands in 1672 and fought in the DUTCH WAR of 1672–78. In 1674 he made peace with England and married (1677) Mary, the Protestant daughter of James, duke of York (later JAMES II of England). After James's accession, William kept in contact with the king's opponents and in 1688 was invited by them to England. He landed with an army and brought about the GLORIOUS REVOLUTION. James was allowed to escape, and William accepted (1689) the offer of Parliament and reigned jointly with his wife, MARY II. William also accepted the BILL OF RIGHTS (1689), which greatly reduced royal power. He defeated (1690) the exiled James at the battle of the Boyne in Ireland and was involved in continental wars until LOUIS XIV recognized him as king in 1697. In England he relied increasingly on WHIG ministers, who were responsible for the establishment (1694) of the Bank of England and the policy of a national debt. William's popularity was diminished after the death (1694) of his childless wife and by the War of the SPANISH SUCCESSION. He was succeeded by Queen ANNE. **William IV,** 1765–1837, king of Great Britain and Ireland (1830–37), was the third son of GEORGE III. Generally passive in politics, he reluctantly gave his promise to the 2d Earl GREY to create, if necessary, enough peers to pass the REFORM BILL of 1832. Political leadership was left to the duke of WELLINGTON, Earl Grey, Viscount MELBOURNE, and Sir Robert PEEL. Good-natured but eccentric, William was only moderately popular. He was succeeded by his niece VICTORIA.

William, kings of the Netherlands and grand dukes of Luxembourg. **William I,** 1772–1843 (r.1815–40), was the son of Prince William V of Orange. He led the Dutch army (1793–95) in the FRENCH REVOLUTIONARY WARS. In 1815 the Congress of VIENNA made him first king of the NETHERLANDS; his domain included BELGIUM and LUXEMBOURG. Belgium rebelled in 1830 (see LONDON CONFERENCE). Forced to liberalize the Dutch constitution, he abdicated. **William II,** 1792–1849 (r.1840–49), was the son of William I. He led (1830) the Dutch army against the Belgians. As king he was compelled to grant (1848) further constitutional reforms. **William III,** 1817–90 (r.1849–90), was the son of William II. He ruled as a constitutional monarch in cooperation with the States-General. On his death his daughter, WILHELMINA, became queen of the Netherlands, and Luxembourg passed to Duke Adolf of Nassau.

William, king of Scotland: see WILLIAM THE LION.

William I, prince of Orange: see WILLIAM THE SILENT.

William of Occam or **Ockham,** c.1285–1349, English philosopher. An exponent of SCHOLASTICISM, he was charged (1324) with heresy by Pope John XXII and fled (1328) to the protection of the pope's great enemy, Holy Roman Emperor Louis IV; his political writings thereafter supported the temporal power of the emperor over that of the pope. Occam's teachings mark an important break with previous medieval philosophy. Adhering to the position of NOMINALISM, he rejected the Aristotelian REALISM of St. Thomas Aquinas, specifically denying the existence of universals except in people's minds and language. He disputed the self-evidence of the Aristotelian final cause and of the existence of God, denying the competence of reason in matters of faith. This led him to hold that logic can be studied outside the province of metaphysics, a position that proved important in the development of scientific enquiry. In logic, Occam is remembered for his use of the principle of parsimony, formulated as "Occam's razor," which enjoined economy in explanation with the axiom "It is vain to do with more what can be done with less."

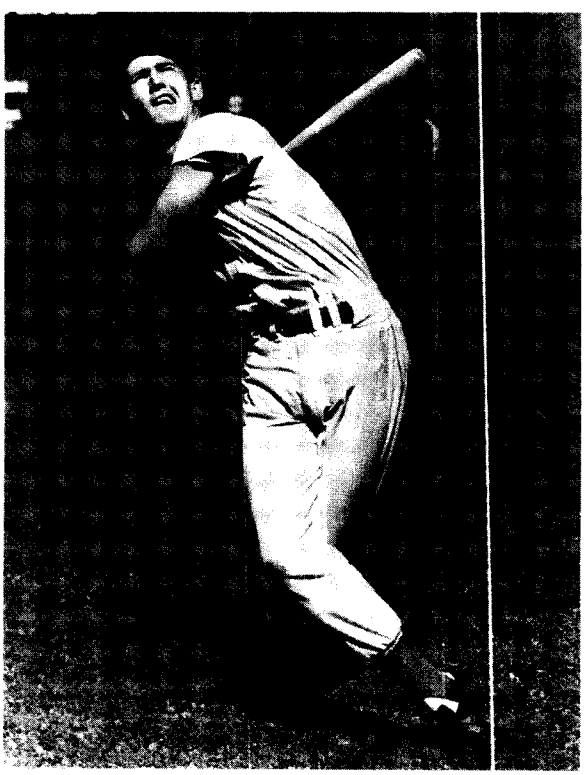
William of Orange. For William I, prince of Orange see WILLIAM THE SILENT; for William III, king of England, see under WILLIAM, kings of England.

Williams, Eric, 1911–81, Trinidadian scholar and politician. Having received his doctorate from Oxford (1938), he left a teaching post at Howard Univ. to foster Caribbean nationalism. He founded the People's National Movement (1956) and served as prime minister of Trinidad and Tobago from independence (1962) until his death.

Williams, Hank, 1923–53, American country singer and songwriter; b. near Georgiana, Ala. He is one of the most important figures in country music's history. His melancholy voice and powerful, simply written songs continue to attract fans.

Williams, Roger, c.1603–1683, American colonial clergyman, advocate of religious freedom, founder of RHODE ISLAND; b. England. Banished by the Puritans from Massachusetts, he established PROVIDENCE in 1636 and welcomed religious dissenters there. In 1654 he became president of the combined colonies of Providence, Newport, Narragansett, and Warwick. He was a trusted friend of the indigenous tribes.

Williams, Ted (Theodore Samuel Williams), 1918–, American baseball player; b. San Diego. One of the finest natural hitters the game has ever known, he played (1939–60) with the Boston Red Sox



Ted Williams

The key to pronunciation appears on page xiii.

continuously, except for military service in World War II and Korea. The tall, left-handed-hitting outfielder, known as the "Splendid Splinter," led the American League in batting six times and in home runs four times. He was the last player to bat over .400 (.406 in 1941). His career totals included a batting average of .344 and 521 home runs. Williams managed the Washington Senators (later, Texas Rangers) from 1969 to 1972.

Williams, Tennessee (Thomas Lanier Williams), 1914–83, one of America's foremost playwrights; b. Columbus, Miss. His poetic dramas, filled with tension and brilliant dialogue, explore society's passions and frustrations. He scored his first successes with *The Glass Menagerie* (1945) and *A Streetcar Named Desire* (1947; Pulitzer). His other plays include *Cat on a Hot Tin Roof* (1955; Pulitzer), *Sweet Bird of Youth* (1959), *The Night of the Iguana* (1961), and *Small Craft Warnings* (1972). Williams also wrote short stories, two novels, verse, and his *Memoirs* (1975).

Williams, William Carlos, 1883–1963, one of the most important modern American poets; b. Rutherford, N.J. A practicing physician, Williams was an acute observer of American life. In his mature verse he developed a lucid, vital style reflecting idiomatic speech and faithful to ordinary things seen and heard. His books of poetry include *Collected Poems* (1934), *Pictures from Brueghel* (1963; Pulitzer), and his major work, the five-volume philosophical poem *Paterson* (1946–58). Williams also wrote critical essays, e.g., *In the American Grain* (1925); short stories; plays; and novels.

Williamsburg, city (1990 pop. 11,530), SE Va., on a peninsula between the James and York rivers; settled 1632 as Middle Plantation, laid out and renamed 1699, inc. 1722. It is a great tourist attraction. Capital of Virginia from 1699 to 1779, it later declined, but in 1926 large-scale restoration began: hundreds of buildings were removed, renovated, or rebuilt, and today Williamsburg retains its colonial appearance. William and Mary College (founded 1693) is located there.

William the Lion, 1143–1214, king of Scotland (1165–1214). William aided the rebellion in England of HENRY II's sons, but was captured by Henry and forced to sign (1174) the treaty of Falaise, which made Scotland a feudal possession of England. In 1189 he bought an annulment of the treaty from RICHARD I. His alliance (1168) with LOUIS VII of France started the long French-Scottish friendship.

William the Silent or **William of Orange** (William I, prince of Orange), 1533–84, principal founder of Dutch independence. A member of the house of NASSAU, he inherited (1544) the principality of Orange, in S France, and was made (1555) stadtholder of Holland, Zeeland, and Utrecht. He opposed repression of the NETHERLANDS by PHILIP II of Spain and helped form the GUEUX party (1566). The duke of ALBA was sent to put down the rebellion (1567), while William, in exile, raised an army to drive the Spanish out. In 1576 the provinces of the Netherlands united under William, but in 1580 he was forced to seek the aid of FRANCIS, duke of Alençon and Anjou. Philip put a price on William's head in 1581, and at a critical stage of the independence struggle he was assassinated.

Willkie, Wendell Lewis, 1892–1944, American political leader; b. Elwood, Ind. A lawyer and head of a giant utility company, he became the unexpected Republican candidate for president in 1940. An opponent of isolationism, he supported F.D. ROOSEVELT's foreign policy but attacked NEW DEAL domestic programs. He attempted to liberalize the REPUBLICAN PARTY.

willow, common name for some members of the family Salicaceae, deciduous trees or shrubs of worldwide distribution. The family comprises the willows and poplars and is typified by male and female flowers borne in catkins on separate plants. The narrower-leaved willows (genus *Salix*) flourish in cold, wet ground. The weeping willow (*S. babylonica*), native to China, and the North American pussy willow (*S. discolor*), with silky catkins, are cultivated as ornamentals. The poplars (genus *Populus*), including the cottonwoods and aspens, usually have heart-shaped or ovate leaves. The white, or silver, poplar (*P. alba*), a popular ornamental native to Eurasia, is now naturalized in North America. The cottonwoods, also called poplars, typically have seeds covered with fibrous coats, which when released at maturity clump together in cottony balls. The quaking aspen (*P. termuloides*), of the mountains of the W U.S., has leaves that quiver in the slightest breeze. Large stands of aspen trees often consist of one or two clones connected at the roots. The yellow poplar, or tulip tree, is an unrelated plant of the MAGNOLIA family.

Wills, Helen Newington, 1906–, American tennis player; b. Alameda co., Calif. Generally considered to have been the foremost woman tennis player of her era, she won the U.S. singles title seven times between 1923 and 1931 and the British singles title eight times between 1927 and 1938.

Wilmington, city (1990 pop. 71,529), seat of New Castle co., NE Del., on the Delaware R. and the Christina and Brandywine streams; settled 1638, inc. as a city 1832. E.I. DU PONT's first powder mill was established on the Brandywine in 1802, and the city grew into a great chemical center. Delaware's largest city and a thriving port, it has many company headquarters and diverse industries and is also a financial center. The city has been Swedish (1638), Dutch (1655), and British (1664). Old Swedes Church (1698) and the nearby Hagley and Winterthur museums and Longwood Gardens are of particular interest.

Wilmot, John: see ROCHESTER, JOHN WILMOT, 2D EARL OF.

Wilmot Proviso, 1846, amendment to a bill put before the U.S. House of Representatives during the MEXICAN WAR. The bill provided a $2 million appropriation for the settlement of border disputes with Mexico. The proviso, sponsored by Rep. David Wilmot of Pennsylvania, would have prohibited SLAVERY in any territory acquired in the Mexican War. The amendment failed in the Senate and never became law, but it created great bitterness and helped crystallize the conflict between North and South.

Wilson, Sir Angus, 1913–91, British writer; b. South Africa. His novels depict a society corrupt in both its public and private aspects. They include *Anglo-Saxon Attitudes* (1956), *No Laughing Matter* (1967), and *Setting the World on Fire* (1980). Wilson has also published collections of short stories.

Wilson, August, 1945–, African-American playwright; b. Pittsburgh, Pa. His emotionally powerful plays are concerned with the experiences of African Americans during the 20th cent. Wilson's plays include *Ma Rainey's Black Bottom* (1984), *Fences* (1987; Pulitzer), *The Piano Lesson* (1990; Pulitzer), and *Two Trains Running* (1992).

Wilson, Charles Thomson Rees, 1869–1959, Scottish physicist. He was Jacksonian professor of natural philosophy at Cambridge. Noted for his studies of atmospheric electricity, he devised a method for protecting barrage balloons from lightning during World War II. For his invention of the Wilson cloud chamber (see PARTICLE DETECTOR) for studying the activity of ionized particles, he shared with Arthur COMPTON the 1927 Nobel Prize in physics.

Wilson, Edmund, 1895–1972, probably the foremost American social and literary critic of the 20th cent; b. Red Bank, N.J. In the 1920s he was an editor of *Vanity Fair* and the *New Republic.* As a critic, he explored the social, psychological, and political conditions that shape literary ideas, a task facilitated by his knowledge of Marxian and Freudian theory. Among his major works are *Axel's Castle* (1931), a study of symbolism; *The Wound and the Bow* (1941); *The Shores of Light* (1952); and *Patriotic Gore* (1962). His social studies include *To the Finland Station* (1940), on the European revolutionary tradition; and *The American Earthquake* (1958), on the Great Depression. Versatile, with wide-ranging interests, he also wrote novels, short stories, plays, and memoirs.

Wilson, Edmund Beecher, 1856–1939, American zoologist; b. Geneva, Ill. He taught at Columbia Univ. (1891–1928), where he initiated genetic research. His main work was on the function of the cell in heredity and on the role of the chromosomes (including the significance of the sex chromosome). His major writing was *The Cell in Development and Inheritance* (1896).

Wilson, Edward O(sborne), 1929–, American biologist and leading proponent of SOCIOBIOLOGY; b. Birmingham, Ala. Educated at the Univ. of Alabama and at Harvard, he joined the Harvard faculty in 1956 and later became professor of zoology. His exhaustive study of ants and other social insects (on which he is the world's chief authority) led to publication of *Sociobiology* (1975), a controversial work on the genetic factors in human behavior; *On Human Nature* (1978; Pulitzer); and, with Bert Hölldobler, *The Ants* (1990; Pulitzer).

Wilson, (James) Harold, 1916–, British prime minister (1964–70, 1974–76). An economist, Wilson was elected to Parliament in 1945 as a Labour party member. He became a spokesman for the party's left wing and in 1963 was elected party leader. As prime minister Wilson worked for closer ties to Europe and to bolster the sagging British economy. His efforts to solve the problem of Rhodesia (see ZIMBABWE) failed. In 1976 he unexpectedly announced his retirement as prime minister and was later knighted. He retained his seat in the House of Commons until created Baron Wilson of Rievaulx (1983).

Wilson, Lanford, 1937–, American playwright; b. Lebanon, Mo. He is a master of realistic dialogue in which monologue, conversation, and direct address overlap. His favorite themes are decay, dissolution, and loss. Among his plays are *The Hot I Baltimore* (1973), *The Fifth of July* (1977), *Talley's Folly* (1979; Pulitzer), *Burn This* (1987), and *Redwood Curtain* (1993).

Wilson, Pete(r Barton), 1933–, U.S. politician; b. Lake Forest, Ill. A lawyer and moderate Republican, he served in the state assembly (1967–72) and as mayor of San Diego (1972–83) before he was elected (1982, 1986) to the U.S. Senate from California. Wilson became governor of California in 1991.

Wilson, (Thomas) Woodrow, 1856–1924, 28th president of the U.S. (1913–21); b. Staunton, Va. He was educated in law at Princeton Univ., the Univ. of Virginia, and Johns Hopkins Univ. (Ph.D., 1886). A noted scholar, he taught at Bryn Mawr College and Wesleyan Univ. before becoming (1890) professor of jurisprudence and political economy at Princeton. In 1902 he became president of Princeton. In 1910 he was elected governor of New Jersey on a reform Democratic ticket. As governor (1911–13) he accomplished various important reforms. At the 1912 Democratic convention he was nominated for president on the 46th ballot, largely through the efforts of W.J. BRYAN and E.M. House. He was elected president when the Republican vote was split between W.H. TAFT and Theodore ROOSEVELT. Wilson's domestic program, known as the "New Freedom," was generally progressive; among its accomplishments were the FEDERAL RESERVE SYSTEM (1913), the FEDERAL TRADE COMMISSION (1914), and the Clayton Antitrust Act (1914). In foreign affairs, the early difficulties with Mexico (see HUERTA, VICTORIANO; VILLA, FRANCISCO) were soon overshadowed by the outbreak of WORLD WAR I in Europe. Wilson's early efforts to maintain U.S. neutrality were shaken by the sinking (1915) of the LUSITANIA and other German aggressions. Nevertheless, he ran for reelection in 1916 on the boast of having "kept us out of war," and narrowly defeated Charles Evans HUGHES, the Republican candidate. Relations with Germany continued to deteriorate and war was declared on Apr. 6, 1917. Wilson viewed the war as necessary to make the world "safe for democracy" and quickly put the nation on a war footing. Looking forward to peace, he enunciated his plans for its implementation with his FOURTEEN POINTS. When the war ended, he sailed (Dec., 1918) for Europe to take part in the peace talks. Wilson's idealism was widely admired in Europe, and he was looked upon as the best hope for a just peace. Despite his disappointment with the eventual treaty (see VERSAILLES, TREATY OF), he pinned his great hopes on the LEAGUE OF NATIONS. At home, however, isolationism had reasserted itself, particularly among the Republicans in Congress. Wilson's last efforts as president were spent in a futile attempt to win U.S. ratification of (and thus membership in) the League. Exhausted from his labors, he suffered a stroke in Sept. 1919 and never fully recovered. He was awarded the 1919 Nobel Peace Prize.

Wilson, William Bauchop, 1862–1934, American labor leader; b. Scotland. He worked in Pennsylvania coal mines as a child and in 1890 helped organize the United Mine Workers of America. A Democratic congressman (1907–13), he headed a committee that drafted the bill creating the U.S. Dept. of LABOR and served (1913–21) as the first secretary of labor.

Winchester, town (1991 pop. 96,386), Hampshire, S England. It was the capital of the Anglo-Saxon kingdom of WESSEX. Even after the NORMAN CONQUEST, when LONDON gained political ascendancy, Winchester remained England's center of learning. It is the site of Winchester College (est. 1382), one of the country's great public schools. The city also exerted great ecclesiastical influence, as reflected in its magnificent cathedral (11th–14th cent.)

Winckler, Hugo, 1863–1913, German Orientalist. A professor at the Univ. of Berlin, he helped excavate the Phoenician city of Sidon. During excavations at BOĞAZKÖY (1906–7) he discovered CUNEIFORM tablets in Hittite.

wind, flow of air parallel to the earth's surface. The direction of wind is indicated by a weather vane. A wind is named according to the direction from which it is blowing, e.g., a wind blowing from the north is a north wind. Wind velocity is measured by means of a cup anemometer, an instrument with three or four small hollow metal hemispheres set so that they catch the wind and revolve about a vertical rod; an electrical device records the revolutions of the cups and thus the wind velocity. Winds are caused by the unequal heating of the earth's surface by the sun. Warmer air expands, becomes lighter, and rises. Cooler air rushes in from surrounding areas to fill the empty space. This process continues, creating a steady flow of air called a convection current. This, along with the rotation of the earth (see CORIOLIS EFFECT) and other secondary factors, causes the basic planetary wind systems that circle the earth, bringing constant changes in the weather.

Windaus, Adolf [vĭn'dous], 1876–1959, German chemist. A professor of chemistry and director of the chemistry laboratories at the Univ. of Göttingen, he won the 1928 Nobel Prize in chemistry for his work on sterols, especially in relation to vitamins. He discovered and synthesized vitamin D_3, the component of vitamin D most important in preventing rickets.

Wind Cave National Park: see NATIONAL PARKS (table).

windflower: see ANEMONE.

Windhoek [vĭnt'hōōk], largest city (1988 est. pop. 115,000) and capital of Namibia. A communications and economic center, it is linked with South Africa's railroad network and conducts a large trade in Karakul sheep skins. In 1892 the city became the capital of the German colony of South West Africa; it was captured by South African troops in World War I. Windhoek still retains a German flavor.

wind instrument, any musical instrument whose tone is produced by a vibrating column of air. In the pipe ORGAN the column of air is set into motion by mechanical means. Other wind instruments are blown by the player and are divided into two groups, the woodwinds and the brass winds or brasses. The woodwinds include the instruments in the flute, clarinet, and oboe families. The brasses include the French horn, bugle, cornet, trombone, trumpet, and tuba. The wind passage of an instrument, called its bore, may be either cylindrical (as in the clarinet, trumpet, trombone, and most flutes) or conical (as in the oboe, French horn, and tuba). The length of the bore (the longer the bore, the lower the pitch) and the kind of mouthpiece (which affects the timbre) are more important than the material (metal or wood) and the shape (straight or round).

Woodwinds. The tone of woodwind instruments is produced by an airstream directed against an edge, either by blowing across or into a mouth hole (as in the flutes), or by forcing air against one or two thin strips of cane, wood, or metal set into the mouthpiece (as in the reed instruments). The foremost type of flute between the 16th and early 18th cent. was the recorder, an instrument with a soft tone, played vertically. It has enjoyed renewed popularity in the 20th cent., and is now available in plastic as well as wood. The transverse flute, with its greater volume and range of pitches, became the principal orchestral flute in the mid-18th cent. Transverse flutes were originally made of wood, but are now often made of silver. The fife, a small transverse flute used for military music, has been largely replaced by the stronger piccolo. The clarinet family includes all single-reed instruments. Clarinets are played vertically and are made in a variety of keys. B-flat and A clarinets are standard orchestral instruments; the higher E-flat clarinet, usually a band instrument, is occasionally used in the orchestra. The saxophone, although a member of the clarinet family and thus considered a woodwind, has a conical bore and is made of brass. Alto, tenor, and baritone saxophones are most frequently used, especially in bands. Members of the oboe family are those with double-reed mouthpieces. The family includes the English horn, an alto oboe used in opera and orchestral music; the bassoon, which plays in the tenor and bass registers; and the contrabassoon or

double bassoon, the lowest voice of the family, consisting of a tube over 16 ft (5 m) long, doubled upon itself four times.

