litchi or **lichee,** Chinese tree (*Litchi chinensis*) of the soapberry family, also cultivated in other warm countries. It has a small, aromatic pulpy fruit in a thin, rough shell. The best-known Chinese fruit, it is eaten fresh, dried, preserved, or canned.

liter: see WEIGHTS AND MEASURES, table.

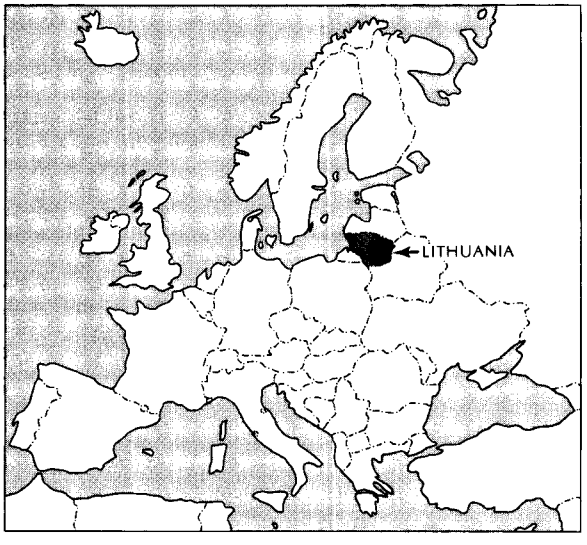
lithium (Li), metallic element, discovered in 1817 by J.A. Arfvedson. A soft, silver-white corrosive ALKALI METAL, lithium is the least dense metal. Lithium compounds are used in lubricating greases, special glasses, and ceramic glazes; as brazing and welding fluxes; and in the preparation of plastics and synthetic rubber. Lithium salts are used in medicine to treat MANIC-DEPRESSION. See ELEMENT (table); PERIODIC TABLE.

lithography, type of planographic or surface printing used as an art process and in commercial PRINTING, where the term is synonymous with offset printing; it is also used in the manufacture of INTEGRATED CIRCUITS. Lithography was invented c.1796 by Aloys SENEFELDER, and the Bavarian limestone he used is still considered the best material for art printing. Lithography is based on the antipathy of oil and water. A drawing is made in reverse on the ground (flat) surface of the stone with a crayon or ink that contains soap or grease. The image produced on the stone will accept printing ink and reject water. Once the grease in the ink has penetrated the stone, the drawing is washed off and the stone kept moist. It is then inked with a roller and printed on a lithographic press. As a process, lithography is probably the most unrestricted, allowing a wide range of tones and effects. Several hundred fine prints can be taken from a stone. The medium was employed by many 19th-cent. artists, including GOYA, DELACROIX, DAUMIER, DEGAS, WHISTLER, and TOULOUSE-LAUTREC. Among American artists noted for their lithographs are A.B. DAVIES, George BELLOWS, and CURRIER AND IVES. The medium remains popular with contemporary artists. **Photolithography** is frequently used in the commercial reproduction of art works. With the process, a photographic negative is exposed to light over a gelatin-covered paper, and those portions of the gelatin that are exposed become insoluble. The soluble portions are washed away, and the pattern to be printed is transferred to a stone or metal plate. In color lithography or color photolithography, a stone or plate is required for each color used. The term photolithography is also applied to a process used in INTEGRATED-CIRCUIT manufacture. Light is shined through the non-opaque portions of a pattern, or photomask, onto a piece of specially coated silicon or other SEMICONDUCTOR material. The portions of the coating that were exposed to light harden, and the unhardened coating is re-

moved, as by an acid bath. The uncovered silicon is altered to produce one layer of the integrated circuit. Advances in this technique have replaced visible and ultraviolet light frequencies with electron and X-ray beams, which permit smaller feature sizes in the patterns.

Lithuania, Lithuanian *Lietuva,* officially Republic of Lithuania, republic (1992 est. pop. 3,789,000), 25,174 sq mi (65,201 sq km), N central Europe, from 1940 to 1991 a constituent republic of the USSR. It borders on the Baltic Sea (W), Latvia (N), Belarus and Poland (E), and the Kaliningrad oblast (SW, a Russian exlcave). The capital and largest city is VILNIUS; other large cities include Kaunus and Klaipeda (Memel). Lithuania is a flatland drained by the Nemen R. Dairying, stock raising, and the growing of such crops as grains and flax are agriculturally important. Among its industries are shipbuilding, metallurgy, food processing, and the manufacture of machinery, textiles, and chemicals. The majority of the population is Lithuanian; minorities include Russians and Poles. Lithuanian is the official language, and Russian and Polish are spoken. Roman Catholicism and Lutheranism are the main faiths.