Brasses. The brasses, in which the lips of the player perform the function of reeds, include the bugle, cornet, trombone, trumpet, and tuba, all of which have cup-shaped mouthpieces, and the French horn, with a funnel-shaped mouthpiece. The bugle, a conical tube coiled once upon itself, is used principally for military and naval bugle calls. Common to orchestras and bands, the trumpet has a cylindrical bore in the shape of a flattened loop, and three valves to regulate pitch. The cornet, with its more conical bore, has greater agility than the trumpet but a less brilliant tone. The trombone, having a cylindrical bore twice bent on itself, has a sliding section that regulates pitch as it lengthens or shortens the instrument. "Tuba" is a general term for a group of low-pitched, valved brass wind instruments, including the familiar contrabass tuba and the sousaphone.

windmill, mechanical device that harnesses wind power in order to pump water, grind grain, power a sawmill, or drive an electrical generator. Windmills were probably not known in Europe before the 12th cent., but thereafter they became the chief source of power until the advent of the STEAM ENGINE during the Industrial Revolution. The operational apparatus of the typical Dutch windmill is a four-to-six-armed structure that carries sails made of light wood or canvas. Revolving in the wind, the sail mechanism turns a shaft that operates the pump, millstone, or saw. Modern windmills are made of various lightweight materials. New types, such as the wind turbine used to generate electricity, are designed to turn even in light winds. Their output—depending on their size and on wind speeds—can vary from 1 kw to the 2,500 kw produced by the newest experimental model.

wind shear, change in the direction or speed of the wind over a comparatively short distance. Shear is usually horizontal in direction, but under certain conditions it may be vertical. Microburst wind shear is an extremely violent downward blast of air that hits the earth and radiates outward. With its sharp shifts in wind direction and relative wind speed it can cause an aircraft to lose lift and crash, especially during takeoff or landing.

Windsor, family name of the royal house of Great Britain. The name Wettin, family name of Prince ALBERT, consort of Queen VICTORIA, was changed to Windsor by GEORGE V in 1917. ELIZABETH II decreed that she and her descendants bearing the title of prince or princess would retain the name Windsor.

Windsor, Edward, duke of: see Edward VIII under EDWARD, kings of England.

Windsor, Wallis Warfield, duchess of, 1896–1986, American-born wife of Edward, duke of Windsor, who as EDWARD VIII abdicated (1936) the British throne in order to marry her. She obtained a divorce from her second husband, E.A. Simpson, in Apr. 1937 and married Edward in June. Special letters patent denied her a share in his royal rank of duke.

Windsor, city (1991 pop. 191,435), SE Ontario, on the Detroit R., opposite DETROIT, Mich. It is a port of entry and a major Canadian industrial center, with automobiles, industrial machinery, and processed food among its principal manufactures. The area was first settled (1749) by French colonists and in the 1790s attracted many Loyalists fleeing the American Revolution. Several towns were combined in 1935 to create the modern city of Windsor.

Windsor, town (1986 est. pop. 132,000), Berkshire, S central England, on the Thames R. The importance of the town derives from **Windsor Castle,** the chief residence of English rulers since WILLIAM I. The castle was improved and rebuilt by several sovereigns. Part of the castle was severely damaged by fire in 1992.

wind tunnel, device for studying the interaction between a solid body and an airstream. A wind tunnel simulates the conditions of an aircraft in flight by causing a high-speed stream of air to flow past a model of the aircraft (or part of an aircraft) being tested. The model is mounted on wires so that lift and drag forces on it can be determined by measuring the tension in the wires. Pressures on the model surface are measured through small flush openings on the surface. Wind tunnels are also used to study the effect of wind on other objects, such as automobiles, buildings, and bridges. See AERODYNAMICS.

Windward Islands: see WEST INDIES.

wine, alcoholic beverage made by FERMENTATION of the juice of the grape. Wines are distinguished by color, flavor, bouquet (aroma), and alcoholic content. They may be red (when whole crushed red or black grapes are used), white (using green grapes or the juice of other grapes only), or rosé (when the skins of red or black grapes are removed after fermentation has begun). Wines are also classified as dry (when grape sugar ferments completely) or sweet (when some sugar remains). There are three main types of wine: natural (still), fortified, and sparkling. The alcoholic content of natural wine comes from fermentation. Fortified wine (e.g., SHERRY, port, Madeira) has brandy or other spirits added to it. Sparkling wine (CHAMPAGNE is the best known) is fermented a second time after bottling. Wine is differentiated by the variety of grape, climate, location and soil of the vineyard, and treatment of the grapes before and during wine making. Fermentation starts when wine yeasts on the skins of ripe grapes come in contact with the grape juice (called must). Run off into casks, the new wine then undergoes a series of chemical processes, including oxidation, precipitation of proteins, and fermentation of chemical compounds, that create characteristic bouquet. After periodic clarification and aging in casks, the wine is ready to be bottled. The world's leading wine producer is France, with outstanding products from Bordeaux and Burgundy, the Loire and Rhone valleys, and Alsace. Other major producers are Italy, Spain, Germany, Chile, Argentina, South Africa, Australia, and the U.S. In the U.S., California is the leading wine-producing region, making European-type wines from grapes of the Old World species. The term *wine* is also applied to beverages made from other plants, e.g., dandelion and elderberry.

Winged Victory: see NIKE.

Winnebago, indigenous North American people with a Siouan language of the Hokan-Siouan stock (see NATIVE AMERICAN LANGUAGES). They lived in Wisconsin and had an Eastern Woodlands culture with some Plains traits (see NORTH AMERICA, INDIGENOUS PEOPLES OF), observing many elaborate ceremonies such as the buffalo dance and the winter feast. They sided with the British in the AMERICAN REVOLUTION and the WAR OF 1812 and secretly joined (1832) the SAC AND FOX in the BLACK HAWK WAR against U.S. troops. Much reduced in population, the Winnebago settled on reservations in Nebraska and Wisconsin. In 1990 there were 6,920 Winnebagos in the U.S.

Winnipeg, city (1991 pop. 616,790), provincial capital, Manitoba, W Canada, at the confluence of the Red and Assiniboine rivers. Long the largest city of the Canadian prairies, it remains one of the world's great wheat-marketing centers. The city is on the site of the French-built Fort Rouge (1738) and the North West Company's Fort Gibraltar, later renamed Fort Garry, then Fort Winnipeg. It began its modern development as an outlet for produce of the prairies when it was first reached by rail in 1881.

Winston-Salem, city (1990 pop. 143,485), seat of Forsyth co., central N.C., in the Piedmont. It is the nation's chief tobacco manufacturer, with extensive storage and auction facilities. Brewing, textiles, and electrical-equipment manufacturing are also important. The city is the financial and shipping center for NW North Carolina. Salem originated (1766) as a MORAVIAN settlement, and many early buildings remain. Winston was established in 1849, and the two communities merged in 1913. Wake Forest Univ. is in the city.

wintergreen or **checkerberry,** low evergreen plant (*Gaultheria procumbens*) of the HEATH family, native to sandy and acid woods of E North America and often cultivated. It has a creeping stem, erect branches, glossy, oval leaves, and small, waxy, white flowers followed by crimson fruits. The aromatic leaves are a source of wintergreen oil (now mostly obtained from the sweet birch or made synthetically), used in medicine and as a flavoring.

Winters, Yvor, 1900–1968, American poet and critic; b. Chicago. A professor at Stanford Univ. (1928–68), he wrote controversial criticism that emphasized the moral content of art. His major critical work is *In Defense of Reason* (1947). His poetry, e.g., *Collected Poems* (1952), ranges from austere to lyrical.

winter solstice: see SOLSTICE.

Winthrop, John, 1588–1649, governor of the Massachusetts Bay Colony; b. England. A member of the MASSACHUSETTS BAY COMPANY, he headed (1629) the group that founded Boston colony. As a distinguished member of the colony—he was elected governor 12

times—he helped shape its theocratic policies. A conservative, he opposed all efforts to liberalize religious or governmental policies. His son **John Winthrop,** 1606–76, b. England, became a lawyer and emigrated to Massachusetts Bay in 1631. In 1633 he was commissioned governor of the new colony at Saybrook (now Deep River), Conn., and in 1646 he founded New London. He was governor (1657, 1659–76) of Connecticut and accomplished (1664) the union of the Connecticut and New Haven colonies. His son **John Winthrop** (Fitz-John Winthrop), 1638–1707, b. Ipswich, Mass., also served as colonial governor of Connecticut. He went to England to serve in Oliver CROMWELL's army, but returned to America (1663) and fought in King Philip's War (1675–76). Elected governor in 1698, he ably served until his death.

Wirt, William, 1772–1834, U.S. attorney general (1817–29); b. Bladensburg, Md. Wirt was the prosecutor of Aaron BURR in 1807, and in 1832 ran for president on the ANTI-MASONIC PARTY ticket. He also wrote sketches in the style of Joseph ADDISON.

Wisconsin, upper midwestern state of the U.S.; bounded by Lake Superior and the Upper Peninsula of Michigan (N), Lake Michigan (E), Illinois (S), and Iowa and Minnesota (W), with the Mississippi R. forming much of that border.

Area, 56,154 sq mi (145,439 sq km). *Pop.* (1990) 4,891,769, a 4% increase over 1980 pop. *Capital,* Madison. *Statehood,* May 29, 1848 (30th state). *Highest pt.,* Timms Hill, 1,952 ft (595 m); *lowest pt.,* Lake Michigan, 581 ft (177 m). *Nickname,* Badger State. *Motto,* Forward. *State bird,* robin. *State flower,* wood violet. *State tree,* sugar maple. *Abbr.,* Wis.; WI.

Land and People. Wisconsin's most notable physical feature is its profusion of lakes: over 8,500, including Lake Winnebago (the largest). Much of the state consists of gently rolling uplands giving way to prairies in the south. Summers are pleasantly cool, except in the south, where temperatures are warm. Winters are often severely cold in the north. Over 65% of the population lives in urban areas. The largest city is MILWAUKEE, followed by MADISON and the port city of GREEN BAY. In 1990 the state was almost 92% white and 5% African American.

Economy. The state's principal manufactured products include industrial machinery, processed foods (especially cheese, butter, meat, and beer), fabricated metals, pulp and paper, and transportation and farm equipment. The chief source of farm income is dairy products (Wisconsin is the second largest U.S. producer), followed by cattle, corn, and hogs. The principal minerals extracted are sand and gravel, stone, lime, zinc, and copper. About 45% of the land is forested, and there is a vigorous lumbering industry.

Government. The amended constitution of 1848 provides for a governor serving a four-year term. The legislature consists of a senate with 33 members elected to four-year terms and a house with 99 members serving for two years. Wisconsin is represented in the U.S. Congress by two senators and nine representatives and has 11 electoral votes.

History. When the Frenchman Jean Nicolet arrived at the site of Green Bay in 1634 in search of furs and the NORTHWEST PASSAGE, the region was the home of the WINNEBAGO, KICKAPOO, and other tribes. Many of them were subsequently displaced by the OTTAWA and HURON, who were forced into the area by white settlement farther east. Great Britain obtained control of the area in 1763, and it formally passed to the U.S. in 1783, becoming part of the NORTHWEST TERRITORY. Wisconsin again fell into British hands temporarily during the WAR OF 1812. Large-scale settlement began in the 1820s, with settlers arriving via the ERIE CANAL and GREAT LAKES. Conflicts with Native Americans culminated in the BLACK HAWK WAR (1832), in which the tribes were brutally crushed. During the mid-19th cent. huge numbers of German immigrants arrived. In the 1870s the great pine forests of N Wisconsin were drastically reduced by a great lumber boom. Early in the 20th cent. Robert M. LA FOLLETTE gained national prominence as the leader of the Progressive movement, which had widespread support in Wisconsin resulting in much social legislation later adopted by other states and the federal government. Since World War II the state's industrial sector has undergone considerable expansion, and in the late 1980s and early 90s its economy weathered the national recession.

Wisdom, biblical book included in the Western canon and the Septuagint, but not in the Hebrew Bible, and placed in the APOCRYPHA in the Authorized Version. Traditionally called the Wisdom of Solomon, the book includes an exhortation to seek wisdom and a history of God's care of the Jews. It is a supreme example of wisdom literature (pre-Christian Jewish philosophical writings).

Wise, John, 1652–1725, American clergyman, exponent of the democratic principles of modern CONGREGATIONALISM; b. Roxbury, Mass. Pastor at Ipswich, Mass., from 1680, he opposed Increase and Cotton Mather (see under MATHER, RICHARD) by resisting the plan to place individual churches under the jurisdiction of associations of ministers.

Wise Men of the East, Magi, or **Three Kings,** men who came, bearing gifts of gold, frankincense, and myrrh, to adore the newborn JESUS. They were guided by the Star of Bethlehem. Christian tradition has set their number as three, called them kings, and named them Caspar or Gaspar, Melchior, and Balthazar. The EPIPHANY commemorates their visit.

Wissler, Clark, 1870–1947, American anthropologist; b. Wayne, Ind. A student of Franz BOAS, he originated the influential "culture area" concept for interpreting ethnographic data. In 1931 he became the first professor of anthropology at Yale Univ. His works include *Relation of Nature to Man in Aboriginal America* (1926) and *Indians of the United States* (1949).

wisteria or **wistaria,** woody, twining vine (genus *Wisteria*) of the PULSE family, cultivated and highly esteemed for the beautiful pendant clusters of lilac, white, or pink flowers. Two species are native to the U.S., but the showier Asian species are commonly cultivated.

witchcraft, exercise of supernatural powers through occult arts such as MAGIC, sorcery, and satanism. Its origins lie in the belief in separate powers of good and evil in ancient pagan cults and in religions including GNOSTICISM and ZOROASTRIANISM. The Christian church persecuted witches from the 14th to the 18th cent.: under the Spanish Inquisition, up to 100 alleged witches were burned in a day; in 1692, 20 persons were executed as witches in Salem, Mass. In the 20th cent. there has been a revival of witchcraft known as Wicca and based on a reverence for nature, the worship of a fertility goddess, a restrained hedonism, and group magic aimed at healing. See also SHAMAN.

witch hazel, common name for some members of the family Hamamelidaceae, trees and shrubs found mostly in Asia. The family includes the winter hazels (genus *Corylopsis*), the witch hazels (genus *Hamamelis*), the sweet gums (genus *Liquidambar*), and the witch elders (genus *Fothergilla*). The American witch hazel (*H. virginiana*), whose leaves resemble those of the HAZEL, is a fall-blooming shrub or small tree found E of the Rockies. The name *witch hazel* is also applied to an astringent liniment obtained from the leaves and bark of the plant. Sweet gums are characterized by their star-shaped leaves, their brilliant fall coloring, and their round fruits with hornlike projections. Their hard wood is used for cabinetmaking.

witenagemot [wĭt"ənəgĭmōt'] [Old Eng., = meeting of counselors], a session of counselors (the witan) of a king in Anglo-Saxon England. Such a body existed in each Anglo-Saxon kingdom. Composed of nobles and churchmen appointed by the king the witan advised him on important matters. It probably had the power (especially in WESSEX) to elect a king.

Wither, George, 1588–1667, English poet. He was imprisoned for the satire *Abuses Stript and Whipt* (1613). There he wrote five pastorals, *The Shepherd's Hunting* (1615). His later works include *Fidelia* (1617) and *Fair Virtue* (1622).

Witherspoon, John, 1723–94, American clergyman, signer of the DECLARATION OF INDEPENDENCE; b. Scotland. A Presbyterian minister, he emigrated (1768) to America to become president of what is now Princeton Univ. He represented New Jersey at the CONTINENTAL CONGRESS.

Witt, Jan de [vĭt], 1625–72, Dutch statesman. As leader of the republican party he was elected (1653) grand pensionary, with control of state affairs and commerce. He negotiated an end to the first and second DUTCH WARS (1652–67) and the War of DEVOLUTION (1667–68). He sought to end the power of the house of Orange, but at the outset of the third Dutch war (1672–78) William of Orange (later WILLIAM III of England) was made stadtholder by popular

acclaim, and de Witt resigned. He and his brother, Cornelius, a naval officer, although cleared of treason charges, were killed by a mob.

Witte, Count Sergei Yulyevich [vĭt'ə], 1849–1915, Russian statesman. He encouraged the development of industry with the help of foreign capital and Siberian colonization as finance minister (1892–1903) for NICHOLAS II, negotiated peace after the RUSSO-JAPANESE WAR (1904–5), and was premier from Oct. 1905 to April 1906.

Wittelsbach, German dynasty. It ruled BAVARIA from 1182, when Count Otto of Wittelsbach was given the duchy of Bavaria by Holy Roman Emperor Frederick I and ruled as Otto I. His son, Otto II, added the Rhenish Palatinate to the family's domains. In the following centuries the two domains were sometimes ruled together and sometimes separately by different branches of the Wittelsbachs. The dynasty's high point was reached in 1742, when Elector Charles Albert became Holy Roman Emperor CHARLES VII. In 1799 all family lands were united under a single ruler, Maximilian I, who in 1806 became king of a much-enlarged Bavaria. The dynasty ended when Louis III was deposed in 1918.

Wittenberg, city (1989 est. pop. 53,400), Saxony-Anhalt, E Germany, on the Elbe R. Today an industrial and mining center, it was first mentioned in the 12th cent. Martin LUTHER and Philip MELANCHTHON taught at its university, which became (16th cent.) the focus of the Protestant REFORMATION. Lucas CRANACH the elder founded a school of painting there. The 15th-cent. Schlosskirche, where LUTHER nailed his 95 theses, still stands.

Wittgenstein, Ludwig Josef Johan, 1889–1951, Austrian philosopher. He studied (1912–13) at Cambridge Univ. under Bertrand RUSSELL. In Vienna in the 1920s he came in contact with adherents of LOGICAL POSITIVISM; they were profoundly influenced by his first major work, the *Tractatus Logico-philosophicus* (1921), which posits a close, formal relationship between language, thought, and the world. Language and thought work literally like a picture of the real world, and to understand any sentence one must grasp the reference of its constituents, both to each other and to the real. Language, however, can indicate an area beyond itself; unsayable things (e.g., things not demonstrable) do exist, and sentences whose structure of meaning amounts to nonsense can result in philosophical insight. Thus Wittgenstein, unlike the logical positivists, allowed for the possibility of a metaphysics. He returned to Cambridge in 1929, and his philosophy entered a second phase, represented by *Philosophical Investigations* (1953). Revising his earlier analysis of language, he now saw language as a response to, as well as a reproduction of, the real. His work greatly influenced what has come to be called ordinary-language philosophy, which maintains that all philosophical problems arise from the illusions created by the ambiguities of language.

Witwatersrand or **the Rand,** rich gold-mining area and chief industrial region of South Africa, in the TRANSVAAL, between the Vaal and Olifants rivers. It includes SOWETO township and the cities of JOHANNESBURG, Benoni, Boksburg, Springs, and Germiston. The Rand produces about one third of the world's total gold output annually. Other major industries include steel milling, machine building, diamond cutting, and the manufacture of textiles and furniture.

Wladislaw, Wladyslaw, or **Wladislas,** Polish rulers: see LADISLAUS.

Wobblies: see INDUSTRIAL WORKERS OF THE WORLD.

Wodehouse, (Sir) P(elham) G(renville), 1881–1975, English novelist and humorist. He is famous for his comic stories of a forever-Edwardian England, featuring Bertie Wooster and his unflappable valet, Jeeves, e.g., *The Inimitable Jeeves* (1924).

Woden, Norse **Odin,** in GERMANIC RELIGION, the supreme God. He established the laws that governed the universe, created the first man and woman, and controlled human destiny. His wife was FRIGG, and his children included Thor, Balder, and Tiw.

Wöhler, Friedrich [vö'lər], 1800–1882, German chemist. Professor at the Univ. of Göttingen, he devised a method for isolating ALUMINUM that he also used to isolate BERYLLIUM and YTTRIUM. Wöhler's synthesis of urea opened a new era in organic chemistry and contributed to the theory of isomerism. He also contributed to the chemistry of metabolism.

Wolf, Hugo [vôlf], 1860–1903, Austrian composer. One of the supreme masters of the German art song, he wrote over 300 LIEDER, in which he adapted WAGNER's musical conceptions. He also wrote an opera, choral works, and chamber music.

wolf, carnivorous MAMMAL related to the JACKAL and DOG. Three wolf species are generally recognized: the gray wolf (*Canis lupus*), the red wolf (*C. rufus*), and the prairie wolf, or COYOTE. The gray wolf, also called timber wolf in North America, resembles a GERMAN SHEPHERD, with a shaggy coat, erect ears, and a bushy tail; the male is usually about 3 ft (90 cm) high at the shoulder and weighs about 100 lb (45 kg). Ruthless hunting nearly exterminated the gray wolf in the 48 states. The red wolf is smaller, 16 in. (41 cm) high at the shoulder and about 60 lb (27 kg), and ranges in color from reddish to nearly black. It is now mainly found in SE Texas and SW Louisiana but has been reintroduced in North Carolina and Tennessee.

Wolfe, James, 1727–59, British soldier. He captured LOUISBURG (1758) and defeated (1759) Gen. MONTCALM on the Plains of Abraham, causing Canada to fall to the British. Both Wolfe and Montcalm were killed in the battle.

Wolfe, Thomas (Clayton), 1900–1938, major 20th-cent. American novelist; b. Asheville, N.C. His four mammoth, highly autobiographical novels, *Look Homeward, Angel* (1929), *Of Time and the River* (1935), *The Web and the Rock* (1939), and *You Can't Go Home Again* (1940), follow a young man from his boyhood in the rural South to his career as a teacher and writer in New York City. The last two books were organized by his editor, Maxwell Perkins, from the material left after Wolfe's premature death. Characterized by lyrical and dramatic intensity and by an obsessive sense of memory, time, and place, the novels present a sweeping picture of American life. Wolfe's other writings include short stories and a writer's journal.

Wölfflin, Heinrich [völf'lĭn], 1864–1945, Swiss art historian. His theory of form greatly influenced art criticism. His works include *Classic Art* (1899).

wolfram: see TUNGSTEN.

Wolfram von Eschenbach [ĕsh'ənbäkh], c.1170–c.1220, German poet. One of the greatest German minnesingers (poets and singers of courtly love), he led a restless, roving life. His only complete work is the famous chivalric poem *Parzival,* noted for its lyricism, humor, and depth of conception. It is the source for the libretto of Richard WAGNER's music drama *Parsifal.*

Wollaston, William Hyde, 1766–1828, English scientist. His achievements include the discovery (1802) of the dark lines (Fraunhofer lines) in the solar spectrum; the invention of the reflecting goniometer and the camera lucida; the discovery of the elements PALLADIUM and RHODIUM; and the establishment of the equivalence of galvanic and frictional electricity. He endowed the Wollaston science medal, awarded annually by the Geological Society, London.

Wollongong, city (1991 pop. 239,900), New South Wales, SE Australia. It is a major iron and steel center; other manufactures include refined copper, chemicals, and textiles. Port Kembla, an important port and the site of one of the world's largest integrated steelworks, was merged with Wollongong in 1947.

Wollstonecraft, Mary, 1759–97, English author and feminist. After publishing *Vindication of the Rights of Woman* (1792), the first great document of FEMINISM, she lived in Paris and befriended leaders of the French Revolution. She married (1797) William GODWIN, but died giving birth to a daughter who became the noted writer Mary Wollstonecraft SHELLEY.

Wolsey, Thomas, 1473?–1530, English statesman and prelate, cardinal of the Roman Catholic Church. He rose rapidly in the service of the young HENRY VIII and by 1514 virtually controlled English domestic and foreign policy. Becoming cardinal and lord chancellor in 1515, he tried unsuccessfully to make England the mediator between France and the Holy Roman Empire. He was twice a candidate for the papacy. His enormous wealth and lavish living caused considerable resentment, and his enemies at court used Henry's divorce from KATHARINE OF ARAGÓN as a means for his ruin. Wolsey incurred the king's anger by failing to secure a quick and favorable decision on the divorce from the church. In Oct. 1529 he lost the chancellorship and all honors except the archbishopric of York. In Nov. 1530 he was arrested on false charges of treason; he died on his way to London.

wolverine or **glutton,** heavy, short-legged, bearlike MAMMAL (*Gulo gulo*) related to the WEASEL, c.3–3½ ft (91–106 cm) long. It inhabits the mountains of North America and Eurasia near the timberline, feeding on many different animals. Its long, dark-brown, frost-proof fur is prized by Eskimos as trim for hoods and cuffs.

woman suffrage, the right of women to vote. First proposed in the U.S. in 1848, the struggle for suffrage was led by Elizabeth Cady STANTON, Lucretia MOTT, Susan B. ANTHONY, Lucy STONE, and other feminists working on both the state and federal levels. The 19th amendment to the Constitution (1920) granted nationwide woman suffrage. In Great Britain John Stuart MILL argued (1869) eloquently for the right of women to vote. More effective was the militant movement that emerged (1903) under Emmeline PANKHURST. In 1928 equal voting rights for all women replaced the limited woman suffrage granted in 1918. Today women are enfranchised in all but a few nations.

wombat, shy, nocturnal MARSUPIAL of Australia and Tasmania, related to the KOALA. Thick-set, with a large head, short legs, a short tail, and a shuffling gait, it is about 3 ft (91.5 cm) long. Wombats live in burrows in forests and grasslands and eat grass, roots, and bark.

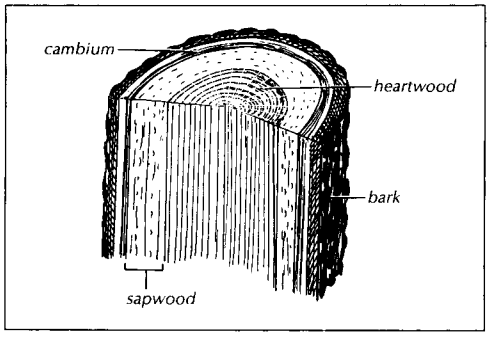
Women's Army Corps (WAC), U.S. army organization that enlisted women for noncombatant military duty. Created as an auxiliary corps in 1942, after U.S. entry into World War II, it was formally established within the regular army in 1948. It reached a peak enlistment of nearly 100,000 in 1945. The WAC was dissolved in 1978.

women's movement: see FEMINISM; WOMAN SUFFRAGE.

Wood, Grant, 1891–1942, American painter; b. Anamosa, Iowa. Influenced by German and Flemish primitive painting, he is noted for his paintings of the 1930s, in which stern people and stylized landscapes offer rigid, decorative images of the rural Midwest. Perhaps the best-known of these is *American Gothic* (1930; Art Inst., Chicago).

Wood, Leonard, 1860–1927, U.S. general; b. Winchester, N.H. He commanded the ROUGH RIDERS in the SPANISH-AMERICAN WAR. As governor general of the Philippines (1921–27), he pursued a harsh, unpopular policy.

wood, in botany, tissue (xylem) forming the bulk of the STEM of a woody plant. Xylem conducts the SAP upward from the ROOT system to the LEAF, stores food, and provides support; it is composed of various cell types specialized for each function. Xylem is formed in the growing season by the CAMBIUM. In temperate regions, cells formed in the spring or wet season are larger and thinner-walled than those formed in the summer or dry season; this results in conspicuous ANNUAL RINGS. Conifer wood (softwood) has a uniform, nonporous appearance; deciduous trees have a vessel-permeated xylem with a complex appearance, often called hardwood. Freshly cut wood contains much moisture and is dried (seasoned) in the sun or in kilns before use.



Wood: cross-section fo a woody stem

woodchuck or **groundhog,** species of marmot. This large RODENT, found throughout most of Canada and the NE U.S., has a heavyset body (about 2 ft/60 cm long, excluding the tail) and is covered with coarse, brownish hair. According to superstition the groundhog leaves its burrow on Feb. 2, Groundhog Day, and returns underground for six weeks if it sees its shadow, indicating six more weeks of winter.

Woodcock, Leonard Freel, 1911–, American labor leader and diplomat; b. Providence, R.I. A machine assembler in Detroit, he became active in the United Auto Workers (UAW) and succeeded (1970) Walter REUTHER as its president. In 1977 he was named head of the U.S. liaison mission in Beijing, People's Republic of China. After full diplomatic relations were established in 1979, he served (1979–81) as ambassador.

woodcut and wood engraving, prints made from designs cut in relief (where material is cut away to leave the design that is printed) on wood, in contrast to INTAGLIO methods (where the lines that are incised are printed) such as ENGRAVING and ETCHING. Woodcutting, the oldest form of printmaking, is done by cutting soft wood with a knife along the grain. Woodcuts appeared in Europe at the beginning of the 15th cent. At that time the same artist designed and carved the block. Later the cutting was often performed by specialists. Used for the block books that preceded printing, woodcuts were often employed as book illustrations after the invention of the printing press. During the RENAISSANCE the most eminent woodcut designers were DÜRER and Hans Holbein, the Younger (see under Hans HOLBEIN, the Elder). With the increasing popularity of engraving on metal, interest in woodcuts declined. It was not revived until the 1890s, with the prints of such artists as GAUGUIN and MUNCH. Many artists of the 20th cent. have used the woodcut; they include DERAIN, DUFY, MAILLOL, and BASKIN. The **wood engraving** is made on hard, end-grained wood carved with a graver or burin. The medium, in which lines usually print white on a black background, was popularized in 18th-cent. England by Thomas Bewick, who produced illustrations for a number of books, including John GAY's *Fables* (1779). Wood engraving was very popular in the 19th cent., in France (where its master was DORÉ), in England, and in the U.S.

Woodhull, Victoria (Claflin), 1838–1927, and **Tennessee Claflin,** 1846–1923, American journalists; b. Ohio. From childhood to early adulthood they were traveling spiritualists. In 1870 they began *Woodhull and Claflin's Weekly,* a sensational journal that supported such controversial goals as woman suffrage, free love, and socialism; in 1872 it published the first English translation of *The Communist Manifesto.* That same year Victoria Woodhull became the first woman candidate for president, running on the People's party ticket with Frederick DOUGLASS. The sisters moved to England in 1877.

woodpecker, name for some members of the family Picidae, climbing BIRDS found in much of the world. Woodpeckers typically have sharp, chisellike bills for pecking holes in trees, where they find insects. Among the North American species are the sociable downy woodpecker (*Picus pubescens*); the hairy woodpecker (*P. villosus*); and the red-crested or pileated woodpecker (*Hylotomus pileatus*). The flickers (genus *Melanerpes*), the only brown-backed woodpeckers, sometimes capture insects in the ground. The sapsuckers, which drink sap through small holes, can damage trees.

Woodson, Carter Goodwin, 1875–1950, African-American educator; b. New Canton, Va. Retiring from teaching (1922), he helped organize (1915) and devoted his time to the Association for the Study of Negro Life and History. He founded and edited the group's publication, the *Journal of Negro History.*

wood sorrel: see OXALIS.

Woodstock, town (1990 pop. 6,290), SE N.Y., in the foothills of the Catskill Mts. In the area are an artists' colony and a summer art school. The town gave its name to the most famous of the music festivals of the 1960s and 70s, held (Aug. 1969) near Bethel, N.Y., c.45 mi (70 km) to the SW.

Woodville, Elizabeth, 1437–92, queen consort of EDWARD IV. She married (1464) Edward in secret and provoked the anger of the powerful Richard Neville, earl of Warwick, but after the marriage became public she obtained many favors for her family. When Edward died (1483), their son EDWARD V became king, but was seized by his uncle, who usurped the throne as RICHARD III. Richard voided Elizabeth's marriage and Edward V and his younger brother were declared illegitimate and imprisoned. After HENRY VII seized the throne, he married (1486) Elizabeth's daughter Elizabeth.

Woodward, Robert Burns, 1917–79, American chemist. A professor at Harvard Univ., he was one of the first to determine the structure of such organic compounds as penicillin, strychnine, terramycin, and aureomycin. For his synthesis of organic compounds (e.g., quinine, patulin, cholesterol, cortisone, strychnine, lysergic acid, lanosterol, reserpine, chlorophyll, and tetracycline) he won the 1965 Nobel Prize in chemistry.

wool, fiber from the fleece of the domestic SHEEP. Wool is warm, absorbent, elastic, strong, and crease-resistant. It was probably the first FIBER to be made into cloth, since herding flocks was the first step in the change from primitive culture and wool is found only on domesticated sheep. Egyptian, Babylonian, and Peruvian archaeological remains have yielded fragments of woolen fabrics. England, with a heritage of sheep raising and weaving from its early history and from Roman influence, became Europe's great wool-producing country, and wool was the staple of British industry until the 18th cent., when COTTON began to supplant it. In the American colonies sheep raising began at JAMESTOWN, and SPINNING and weaving were important domestic industries. The first factory in America using water power to weave wool was opened at Hartford, Conn., in 1788. The U.S. now produces a substantial amount of the world's wool; other major producers include Australia, Great Britain, Russia, and Kazakhstan. In wool making, sheep are sheared with mechanical clippers. The wool is then sorted according to fineness, crimp, length of fiber, and felting qualities, and dirt and lanolin are removed. Wool may be bleached or dyed as fleece, yarn, or cloth. Woolen cloth is woven from short-staple fibers spun into soft yarn. Worsted yarn produces cloth with a hard, smooth texture, e.g., gabardine, serge.

Woolf, Virginia (Stephen), 1882–1941, English novelist. She was an innovative influence on the 20th-cent. novel. With her husband, Leonard Woolf, she set up the Hogarth Press in 1917. Their home was the center for the BLOOMSBURY GROUP. In her writing she concentrated on the flow of ordinary experience through the STREAM OF CONSCIOUSNESS technique. Her prose is poetic, symbolic, and visual. Woolf's novels include *Mrs. Dalloway* (1925), *To the Lighthouse* (1927), *Orlando* (1928), *The Waves* (1931), and *Between the Acts* (1941). Her criticism is contained in *The Common Reader* (1925) and volumes of essays, letters, and diaries. She also wrote two feminist tracts, *A Room of One's Own* (1929) and *Three Guineas* (1938).

Woollcott, Alexander, 1887–1943, American author; b. Phalanx, N.J. Known for his flamboyance and sardonic wit, he was a well-known drama critic (1914–28) for major New York City dailies. His gossipy essays are collected in *While Rome Burns* (1934) and *Long Long Ago* (1943).

Woolworth, Frank Winfield, 1852–1919, American merchant; b. Rodman, N.Y. Starting (1879) with a five-and-ten-cent store in Lancaster, Pa., he extended his business throughout the U.S. and to other countries. In 1911 the F.W. Woolworth Co. was incorporated, with ownership of over 1,000 five-and-dimes, and he became director of various financial firms. In 1913 he built the Woolworth Building (N.Y.C.), then the world's tallest building (792 ft/241.4 m).

Worcester, city (1990 pop. 169,759), seat of Worcester co., central Mass., on the Blackstone R.; inc. 1722. The river's canalization (1822) brought rapid industrialization. Manufactures include machinery, metal goods, chemicals, plastics, and pharmaceuticals. Settled in 1673, the city was the scene of Native American attacks (1675, 1683) and fighting in Shays's Rebellion (1786; see under SHAYS, DANIEL). It is the site of Clark Univ. and the College of the Holy Cross.

word processing, use of a computer program or a dedicated hardware and software package to write, edit, and print a document. Text is entered using a keyboard similar to a typewriter's. Most word processors have various functions that allow a person to revise text without retyping an entire document, and a document's format—type size, line spacing, margins, page length, and the like—usually can be readily altered. Documents are stored on magnetic disk or tape for later retrieval and use.

Wordsworth, William, 1770–1850, English poet. After graduating from Cambridge in 1791, Wordsworth went abroad. In 1792, a Frenchwoman, Annette Vallon, bore him a daughter, but they never married. He returned to England imbued with the spirit of the FRENCH REVOLUTION. In 1793 *An Evening Walk* and *Descriptive Sketches* were published. Prevented by the REIGN OF TERROR from returning to France, Wordsworth settled in Dorsetshire with his sister Dorothy, 1771–1855, who throughout his life shared his poetic vision; her journals were published after her death. With his close friend Samuel Taylor COLERIDGE, Wordsworth wrote *Lyrical Ballads* (1798), an attempt to use the language of ordinary speech in poetry. This famous book, which included his "Tintern Abbey," introduced ROMANTICISM into England. A second edition (1800) contained an essay outlining Wordsworth's poetic principles. In 1799 Wordsworth and his sister moved to Grasmere, in the Lake District, where they lived thereafter. He married Mary Hutchinson in 1802. The second version of *The Prelude,* a long autobiographical poem, was completed in 1805 but not published until after his death (the other versions are 1799 and 1850). *Poems in Two Volumes* (1807) included "Ode: Intimations of Immortality." Few notable works were written thereafter, apart from *The Excursion* (1814), "Laodamia" (1815), and *Memorials of a Tour of the Continent, 1820* (1822). In 1843, having long since put aside radicalism, Wordsworth was named poet laureate. Today he is recognized for his profundity of thought, love of nature, and innovative use of language.

work, in physics, transfer of ENERGY by a force acting against a resistance or a body and resulting in displacement. Work W has a magnitude equal to the scalar product (see VECTOR) of the force F and the distance d of the resulting movement; thus $W = Fd \cos$, where is the angle between the directions of the force and the movement. The foot-pound (ENGLISH UNITS OF MEASUREMENT), the erg (cgs system), and the joule (mks system) are the units of work or energy expended, respectively, by a 1-lb force acting through a distance of 1 ft, by a 1-dyne force through 1 cm, and by a 1-newton force through 1 m. One foot-pound equals 1.356 joules; 1 erg equals 10^{-7} joules.

workers' compensation or **workmen's compensation,** payment by employers for the cost of injuries, or some occupational diseases, received by employees in the course of their work. Benefits usually cover medical expenses, payments for incapacity to work, and, increasingly, vocational rehabilitation. Workers' compensation legislation was first passed in Germany, Austria, and Great Britain in the late 1800s, and by 1920 all but six states in the U.S. had passed some form of it. U.S. state legislation covers over 85% of all workers.

working dog, class of dogs raised either to herd cattle and sheep, as draft animals, as wartime message carriers, in police and rescue work, as guardians, or as guide dogs. See individual breeds, e.g., BOXER, COLLIE, DOBERMAN PINSCHER, GERMAN SHEPHERD, GREAT DANE, OLD ENGLISH SHEEPDOG, ST. BERNARD.

Work Projects Administration (WPA), 1935–43, U.S. government agency during the NEW DEAL. It was established as the Works Progress Administration, and its name was changed in 1939. The WPA undertook extensive building and improvement projects to provide work for the unemployed. It constructed 116,000 buildings, 78,000 bridges, and 651,000 mi (1,047,000 km) of public roads. Also included under the WPA were the Federal Arts Project, Federal Theatre Project, Federal Writers' Project, and National Youth Administration.

World Bank: see INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.

World Council of Churches, international, interdenominational organization of Protestant and Orthodox churches, begun at Amsterdam in 1948. The council has no power over the 335 member churches, but provides an opportunity for cooperation in matters of common concern. The headquarters are at Geneva, Switzerland.

World Court, popular name of the Permanent Court of International Justice, established (1920) by the LEAGUE OF NATIONS. Headquartered at The HAGUE, it comprised 15 judges empowered to render judgments in international disputes brought before them. The U.S. never joined the court, but an American jurist always sat on its bench. Dissolved in 1945, the court was supplanted by the UN International Court of Justice (see UNITED NATIONS, table).

World Health Organization: see UNITED NATIONS (table 3).

World Intellectual Property Organization: see UNITED NATIONS (table 3).

World Meteorological Organization: see UNITED NATIONS (table 3).

World Trade Center, building complex in lower Manhattan, N.Y.C., consisting of seven buildings and a shopping concourse. Most prominent are the 110-story, rectangular twin towers rising to 1,350 ft (411 m), second in height only to Chicago's SEARS TOWER. Designed by Minoru YAMASAKI and Emery Roth, the towers and concourse portion of the center was completed in 1973 at a cost of $750 million. A massive bomb explosion damaged portions of the complex in 1993.

World War I, 1914–18, also called the Great War, conflict, chiefly in Europe, among most of the world's great powers. On one side were the Allies (chiefly France, Britain, Russia, and the U.S.); on the other were the Central Powers (Germany, Austria-Hungary, and Turkey). Prominent among the war's causes were the imperialist, territorial, and economic rivalries of the great powers. The German empire in particular was determined to establish itself as the preeminent power on the Continent. The Germans were also intent on challenging the naval superiority of Britain. However, it was rampant nationalism—especially evident in the Austro-Hungarian empire—that furnished the immediate cause of hostilities. On June 28, 1914, Archduke FRANCIS FERDINAND, heir apparent to the Austro-Hungarian throne, was assassinated at Sarajevo by a Serbian nationalist. One month later, after its humiliating demands were refused, Austria-Hungary declared war on Serbia. Other declarations of war followed quickly, and soon every major power in Europe was in the war. On the Western Front, the Germans smashed through Belgium, advanced on Paris, and approached the English Channel. After the first battles of the MARNE and YPRES, however, the Germans became stalled. Grueling trench warfare and the use of poison gas began all along the front, and for the next three years the battle lines remained virtually stationary despite huge casualties at VERDUN and in the Somme offensive during 1916. On the Eastern Front, the Central Powers were more successful. The Germans defeated (Aug.–Sept. 1914) the Russians at Tannenberg and the Masurian Lakes. Serbia and Montenegro fell by the end of 1915. In the south, the Italian campaigns were inconclusive, though they benefited the Allied cause by keeping large numbers of Austrian troops tied down there. In Turkey, the Allies' ambitious Gallipolli Campaign (1915), an attempt to force Turkey out of the war, was a costly failure. In the Middle East, T.E. LAWRENCE stirred Arab revolt against Turkey. U.S. neutrality had been threatened since 1915, when the British ship LUSITANIA was sunk. By 1917 unrestricted German submarine warfare had caused the U.S. to enter the war on the side of the Allies. An American Expeditionary Force, commanded by Gen. PERSHING, landed in France and saw its first action at Château-Thierry (June 1917). In Mar. 1918 the new Soviet government signed the Treaty of BREST-LITOVSK with the Central Powers. The Germans were stopped just short of Paris in the second battle of the Marne, and an Allied counteroffensive was successful. The Turkish and Austro-Hungarian empires, disintegrating from within, surrendered to the Allies, as did Bulgaria. After revolution erupted in Germany, the armistice was signed on Nov. 11, 1918. The Treaty of VERSAILLES and the other treaties that ended the war changed the face of Europe and the Middle East. Four great empires—Germany, Austria-Hungary, Russia, and Turkey—had disappeared by the end of the war. Replacing them were governments ranging from monarchies and sheikhdoms through constitutional republics to the Marxist socialist state of the USSR. The war itself had been one of the bloodiest in history, without a single decisive battle. A total of 65 million men and women had served in the armies and navies; an estimated 10 million persons had been killed and double that number wounded. Such statistics contributed to a general revulsion against war, leading many to put their trust in multinational disarmament pacts and in the newly formed LEAGUE OF NATIONS.

World War II, 1939–45, conflict involving every major power in the world. On one side were the Allies (chiefly Great Britain, the U.S., and the Soviet Union) and on the other side the Axis powers (Germany, Japan, and Italy). The conflict resulted from the rise of totalitarian, militaristic regimes in Germany, Japan, and Italy after WORLD WAR I. Partly responsible also were the humiliating peace treaties forced on Germany after that war and the worldwide economic disorders brought on by the GREAT DEPRESSION of the 1930s. In Asia the second SINO-JAPANESE WAR (1931) was followed by continuing Japanese aggression. In 1936 Benito MUSSOLINI conquered Ethiopia for Italy, thereby dramatizing the ineffectuality of the LEAGUE OF NATIONS. French and British appeasement of Adolf HITLER's Nazi regime in Germany culminated in the MUNICH PACT (1938), which sacrificed much of Czechoslovakia to Germany. France and Britain, nevertheless, began to rearm and to offer guarantees to other potential victims of German aggression, notably Poland. In Aug. 1939 Germany and the Soviet Union, previously bitter enemies, concluded a nonaggression pact, thus freeing Hitler to invade Poland (Sept. 1). France and Britain immediately declared war on Germany, officially beginning World War II. The Germans won a quick victory in Poland, and went on to occupy Norway and Denmark in 1940. In May they overran the Low Countries, broke into France, and swept to the English Channel. On June 22 France surrendered (although a Free French force continued to fight). Britain, under Prime Min. Winston CHURCHILL, was left to fight alone. The Battle of Britain (Aug.–Oct. 1940), Germany's attempt to bomb Britain into submission, was the only German failure of the war's early years. Axis land operations continued in N Africa and in the Balkans, where Greece and Yugoslavia were occupied. On June 22, 1941, Germany invaded the Soviet Union, bringing that nation, under Premier Joseph STALIN, into the war. Meanwhile, the U.S., under Pres. F.D. ROOSEVELT, was drawing closer to the Allies. On Dec. 7, 1941, Japan attacked PEARL HARBOR, bringing the U.S. into the war. But Axis successes continued. By 1942 Japan had conquered the Philippines, many other Pacific islands, and all of Southeast Asia; German forces in the Soviet Union reached Stalingrad and the Caucasus; ROMMEL seemed about to take Cairo; and German submarines were threatening to wipe out Allied shipping. Late in 1942, however, the Allies began to rally. In N Africa, British Gen. MONTGOMERY's rout of Rommel at Alamein (Oct. 1942; see NORTH AFRICA, CAMPAIGNS IN), and the landing of U.S. troops in Algeria, resulted in Allied victory in Africa. The Allies conquered Sicily and S Italy, and Italy surrendered (Sept. 1943). In the Pacific, U.S. forces won (1942) the naval battles of the Coral Sea and Midway, landed on GUADALCANAL, and began the island-hopping strategy that by 1945 had won back the Philippines and brought a striking force to Japan's doorstep at IWO JIMA and OKINAWA. The German surrender at Stalingrad (1943; see VOLGOGRAD) was followed by a Soviet offensive that by 1944 had taken Russian troops deep into Poland, Hungary, and the Balkans. In the battle of the Atlantic, the German submarine fleet was virtually destroyed. German resistance in N Italy was stubborn, however, especially at Cassino and Anzio. On June 6, 1944 (known thereafter as D Day), the final Allied campaign began with the landing of troops in Normandy. In August a second force landed in S France. By late 1944 Belgium and France were liberated, and the war had been carried into the Netherlands and Germany. Allied bombing meanwhile, was destroying German industrial centers. In Dec. 1944 the Germans staged a last-ditch counterattack in the Ardennes. By Jan. 1945, however, the Allies were continuing their drive into Germany. The Russians had conquered E Germany to the Oder. On March 7 the Western Allies broke through the Siegfried Line, crossed the Rhine, and overran W Germany. In Apr. 1945, after Hitler's suicide, German resistance collapsed, and on May 7, 1945, Germany surrendered unconditionally. The Allies now turned their attention to the Pacific. The Soviet Union declared war on Japan and occupied Manchuria. In Aug. 1945, while U.S. troops were preparing to invade Japan's home islands, Pres. TRUMAN ordered the dropping of the ATOMIC BOMB on HIROSHIMA and NAGASAKI. Japan announced its surrender on Aug. 14, 1945, thereby bringing to an end the costliest war in history.