History. The Lithuanians may have settled along the Neman (Nemanus) as early as 1500 B.C. In the 13th cent., to protect themselves against the Livonian and Teutonic knights, they formed a strong, unified state which, by absorbing neighboring Russian principalities, became one of the largest in medieval Europe. Between 1386 and 1569, Lithuania gradually merged with Poland. In 1795 it came under Russian control. Independence was declared in 1918, but Poland held Vilnius from 1920 to 1939. In 1940, the USSR forcibly annexed Lithuania. During the German occupation (1941–44) in WORLD WAR II, Lithuania's large Jewish minority was virtually exterminated. The country was returned to Soviet rule after the war. In 1990 Sajudis, a noncommunist coalition, won control of the Lithuanian parliament, and Vytautus Landsbergis became president. The parliament declared Lithuania independent, but the USSR imposed an economic embargo that compelled Lithuania to suspend enforcement of the declaration. In Jan. 1991 the Soviet army unsuccessfully attempted to oust Lithuania's government. After the failed hard-line coup against Soviet Pres. GORBACHEV, the USSR recognized Lithuania's independence. In 1992 the Democratic Labor (former Communist) party defeated Sajudis, and Algirdas Brazauskas, a former Communist, was elected president (1993). Lithuania signed a free-trade agreement with Estonia and Latvia in 1993.



Lithuanian, a language belonging to the Baltic subfamily of the Indo-European family of languages. See LANGUAGE (table).

litmus, organic dye usually used as an indicator of acidity or alkalinity (see ACIDS AND BASES). Naturally pink in color, it turns blue in alkaline solutions and red in acids. Litmus paper is paper treated with the dye.

Little Bighorn, river, flowing c.90 mi (145 km) from N Wyo. to join the Bighorn R. in S Mont. **Little Bighorn National Battlefield,** in SE Montana, commemorates the famous Battle of the Little Bighorn on June 25–26, 1876, in which Col. George CUSTER and most of his force were killed by Sioux and Cheyennes.

Little Entente, loose alliance formed in 1920–21 by Czechoslovakia, Romania, and Yugoslavia and supported by France. Its aims were to contain Hungary and to prevent the restoration of the HAPSBURGS. Romania and Yugoslavia were also members of the Balkan Entente (1934). The general purposes of both ententes were to preserve the territorial status quo and to encourage closer economic ties. The Little Entente was successful until the rise of HITLER in Germany and was ended by the MUNICH PACT (1938).

Little Richard, 1935–, American musician and singer; b. Macon, Ga. as Richard Wayne Penniman. One of the first rock musicians in the 1950s, he recorded "Tutti Frutti," "Long Tall Sally," and "Good Golly Miss Molly." His music influenced, among others, the BEATLES. See also ROCK MUSIC.

Little Rock, city (1990 pop. 175,795), state capital and seat of Pulaski co., central Ark., a port on the Arkansas R.; inc. 1831. It is the administrative, commercial, industrial, and cultural center of the state. Agricultural-products, bauxite, and lumber industries are important. A river crossing before 1819, Little Rock became territorial capital in 1821. It was a center of world attention in 1957, when federal troops enforced a school-desegregation order.

Little Turtle, c.1752–1812, chief of the MIAMI; b. Indiana. Noted for his military skill, he defeated the U.S. army in several engagements but counseled against the disastrous battle with Gen. Anthony WAYNE at Fallen Timbers (1794). He reluctantly signed the Treaty of Greenville (1795), ceding much of Ohio to the U.S. Later he refused to join TECUMSEH's confederacy against the whites.