World Wildlife Fund (WWF), international organization formed to raise money for conservation projects, est. 1961. The international organization became (1986) the **Worldwide Fund for Nature,** but the affiliated group in the U.S. retained its original name. It has been responsible for international agreements on conservation and has supported research on ENDANGERED SPECIES, including the giant PANDA, its symbol.

worm, term for various unrelated invertebrates with soft, often long and slender bodies. The most primitive are the FLATWORMS, including the PLANARIANS, FLUKES, and TAPEWORMS. RIBBON WORMS are col-

The key to pronunciation appears on page xiii.

orful marine carnivores, and several loosely related groups of tube-like worms (e.g., horsehair worms, NEMATODES, and ROTIFERS). The segmented or ANNELID WORMS include the EARTHWORMS and LEECHES. Although it has no taxonomic validity, the term *worm* is also used for the SHIPWORM (a type of CLAM), some insect larvae (e.g., the armyworm and inchworm), and the acorn worm.

Worms, Diet of, 1521, most famous of the imperial diets held at Worms, Germany. Called by Holy Roman Emperor CHARLES V, it took up, among other business, the matter of Martin LUTHER. Luther appeared under a safe-conduct and refused to yield his position, traditionally ending his defense with: "Here I stand. I cannot do otherwise. God help me. Amen." The Edict of Worms, issued May 25, declared him an outlaw, thus hardening the lines of the REFORMATION.

Wounded Knee, creek and village (1990 pop. 18) in South Dakota, site of the last major battle of the INDIAN WARS (Dec. 29, 1890), in which U.S. troops killed almost 200 Sioux, including women and children. In 1973, 200 members of the AMERICAN INDIAN MOVEMENT occupied the village of Wounded Knee for 69 days, demanding a Senate investigation into the condition of Native Americans.

Wovoka, c.1858–1932, prophet of the messianic GHOST-DANCE religion, a PAIUTE. He taught that pacifism and the sacred dance would cause the whites to disappear and would free all Native Americans from death, disease, and misery. After his supernatural "bullet-proof" ghost shirts failed tragically at WOUNDED KNEE, the appeal of his religion waned.

WPA: see WORKS PROJECTS ADMINISTRATION.

Wrangell–St. Elias National Park: see NATIONAL PARKS (table).

Wren, Sir Christopher, 1632–1723, English architect, astronomer, and mathematician. After the great fire of 1666, he produced a masterly plan for the rebuilding of London, never executed. He designed, however, many new buildings, most notably ST. PAUL'S CATHEDRAL. From 1670 to 1711 he executed 52 London churches, noted for their varied and original designs and fine spires, e.g., St.-Mary-le-Bow. Among his secular works were the Sheldonian Theatre, Oxford; Trinity College Library, Cambridge; Chelsea Hospital, London; and others. His buildings exhibit great elegance, clarity, and dignity.

wren, small, plump, perching songbird of the primarily New World family Troglodytidae. Its plumage is usually brown or reddish above and white, gray, or buff below. Among the best singers are the canyon, Carolina, and winter wrens. Wrens are valuable insect destroyers.

wrestling, sport in which two unarmed opponents grapple with one another. The object is to secure a fall, i.e., to pin the opponent's shoulders to the floor. Two distinctly different styles exist today. Greco-Roman wrestling, popular in continental Europe, permits no holds below the waist and takes place mostly on the ground. Freestyle wrestling, favored in the U.S., Britain, and elsewhere, permits tackling, tripping, and other rough features. In amateur wrestling, contestants are classified by weight. One of the earliest sports known, wrestling was extremely popular among the ancient Greeks. Competition in both styles is part of the modern Olympic program. Jujitsu (see MARTIAL ARTS) and sumo are forms of wrestling practiced in Japan. Professional wrestling, popular in the U.S., is less a competitive sport than a staged entertainment.

Wright, Frances (Fanny), 1795–1852, Scottish-American reformer, later known as Mme Darusmont. She founded (1825) NASHOBA, a colony for freed slaves near Memphis, Tenn., and after its failure worked for women's rights, universal education, abolition of slavery, and birth control. Wright also edited, with Robert Dale OWEN, the *Free Enquirer.*

Wright, Frank Lloyd, 1869–1959, American architect; b. Richland Center, Wis. He worked with Louis SULLIVAN. Beginning in 1893 he built a series of homes in and around Chicago with low horizontal lines echoing the landscape—his "prairie style," e.g., the Robie House, Chicago (1909). From the beginning he practiced radical innovation in both structures and aesthetics. He did pioneer work in integrating machine methods and materials into a true architectural expression. Many of his innovations, e.g., open planning—eliminating traditional room division to achieve fluid inner space—set standards. The Larkin Building, Buffalo, N.Y. (1904, destroyed 1950), and Oak Park Unity Temple, near Chicago (1906), were highly influential early designs. The Imperial Hotel, Tokyo (1916–23, demolished 1968), and Wright's home, "Taliesin," Spring Green, Wis. (1911, twice rebuilt), were especially famous. Later designs included the Kaufmann house, "Falling Water," Bear Run, Pa. (1936–37), cantilevered over a waterfall; and the Guggenheim Museum, N.Y.C. (1946–59), with its spiral ramp.

Wright, Jim (James Claud Wright, Jr.), 1922–, U.S. politician, speaker of the U.S. House of Representatives (1987–89); b. Fort Worth, Tex. A Texas state representative (1947–49) and mayor (1950–54) of Weatherford, Tex., he was elected as a U.S. representative from Texas in 1954. A moderate Democrat, he became House majority leader in 1976. In 1987 he became House speaker, but he resigned two years later amid charges of unethical conduct.

Wright, Orville, 1871–1948, b. Dayton, Ohio, and **Wilbur Wright,** 1867–1912, b. near New Castle, Ind., American airplane inventors. Influenced by Otto LILIENTHAL's glider flights, the Wright brothers used their Dayton bicycle shop to construct their early aircraft. Their use of movable wing assembly parts to direct the craft was an important advance. With an engine Orville designed, they made on Dec. 17, 1903, near Kitty Hawk, N.C., the first four controlled, sustained flights in a power-driven AIRPLANE.

Wright, Patience Lovell, 1725–86, American sculptor; b. Bordentown, N.J. Her wax portraits were the earliest recorded sculptures made in the American colonies. Wright lived in England from 1772, where she modeled likenesses of the king, the queen, and other notables. A son, **Joseph Wright,** 1756–93, was a portrait painter. A characteristic example of his work is a portrait of John Jay (N.Y. Historical Soc.).

Wright, Richard, 1908–60, African-American author; b. near Natchez, Miss. Wright wrote powerfully of the plight of African Americans in America. His major works are the novel *Native Son* (1940, unexpurgated ed. 1991) and the autobiography *Black Boy* (1945). He also wrote other novels, short stories, and nonfiction.

Wrocław [vrôts'läf], Ger. *Breslau,* city (1989 est. pop. 636,000), SW Poland, on the Oder (Odra) R. It is a port and an industrial center with such manufactures as heavy machinery and computers. Settled before the 11th cent., it became (1163) the capital of SILESIA and passed to BOHEMIA (1335), the HAPSBURGS (1526), and PRUSSIA (1742). In 1945 it was given to Poland, and its German residents were expelled. Historic buildings include a 13th-cent. cathedral and a Gothic town hall.

wrought iron, commercially purified IRON. In the Aston process, pig iron is refined in a Bessemer converter and then poured into molten iron-silicate slag. The resulting semisolid mass is passed between rollers that squeeze out most of the slag. Wrought iron is tough, malleable, ductile, and corrosion-resistant, and melts only at high temperature. It is used to make ornamental ironwork, rivets, bolts, pipes, chains, and anchors.

Wuhan, city (1990 est. pop. 3,750,000), capital of Hubei prov., central China, at the junction of the Han and Chang (Yangtze) rivers. The great industrial, commercial and transportation hub of central China, Wuhan comprises the former cities of Hankou, Hanyang, and Wuchang. Wuhan is a center of Chinese iron and steel production and an inland port that can handle oceangoing vessels, even though it is 600 mi (970 km) from the sea.

Wuhsi: see WUXI.

Wundt, Wilhelm Max [vōōnt], 1832–1920, German physiologist and psychologist. In 1878 he founded at Leipzig the first laboratory for experimental psychology. His experimental method remains a permanent contribution to psychology.

Wu P'ei-fu [wōō pā-fōō], 1874–1939, Chinese general. After military service under the Ch'ing dynasty, he supported YÜAN SHIH-KAI as president of China. After 1916 Wu warred with other leaders for control of N China. He was defeated (1926) by CHIANG KAI-SHEK'S Northern Expedition.

Württemberg [vur'təmbĕrk"], former state, SW Germany. STUTTGART was the capital. It included the Swabian Jura in the south and part of the Black Forest in the west, and was divided between the medieval duchies of FRANCONIA and SWABIA. Under the HOLY ROMAN EMPIRE, the counts of Württemberg expanded (after the 11th cent.) their territory and were raised to ducal rank in 1495. Under Duke Frederick II (later King Frederick I), Württemberg, through its alli-

ance with NAPOLEON I, acquired additional territory and became an electorate (1803) and a kingdom (1806). It supported Prussia in the AUSTRO-PRUSSIAN WAR (1866) and the FRANCO-PRUSSIAN WAR (1870–71) and joined (1871) the German empire. The monarchy was abolished in 1918, and in 1919 Württemberg joined the Weimar Republic. Temporarily partitioned after WORLD WAR II, it was incorporated (1952) into the new West German (since 1990, German) state of Baden-Württemberg.

Wuxi or **Wuhsi** [both: wōō-shē], city (1987 est. pop. 860,000), S Jiangsu prov., China, on the GRAND CANAL. Long famous for its silks and scenery, Wuxi remains a center of the silk industry and an important tourist attraction. It is also well-known for high-technology and light-industrial products.

Wyandot: see HURON.

Wyatt, Sir Thomas, 1503–42, English poet and statesman. Wyatt served Henry VIII and is thought to have been Anne BOLEYN's lover before her marriage. Influenced heavily by the Italian love poets, he wrote the first SONNETS in English. He also wrote lyrics, rondeaus, satires, and psalms.

Wyatt, Sir Thomas, d. 1554, English rebel. Objecting to MARY I's planned marriage to PHILIP II of Spain, he raised an army in Kent and marched (1554) on London. He failed to capture Mary or take the city, and was hanged for treason.

Wycherley, William [wĭch'ərlē], 1640?–1716, English dramatist. His comedies include *Love in a Wood* (1671), *The Gentleman Dancing-Master* (1672), *The Country Wife* (1674), and *The Plain Dealer* (1676). Although his plays are the most vicious and licentious of RESTORATION comic dramas, he earned a prominent place in English stage history with his brilliant wit and satire.

Wyclif, Wycliffe, Wickliffe, or **Wiclif, John** [all: wĭk'lĭf], c.1328–1384, English reformer. He believed that Jesus is humanity's overlord and championed the people against the abuses of the church. Wyclif attacked orthodox church doctrine, especially that of transubstantiation, and held that the Scriptures are the supreme authority. Condemned (1380, 1382) as a heretic, he was left undisturbed in his retirement. His teachings were spread by "poor priests" (see LOLLARDRY) and influenced John HUSS. Wyclif brought about the Wyclif Bible, the first English translation of the Latin Bible.

Wyeth, Andrew Newell [wī'əth], 1917–, American painter; b. Chadds Ford, Pa.; son of the illustrator N.C. Wyeth. One of the most popular contemporary American painters, Wyeth portrays the people and places of rural Pennsylvania and Maine in a meticulous, naturalistic style that is so intense and immediate as to appear surreal. His best-known painting is *Christina's World* (1948; Mus. Mod. Art, N.Y.C.). His son **James Browning Wyeth,** 1946–, b. Wilmington, Del., is also an artist.

Wylie, Elinor (Hoyt), 1885–1928, American author; b. Somerville, N.J. Her highly polished, melodious, and deeply emotional poetry is included in such collections as *Nets to Catch the Wind* (1921) and *Angels and Earthly Creatures* (1929). Among her delicately wrought novels, filled with ironic fancy, are *Jennifer Lorn* (1923), *The Orphan Angel* (1926), and *Mr. Hodge and Mr. Hazard* (1928).

Wyoming, state of the W U.S.; bordered by South Dakota and Nebraska (E), Colorado and Utah (S), Idaho (W), and Montana (N). *Area,* 97,914 sq mi (253,597 sq km). *Pop.* (1990) 453,588, an 3.7% decrease from 1980 pop. *Capital,* Cheyenne. *Statehood,* July 10, 1890 (44th state). *Highest pt.,* Gannett Peak, 13,804 ft (4,210 m); *lowest pt.,* Belle Fourche R., 3,100 ft (946 m). *Nickname,* Equality State. *Motto,* Equal Rights. *State bird,* meadowlark. *State flower,* Indian paintbrush. *State tree,* cottonwood. *Abbr.,* Wyo.; WY.

Land and People. E Wyoming is part of the GREAT PLAINS, except in the northeast, where the BLACK HILLS are located. Farther west, the ranges of the ROCKY MOUNTAINS, which include the dramatic Wind River and TETON ranges, cut across the state diagonally. The cool, dry climate brings mild summers and severe winters to most of the state. Almost 50% of the land is controlled by the federal government. Sparsely populated Wyoming has the smallest population of any state, and almost two thirds of the residents live in urban areas. The largest city is CHEYENNE, followed by CASPER. In 1990 the state was over 94% white.

Economy. Wyoming's economy is almost entirely dominated by primary production. Mining is the leading source of income; the state is one of the leading U.S. producers of coal, oil, and natural gas, uranium, and sodium carbonate. Portland cement and crushed stone are also important. Agriculture is dominated by cattle and sheep ranching. The principal dry farm crops are wheat, beans, barley, and oats; the leading irrigated crop is sugar beets. Tourism is the second largest source of income. Visitors are attracted by rodeos, excellent hunting and fishing, and two spectacular NATIONAL PARKS (see table), Yellowstone and Grand Teton. The small industrial sector is dominated by oil refining, food processing, and the manufacture of clay, glass, and wood products.

Government. The state constitution of 1890 provides for a governor serving a four-year term. The legislature consists of a senate with 30 members serving four-year terms and a house with 64 members elected for two-year terms. Wyoming is represented in the U.S. Congress by two senators and one representative and has three electoral votes.

History. Present-day Wyoming was the home of many Native American tribes, including the CROW, Shoshone, CHEYENNE, ARAPAHO, and SIOUX, who lived by hunting buffalo. During the early 19th cent. the so-called MOUNTAIN MEN trapped furs in the area. With the decline of the fur trade during the 1840s, the few settlers began to supply wagon trains crossing the area on the OREGON TRAIL, and later the BOZEMAN and Overland trails, which cut through the South Pass on their way west. The arrival (1868) of the Union Pacific RR was a great stimulus to settlement. The Native Americans were conquered by the late 1870s, and large-scale ranching began. The activities of cattle rustlers and vigilante groups reached a climax in the cattle war of Johnson County (1892), which was followed by conflicts between sheep- and cattle-ranchers. Petroleum production began in the 1880s. In the 1920s the state's TEAPOT DOME oil deposits became the symbol of corruption in the administration of Pres. Warren G. HARDING. The national energy crisis of the 1970s brought a dramatic boom to Wyoming's energy industries, especially coal mining. By the mid-1980s, however, the state's economy had declined due to a fall in energy prices and a lack of diversity, and environmental problems precipitated by the energy industry had become a concern.

Wyspiański, Stanisław [vĭspyä'nyəskē], 1869–1907, Polish dramatist, painter, and poet. With such plays as *The Legion* (1900) he founded modern Polish drama. His artistic work includes murals, stained-glass windows, and costumes.

Wyss, Johann David [vēs], 1743–1818, Swiss author. He wrote the children's classic *The Swiss Family Robinson* (1813), based on Daniel DEFOE's *Robinson Crusoe.* His son, **Johann R. Wyss,** 1781–1830, was professor of philosophy at Berne and wrote the Swiss national anthem.

Wyszynski, Stefan Cardinal, [vĭzĭn'skē], 1901–81, Roman Catholic primate of POLAND (1949–81). He was imprisoned (1953–56) by the Communist authorities. After his release, however, he achieved a degree of church autonomy unequaled in any other Communist country.

X

Xe, chemical symbol of the element XENON.

xenon (Xe), gaseous element, discovered spectroscopically in 1898 by William RAMSAY and M.W. Travers. It is a rare, colorless, odorless, tasteless INERT GAS used in certain photographic-flash lamps, in high-intensity arc lamps for motion-picture projection and for arena and stadium lighting, in high-pressure arc lamps to produce ultraviolet light, and in numerous radiation-detection instruments. See ELEMENT (table); PERIODIC TABLE.

Xenophon [zĕn'əfən], c.430 B.C.–c.355 B.C., Greek historian. A well-to-do young disciple of SOCRATES, he joined the Greek force (the Ten Thousand) that supported CYRUS THE YOUNGER of Persia. They fought well, but after the disastrous battle of Cunaxa (401 B.C.), they were left to fight their way home through unknown and hostile land. He was chosen a leader and told the story of this heroic retreat in his most famous work, the *Anabasis.* His other works include the *Hellenica* and the *Memorabilia.* He lived and wrote in exile in Sparta.

xerography: see PHOTOCOPYING.

Xerxes, c.519–465 B.C., king of Persia, son of DARIUS I. He continued his father's campaign against Greece for its role in the Ionian revolt by establishing alliances with Carthage and other Greek city-states and mounting (480) a military expedition. His armies scored a devastating victory at Thermopylae and destroyed Attica. His navy's limited success at Artemisium was reversed by the triumph of the Greek fleet at Salamis. After his defeat, he retired to his court at Susa, where he was murdered.

Xhosa, Bantu-speaking people of S Africa, formerly called Kafirs or Kaffirs by European colonialists. Farmers and cattle raisers, the Xhosa, who inhabited their lands for centuries before European settlement, lived traditionally in patrilineal clans governed by an elected chief and council. Today they predominate in the BANTUSTAN of Transkei, but many live in other parts of South Africa.

Xiamen [shēä-mŭn] or **Amoy** [əmoi'], city (1986 est. pop. 344,000), S Fujian prov., China, on Xiamen island at the mouth of the Jiulong R. Fishing, shipbuilding, and food processing are the major industries. The city was one of the earliest seats of European commerce in China. Xiamen is a special economic zone (authorized 1980).

Xi'an or **Sian** [both: shē-än], city (1990 est. pop. 2,760,000), capital of Shaanxi prov., N central China, in the Wei R. valley. Located on the main east-west RR and the primary transport center for central China, Xi'an is one of China's industrial and commercial hubs. It produces steel, machinery, textiles, and light industrial products and is an important cultural center. The tomb of Shih Huang-Ti, who unified China in 221 B.C., was discovered in Xi'an in 1974. Filled with thousands of full-sized terra cotta horses and soldiers, it is one of China's most important archeological sites and tourist attractions.

Xinjiang [shĭn'jēäng] or **Sinkiang** [sĭn'kyäng], officially Xinjiang Uygur Autonomous Region, autonomous region (1990 pop. 15,156,000), c.660,000 sq mi (1,709,400 sq km), NW China, bordered by Russia (N), Kazakhstan, Kyrgyzstan, Tajikistan, and Afghanistan (W), Kashmir and Tibet (S), and Qinghai and Gansu provs. and the Republic of Mongolia (E). The capital is Ürümqi. Agriculture and stock raising are important, and there are extensive mineral deposits. Manufactures include chemicals, farm machinery, and oil. China's nuclear arms program is centered at Lop Nur in W Xinjiang. The UIGURS, a Turkic people, are the largest ethnic group, and 12 other minority nationalities, many of them also Turkic, also live in the region; ethnic Chinese, however, are approaching numerical parity with the Uigurs. Islam is widely practiced. Also known as Chinese, or Eastern, Turkistan, Xinjiang first passed to China in the 1st cent. B.C. It was subsequently occupied by the Uzbeks (7th cent.), Tibetans (8th cent.), Uigurs, Arabs (10th cent.), Mongols (13th cent.), and Manchus (18th cent.). It became a Chinese province in 1881; in the 1960s and 70s it was the site of Sino-Soviet border clashes. In the early 1990s there was increasing discontent with Chinese rule among the Turkic peoples of Xinjiang.

X ray, invisible, highly penetrating ELECTROMAGNETIC RADIATION of much shorter wavelength (higher frequency) than visible light. The wavelength range for X rays is from about 10^{-8} m to about 10^{-11} m. Hard X rays have higher frequencies and are more penetrating; soft X rays have lower frequencies and are less penetrating. Discovered in 1895 by Wilhelm ROENTGEN, X rays are produced by the impact of high-energy electrons (of several thousands of eV) on a metal anode in a highly evacuated glass bulb. Among other applications, X rays are used in diagnostic medicine and in the study of crystal structure (see X-RAY CRYSTALLOGRAPHY). X rays provide a image of the body's interior when they pass through it and strike a photographic plate or fluorescent screen; denser materials absorb more X rays and appear brighter. Several techniques, known as X-ray microscopy or microradiography, can provide enlarged images of the structure of an opaque object.