Liu Shaoqi or **Liu Shao-Ch'i** [both: lyōō shou-chē], 1893?–1969, Chinese Communist leader. An expert on organization and party structure, he was chairman and head of state of the Chinese People's Republic (1959–68). Liu was criticized during the Cultural Revolution (1966–69) and was removed from power in 1968. He was posthumously rehabilitated (1980) by DENG XIAOPING and a collection of his writings was published in 1982.

liver, largest glandular organ of the body. It lies on the right side of the abdominal cavity, beneath the diaphragm, and is made up of four unequal lobes. Liver tissue consists of thousands of tiny lobules, in turn made up of hepatic cells, the basic metabolic cells. The liver is thought to perform over 500 functions involving the DIGESTIVE SYSTEM, EXCRETION, blood chemistry and detoxification, and the storage of vitamins and minerals. Of the liver's many digestive system functions, the production of BILE (for fat digestion) and storage of glucose (see GLYCOGEN) are particularly important.

Liverpool, city (1991 pop. 452,450), Merseyside, NW England, on the Mersey R. It is one of Britain's greatest ports and largest cities and a major outlet for industrial exports. Food processing and the manufacture of electrical equipment and chemicals are major industries. Chartered in 1207, the city was once famous for its pottery and its textile industry.

liverwort, member of a group of small, flowerless, primitive green land plants that are alternately considered a class (Marchantiopsida) or division (Hepatophyta) of BRYOPHYTES. They are characterized by horizontal growth and are related to the MOSSES. Usually growing in moist places, liverworts are considered intermediate between the aquatic ALGAE and the terrestrial mosses and FERNS. The ancients believed that liverworts could cure diseases of the liver, hence their name.

Livingston, family of American statesmen, diplomats, and jurists. **Robert R. Livingston,** 1654–1728, b. Scotland, emigrated to America in 1673 and made his home in Albany, N.Y. He acquired extensive landholdings and influence in the colony. His grandson, **Robert R. Livingston,** 1718–75, was a judge of New York's supreme court (1763–75) and a delegate to the Stamp Act Congress. His son, **Robert R. Livingston,** 1746–1813, b. N.Y.C., conducted the negotiations that led to the LOUISIANA PURCHASE and financed the steamboat experiments of Robert FULTON. A brother, **Edward Livingston,** 1764–1836, b. Livingston Manor, N.Y., was a U.S. con-

gressman (1795–1801) and mayor of New York City before moving to Louisiana. He served again as a congressman (1823–29) and then as a senator (1829–31) before becoming secretary of state under Pres. JACKSON. Another grandson of Robert R. Livingston (1654–1728) was **Philip Livingston,** 1716–78, b. Albany, who signed the DECLARATION OF INDEPENDENCE and was active in the CONTINENTAL CONGRESS. He was one of the original promoters of King's College (now Columbia Univ.). His brother, **William Livingston,** 1723–90, attended the First and Second Continental Congresses and was New Jersey's first governor (1776–90). His influence played a large part in New Jersey's prompt ratification of the U.S. Constitution.

Livingstone, David, 1813–73, Scottish explorer in Africa. While a medical missionary in what is now BOTSWANA (1841–52), he crossed the KALAHARI desert and discovered the ZAMBEZI R. In 1855 he discovered VICTORIA FALLS. He set out to seek the source of the NILE in 1866. H.M. STANLEY went in search of him, finding him in 1871. Stanley then joined him on a journey (1871–72) to the north end of Lake TANGANYIKA. Livingstone died in an African village; his body is buried in Westminster Abbey.

living will, document in which a person, in case of incapacitation, expresses in advance his or her wishes concerning the use of medical measures to prolong life. Typically living wills are used to reject "extraordinary" measures, such as intravenous feeding and mechanical respirators, when death appears imminent. The use of living wills was affirmed by a 1990 U.S. Supreme Court decision. Family members and medical personnel sometimes challenge a living will because of unclear or legally invalid instructions, concern over possible legal consequences, or the emotional difficulty involved in withholding treatment. See also HEALTH-CARE PROXY.

Livonia, city (1990 pop. 100,850), SE Mich., a suburb of DETROIT; founded 1835, inc. 1950. Its manufactures include automobile bodies, tools and dies, and paints.

Livy (Titus Livius), 59 B.C.–A.D. 17, Roman historian; b. Patavium (Padua). His life work was a history of Rome (entitled *Books from the Founding of Rome*) from its founding in 753 B.C. to DRUSUS (9 B.C.). Of the original 142 books, 35 are extant. While Livy's accuracy is often questionable, he has achieved a long popularity because of his vivid depictions, freedom of expression, and masterly style.

lizard, REPTILE of the order Squamata, which also includes the SNAKE, distributed worldwide (except for the Arctic) but most common in warm climates. Lizards typically have four legs with five toes on each foot, although a few are limbless, retaining internal vestiges of legs. They also differ from snakes in having ear openings, movable eyelids, and less flexible jaws. Several, most notably CHAMELEONS, undergo color changes under the influence of environmental and emotional stimuli. Lizards range in size from species under 3 in. (7.6 cm) long to the 10-ft (3-m) Komodo dragon (see MONITOR).

Ljubljana, Ger. *Laibach,* city (1987 est. pop. 233,000), capital of SLOVENIA, on a tributary of the Sava R. Located in W central Slovenia, it is the country's largest city and an industrial and transportation center. Manufactures include textiles, chemicals, and electronic equipment. The city has a medieval fortress and several fine palaces and churches. Known as Emona in Roman times, Ljubljana passed (1277) to the Hapsburgs. In 1919 it became part of the Kingdom of the Serbs, Croats, and Slovenes (later Yugoslavia). In 1946 Ljubljana became the capital of the Yugoslav constituent republic of Slovenia, which declared its independence in 1991.

llama, South American domesticated hoofed MAMMAL (*Lama glama*) of the CAMEL family. It resembles a large, long-eared, long-necked sheep and provides the indigenous people of the Andes with wool, milk, and meat. Its usefulness as a pack animal is enhanced by its ability to work at exceptionally high altitudes. In the U.S. llamas have also been used as guard animals for sheep flocks.

llanos, Spanish American term for prairies, applied specifically to the plains of the ORINOCO R. basin, in Venezuela and Colombia. They are low-lying and hot, with wet and dry seasons. Cattle ranching, farming, and oil and gas drilling are important.

Lleras Camargo, Alberto [lyä'räs kämär'gō], 1906–90, president of COLOMBIA (1945–46, 1958–62). After his first brief term as Liberal president, he became (1948) the first secretary general of the Organization of American States. In 1957 he helped to depose dictator Rojas Pinilla and to institute bipartisan Liberal-Conservative rule, ending 10 years of bloody political strife in the nation.

Lleras Restrepo, Carlos [lyä'räs rästrā'pō], 1908–, president of COLOMBIA (1966–70). He was Liberal party leader during Colombia's bloody civil war (1948) and became so again in 1961. His government reduced inflation, diversified the economy, and instituted land reform.

Llewelyn ap Gruffydd [lo͞oĕl'ĭn äp gro͞o'fĭth], d. 1282, Welsh prince; last independent ruler of Wales. By 1263 he had recovered much of Wales from the English. He sided with Simon de MONTFORT in the BARONS' WAR and was recognized (1267) by HENRY III as prince of Wales. In 1277 he submitted to EDWARD I, but was killed in a subsequent revolt.

Lloyd, Chris Evert: see EVERT, CHRIS.

Lloyd, Harold, 1893–1971, American film actor; b. Burchard, Kans. A bespectacled innocent, he blundered into hair-raising situations in such silent comedies as *Safety Last* (1923) and *The Freshman* (1925).

Lloyd George, David, 1st **Earl Lloyd-George of Dwyfor,** 1863–1945, British statesman. Elected as a Liberal to Parliament in 1890, he served until 1945. He gained a reputation as an anti-imperialist and as the author of far-reaching social reforms, proposed in 1905 and while chancellor of the exchequer (1908–15) under Herbert Asquith. Replacing (1916) Asquith as prime minister during WORLD WAR I, he formed a strong war cabinet, waged war aggressively, and played a moderating role in shaping the Treaty of VERSAILLES. His coalition fell (1922) when the Conservatives withdrew. He later (1926–31) led the remnants of the LIBERAL PARTY and played a quixotic part in politics in the 1930s and the early months of WORLD WAR II.