X-ray astronomy, study of celestial objects by means of the X RAYS they emit. The sun was the first celestial body found to emit X rays. Since then many X-ray sources—such as centers of GALAXIES, clouds of extremely hot gas between galaxies, and double stars in which one star is a NEUTRON STAR—have been discovered. Because X rays are difficult to observe from the ground due to atmospheric interference, high-altitude balloons, sounding ROCKETS, and orbiting OBSERVATORIES must be used. The High Energy Astrophysical Observatory II, or Einstein Observatory, detected several thousand new X-ray sources in our galaxy and beyond. See also GAMMA-RAY ASTRONOMY.

X-ray crystallography, study of the molecular structure of crystalline compounds through X-ray DIFFRACTION techniques. When an X-ray beam bombards a crystal, the atomic structure of the crystal causes the beam to scatter in a specific pattern. This phenomenon, known as X-ray diffraction, occurs when the wavelength of the X rays and the distances between atoms in the crystal are of similar magnitude. X-ray crystallography provides information on the positions of individual atoms in the crystal, the distances between atoms, the angles of the atomic bonds, and other features of molecular geometry. The technique is also used to determine the structure of proteins, nucleic acids, and other substances.

xylem: see STEM; WOOD.

xylophone: see PERCUSSION INSTRUMENT.

XYZ Affair, name usually given to an incident (1797–98) in Franco-American diplomatic relations. In 1797 Pres. John Adams named a three-member commission—John MARSHALL, Elbridge GERRY, and C.C. Pinckney—to resolve Franco-American disputes. It was hinted to them through Mme de Villette that the French foreign minister, Charles Maurice de TALLEYRAND, would require bribes and loans totaling $250,000 before talks could begin. The commissioners held secret negotiations concerning the money with X (Jean Conrad Hottinguer), Y (an American banker in Hamburg named Bellamy), and Z (Lucien Hauteval). When news of the talks became public and created an uproar in the U.S., the whole mission collapsed. Franco-American differences were finally settled by the Convention of 1800.

Y

Y, chemical symbol of the element YTTRIUM.

Yahweh: see GOD.

Yahya Khan, Agha Muhammad, 1917–80, Pakistani general and president (1969–71). He was commander in chief of the army (1966–69) and succeeded Gen. AYUB KHAN as president. The defeat (1971) of Pakistan's army and the secession of Bangladesh from Pakistan forced his resignation. He was placed under house arrest for five years.

yak, bovine MAMMAL (*Bos grunniens*) of TIBET and adjacent regions. Oxlike in build, with humped shoulders, a long, thick coat, and large, upcurved horns, it has been hunted to near extinction. The wild yak may reach 65 in. (165 cm) at the shoulder. Yaks live in isolated herds at elevations above 14,000 ft (4,300 m). Long domesticated, they are a source of milk, meat, and leather, and are used as draft animals.

Yale University, at New Haven, Conn.; founded 1701, the third-oldest institution of higher learning in the U.S. First called the Collegiate School, it opened at what is now Clinton, Conn., later moving to Old Saybrook and (1716) to New Haven, where it was renamed in honor of a benefactor, Elihu Yale. It achieved a substantial scholastic reputation as a college before expanding (19th cent.) into one of the premier American universities. The first Ph.D. degree in the U.S. was bestowed there in 1861. The Peabody Museum of Natural History and the Yale Art Gallery are renowned, and the university library is one of the nation's largest.

Yalow, Rosalyn Sussman, 1921–, American medical physicist; b. N.Y.C. She did research on the medical use of radioisotopes, radioimmunoassay, and radiation chemistry. In 1977, she was awarded the Nobel Prize in medicine or physiology for research on the role of hormones in the chemistry of the body.

Yalta Conference, 1945, meeting at Yalta (Crimea, USSR; now in Ukraine), of British Prime Min. CHURCHILL, U.S. Pres. F.D. ROOSEVELT, and Soviet Premier STALIN. Among the chief decisions agreed upon by the "Big Three" were these: (1) a four-power occupation of Germany (with France being the fourth power); (2) a founding conference for the UN to be held later that year; (3) the Soviet Union's agreement to enter the war against Japan after Germany's defeat; receiving occupation areas in the East in return; and (4) a guarantee of representative government in Poland. Because of the secrecy of its agreements and what were considered by some to be undue concessions to the Soviet Union, the Yalta Conference has long been the subject of heated controversy.

Churchill, Roosevelt, and Stalin at the Yalta Conference, 1945

Yalu, river, c.500 mi (800 km) long, flowing generally southwest to the Bay of Korea at Dandong and forming part of the China-North Korea border. The river generates hydroelectricity at the Supung Dam above Sinuiju, North Korea, and is used to float timber to sawmills. China's involvement in the KOREAN WAR began (1950) when its troops crossed the Yalu.

yam, common name for some members of the family Dioscoreaceae, tropical and subtropical climbing herbs and shrubs with starchy RHIZOMES often cultivated for food. The thick rhizomes, especially of the genus *Dioscorea,* often weigh up to 30 lb (13.6 kg) and are an important food source for humans and livestock. The SWEET POTATO, erroneously called yam, belongs to the MORNING GLORY family.

Yamasaki, Minoru, 1912–86, American architect; b. Seattle. His designs are seen in airport buildings in St. Louis (1951) and Boston (1968); at the U.S. Consulate General, Kobe, Japan at the U.S. science pavilion for the Seattle Exposition (1962); and at the WORLD TRADE CENTER complex, N.Y.C.

Yamoussoukro, city (1990 est. pop. 100,000), capital of Côte d'Ivoire. Located in the central part of the country, it is the birthplace of Pres. HOUPHOUËT-BOIGNY. The government began transferring here in 1983, but most government offices and foreign embassies remain in the former capital, ABIDJAN. The world's largest Christian church, the Basilica of Our Lady of Peace, is in Yamoussoukro.

Yan'an or **Yenan** [both: yĕn-än], city (1986 est. pop 87,000), N Shaanxi prov., China. It is a regional market center. Famed as the terminus of the LONG MARCH (1934–35) and capital of the Chinese Communist base areas (1936–47), the city and its monuments attracted millions of visitors in the 1960s and 70s. Since 1978 and the de-emphasis of MAO ZEDONG's leadership, far fewer visitors have gone to Yan'an.

Yangon [yäng'gōn] or **Rangoon,** largest city (1983 pop. 2,458,712) and capital of Myanmar, near the mouth of the Yangon R. A major port, it is the country's foremost industrial, commercial, and transportation center. Its products include rice, teak, oil, and steel. Dominated by the ancient golden-spired Shwe Dagon Pagoda, it was a fishing village until it was made the capital (1755) by Alaungapaya, founder of the last line of Burman kings. Modernized under British colonial rule (1852–1937), it was severely damaged by an earthquake (1930) and by bombing in World War II.

Yangtze or **Yangzi:** see CHANG.

Yaoundé, city (1990 est. pop. 750,000), capital of Cameroon. It is the country's administrative, financial, and communications center, and a regional trade center for coffee, cocoa, copra, sugarcane, and rubber. Founded (1888) by German ivory-traders, it was (1919–40, 1946–60) the capital of the French CAMEROONS and became (1960) the capital of Cameroon.

yard: see ENGLISH UNITS OF MEASUREMENT; WEIGHTS AND MEASURES, table.

Yaroslav, 978–1054, grand duke of Kiev (1019–54); son of VLADIMIR I. Designated by his father to rule Novgorod, he wrested Kiev from his brother. He consolidated Kiev's power, but civil war among his sons followed his death.

Yb, chemical symbol of the element YTTERBIUM.

Yeager, Chuck (Charles Elwood Yeager), 1923–, American aviator. A fighter pilot during World War II, he was a test pilot during the early postwar years. Among other records, he was the first person to fly faster than the speed of sound (1947) and set a world speed record of 1,650 miles per hour (1953). His obvious bravery, technical skill, and unaffected manner have to a large public made him the quintessential American hero. He wrote (with Leo Janos) *Yeager* (1985).

year, time required for the earth to complete one orbit about the sun. The **tropical,** or **solar, year** measured relative to the sun is the time (365 days, 5 hr, 48 min, 46 sec of mean SOLAR TIME) between successive vernal EQUINOXES. The **sidereal year** is the time (365 days, 6 hr, 9 min, 9.5 sec of mean solar time) required for the earth to complete an orbit of the sun relative to the stars; it is longer than the tropical year because of the PRECESSION OF THE EQUINOXES. The **anomalistic year** is the time (365 days, 6 hr, 13

min, 53.0 sec of mean solar time) required for the earth to go from its perihelion point once around the sun and back to this point; its greater length is due to the slow rotation of the earth's orbit as a whole.

yeast, name for certain microscopic, unicellular fungi (see FUNGUS), and for commercial products consisting of masses of yeast cells. Yeasts consist of oval or round cells that reproduce mainly by budding (a small outgrowth on the cell's surface increases in size until a wall forms to separate the new individual, or bud) but also by means of SPORES. They are used in alcoholic FERMENTATION and to leaven bread. Brewer's yeast is high in B-complex vitamins and is used as a dietary supplement. Certain other fungi are also sometimes called yeasts.

Yeats, William Butler, 1865–1939, Irish poet and playwright. The son of an artist, he studied painting and lived in London and in Sligo, where many of his poems are set. Fascinated by Irish legend and the occult, he soon became a leader of the Irish literary renaissance. His first work, the drama *Mosada* (1886), reflects these concerns, but the long poems in *The Wanderings of Oisin* (1889) show an intense nationalism, a feeling strengthened by his hopeless passion for the Irish patriot Maud Gonne. Yeats's poetry before 1900 reveals his debt to SPENSER, SHELLEY, and the PRE-RAPHAELITES. Verses from this period include "The Lake Isle of Innisfree" and "When You Are Old." In 1898 he helped found the Irish Literary Theatre, where his *The Countess Cathleen* (1899) and *Cathleen ni Houlihan* (1902) were performed. *The Hour Glass* (1904), *The Land of Heart's Desire* (1904), and *Deirdre* (1907) appeared at the Abbey Theatre. His prose tales were collected in *The Celtic Twilight* (1893) and the symbolic *Secret Rose* (1897). As he grew older, Yeats's poetry moved from transcendentalism to a more physical realism. Polarities between the physical and the spiritual were central in poems like "Sailing to Byzantium" and "The Second Coming." Some of his best work came late, in *The Tower* (1928) and *Last Poems* (1940). The prose work *A Vision,* an occult view of history written after 1917 with his wife, Georgie Hyde-Lees, was a source for much of his later work. Yeats received the Nobel Prize in literature in 1923.

Yekaterinburg or **Ekaterinburg,** formerly **Sverdlovsk,** city (1990 est. pop. 1,370,000), E European Russia, in the eastern foothills of the central URALS, on the Iset R. Among the region's largest cities, it is a western terminus of the Trans-Siberian RR and a major producer of turbines, ball bearings, and other manufactures. Nearby are gold and copper mines. It was founded in 1721 and named for CATHERINE I. In 1918, NICHOLAS II and his family were shot in Yekaterinburg. It was renamed Sverdlovsk in 1924. During World War II much industry was moved to the region from the European USSR. In 1991 the original name of the city was restored.

yellow daisy: see BLACK-EYED SUSAN.

yellow fever, acute infectious disease caused by a virus transmitted by the bite of the female *Aedes aegypti* mosquito. It causes fever, chills, prostration, JAUNDICE, and, in severe cases, internal hemorrhage, COMA, and death. Endemic to many tropical and subtropical areas, the disease was once prevalent in the Caribbean. In 1900 a team headed by Walter REED proved the mosquito-transmission theory of the Cuban physician C.J. FINLAY, and U.S. Surgeon General W.C. Gorgas led mosquito-eradication and sanitation procedures to control the disease before construction of the Panama Canal could begin. The disease now occurs in sporadic outbreaks, and immunization is an effective preventive measure.

Yellowknife, town (1991 pop. 15,179), capital of the Northwest Territories, NW Canada, on Great Slave Lake and the Yellowknife R. It was founded in 1935, moved to a new site in 1945, and became the territorial capital in 1967. Gold mining is the principal industry.

Yellow River: see HUANG HE.

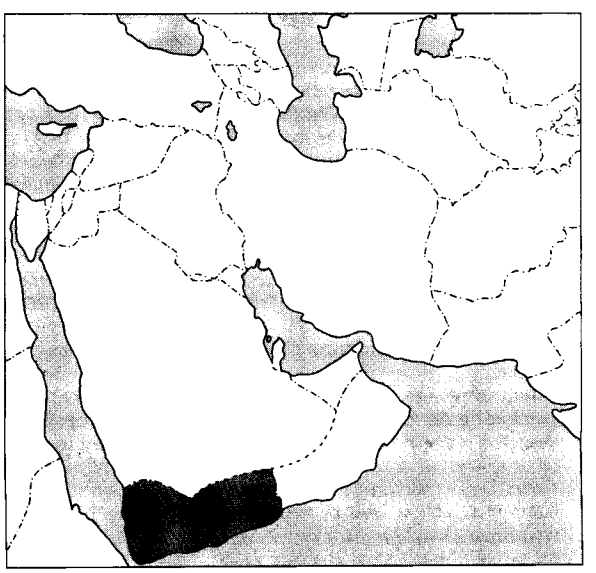
Yellow Sea or **Huang Hai,** western arm of the Pacific Ocean, between China's east coast and Korea. The shallow sea, which has a maximum depth of c.500 ft (150 m), is underlaid by potentially rich oil deposits. Bo Hai, in the northwest, is the largest inlet. South of Korea it becomes the EAST CHINA SEA. Colored silt, deposited by feeder rivers, gives the Yellow Sea its name.

Yellowstone National Park: see NATIONAL PARKS (table).

Yeltsin, Boris Nikolayevich, 1931–, Soviet and Russian political leader, president of RUSSIA (1991–). Appointed Moscow Communist party boss by Mikhail GORBACHEV in 1985, he was ousted (1987) after clashing with conservatives and criticizing Gorbachev's reforms as inadequate. In 1987 he won election to the USSR's Supreme Soviet as an opposition member. In 1990 he was elected to the Russian Republic's Supreme Soviet, was elected Russian president by the Supreme Soviet, and resigned from the Communist party. He retained (1991) the presidency in a popular election. A populist and Russian nationalist, he became Gorbachev's chief liberal opponent. His opposition to the attempted coup against Gorbachev (Aug. 1991) shifted power to the reformers and republics, and he helped to found (Dec. 8, 1991) the COMMONWEALTH OF INDEPENDENT STATES, ending attempts to preserve the USSR. As president of an independent Russia, he moved to end state control of the economy and privatize most enterprises. Economic difficulties and political opposition, particularly from the Supreme Soviet (parliament), slowed his program and forced compromises. In Sept. 1993 Yeltsin suspended parliament and called for new elections. When parliament's supporters resorted to arms, they were crushed by the army and jailed. Although he won approval of his proposed constitution in the Dec. 1993 voting, many of his opponents won seats in the new legislature. In foreign affairs, Yeltsin greatly improved relations with the West and signed (1993) the START II nuclear DISARMAMENT treaty with the U.S. He failed, however, to secure more than a limited amount of economic aid.

Yemen, officially Republic of Yemen, republic (1992 est. pop. 10,395,000), 207,000 sq mi (536,000 sq km), SW Asia, on the S Arabian peninsula, bordered by Saudia Arabia (N), Oman (E), the Gulf of Aden (S), and the Red Sea (W); formed in 1990 by the union of Yemen Arab Republic (Yemen or Northern Yemen) and the People's Democratic Republic of Yemen (Southern Yemen). The capital is SANA; the port of ADEN is the commercial capital. A narrow coastal plain rises to interior highlands and the Rub al Khali desert. The country includes several islands, e.g., Perim and SOCOTRA. Yemen is very poor, with a per capita income that is among the lowest in the world. Most of the population is engaged in growing grains, vegetables, fruits, cotton, coffee, and khat (a narcotic shrub), and raising sheep, goats, and camels. There are oil reserves, and imported oil is processed into petroleum products for export. Other manufacturing, largely based on agricultural products, provides little revenue. Salt is the only commercially exploitable mineral. Handicrafts are important in the economy, as are remittances sent home by Yemenis working abroad. The great majority of the inhabitants are Arabs, about two thirds of which are Sunni Muslims and the rest Shiite Muslims. Arabic is the official language.

History. Once part of the ancient Sabaean kingdom (fl. c.750 B.C.–115 B.C.), Yemen was later ruled by the Himyarites, Romans, Ethiopians, and Persians. It was conquered by Muslim Arabs in the



7th cent. A.D., and in the 16th cent. it became part of the OTTOMAN EMPIRE. The northwestern portion bordering on the Red Sea was established in 1918 as an independent kingdom (known as Yemen or Northern Yemen) ruled by the Rassite dynasty, imams of the Zaidi Shiite sect of Islam. In 1962 an army coup led to the proclamation of a republic. Civil war followed, with Egypt supporting the republicans and Saudi Arabia and Jordan backing the royalists; it ended in 1970 with a republic in place. The southern portion bordering on the Gulf of Aden was penetrated in the 19th cent. by the British, who conquered ADEN in 1839 and between 1886 and 1914 signed a number of protectorate treaties with local rulers. Aden was made a crown colony in 1935 and the area to its east became the Aden Protectorate in 1937. In the 1960s, nationalist groups demanding independence began a terrorist campaign against the British, and independence was granted to Southern Yemen in 1967. The National Liberation Front gained control of the government and established a Marxist regime in 1971. Unity agreements between the two Yemens in 1971 and 1981 were not implemented because of recurrent warfare, but a merger negotiated in 1989 resulted in formal unification in 1990. Pres. Ali Abdullah Saleh of Northern Yemen became president.

Yenan: see YAN'AN.

Yenisei, great river of SIBERIA, c.2,500 mi (4,020 km) long. It is formed by the confluence of the Bolshoi Yenisei and Maly Yenisei rivers near the Mongolian border and flows west, then generally north, to enter the Arctic Ocean through the Kara Sea. The river is frozen during the winter; the ice of its upper course melts earlier in the spring than that of its lower course, causing extensive flooding. Part of the Yenisei's great hydroelectric potential is harnessed at Krasnoyarsk and Sayan.

yeoman, class in English society. It generally means a free landowner of a rank lower than the gentry. Certain retainers in noble and royal households were also called yeomen. The Yeomen of the Guard, often called Beefeaters, became the bodyguard of the English monarch. The more modern military use of the term dates from the 18th cent., when volunteer cavalry units called yeomanry were used to suppress riots.

yerba maté: see MATÉ.

Yerevan, city (1990 est. pop. 1,200,000), capital of ARMENIA, SW Asia, on the Razdan R. The city's industries produce metals, machine tools, electrical equipment, and chemicals. Archaeological evidence indicates that the fortress of Yerbuni stood on the city's site in the 8th cent. B.C. Known in the 7th cent. A.D., Yerevan was the capital of the kingdom of Armenia under Persian rule and later (14th–19th cent.) part of the empires of TIMUR, Persia, Turkey, and Russia. In 1920 it became the capital of the Armenian Soviet Socialist Republic, which became independent in 1991 when the USSR disintegrated.

yeti: see ABOMINABLE SNOWMAN.

Yevtushenko, Yevgeny Aleksandrovich [yĕv'tōōshĕng'-kō], 1933–, Russian poet. With VOZNESENSKY and others he helped revive Russian lyric poetry. In works such as "Babi Yar" (1961) and "The Heirs of Stalin" (1962) he exposed serious defects in Soviet society. His long poems include *The Bratsk Station* (1964–65) and *Kazan University* (1970). He wrote the novel *Wild Berries* (tr. 1984).

yew, evergreen tree or shrub (genus *Taxus*) of the family Taxaceae, somewhat similar to HEMLOCK but bearing red berrylike fruits instead of true cones. Of somber appearance, with dark green leaves, yews have been associated with death and funeral rites since antiquity. The wood of the English yew (*T. baccata*) was used for the longbows of English archers, and the wood of several species is still so used. The Pacific, or Western, yew (*T. brevifolia*), native to the NW U.S. and British Columbia, is valued for its bark, which is processed to yield paclitaxel (Taxol), a drug used to treat ovarian cancer.

Yiddish language, member of the West Germanic group of the Germanic subfamily of the Indo-European family of languages. Although it is not a national language, Yiddish is spoken by about 4 million Jews all over the world, especially in Argentina, Canada, France, Israel, Mexico, Romania, and the U.S. Before the annihilation of 6 million Jews by the Nazis, Yiddish was the tongue of more than 11 million people. See LANGUAGE (table).

YMCA: see YOUNG MEN'S CHRISTIAN ASSOCIATION.

YMHA and YM-YWHA: see YOUNG MEN'S AND YOUNG WOMEN'S HEBREW ASSOCIATION.

yoga [Skt., = union], general term for spiritual disciplines, followed for centuries by devotees of both HINDUISM and BUDDHISM, to attain higher consciousness and liberation from ignorance, suffering, and rebirth. It is also the name of one of the six orthodox systems of INDIAN PHILOSOPHY. *Raja yoga* royal yoga was expounded by Patanjali (2d cent. B.C.), who divided the practice into eight stages, the highest of which is samadhi, or identification of the individual consciousness with the Godhead. Hindu tradition in general recognizes three main types of yoga: *jnana yoga,* the path of wisdom and discrimination; *bhakti yoga,* the path of love and devotion to a personal God; and *karma yoga,* the path of selfless action. *Hatha yoga,* widely practiced in the West, emphasizes physical control and postures. *Kundalini yoga,* associated with TANTRA, is based on the physiology of the "subtle body." It attempts to open centers of psychic energy called *chakras,* said to be located along the spinal column, and to activate the *kundalini,* a force located at the base of the spine. Yoga is usually practiced under the guidance of a guru, or spiritual teacher. Contemporary systems of yoga stress attaining spiritual realization without withdrawing from the world, as the older traditions taught.

yogurt: see FERMENTED MILK.

Yokohama, city (1990 pop. 3,220,350), capital of Kanagawa prefecture, SE Honshu, Japan. The second largest city in Japan and a leading seaport, it is part of the extensive urban-industrial belt around Tokyo. When U.S. Commodore Matthew C. PERRY first visited Yokohama in 1853, it was a small fishing village. Among its present industries are shipyards, steel mills, oil refineries, chemical plants, and many types of factories. Yokohama has a variety of Christian churches, Shinto shrines and temples, and many parks and gardens.

Yom Kippur: see under JEWISH HOLIDAYS.

Yom Kippur War: see ARAB-ISRAELI WARS.