Lloyd Webber, Sir Andrew, 1948–, British composer. A member of a successful musical family, he began composing musicals as a teenager. His first success was *Jesus Christ Superstar* (1970). Among his other musicals are *Evita* (1976), a fictional biography of Eva PERON, *Cats* (1981), based on poems by T.S. ELIOT, *The Phantom of the Opera* (1986; Tony Award), and *Sunset Boulevard* (1993).

loam, soil composed of sand, silt, clay, and organic matter in evenly mixed variously sized particles. Loams are more fertile than sandy soils and are not stiff and tenacious like clay soils. Their porous texture permits high moisture retention and air circulation, and most agriculturally important soils are loams. Loam soils are classified as sand, silt, or clay loams, depending on the largest component. Loam is often popularly confused with HUMUS.

Lobachevsky, Nikolai Ivanovich, 1793–1856, Russian mathematician. Independently of János Bolyai he developed (1826) hyperbolic geometry, one type of NON-EUCLIDIAN GEOMETRY.

lobefin, name for several lunged, fleshy-finned, bony FISHES, predecessors of the AMPHIBIANS. Lobefins were considered extinct until 1938, when a live coelocanth (*Latimeria chalumne*), a marine lobefin, was caught off S Africa. Coelocanths are brown to blue and 5 ft (150 cm) long, with circular, overlapping scales, a laterally flattened three-lobed tail, a spiny dorsal fin, and a vestigial lung.

Lobito, city (1983 est. pop. 150,000), W central Angola, on the Atlantic Ocean. It is Angola's chief port, with such exports as ores, grains, and coffee. Industries include shipbuilding and food processing. Founded (1843) by the Portuguese and built mainly on reclaimed land, the city became a commercial center after the completion (1929) of the Benguela RR, but declined in the 1970s due to damage of port facilities during the war of independence from Portugal.

lobster, large marine CRUSTACEAN with five pairs of jointed legs, the first pair bearing large pincerlike claws of unequal size adapted to crushing the shells of its prey. The dark-green common American lobster (*Homarus americanus*) is found from Labrador to North Carolina, but especially along the New England coast. When lobster is cooked, the shell turns bright red; the meat is considered a delicacy.

local area network (LAN), a network dedicated to sharing data among several single-user computer workstations or PERSONAL COMPUTERS. A LAN can have from two to several hundred such nodes,

each separated by distances of from several feet to as much as a mile, and should be distinguished from connections among computers over public carriers, such as telephone circuits, that are used for other purposes. See also MODEM.

Local Group of galaxies: see GALAXY.

Locarno Pact, 1925, agreement reached at Locarno, Switzerland, by Great Britain, France, Germany, Italy, Belgium, Czechoslovakia, and Poland. It guaranteed the demilitarized status of the RHINELAND and the common borders of Belgium, France, and Germany, all as specified by the Treaty of VERSAILLES of 1919. Germany, Poland, and Czechoslovakia also signed border agreements. The "spirit of Locarno" was widely hailed as ushering in an era of international peace and good will. In 1936, however, HITLER denounced the pact, and Germany remilitarized the Rhineland, a step toward WORLD WAR II.

lock, canal: see CANAL.

Locke, John, 1632–1704, English philosopher, founder of British EMPIRICISM. Locke's two most important works, *Essay concerning Human Understanding* and *Two Treatises on Civil Government,* both published in 1690, quickly established him as the leading philosopher of freedom. In the *Essay* he opposed the rationalist belief in innate ideas, holding that the mind is born a blank upon which all knowledge is inscribed in the form of human experience. He distinguished the primary qualities of things (e.g., extension, solidity, number) from the secondary qualities (e.g., color, smell, sound), which he held to be produced by the direct impact of the world on the sense organs. The primary qualities affect the sense organs mechanically, providing ideas that faithfully reflect reality; thus science is possible. Later empiricists such as HUME and George BERKELEY based their systems largely on Locke's theory of knowledge. In political theory he was equally influential. Contradicting HOBBES, Locke maintained that the original state of nature was happy and characterized by reason and tolerance; all human beings were equal and free to pursue "life, health, liberty, and possessions." The state formed by the SOCIAL CONTRACT was guided by the natural law, which guaranteed those inalienable rights. He set down the policy of checks and balances later followed in the U.S. CONSTITUTION; formulated the doctrine that revolution in some circumstances is not only a right but an obligation; and argued for broad religious freedom. Much of the liberal social, economic, and ethical theory of the 18th cent. was rooted in Locke's social-contract theories. One of the major influences on modern philosophical and political thought, he epitomized the ENLIGHTENMENT's faith in the middle class, in the new science, and in human goodness.

Lockerbie, rural village (1988 est. pop. 3,000), SW Scotland, near the English border. On Dec. 21, 1988, a terrorist bomb exploded in flight on a Frankfurt–New York Pan Am Boeing 747. The plane crashed around Lockerbie, killing all 259 aboard and 11 village inhabitants. The refusal of Libya to let the U.S. and Britain try the Libyan intelligence agents accused of involvement in the bombing led (1992) to UN sanctions against LIBYA.

lockjaw: see TETANUS.

Lockyer, Sir Joseph Norman, 1836–1920, English astronomer. One of the first to make a spectroscopic study of the sun and stars, he devised (1868) a way of observing solar prominences in daylight; he also identified helium in the sun and applied the name *chromosphere* to the layer of gas around the sun. He was director (1890–1913) of the Solar Physics Observatory and was the founder and first editor (1896–1919) of *Nature,* considered the world's leading general scientific periodical.

locomotive, vehicle used to a pull a train of unpowered RAILROAD cars. From their invention in the early 19th cent. until the early years of the 20th, all locomotives were powered by STEAM ENGINES fueled by wood or coal, with a rod-and-piston arrangement to move the drive wheels. The front wheel assembly (the swivel truck) and the wheels mounted under the cab were unpowered. **Electric locomotives,** introduced c.1895, obtained their power from an electric trolley, or pantograph, running on an overhead wire, or from a third rail. Electric locomotives are used chiefly on steep grades and on runs of high traffic density. Although very efficient, they are not more widely used because of the cost of electrifying larger railroad systems. In parts of Europe and in Japan, however, high-speed electric locomotives are widely used. American railroads today are largely powered by **diesel-electric locomotives** (introduced c.1924). These use a DIESEL ENGINE to drive an electric generator, which feeds electric motors that turn the driving wheels. **Gas turbine–electric locomotives** are similar to the diesel-electric but use a gas TURBINE to drive the generator

locust, in botany, deciduous tree or shrub (genus *Robinia*) of the PULSE family, native to the U.S. and Mexico. The black locust (*R. pseudoacacia*), a popular ornamental, has fragrant flowers; its durable wood is used for treenails in shipbuilding and for fenceposts, turning, and fuel. The CAROB, thought to be the biblical locust tree, and the HONEY LOCUST belong to other genera in the same family.

locust, in zoology, migratory INSECT of the short-horned GRASSHOPPER family. Locust migration is an occasional event. Under certain environmental conditions, which also lead to population increases, young locusts develop into a short-winged migratory form, gather in huge swarms, and, at maturity, take to the air. The swarms can include more than 100 billion insects. When they finally settle, the resulting agricultural devastation is enormous.

lodestone: see MAGNETITE.

Lodge, Henry Cabot, 1850–1924, U.S. senator from Massachusetts (1893–1924); b. Boston. He wrote several historical works and was a U.S. congressman (1887–93). A conservative Republican senator, he welcomed war with Spain in 1898, bitterly criticized Pres. WILSON's peace policy, and opposed U.S. entry into the LEAGUE OF NATIONS. His grandson, **Henry Cabot Lodge, Jr.,** 1902–85, was also a Republican senator from Massachusetts (1937–44, 1947–53). In 1952 he lost a bid for reelection to John F. KENNEDY. Later he served as U.S. representative to the UN (1953–60). He was ambassador to South Vietnam (1963–64, 1965–67) and West Germany (1968–69), and chief U.S. representative (1969) at the Paris peace talks on Vietnam.

Łódź [lōōj], city (1989 est. pop. 851,000), central Poland. Łódź is Poland's second largest city and the center of its textile industry. Other manufactures include chemicals and radios. The city was chartered in 1423, passed to Prussia (1793) and Russia (1815), and reverted to Poland in 1919.

Loewi, Otto, 1873–1961, American physiologist and pharmacologist; b. Germany. For his discovery of the chemical transmission of nerve impulses he shared with Sir Henry DALE the 1936 Nobel Prize in physiology or medicine. Loewi investigated the physiology and pharmacology of metabolism, the kidneys, the heart, and the nervous system. He was professor of pharmacology at the Univ. of Graz, Austria (1909–38), and New York Univ. (1940–61).