Yonkers, city (1990 pop. 188,082), SE N.Y., on the Hudson R. just N of the Bronx (N.Y.C.); inc. 1855. Its famous elevator works date from 1852. Other manufactures include chemicals, electronic equipment, and clothing. Yonkers was a trade center in colonial days.

York, Alvin Cullum, 1887–1964, American soldier known as Sergeant York; b. Fentress co., Tenn. For his heroic actions in the Argonne forest (Oct. 8, 1918), York received the highest decorations of the French and American governments. He was the greatest popular hero of WORLD WAR I.

York, city (1991 pop. 98,745), N Yorkshire, N England. Its manufactures include chocolate and precision instruments, and it is a great rail center. A major Roman military post, it was later important in the Kingdom of NORTHUMBRIA. An archbishopric since the 7th cent., it is the ecclesiastical center of N England and the site of the Norman Cathedral of St. Peter (York Minster). York was the Viking city of Jorvik from 867–1067.

York, house of, royal house of England, dating from the creation (1385) of Edmund of Langley, fifth son of EDWARD III, as duke of York. The claims to the throne of his grandson, Richard, duke of York, in opposition to HENRY VI, head of the house of LANCASTER, resulted in the Wars of the ROSES. The royal members of the house of York were EDWARD IV, EDWARD V, and RICHARD III. The houses of York and Lancaster were united by the marriage (1486) of the Lancastrian HENRY VII to Elizabeth, daughter of Edward IV.

Yorkshire terrier, spirited TOY DOG; shoulder height c.9 in. (22.8 cm); weight, 4–7 lb (1.8–3.2 kg). Its long, fine coat is steel-blue and tan. It was developed by cross-breeding in England, in the mid-19th cent.

Yorktown campaign, 1781, the closing military operations of the AMERICAN REVOLUTION. After his unsuccessful Carolina campaign (1780–81), Gen. CORNWALLIS retreated into Virginia, fortified Yorktown, and awaited reinforcements from Sir Henry CLINTON in New York. Clinton delayed, however, and the French fleet under Adm. de GRASSE blockaded Chesapeake Bay. Generals Washington and ROCHAMBEAU rushed south with French troops, while STEUBEN and LAFAYETTE maintained a brilliant holding action. Unable to escape, Cornwallis surrendered on Oct. 17, 1781, thereby bringing victory to the rebellious Colonies.

The key to pronunciation appears on page xiii.

Yoruba, people of SW Nigeria, numbering about 13 million. They are unusual among Africans in their tendency to form urban communities. Today many of the largest cities of Nigeria, e.g., LAGOS and IBADAN, are in Yorubaland. The old Yoruba kingdom of Oyo dominated both Benin (see BENIN, former kingdom) and Dahomey (see BENIN, republic), but after 1700 its power waned. In the early 19th cent. the Yoruba were divided among several smaller states.

Yosemite National Park: see NATIONAL PARKS (table).

Yoshida Shigeru [yō'shēdä], 1878–1967, Japanese statesman. He led the Liberal party after 1945 and was prime minister five times between 1946 and 1954. During his administration a new constitution was promulgated, land reforms instituted, and the postwar U.S. occupation ended.

Young, Andrew Jackson, Jr., 1932–, African-American civil-rights leader, clergyman, and public official; b. New Orleans. He was a leading civil-rights activist in the 1960s and, as a Democrat from Georgia, served (1973–77) in the U.S. House of Representatives. Under Pres. CARTER, Young was permanent representative to the UN (1977–79) and was noted for his outspokenness. He served as mayor of Atlanta (1982–89) and ran for, but failed to win, the Democratic nomination for governor of Georgia in 1990.

Young, Brigham, 1801–77, American MORMON, leader of the Church of Jesus Christ of Latter-Day Saints; b. Whitingham, Vt. He was perhaps a greater molder of Mormonism than its founder, Joseph SMITH. Young led a group to the Mormon community at Kirtland, Ohio, and became (1835) one of the Council of Twelve. He became prominent after the persecutions of Mormons in Missouri and was a leader in the move to Nauvoo, Ill. After Smith's assassination (1844), he was the chief figure in maintaining church unity and was henceforth the dominant person in Mormonism. Young led (1846–47) the great migration west and directed the settlement at Salt Lake City. In Utah he exercised supreme control, and the Mormon cooperative theocracy prospered. He headed the church, and after the creation of the U.S. provisional government, he became territorial governor. Trouble between the U.S. and the Mormons over polygamy and church power led to the U.S. military expedition of 1857–58, but Young avoided an open break with the government, although he lost his post as governor. He probably had 27 wives, and unjustified charges of sensuality were often leveled against him. He was, in reality, a stern moralist, as well as a brilliant leader.

Young, Cy (Denton T. Young), 1867–1955, American baseball player; b. Gilmore, Ohio. In 22 seasons (1890–1911) as a pitcher for the Cleveland Indians, St. Louis Cardinals, Boston Red Sox, and Boston Braves, he won 511 games, more than any other pitcher in history. He pitched 76 shutouts and 3 no-hit games, one of which was a perfect game.

Young, Edward, 1683–1765, English poet and dramatist, famous for his long didactic poem *The Complaint, or Night Thoughts on Life, Death, and Immortality* (1742–45), an influence on ROMANTICISM. He also wrote a series of satires, *The Universal Passion* (1725–28).

Young, Lester, 1909–59, African-American musician; b. Woodville, Miss. Young was, with Coleman HAWKINS, a major influence on tenor saxophone style; his work greatly influenced the modern JAZZ of the 1950s. Billie HOLIDAY gave him the nickname "President," which later became "Prez."

Young, Thomas, 1773–1829, English physicist, physician, and Egyptologist. He was professor of natural philosophy (1801–3) at the Royal Institution, where he presented the modern physical concept of energy, and was elected (1811) a staff member of St. George's Hospital, London. He stated (1807) a theory of color vision known as the Young-Helmholtz theory and described the vision defect called ASTIGMATISM. Reviving the wave theory of LIGHT, Young applied it to refraction and dispersion phenomena. He also established a coefficient of elasticity (Young's modulus; see STRENGTH OF MATERIALS) and helped to decipher the ROSETTA STONE.

Young, Whitney Moore, Jr., 1921–71, African-American civil-rights leader; b. Lincoln Ridge, Ky. A social worker by profession, he joined the National Urban League in 1947 as director of industrial relations for St. Paul, Minn. He headed the League from 1961 until his death and was one of the leading CIVIL-RIGHTS activists of the 1960s.

Younger, Cole (Thomas Coleman Younger), 1844–1916, American outlaw; b. Jackson co., Mo. He and his two brothers joined the outlaw band of Jesse JAMES and were captured (1876) during an attempted bank robbery at Northfield, Minn. Cole Younger was paroled in 1901 and lived peacefully thereafter.

Young Men's and Young Women's Hebrew Associations (YMHA, YWHA), organizations that promote health, social activities, recreation, and Jewish culture among Jews of all ages. The first YMHA was founded in Baltimore in 1854. A YWHA was organized as an auxiliary of the New York City YMHA in 1888, and the first independent YWHA was formed in 1902. The organizations have since merged under the name **Jewish Community Centers,** although many retain the designation YM-YWHA.

Young Men's Christian Association (YMCA), organization originally concerned with the spiritual and social well-being and the physical and intellectual development of young men. Begun (1844) in London, it took root in the U.S. in 1851 and now has branches on all continents. Membership, which is not limited to men or Christians, is 12.7 million.

Young Pretender: see under STUART, JAMES FRANCIS EDWARD.

Young's modulus: see STRENGTH OF MATERIALS.

Youngstown, city (1990 pop. 95,732), seat of Mahoning co., NE Ohio, in a coal and iron region near the Pa. line; founded 1797, inc. 1849. The first iron furnace was built in 1803, and Youngstown became one of the country's largest iron and steel centers until the 1970s; some steel is still produced. Rubber goods, electric lamps, and a variety of other products are also manufactured there.

Young Turks: see OTTOMAN EMPIRE.

Young Women's Christian Association (YWCA), organization devoted to promoting the welfare of women and girls through opportunities for spiritual, social, intellectual, and physical development. The nondenominational movement grew out of mid-19th cent. British homes and prayer unions for young women. The first official American YWCA was in New York (1858). The world organization, based in Geneva, was established in 1894. There are some 2 million members; men may join as associate members.

Yourcenar, Marguerite, 1903–87, French novelist; b. Belgium, as Marguerite de Crayencour. She has lived in the U.S. since 1939. She is noted for her reconstructions of historical eras and people, as in *Memoirs of Hadrian* (1951), about the Roman emperor, and *The Abyss* (1968), set in N Europe in the 16th cent. In 1980 she became the first woman to be admitted to the French Academy.

Youskevitch, Igor [yo͞oskē'vĭch], 1912–, Russian ballet dancer. He joined (1938) the Ballet Russe de Monte Carlo, danced (1946–55) with the Ballet Theater (N.Y.C.), and returned to the Ballet Russe. He is famed for his classic style, e.g., *Afternoon of a Faun.*

Youth, Isle of, formerly **Isle of Pines,** island, 1,180 sq mi (3,056 sq km), off the coast of SW Cuba. It was discovered by COLUMBUS in 1494 and passed to U.S. control in 1898, after the SPANISH-AMERICAN WAR. Because its name was omitted from the PLATT AMENDMENT, defining Cuba's boundaries, it was claimed by both the U.S. and Cuba until a treaty signed in 1925 confirmed Cuba's possession. Near Nueva Gerona, the capital, is a prison in which political dissidents have been detained by several regimes.

Ypres, battles of, three major battles of WORLD WAR I fought at Ypres, in SW Belgium. In the first (Oct.–Nov. 1914) the British, at great cost, stopped the German "race to the sea." In the second (Apr.–May 1915) the Germans unsuccessfully assaulted the British salient. Poison gas was used for the first time. In the third (Oct.–Nov. 1917), also known as Passchendaele, the British attacked the German line but advanced only 5 mi (8 km) at a cost of 300,000 lives.

Ypsilanti or **Hypsilanti,** prominent Greek family of Phanariots. **Alexander Ypsilanti,** c.1725–c.1807, was dragoman (minister) of the Ottoman emperor and hospodar (governor) of Walachia (1774–82, 1796–97) and of Moldavia (1768–88). He was executed by the sultan for conspiracy. His son, **Constantine Ypsilanti,** 1760–1816, was hospodar of Moldavia (1799–1801) and of Walachia (1802–6). He was deposed for being pro-Russian and was reinstated in 1807 by the Russians. He encouraged the Serbian revolt against Turkey. His elder son, **Alexander Ypsilanti,** 1792–1828, was a leader in the Greek War of Independence and led unsuccessful uprisings in Moldavia and Walachia. After being defeated by the Turks, he was imprisoned in Austria, where he died. His

younger brother, **Demetrios Ypsilanti,** 1793–1832, also played a prominent part in the Greek revolt. In 1821 he captured Trípolis, Turkey's chief fort on the Peloponnesus. In 1828 he became commander of the Greek forces in E Greece. He resigned in 1830 after differences with other Greek leaders.

ytterbium (Tb), metallic element, discovered by J.C.G. de Marignac in 1878. A soft, malleable, ductile, lustrous, silver-white RARE-EARTH METAL in the LANTHANIDE SERIES, it forms many compounds. It is widely distributed in a number of minerals, but has no commercial uses. See ELEMENT (table); PERIODIC TABLE.

yttrium (Y), metallic element, first isolated by Friedrich WÖHLER in 1828. Yttrium is an iron-gray RARE-EARTH METAL. Its oxide is used in making red phosphors for color-television picture tubes. See ELEMENT (table); PERIODIC TABLE.

Yüan, dynasty: see CHINA.

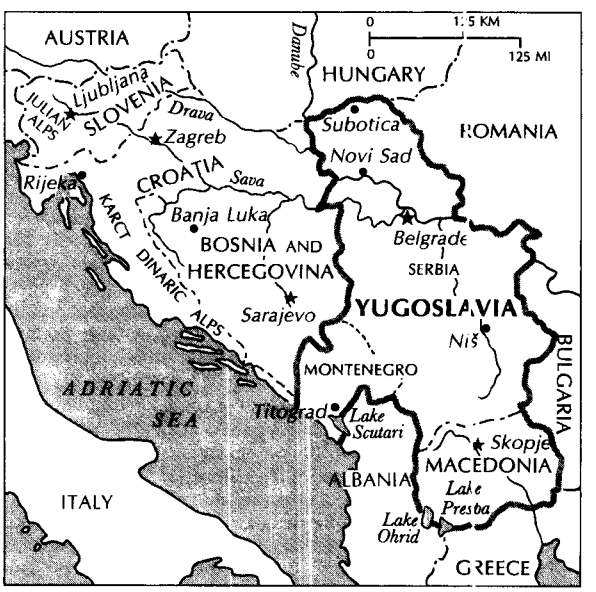
Yüan Shih-kai [yüan shŭr-kī], 1859–1916, president of China (1912–16). He was entrusted with defending the Ch'ing empire against the revolution of 1911, but on his advice the Emperor Hsuan T'ung (Henry PU YI) resigned. Soon after, SUN YAT-SEN, who had been elected the first president of China, resigned in Yüan's favor. Yüan's rule proved dictatorial, and in 1916 he briefly assumed the title of emperor.

Yucatán, peninsula, c.70,000 sq mi (181,000 sq km), extending from SE Mexico into Belize and Guatemala. It is a low, flat limestone tableland rising to c.500 ft (150 m) in the south. Its northern continuation is the oil-rich Campeche bank, under Campeche Bay and the Gulf of Mexico. The climate is hot and dry in the north, hot and humid in the south. Centuries before the Spanish arrived (early 16th cent.), Yucatán was the seat of the great civilization of the MAYA, whose descendants predominate in today's population. The developing economy is based on tourism, the production of oil and lumber, and light industry and assembly plants.

yucca, stiff-leaved, stemless or treelike SUCCULENT (genus *Yucca*) of the LILY family, native mainly to Mexico and the SW U.S. Yuccas produce a large stalk of white or purplish blossoms. They are pollinated by the yucca moth, and in its absence they rarely produce FRUIT. Species include the Adam's-needle (*Y. filamentosa* and others), the Joshua tree (*Y. brevifolia*), and the Spanish dagger (*Y. gloriosa*). Roots of some species are used for soap.

Yugoslavia, Serbo-Croatian *Jugoslavija,* officially Federal Republic of Yugoslavia, federal republic (1992 est. pop. 10,642,000), 39,439 sq mi (102,147 sq km), SE Europe, on the Balkan Peninsula; bordered by the Adriatic Sea, Bosnia and Hercegovina, and Croatia (W), Hungary (N), Romania and Bulgaria (E), and Macedonia and Albania (S). It is (since 1992) a federation of two republics: SERBIA and MONTENEGRO. Four other Yugoslav republics, SLOVENIA, CROATIA, BOSNIA AND HERCEGOVINA, and MACEDONIA, declared independence in 1991 and 1992. Principal cities include BELGRADE (the capital), Niš, Novi Sad, Priština, and Podgorica. About half of Yugoslavia is mountainous. Agriculture is largely concentrated in NE Serbia, along the Danubian plain. Crops include corn, wheat, sugar beets, and potatoes, and there are extensive vineyards. Yugoslavia's major industries are metal processing and the production of textiles, machinery, chemicals, and glass. Mining is also important; there are significant deposits of coal, copper, petroleum, and iron. The nation's breakup and the resulting civil war and international economic embargo have led to economic collapse and hyperinflation. The Yugoslav people consist of Serbs and Montenegrins (closely related to Serbs), who use the Cyrillic alphabet and belong to the ORTHODOX EASTERN CHURCH, and other ethnic groups, mainly Albanians (see KOSOVO) and Hungarians. Serbs and Montenegrins share the same language, Serbo-Croatian.

History. Yugoslavia's existence as a nation began after World War I. Of its component republics, only Serbia (which included the present independent republic of Macedonia) and Montenegro were independent states in 1914; Croatia, Slovenia, and Bosnia and Hercegovina belonged to the AUSTRO-HUNGARIAN MONARCHY. The movement for unification, led by Serbia, was a major cause of WORLD WAR I. In 1918 the "Kingdom of the Serbs, Croats, and Slovenes" was proclaimed. The name was changed to Yugoslavia in 1929 and a parliamentary constitution adopted in 1931. From its inception, the new country was plagued by demands for autonomy by Croatian and Macedonian nationalists, culminating in 1934 with the assassination of King ALEXANDER. Tension also arose from territorial disputes with Italy, Hungary, and Bulgaria. Yugoslavia had joined Czechoslovakia and Romania in the LITTLE ENTENTE in the 1920s, but in 1939 it drew closer to the AXIS powers. A coup in 1941 brought a neutral government to power, but soon afterwards Yugoslavia was invaded and occupied by Germany and its allies. Partisan troops, led by royalist Gen. Draza MIHAJLOVIĆ and Communist Marshal Josip TITO, battled the occupation forces until 1943, when civil war erupted between the rival leaders. Tito, supported by the USSR and Britain, was victorious. By 1944 the Germans had been driven from Yugoslavia, and in 1945 Tito became premier, deposed the king, and established a Communist state closely allied with the USSR. In 1948 Tito broke with the Soviet leadership. He developed a "national communism" abandoning farm collectivization and, to some extent, centralized government controls; intellectual freedom was restricted, however, and renewed Croatian nationalist agitation was suppressed. After Tito's death (1980), a collective presidency was established. In 1990 the Communist party relinquished its monopoly on political power. Previously contained ethnic tensions became more prominent, and Slovenia and Croatia declared (1991) independence, a move resisted by Serbia and its president, Slobodan MILOŠEVIĆ. In Croatia battling between Croatian forces and Serb militias escalated into civil war (1991–92). Bosnia and Hercegovina (1991) and Macedonia (1992) also became independent, and intense fighting erupted (1992) in Bosnia. The UN imposed economic sanctions, including a naval blockade, on Yugoslavia for supporting Serbian forces in Bosnia and withheld recognition of the new Yugoslav state established by Serbia and Montenegro.



Yukawa Hideki, 1907–81, Japanese physicist. In 1935 he predicted the existence of the pi meson (or pion; see ELEMENTARY PARTICLES), a particle that is heavier than an electron but lighter than a proton and that carries the STRONG INTERACTION between particles in the atomic nucleus. After particles corresponding to his prediction were discovered in 1947, Yukawa was awarded the 1949 Nobel Prize for physics.

Yukon, major river of NW North America, flowing c.2,000 mi (3,200 km) from Atlin Lake in BRITISH COLUMBIA, Canada, through the SW YUKON TERRITORY and across central Alaska before entering the BERING SEA through a large delta near Norton Sound. Rich in hydroelectric potential and an important salmon-fishing area, it is, for three months of the year, navigable by river boats to WHITEHORSE, in the Yukon, c.1,755 mi (2,860 km) upstream.

Yukon Territory, region (1991 pop. 27,797), 186,299 sq mi (482,515 sq km), NW Canada, bordered by the Arctic Ocean (N) the North-

The key to pronunciation appears on page xiii.

west Territories (E), British Columbia and Alaska (S), and Alaska (W). WHITEHORSE is the capital (since 1952) and largest town; DAWSON is next in importance. Although most of the territory is in the YUKON R. watershed, the northern and southeastern regions drain into the MACKENZIE R. system. The extreme north is uninhabited, and throughout the Yukon winters are long and cold. Most settlements are located along riverbanks. The leading industry in the territory is mining; lead, zinc, silver, gold, and copper are the principal minerals. Manufacturing is relatively unimportant, but tourism is gaining in importance because of the Yukon's great natural beauty. The Alaska Highway and other all-weather roads have been built since World War II. Fur traders from the HUDSON'S BAY COMPANY explored the region in the 1840s and several posts were set up. After the famous gold strikes in the Klondike R. region in the 1890s, more than 30,000 people came in search of gold. The Canadian government, which acquired the Yukon from the Hudson's Bay Company in 1870, first administered it as part of the NORTHWEST TERRITORIES and made it a separate district in 1895. The Yukon became a separate territory in 1898. Native land claims and the desire for provincial status have dominated recent politics. The government consists of a federally appointed commissioner and an elected legislative council. The Yukon sends one senator (appointed) and one representative (elected) to the national parliament.

Yuman [yo͞o'mən], branch of Native American languages belonging to the Hokan-Siouan linguistic stock of North America and Central America. See NATIVE AMERICAN LANGUAGES (table).

YWCA: see YOUNG WOMEN'S CHRISTIAN ASSOCIATION.

YWHA: see YOUNG MEN'S AND YOUNG WOMEN'S HEBREW ASSOCIATION.

Z

Zacharias or **Zachary, Saint,** pope (741–52), a Calabrian Greek. A guardian of church authority, he persuaded the Lombards to restore some towns to the papacy and favored the Frankish king PEPIN THE SHORT. His letters, notably to St. BONIFACE, are still extant. Feast: Mar. 22.

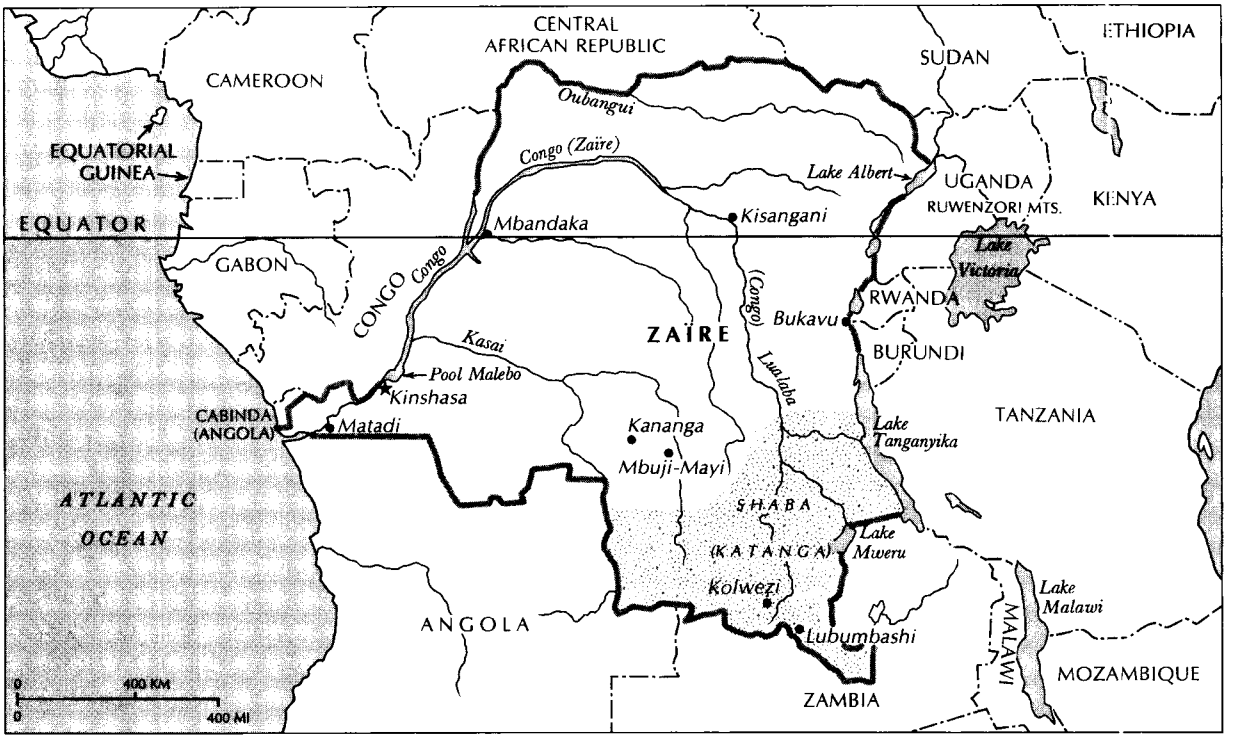
Zagreb, city (1991 est. pop. 706,800), capital of CROATIA, in the N central part of the country on the Sava R. It is Croatia's largest city and a major financial and industrial center. Manufactures include machinery and chemicals. Site of a Roman town, Zagreb was ruled by Hungary from the 13th cent. and, under the AUSTRO-HUNGARIAN MONARCHY, became (1867) the capital of an autonomous Croatia. After 1918 it was part of YUGOSLAVIA until Croatia declared its independence in 1991. A modern city, it contains the historic Kaptol district, with the Catholic cathedral (begun 1093).