Logan, James, c.1725–80, Mingo chief; b. Pennsylvania. A friend of whites until they killed (1774) his family, he led Native Americans of the Ohio and Scioto rivers on retaliatory raids, resulting in Lord DUNMORE's War. An eloquent speech in which he refused to participate in a peace treaty is famous.

Logan, Mount, 19,524 ft (5,951 m), highest mountain in Canada and second highest in North America, in SW Yukon Territory, at the center of a vast glacial expanse. Named for Sir William Logan, a Canadian geologist, it was first climbed in 1925.

logarithm, the power to which a number, called the base, must be raised in order to obtain a given positive number. For example, the logarithm of 100 to the base 10 is 2, because $10^2 = 100$. Common logarithms use 10 as the base; natural, or Napierian logarithms (for John NAPIER) use the number *e* (see separate article) as the base.

logic, systematic study of valid inference. Classical, or Aristotelian, logic is concerned with the formal properties of an argument, not its factual accuracy. Aristotle, in his *Organon,* held that any logical argument could be reduced to a sequence of 3 propositions (2 premises and a conclusion), known as a SYLLOGISM, and posited 3 laws as basic to all logical thought: the law of identity (*A is A*); the law of contradiction (*A cannot be both A and not A*); and the law of the excluded middle (*A must be either A or not A*). Aristotle assumed a correspondence linking the structures of reality, the mind, and language, a position known in the Middle Ages as REALISM. The opposing school of thought, NOMINALISM, represented by WILLIAM OF OCCAM, maintains that language and logic correspond to the structure of the mind only, not to that of reality. John Stuart MILL in the 19th cent. helped to formulate the scientific method of IN-

DUCTION, i.e., movement from specific perceptions to generalizations. Aristotelian logic basically held sway in the Western world for 2,000 years, but since the 19th cent. it has been largely supplanted as a field of study by symbolic logic, which replaces ordinary language with mathematical symbols. Symbolic logic draws on the concepts and techniques of mathematics, notably SET theory, and in turn has contributed to the development of the foundations of mathematics. In the early 20th cent. Bertrand RUSSELL and Alfred North WHITEHEAD attempted to develop logical theory as the basis for mathematics. See also DEDUCTION.

logical positivism, also known as scientific EMPIRICISM, modern school of philosophy that in the 1920s attempted to introduce the methodology and precision of mathematics to the study of philosophy, much as had been done in symbolic logic (see LOGIC). Led by the Vienna Circle, a group including the philosophers Rudolf CARNAP and Moritz Schlick and the mathematician Kurt GÖDEL, the logical positivists held that metaphysical speculation is nonsensical; that logical and mathematical propositions are tautological; and that moral and value statements are merely emotive. The function of philosophy, they maintained, is to clarify concepts in both everyday and scientific language. The movement received its inspiration from the work of FREGE, Bertrand RUSSELL, WITTGENSTEIN, and G.E. MOORE. The Vienna Circle disintegrated in the late 1930s after the Nazis took Austria, but its influence spread throughout Europe and America, and its concept, particularly its emphasis on the analysis of language as the function of philosophy, has been carried on throughout the West.

logic circuit, ELECTRIC CIRCUIT whose output depends upon the input in a way that can be expressed as a function in symbolic LOGIC; it has one or more binary inputs (capable of assuming either of two states, e.g., "on" or "off") and a single binary output. Logic circuits that perform particular functions are called gates. Basic logic circuits include the AND gate, the OR gate, and the NOT gate, which perform the logical functions *AND, OR,* and *NOT.* Logic circuits, which are mainly used in digital COMPUTERS, can be built from any binary electric or electronic devices, including switches, RELAYS, ELECTRON TUBES, solid-state DIODES, and TRANSISTORS.

Lohengrin [lō'ən-grĭn], in medieval German story, knight of the Holy Grail, son of Parzival. He rescues and marries Princess Elsa but is doomed to leave her. An epic poem (c.1285–90), ascribed to WOLFRAM VON ESCHENBACH, tells the story. Richard WAGNER based his libretto for the opera *Lohengrin* (1850) on this source.

Loire [lwär], longest river of France, flowing c.630 mi (1,015 km) in a wide arc N and W to the Atlantic from the Cévennes Mts. of SE France. It crosses the MASSIF CENTRAL through deep gorges and, at Orléans, enters a broad valley in the nation's agricultural heartland. It widens at Nantes into an estuary c.35 mi (55 km) long. Important in French history, the Loire valley is noted for its elegant châteaux.

Loki [lō'kē], in Norse mythology, the personification of evil. He constantly sought to overthrow the gods of ASGARD. His worst exploit was the murder of BALDER.

Lollardry or **Lollardy,** medieval English movement for church reform, led by John WYCLIF, whose "poor priests" spread his ideas in the late 14th cent. Opposed to the great wealth of the church, Lollards taught that the clergy should be poor, that believers could interpret the Bible for themselves, that the doctrine of transubstantiation was false, and that clerical and monastic celibacy was unnatural. In the early 15th cent. the movement gained momentum and was put down by statute (1401) and by force (1414). The Lollards then went underground and survived until the 16th cent. Many Lollard ideas were reflected by the HUSSITES.

Lombardi, Vince(nt Thomas), 1913–70, American football coach; b. N.Y.C. He played football at Fordham Univ., coached in high school and college, then entered professional football. In 1959 he became head coach of the Green Bay Packers, developing them into the dominant professional team of the 1960s and winning five national championships. In 1969 he coached the Washington Redskins to a second-place finish.

Lombard League, alliance formed in 1167 by the communes of Lombardy against Holy Roman Emperor FREDERICK I when he tried to assert his authority in Lombardy. Previously, some communes had favored the emperor, others had favored Pope ALEXANDER III. The league, which was supported by the pope, defeated (1176) Frederick at Legnano, but after the peace (1183) it tended to split into rival factions. The league was revived in 1226 against the Emperor FREDERICK II, who in 1237 defeated it at Cortenuova. The Lombard communes then took opposing sides, favoring either the popes or the HOHENSTAUFEN.

Vince Lombardi

Lombards, ancient Germanic people. The Byzantines allowed the Lombards to settle (547) in the area of modern Hungary and E Austria. In 568 they invaded N Italy and established a kingdom, with Pavia as its capital. Soon they spread into central and S Italy, where the duchies of Spoleto and Benevento were set up independently. However, the Byzantines still held much of the Adriatic coast, and the PAPACY kept Rome and the PAPAL STATES. The Lombard kingdom reached its height in the 7th and 8th cent., and paganism and ARIANISM gave way to Catholicism. King Liutprand consolidated the kingdom and reduced Spoleto and Benevento to vassalage. His successors took RAVENNA (751) and threatened Rome (772). CHARLEMAGNE then defeated the Lombards; he was crowned (774) with the Lombard crown at Pavia. Of the Lombard kingdom only Benevento remained; it was conquered by the Normans in the 11th cent.

Lombardy, region (1990 pop. 8,911,995), c.9,200 sq mi (23,830 sq km), N Italy. MILAN is the capital. Lombardy has Alpine peaks and glaciers, and upland pastures that slope to the rich Po valley. Agriculture is important, but Lombardy is also Italy's industrial heart, with such manufactures as steel, textiles and clothing, and machinery. In 569 the area became the center of the kingdom of the LOMBARDS, for whom the region is named. In the 11th cent. autonomous communes arose, and Lombard merchants did business throughout Europe. Spanish rule (1535–1713) was followed by Austrian (1713–96) and French (1796–1814). In 1815 the Lombardo-Venetian kingdom was established under Austrian rule. Lombardy passed to Sardinia in 1859 and in 1861 became part of the new kingdom of Italy.

Lomé, city (1985 est. pop. 400,000), capital of Togo, on the Gulf of Guinea. It is the country's administrative, communications, and economic center, and the chief port. Lomé is linked by road, rail, and air to other towns in Togo, and it has an international airport. It was a small village until it became (1897) the capital of the German colony of Togo.

London, Jack (John Griffith London), 1876–1916, American author; b. San Francisco. A sailor, gold-seeker in the Klondike, and war correspondent, he created romantic yet realistic and often brutal fiction. Among his many popular novels are *The Call of the Wild* (1903), *The Sea-Wolf* (1904), *White Fang* (1905), and the partially autobiographical *