Zagros, mountain system of W Iran, extending c.1,100 mi (1,770 km) southeast from the Turkish-Armenian-Azerbaijan frontier (N) to the Strait of Hormuz (S) along the western edge of the central Iranian plateau. Mt. Sabalan (15,592 ft/4,752 m) is the highest peak. The Zagros decrease in elevation and become increasingly arid toward the south. Kurds, Lurs, Bakhtiaris, Kashkais, and other minorities are the chief inhabitants. Iran's great oil fields lie along the western foothills.

Zaharias, Mildred "Babe" Didrikson: see DIDRIKSON, BABE.

Zaïre [zī'ēr, zäēr'], officially Republic of Zaïre, formerly Republic of the Congo (1960–65) and Democratic Republic of the Congo (1965–71), republic (1992 est. pop. 39,084,000), c.905,000 sq mi (2,344,000 sq km), central Africa, bordered by Angola (SW), Congo (W), the Central African Republic and Sudan (N), Uganda, Rwanda, Burundi, and Tanzania (E), and Zambia (SE). Principal cities include KINSHASA (the capital), Kananga, and LUBUMBASHI. Virtually all of Zaïre, which lies astride the equator, is part of the vast CONGO (Zaïre) R. drainage basin. North central Zaïre is a large plateau covered with rain forest. To the east, on the Uganda border, are the Ruwenzori Mts., which rise to over 16,000 ft (4,880 m), and lakes Albert, Edward, and Tanganyika. Savanna-covered plateaus in the southeast rise to c.6,800 ft (2,070 m). Zaïre's mineral wealth is the mainstay of the economy, accounting for about 75% of export earnings. Most important are copper, diamonds (the world's leading producer), cobalt (65% of world reserves), zinc, manganese, and uranium; offshore petroleum production began in 1975. The principal food crops are cassava, yams, maize, rice, groundnuts, plantains, and pulses. The leading farm exports are palm products, coffee, and rubber; large amounts of timber (notably ebony and teak) are also produced. Manufactures include processed metals, foodstuffs, textiles, clothing, iron and steel, cement, and chemicals. Nonetheless, Zaïre has failed to harness the full potential of its vast natural resources. It experienced a severe decline in per capita income after 1973 and near total economic collapse, brought on by corruption and a governmental crisis, in the early 1990s. The population is made up of some 200 ethnic groups, the majority of which speak a Bantu language; there are also Nilotic speakers in the north, and scattered groups of PYGMIES. French is the official language, but Swahili and Lingala are widely spoken. About 50% of the people are Catholic, 20% Protestant, and 10% Muslim, but many also adhere to traditional beliefs.

History. Pygmies were probably the earliest inhabitants of the region, but by the end of the 1st millennium B.C. Bantu speakers migrated into Zaïre from the northwest. The Bantu worked the copper deposits from about 700 A.D., eventually coalescing into independent, often complex, states, including the Lunda kingdom of Mwata Yamo (est. 15th cent.), in SW Zaïre; a Luba empire (est. early 16th cent.), in central Shaba; the Kuba kingdom of the Shongo (est. early 17th cent.), in S Zaïre; and the Lunda kingdom of Mwata Kazembe (est. 18th cent.), near the present Zaïre-Zambia border. Following the visit of Diogo Cão in 1482, the Portuguese, who were active in trading, established a presence in the region. Beginning in the 1870s the territory was colonized and unified by LEOPOLD II of Belgium, who in 1885 privately founded and headed an independent state (the Congo Free State) in the Congo Basin; it was annexed by Belgium in 1908, becoming the colony of the Belgian Congo. Under Belgian rule the Congo became a rich field for European investment, especially in mining operations and plantations. Nationalist sentiment, led by Joseph KASAVUBU and Patrice LUMUMBA, reached a peak in the 1950s, and Belgium was forced to grant independence in 1960. However, the new Republic of the Congo was soon torn by ethnic and personal rivalries. Within weeks the army mutinied, and Moïse TSHOMBE declared the copper-rich province of Katanga (now SHABA), of which he was provisional president, to be independent. The ensuing civil war, which involved UN forces, Belgian troops, and U.S. and Soviet support of opposing factions, did not end until 1963, when Katanga agreed to rejoin the republic. By the end of the 1960s the country had begun to experience a degree of political stability. Col. Joseph Mobotu (later MOBUTO SESE SEKO), who took power in 1965, served as president from 1970, suppressing tribal conflicts and instilling a sense of nationhood. The U.S. supported him as a regional bulwark against communism despite his regime's corruption. A ban on opposition political parties was ended only in 1990, in response to growing political unrest. Economic deterioration, loss of Western



support with the end of the cold war, failure of a national political conference, and rioting begun by unpaid soldiers led Mobutu to agree to a coalition government with opposition leaders in 1991. He retained control of the army and important government ministries, however, and later replaced the prime minister. Economic collapse has continued unabated.

Zaïre, river: see CONGO.

Zama [zā'mə], ancient town near the northern coast of Africa, in present Tunisia. Scipio Africanus Major defeated HANNIBAL at or near Zama in the final battle of the Second PUNIC WAR (202 B.C.), but there were several towns named Zama.

Zambezi, river, flowing c.1,700 mi (2,740 km) through S central Africa to the Mozambique Channel. Part of its large hydroelectric potential is harnessed by KARIBA DAM (completed 1959), on the Zimbabwe-Zambia border, and Cabora Bassa Dam (completed 1975), in Mozambique. VICTORIA FALLS and many rapids restrict navigation to local traffic.

Zambia [zăm'bēə], officially Republic of Zambia, republic (1992 est. pop. 8,745,000), 290,584 sq mi (752,614 sq km), S central Africa, bordered by Zaïre (N), Tanzania (NE), Malawi and Mozambique (E), Zimbabwe, Botswana, and Namibia (S), and Angola (W). Major cities include LUSAKA (the capital), KITWE, and NDOLA. Zambia is on a highland plateau, which rises in the east; the country's highest point (c.7,120 ft/2,170 m) is on the Nyika plateau, adjacent to Malawi. VICTORIA FALLS and the huge Lake Kariba (formed by KARIBA DAM), both on the border with Zimbabwe, are part of the ZAMBEZI R., which drains the western part of the country. Zambia's economy is dependent almost entirely on its mineral wealth, notably copper, of which it is one of the world's leading producers, and cobalt; coal, zinc, lead, and manganese are also important. Manufactures include food products, textiles and clothing, and building materials. Much of the population is engaged in subsistence farming, however, growing corn and other grains, beans, peanuts, and tobacco and raising cattle. About 98% of the inhabitants are members of Bantu-speaking ethnic groups, but English is the official language. Some 70% of the population is Christian, equally divided between Roman Catholics and Protestants; the rest follow traditional beliefs.

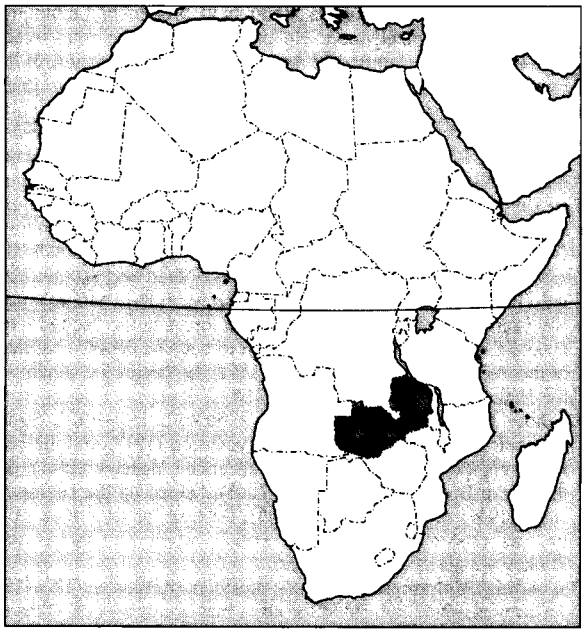
History. Some Bantu-speaking peoples migrated into the region that is now Zambia around A.D. 1200, but the ancestors of most modern Zambians arrived from present-day Angola and Zaïre between the 16th and 18th cent. The British explorer David LIVINGSTONE first visited Zambia in 1851 and later discovered Victoria Falls. In 1890 Cecil Rhodes's British South Africa Company began to administer the area under treaties signed with African leaders; it became the protectorate of Northern Rhodesia in 1911 and passed under British administration in 1924. Massive copper deposits were discovered in N central Zambia in the late 1920s, and European colonists began to pour into the area. However, economic prosperity was not shared with the African laborers who worked in the mines, and who staged periodic strikes to protest their treatment, finally organizing a nationalist movement in 1946. In 1953, despite the protests of the black nationalists, Southern Rhodesia (now Zimbabwe), Northern Rhodesia, and Nyasaland (now Malawi) were brought together by Britain in the Federation of Rhodesia and Nyasaland. The federation was dissolved in 1963, when Nyasaland and Northern Rhodesia withdrew, and the Republic of Zambia was proclaimed independent in 1964, with Kenneth KAUNDA as president. Kaunda ended European economic domination and in 1972 created a one-party state. In the 1970s Zambia suffered severe economic hardship as a result of its opposition to the white regime in Southern Rhodesia and a drop in copper prices. Demonstrations in 1990 led Kaunda to legalize opposition parties. Multiparty presidential and parliamentary elections were held in 1991, and Kaunda was overwhelmingly defeated by Frederick Chiluba, whose party also won control of parliament.

Zampieri, Domenico: see DOMENICHINO.

Zangwill, Israel, 1864–1926, English author. A journalist, he also wrote *Children of the Ghetto* (1892), *Dreamers of the Ghetto* (1898), and *The Melting Pot* (1914).

Zanzibar, region (1988 pop. 375,539), 950 sq mi (2,46 sq km), Tanzania, E Africa, consisting chiefly of the islands of Zanzibar and Tumbatu, in the Indian Ocean. The major city is also named Zanzibar. The economy of the region is almost entirely agricultural, and Zanzibar and the nearby island of Pemba produce a large portion of the world's cloves. The Portuguese gained control in 1503, using the island as a base for territorial expansion on the African coast and for the slave trade. In 1698 Zanzibar and Pemba fell to the rulers of Oman. Under the Omani sultanate of Zanzibar (est. 1840), Muslim traders pushed deep into Africa in search of

The key to pronunciation appears on page xiii.



slaves and ivory. The islands became a British protectorate in 1890 and an independent nation in 1963. In 1964 leftists deposed the sultan, and the two islands merged with Tanganyika to form TANZANIA. Zanzibar retains control of its internal affairs.

Zapata, Emiliano, c.1879–1919, Mexican revolutionary. A tenant farmer of indigenous descent, he tried to recover (1908) expropriated village lands, and he led (1910–19) an army of indigenous people in the Mexican revolution with the goal of regaining the land. In defense of this program, he fought federal governments and largely controlled S Mexico. His army occupied Mexico City three times (1914–15), but he finally retired to Morelos, where he was treacherously killed by a government emissary. Zapata is still revered by Mexicans of indigenous descent.

Zápolya, John: see JOHN I, king of Hungary.

Zápolya, John Sigismund: see JOHN II, king of Hungary.

Zápolya, Stephen [zä'pôlyŏ], d. 1499, palatine (regent) of Hungary (1492–99). He fought (1479–81) against the Turks and conquered (1481–85) the archduchy of Austria for King MATTHIAS CORVINUS. His son became King JOHN I of Hungary.

Zapotec, indigenous people of S Mexico (see MIDDLE AMERICA, INDIGENOUS PEOPLES OF), whose language is often placed in the Macro-Otomanguean division (see NATIVE AMERICAN LANGUAGES). They had no traditions or migration legends, but believed themselves born directly from rocks, trees, and jaguars. The early Zapotec were agricultural city-dwellers whose religion involved ancestor worship and a cult of the dead. A high civilization flourished some 2,000 years ago at their religious center at Mitla and city of Monte Albán. Their arts, architecture, writing, mathematics, and calendar suggest links with the OLMEC, MAYA, and TOLTEC. About 1300 the MIXTEC took their cities, but the Zapotec remained autonomous until the arrival of the Spanish by allying with the AZTEC. The Zapotec number c.300,000; their culture blends native and Spanish elements.

Zaragoza [thärägō'thä] or **Saragossa,** city (1988 est. pop. 582,000), capital of Zaragoza prov. and chief city of Aragón, NE Spain, on the Ebro R. It is the center of a fertile agricultural region; its manufactures include vehicles and wood products. Held by the Romans, Goths, and MOORS (from the 8th cent.), it was taken (1118) by ALFONSO I of Aragón. In the PENINSULAR WAR the city yielded to a French siege (1808–9) only after some 50,000 defenders had died. Zaragoza is rich in art and contains two cathedrals.

Zea, Francisco Antonio [sä'ä], 1770–1822, Colombian revolutionary. After being imprisoned in Spain for revolutionary activities, he helped Simón BOLÍVAR liberate South America and was vice president (1819) of Venezuela and of Greater Colombia.

zebra, herbivorous, hoofed African MAMMAL (genus *Equus*), distinguished from other HORSES by its striking pattern of alternating white and dark brown (or black) stripes. Standing about 4 ft (120 cm) high, the zebra has a heavy head, a stout body, and a short, thick mane. It inhabits open plains or brush country in herds of up to 1,000, often mixing with other grazing animals, e.g., ANTELOPE, and can run at speeds of up to 40 mi (60 km) per hr.

zebu, domestic MAMMAL of the CATTLE family, *Bos indicus*, found in E Asia, India, and Africa. It has a large, fatty hump and is fawn, gray, black, or bay. The zebu has great endurance and is used in India for riding and draft purposes. In the U.S. zebus are called Brahman cattle.

Zebulun: see ISRAEL, TRIBES OF.

Zechariah [zĕk"ərī'ə] or **Zacharias** [zăk"ərī'əs], book of the OLD TESTAMENT, 38th in the Authorized Version, 11th of the Minor PROPHETS, dated 519 and 517 B.C. It contains a section with eight visions of restitution for JERUSALEM; another, perhaps later, section prophesies troubles and ultimate redemption.

Zedekiah [zĕd"əkī'ə], last king of Judah (c.597–586 B.C.). He was set on the throne as the puppet of NEBUCHADNEZZAR, but he allied himself with the Egyptians. The Babylonians then destroyed the kingdom of Judah and carried Zedekiah with his people into captivity in Babylonia.

Zelaya, José Santos [sälä'yä], 1853–1919, president of NICARAGUA (1894–1909). Zelaya ruled as dictator and developed transportation, coffee growing, and education while draining the country's resources for his own profit. His attempt to foment revolutions in neighboring states alarmed the U.S., which helped rebel forces to overthrow him.

zemstvo [zĕmst'vō] [Rus., from *zemlya* = land], local assembly in Russia, 1864–1917. Begun under ALEXANDER II, the zemstvo handled education, health, and other district matters, and chose delegates to the provincial assembly. In 1917 (see RUSSIAN REVOLUTION) the SOVIET replaced the zemstvo.

Zen Buddhism, Buddhist sect of Japan and China, based on the practice of MEDITATION rather than on adherence to a particular scriptural doctrine. Its founder in China was the legendary Bodhidharma (5th cent. A.D.), who taught "wall-gazing" and followed the Yogacara or Consciousness School of BUDDHISM, which held consciousness as real, but not its objects. The characteristic Zen teaching of sudden enlightment, or *satori*, goes back to Hui-neng, an illiterate master of the 7th cent. who defined enlightenment as the direct seeing of one's own "original nature" (i.e., Buddha). The golden age of Zen (8th–9th cent.) developed a unique style of oral instruction, including nonrational elements such as the *koan*, a subject given for meditation, usually in the form of a paradoxical saying, to test the enlightenment of students of Zen. After the persecution of Buddhism in 845, Zen emerged as the dominant Chinese sect. Two main schools, the *Lin-chi* (Jap. *Rinzai*), emphasizing the *koan* and *satori*, and the *Ts'ao-tung* (Jap. *Soto*), emphasizing the practice of meditation (*zazen*), were transmitted to Japan in the 14th cent. and greatly influenced politics and culture (e.g., poetry, painting, landscape gardening, the tea ceremony, and flower arranging) before declining in the 16th and 17th cent. Revived in the 18th cent., Zen thought was made known in the West by the writings of D.T. Suzuki, and after World War II it attracted interest in the U.S.

Zenger, John Peter, 1697–1745, American journalist; b. Germany. In 1734 he was imprisoned for political articles published in his newspaper, the New York *Weekly Journal*. Andrew Hamilton (1676?–1741) secured his acquittal in 1735. The case was an important landmark in establishing freedom of the press in America.

Zeno, d. 491, Roman emperor of the East (474–91) who succeeded his son, LEO I. He made peace with the Vandal king GAISERIC and made concessions to ODOACER in Italy. He freed the East from the raids of the Ostrogoths and encouraged their king, Theodoric the Great, to invade Italy (488).

Zeno of Elea, c.490–c.430 B.C., Greek philosopher of the Eleatic school founded by PARMENIDES. Zeno's only known work, extant in fragmented form, uses a series of paradoxes to show the error of commonsense notions of time and space, thereby demonstrating Parmenides' doctrine that motion and multiplicity are logically im-

possible. Contemporary thinkers have shown renewed interest in the problems Zeno raised.

Zephaniah [zĕf'ənī'ə] or **Sophonias** [sōfənī'əs], book of the OLD TESTAMENT, 36th in the Authorized Version, 9th of the Minor PROPHETS. The prophet lived in the second half of the 7th cent. B.C. The book consists of a denunciation of Judah for idolatry and wealth and a prophecy of salvation and the return from captivity of a remnant of Israel.

Zeppelin, Ferdinand, Graf von, 1838–1917, German army officer and airship inventor and builder. He invented (1900) the first rigid AIRSHIP and built (1906) one that had a speed of 30 mi (48 km) per hr.

Żeromski, Stefan [zhĕrôm'skē], 1864–1925, Polish novelist, short-story writer, and poet. In such novels as *Homeless People* (1900), *Ashes* (1904), and *Faithful River* (1912) he expressed a deep concern with freedom and social justice.

Zeus [zōōs], in Greek religion, supreme god; son of CRONUS, whom he succeeded, and RHEA; brother and husband of HERA. After the overthrow of the TITANS, when lots were cast to divide the universe, the underworld went to HADES, the sea to POSEIDON, and the heavens and earth to Zeus. An amorous god, he loved goddesses, nymphs, and mortals, and fathered many children. Ruling from his court on Mt. Olympus, Zeus was the symbol of power, rule, and law; the rewarder of good; and the punisher of evil. Also the god of weather (his most famous weapon was the thunderbolt) and fertility, he was worshiped in connection with almost every aspect of life. The Romans equated Zeus with their own supreme god, JUPITER.

Zhangjiakou or **Changkiakow** [both: jäng-jēä-kou], city (1986 est. pop. 493,000), NW Hebei prov., China. A major trade center for N China and Mongolia, it has food-processing plants, machine shops, and tanneries. An important Ch'ing dynasty military center, it declined somewhat after the opening (1905) of the Trans-Siberian RR.

Zhao Ziyang, 1919–, premier of China (1980–87), general secretary of the Communist party (1987–89). Zhao was purged in the CULTURAL REVOLUTION, but was later rehabilitated. In 1975 he was named governor of Sichuan prov. He was elected to the politburo in 1979, later succeeded HUA GUOFENG as premier, and became party general-secretary in 1987. A proponent of economic liberalization, he supported the students in the pro-democracy demonstrations in May 1989, but was overruled by the party and subsequently removed from power.

Zhengzhou or **Chengchow** [both: jŭng-jō], city (1990 est. pop. 1,710,000), capital of Henan prov., E central China. It is one of China's textile centers and a flourishing industrial city. A major railway center linking BEIJING and GUANGZHOU on the north-south RR and XI'AN and SHANGHAI on the east-west RR, Zhengzhou was the site of major fighting during the Cultural Revolution (1966–69).

Zhirinovsky, Vladimir Volfovich, 1946–, Russian politician; b. Kazakhstan. A lawyer, he founded the Liberal Democratic party, an extreme right Russian nationalist group, in 1990 and finished (1991) a distant third behind YELTSIN in the Russian Republic's presidential election. He later defended the failed coup against GORBACHEV (1991) and was an outspoken critic of Yeltsin, but he did not join the parliament's bid to oust Yeltsin in 1993. Although he was denounced as a fascist by his opponents, his party subsequently won the largest share (23%) of the popular vote in the 1993 legislative elections.

Zhivkov, Todor, 1911–, Bulgarian Communist leader. He was a partisan leader in World War II and became (1954) Communist party first secretary. He also held important posts in the government, including premier (1962–71) and head of state (1971–89). He resigned his government and party posts in 1989 and was later expelled from the party and convicted (1992) of corruption.

Zhou Enlai or **Chou En-lai** [both: jō ĕn-lī], 1898–1976, Chinese Communist leader. He studied in Europe and there became a founder of the Chinese Communist party. He returned (1924) to China and joined SUN YAT-SEN, who was then cooperating with the Communists. In 1927 Zhou organized a general strike in Shanghai that led to the city's capture by CHIANG KAI-SHEK and the Nationalists in the Northern Expedition. After the break (1927) between Chiang and the Communists, Zhou held prominent Communist military and political posts. He participated in the LONG MARCH (1934–35) of the Communist army, and after the creation of the People's Republic of China (1949) he was foreign minister (1949–58) and premier (1949–76). He headed the Chinese delegation to the Geneva Conference of 1954 and to the Bandung Conference (1955). He is believed to have been largely responsible for China's reestablishment of contacts with the West in the 1970s.

Zhu De or **Chu Teh** [both: jōō dŭ], 1886–1976, Chinese Communist soldier. In 1922 he went to Europe, where he joined the Chinese Communist party. He returned to China and in 1927 when CHIANG KAI-SHEK broke with the Communists, Zhu joined MAO ZEDONG. Zhu led (1934–35) his section of the Red Army on the LONG MARCH to NW China and commanded Communist forces in the Second SINO-JAPANESE WAR. He left his military post to become deputy chairman of the People's Republic of China (1954); he became chairman of the National People's Congress in 1959.

Zhukov, Georgi Konstantinovich [zhōō'kôf], 1896–1974, Soviet marshal. He fought in the RUSSIAN REVOLUTION (1917) and the civil war (1918–20). In WORLD WAR II he defended Moscow (1941), defeated the Germans at Stalingrad (1943), helped lift the Leningrad siege (1944), and took Berlin (1945). Defense minister after 1955, he was ousted by KHRUSHCHEV (1957); when Khrushchev fell, Zhukov appeared again in public.

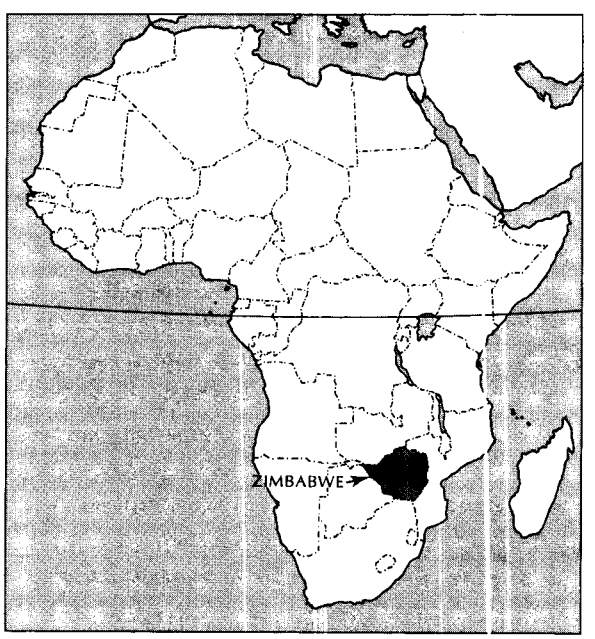
Zia ul-Haq, Mohammad, 1924–88, president of Pakistan (1978–88). An army general, he headed the junta that overthrew (1977) Prime Min. Z.A. BHUTTO and imposed martial law. Zia assumed the presidency in 1978. He lifted martial law in 1985, and after the dismissal of Prime Minister Mohammed Khan Junejo, dissolved the Parliament and called a general election (1988). He was killed in a plane crash.

zidovudine: see AZT.

Ziegfeld, Florenz [zēg'fĕld], 1869–1932, American theatrical producer; b. Chicago. He is best known for the *Ziegfeld Follies,* an extraordinarily elaborate revue produced annually for 24 years, starting 1907. His other productions include *Show Boat* (1927) and *Bitter Sweet* (1929).

ziggurat, form of temple common to the Sumerians, Babylonians, and Assyrians, built from the end of the 3d millennium B.C. to the 6th cent. B.C. It was a pyramidal brick structure with receding tiers, set on a rectangular, square, or oval platform, with a shrine at the summit.

Zimbabwe [zĭmbäb'wā], officially Republic of Zimbabwe, republic (1992 est. pop. 11,033,000), 150,803 sq mi (390,580 sq km), S cen-



The key to pronunciation appears on page xiii.

tral Africa, bordered by Zambia (N), Mozambique (NE and E), and Botswana (SW and W). Principal cities include HARARE (the capital) and BULAWAYO. Most of Zimbabwe consists of a high plateau, the highveld (above 4,000 ft/1,219 m), that crosses the country from southwest to northeast; on either side of it are the middleveld (below 4,000 ft/1,219 m) and the lowveld (below 3,000 ft/914 m). The Eastern Highlands, a narrow belt along the Mozambique border, are the site of Mt. Inyangani (8,503 ft/2,592 m), the country's highest point. The economy is supported mainly by agriculture and mining. The principal cash crops include tobacco, corn, tea, cotton, sugarcane, and peanuts. The leading mineral exports are gold and nickel. Forests in the southeast yield valuable hardwood. Among Zimbabwe's industrial products are iron and steel, cement, food products, machinery, textiles, and consumer goods. The population consists primarily of Bantu-speaking ethnic groups, mostly Shona with a large Ndebele minority. There are also about 100,000 people of European descent who remained after independence and continue to dominate Zimbabwe's economy, and small Asian and mixed race minorities. English is the official language, but the Shona and Ndebele speak their own languages. Most of the population practice traditional African religions, but 25% is Christian and the Asians are Muslim and Hindu.

History. Early Iron Age cultures in present-day Zimbabwe were supplanted by Bantu-speaking peoples who migrated into the area after the 5th cent. A.D. In the early 16th cent. the Portuguese developed trade with Shona-dominated states, which in the 1830s became subject to Ndebele invaders. In 1889 Cecil Rhodes's British South Africa Company obtained a charter to colonize the region, which they called Rhodesia. The company founded (1890) Fort Salisbury and in 1893 defeated the Ndebele and took control of the territory. In 1922 the settlers rejected incorporation into the Union of South Africa and chose to make Southern Rhodesia a self-governing British colony, a status achieved in 1923. Thereafter a series of white governments developed the economy but failed to share the benefits with the African majority. Joining Northern Rhodesia (now Zambia) and Nyasaland (now Malawi), in 1953 Southern Rhodesia became a member of the Federation of Rhodesia and Nyasaland, which disbanded in 1963, when the other members moved toward independence. Ian SMITH, a staunch conservative who became prime minister in 1964, proclaimed the colony's unilateral independence (as Rhodesia) from Britain in 1965, an act the British denounced as rebellion. In 1970 Rhodesia became a republic, with complete separation of the franchise along racial lines. UN economic sanctions were applied against the Smith regime, and two African nationalist groups, led by Joshua Nkomo and Robert MUGABE, launched guerrilla attacks against the government. Smith and three moderate black leaders agreed (1978) to set up an interim biracial government, and elections were held in 1979, but Britain and the black nationalists rejected the settlement. Finally, a London conference reached an accord on legal independence under black majority rule, and the new state of Zimbabwe came into being in 1980. The government of national unity, established upon independence, ended in 1982, when Prime Minister Mugabe ousted Nkomo from the cabinet. In 1987 the country adopted a presidential system of government, and Mugabe became president. In an attempt to end factional fighting, Mugabe and Nkomo agreed to merge their parties the same year. By 1990 the restrictions imposed by the accord of 1980, such as reserving a portion of the legislature for white representation, had been removed, and the national state of emergency, which dated to 1965, was ended.

Zimbabwe [Bantu, = stone houses], ruined city, SE Zimbabwe, found c.1870 and believed by some to be the biblical OPHIR, site of King Solomon's mines. Archaeological evidence shows that it was first occupied (3d cent.) by early IRON AGE peoples; later African cultures built the great wall (11th cent.) and richly decorated buildings.

zinc (Zn), metallic element. A lustrous, bluish-white, fairly reactive metal, zinc is ductile and malleable when heated. It is commercially important in GALVANIZING iron and in the preparation of certain alloys, e.g., BRASS and sometimes BRONZE. It is used for the negative plates in certain electric batteries, and for roofing and gutters. Zinc compounds are numerous and widely used. Zinc is essential for growth of plants and animals. See ELEMENT (table); PERIODIC TABLE.

zinnia, plant (genus *Zinnia*) of the COMPOSITE family, native chiefly to Mexico. The common garden zinnia (*Z. elegans*) is a rather coarse, easily cultivated annual, popular as a cut flower for its warm colors—ranging from white and yellow to red and purple—and for its bold, stiff aspect. The zinnia is the state flower of Indiana.

Zinoviev, Grigori Evseyevich [zēnô'vēēf], 1883–1936, Soviet leader. He sided with LENIN in the 1903 Social-Democratic party split (see BOLSHEVISM AND MENSHEVISM). After the RUSSIAN REVOLUTION of Nov. 1917, he led the COMINTERN (1919–26) and served on the Communist party politburo (1921–26). After Lenin's death (1924) Zinoviev, KAMENEV, and STALIN shared power. In 1925 Stalin turned on Zinoviev and Kamenev, and they joined the TROTSKY faction. Zinoviev was expelled from the party in 1927 but was readmitted in 1928 with little power. In 1935 he was tried for alleged involvement in the death of Stalin's aide Sergei M. Kirov. In 1936 Zinoviev, Kamenev, and others were tried for treason and executed.

Zinzendorf, Nikolaus Ludwig, Graf von [tsĭn'tsəndôrf], 1700–1760, German churchman, patron, and bishop (from 1737) of the refounded MORAVIAN CHURCH. Reared under Pietistic influences, he established (1722) a Moravian colony called Herrnhut on his Saxony estates, but was exiled (1736) for his religious views. In America (1741–43) he helped to found Moravian congregations in E Pennsylvania. He was allowed to return to Saxony in 1747.

Zion or **Sion,** part of JERUSALEM. It is defined in the BIBLE as the City of David. There is controversy about its exact location. The name is symbolic of Jerusalem, of the Promised Land, of Israel's hope of returning to Palestine (hence the term ZIONISM), and, among Christians, of heaven.

Zionism, movement for reconstituting a Jewish state in Palestine. Dating from the Roman destruction of Jerusalem (A.D. 70) and the dispersion of the JEWS, the movement emerged in its modern form as a response to European ANTI-SEMITISM. The first World Zionist Congress was convened (1897) in Basel, Switzerland, by Theodore HERZL. The movement, under Chaim WEIZMANN, was given impetus by the Balfour Declaration (see BALFOUR, Arthur James) of 1917, which promised the Jews a national homeland in PALESTINE, then part of the OTTOMAN EMPIRE. After WORLD WAR II and the HOLOCAUST, increased Jewish settlement in the British mandate of Palestine led to armed conflict with the British and with the Arab inhabitants. Zionism was divided between followers of the militant Zionist leader Vladimir Jabotinsky (including Menachem BEGIN), who demanded unrestricted immigration throughout Palestine, and those, led by David BEN-GURION, who reluctantly accepted the UN plan for partition. After the creation of the state of ISRAEL (1948), the World Zionist Congress was separated from the Israeli government. The present-day Zionist movement facilitates immigration to Israel and supports cultural and educational activities in Israel and elsewhere.

Zion National Park: see NATIONAL PARKS (table).

zirconium (Zr), metallic element, discovered in oxide form by M.H. Klaproth in 1789. It is a very strong, malleable, ductile, lustrous, silver-gray metal that is extremely resistant to heat and corrosion. Zirconium is used in flashbulbs and to clad uranium fuel for nuclear reactors; its compounds are used as refractory material in furnaces, crucibles, and ceramic glazes. See ELEMENT (table); PERIODIC TABLE.

zither: see STRINGED INSTRUMENT.

Zn, chemical symbol of the element ZINC.

zodiac, zone of the sky that includes about 8° on either side of the ECLIPTIC. The apparent paths of the sun, the moon, and the major planets all fall within this zone. The zodiac is divided into 12 equal parts of 30° each, each part being named for a CONSTELLATION and represented by a sign (see table). Because of the PRECESSION OF THE EQUINOXES, the equinox and solstice points have each moved westward about 30° in the last 2,000 years; thus the zodiacal constellations, which were named in ancient times, no longer correspond

Aries	*The Ram*	♈	*March 21-April 19*
Taurus	*The Bull*	♉	*April 20-May 20*
Gemini	*The Twins*	♊	*May 21-June 21*
Cancer	*The Crab*	♋	*June 22-July 22*
Leo	*The Lion*	♌	*July 23-Aug. 22*
Virgo	*The Virgin*	♍	*Aug. 23-Sept. 22*

Pisces	*The Fishes*	♓	*Feb. 19-March 20*

to the segments of the zodiac represented by their signs. The zodiac is of importance in ASTROLOGY.

Zoë, d. 1050, Byzantine empress, daughter of CONSTANTINE VIII. She ruled jointly with her first husband, ROMANUS III, and, after his murder (1034), with her second husband, Michael IV, who perhaps was involved in the murder. Michael's successor and nephew, Michael V, briefly exiled Zoë in 1042, but she soon deposed and blinded him. She then ruled with her third husband, Constantine IX, and her sister, Theodora. Their reign was remarkable for intellectual brilliance and extraordinary corruption. This period saw the final schism between the Eastern and Western churches.

Zog, 1895–1961, king of Albania (1928–46). Originally named Ahmedi Zogu, he was premier (1922–24) and dictator (1925–39). In 1928 he proclaimed himself king. He abdicated after World War II, which he spent in exile.

Zola, Émile [zôlä'], 1840–1902, French novelist, the leading exemplar of NATURALISM. Influenced by TAINE, he wrote a vast series of novels depicting Second Empire French society in minute and often sordid detail. Best known are *The Dram Shop* (1877), *Nana* (1880), and *Germinal* (1885). His zeal for social reform and staunch anti-Catholicism led him to take a strong stand in the DREYFUS AFFAIR with his article "J'accuse" (1898). Prosecuted for libel, he escaped to England, remaining there until amnestied a few months later.

Zond, in space exploration: see SPACE PROBE (table).

zoological garden or **zoo,** public or private park where living animals are kept for exhibition and study. Most animals are captured in their native habitat, although some are born in captivity. Many modern zoos attempt to save species faced with extinction by breeding them in captivity, and a few species have been reintroduced into the wild. A modern trend is the exhibition of animals in enclosures simulating their natural habitats rather than in cages. The menageries and aviaries of ancient China, Egypt, and Rome were famous. Notable present-day zoos include those in the Bronx (N.Y.), San Diego, Chicago, London, Paris, and Berlin.

zoology, in biology, the study of ANIMALS. Early efforts to classify animals were based on physical resemblance, habitat, or economic use (see CLASSIFICATION). The invention of the microscope and the use of experimental techniques expanded zoology as a field and established many of its branches, e.g., CYTOLOGY, HISTOLOGY, embryology, PHYSIOLOGY, and GENETICS. Modern zoology studies cell structure and function, as well as psychological, anthropological, and ecological aspects of animals.

Zorach, William [zôr'äk], 1887–1966, American sculptor; b. Lithuania; emigrated to the U.S. when he was four. Without formal training in sculpture, he evolved a style of monumental simplicity and solidity in his stone or wood pieces. A typical example is *Future Generation* (Whitney Mus., N.Y.C.).

Zoroaster, c.628 B.C.–c.551 B.C., religious teacher and prophet of ancient Persia, founder of ZOROASTRIANISM. Zoroaster is derived from the Greek form of Zarathushtra (or Zarathustra), his Persian name. During his lifetime the new religion he founded spread rapidly. The circumstances of Zoroaster's death are not known.

Zoroastrianism, religion founded by ZOROASTER, but with many later accretions. Its scriptures are the *Avesta* or the *Zend Avesta.* According to Zoroaster, there are good spirits, or *ahuras,* headed by Ahura Mazdah (also Ormazd or Ormuzd), opposed by evil spirits, the *daevas* or *divs,* led by Ahriman. The war between these two supernatural hosts will result in the ultimate triumph of Ahura Mazdah. The first period of Zoroastrianism was under the ACHAEMENIDS. Alexander's conquest of Persia sent Zoroastrianism into a decline. It reemerged (A.D. c.226) under Ardashir I, who established the Sassanian dynasty and tried to revive Achaemenian culture. In the mid-7th cent. Persia fell to Islam, and Zoroastrianism virtually disappeared. Aside from the PARSIS of India, fewer than 10,000 persons in Iran practice the religion today.

Zorrilla y Moral, José [thôrē'lyä ē mōräl'], 1817–93, Spanish romantic dramatist and poet. His works include the popular play *Don Juan Tenorio* (1844); *Granada* (1852), a retelling of legends in verse; and an autobiography.

Z particle: see W AND Z PARTICLES.

Zr, chemical symbol of the element ZIRCONIUM.

Zuccaro [tsōōk'kärō], **Zuccari,** or **Zucchero,** Italian painters, two brothers who were leading late mannerists in Rome (see MANNERISM). **Taddeo Zuccaro,** 1529–66, was painter to Pope Julius III and Pope Paul IV. He and his brother painted historical and mythological scenes for Caprarola Palace, as well as frescoes in the Vatican. Taddeo's other works in Rome include the *Dead Christ* (Borghese Gall.). **Federigo Zuccaro,** 1543–1609, was associated with his brother, but traveled extensively in Europe. He painted portraits of Queen Elizabeth and Mary Stuart and did work for Philip II in the ESCORIAL in Spain. He constructed and decorated the Zuccari Palace and was one of the first to develop lectures and theoretical discussions on art.

Zuckmayer, Carl [tsōōk'mīər], 1896–1977, German dramatist. His successful comedies include *The Merry Vineyard* (1925), *The Captain of Köpenick* (1931), and *The Devil's General* (1946); the last two were adapted as films. During World War II Zuckmayer lived in the U.S. His best-known screenplay is *The Blue Angel* (1930).

Zuider Zee, former North Sea inlet, N Netherlands. Most of it was enclosed by a dam (1932) to form the IJSSELMEER.

Zukerman, Pinchas, 1948–, Israeli violinist and conductor. A violin protégé of Isaac STERN, he came to the U.S. in 1962 and made his New York City debut in 1963. He is a noted chamber music performer and was (1980–87) musical director of the St. Paul (Minn.) Chamber Orchestra.

Zulu, African people whose historic home is Zululand, in South Africa. Traditionally, the Zulu lived as members of an extended family in a fenced compound (kraal), headed by the oldest man. Their economy often still depends on cattle raising. The prolonged absence of a majority of the men, many employed in distant cities and mines, has, however, weakened tribal society. The Zulu became historically important with the conquests of their chief Shaka (d. 1828), and they later resisted Boer settlers. In 1873, under CETEWAYO, they defeated several British forces, but Britain triumphed in 1879. Their lands were annexed by Britain in 1887 and incorporated into Natal in 1897. The Zulu-dominated Inkatha Freedom party (see BUTHELEZI, MANGOSUTHU GATSHA) initially opposed the accord between the AFRICAN NATIONAL CONGRESS and the South African government but participated in the 1994 multiracial elections.

Zuñi, pueblo (1990 pop. 7,405), W New Mexico, in the Zuñi reservation. Built c.1695, it is on the site of one of the seven original Zuñi villages attacked in 1540 by CORONADO, who was seeking the mythical gold-rich cities of Cibola. The inhabitants are PUEBLO people of the Zuñian linguistic family (see NATIVE AMERICAN LANGUAGES). Sedentary farmers, they are noted for basketry, pottery, turquoise jewelry, and weaving, and for the ceremonial dances of the traditional religion most still practice.

Zurbarán, Francisco de [thōōrbärän'], 1598–1664, Spanish BAROQUE painter. His early paintings often suggest the austere simplicity of wood sculpture, e.g., *St. Michael* (Metropolitan Mus.). His later realistic style is seen in his famous *Apotheosis of St. Thomas Aquinas* (1631; Seville).

Zürich [tsü'rĭkh], city (1990 pop. 342,861), capital of Zürich canton and the largest Swiss city, N Switzerland, on the Lake of Zürich. The commercial and intellectual center of German-speaking Switzerland, it is a banking and publishing center; among its manu-

The key to pronunciation appears on page xiii.

factures are machine tools. Built on a site occupied since Neolithic times, the city was conquered (58 B.C.) by the Romans and, after the 5th cent., passed to the Alemanni, the Franks, and Swabia. It was an imperial free city after 1218 and joined the Swiss Confederation in 1351. Under the influence of ZWINGLI (16th cent.) it became the leading power of the Swiss Reformation. It has the largest Swiss university and a world-famous polytechnic school (both est. 19th cent.).

Zweig, Arnold [tsvīk], 1887–1968, German novelist and dramatist. Among his best-known works is the trilogy of novels including *Education Before Verdun* (1935), *The Case of Sergeant Grischa* (1927), and *The Crowning of a King* (1937), and *The Axe of Wandsbek* (1947), a powerful study of life in Germany in 1937. A Zionist, Zweig went to Palestine during the NAZI era. After 1948 he lived in East Germany.

Zweig, Stefan [tzvīk], 1881–1942, Austrian biographer, poet, and novelist. Outstanding are his sensitive biographies, notably of Marie Antoinette (1932) and Mary Queen of Scots (1935). He went into exile (1934) during the NAZI period, eventually emigrating (1941) to Brazil, where he committed suicide.

Zwingli, Huldreich or **Ulrich** [tsvĭng'lē], 1484–1531, Swiss Protestant reformer. A Roman Catholic priest, he was considerably influenced by the humanist precepts of ERASMUS. He later accepted Martin LUTHER's doctrine of justification by faith alone, but his independent study of the Scriptures had led him after 1516 to question and finally to renounce the teaching of the Roman church. He became (1518) a vicar in Zürich and began preaching against many church practices. The beginning of the REFORMATION in Switzerland dates from his lectures (1519) on the New Testament, in which he proclaimed the Scriptures to have sole authority. In 1523, Zwingli presented his doctrines in 67 theses, which were approved by a general council in Zürich and instituted in the local churches. In 1525 the Catholic Mass was replaced by a reformed service in his church. He became embroiled in an argument with the Lutherans about the nature of the Eucharist, and Zwingli and Luther could reach no agreement at the Marburg Colloquy (1529). Zwingli was killed at Kappel in a war with the Catholic Swiss cantons. The Reformation in Switzerland passed to John CALVIN, who built his theological system on the groundwork laid by Zwingli, but he resisted Zwingli's more radical teaching on baptism and the Lord's Supper.

Zworykin, Vladimir Kosma, 1889–1982, American physicist and inventor; b. Russia. He came to the U.S. in 1919 and joined (1929) the Radio Corp. of America, becoming vice president in 1947. He and his co-workers developed the iconoscope, a scanning tube for the TELEVISION camera, and the kinescope, a cathode-ray picture tube in the television receiving apparatus.

zydeco, American musical form originating among the Cajuns and African-American Creoles of Louisiana. Drawing on elements of jazz, country and western music, and blues, it is characterized by its creole flavor and strong dance rhythms.
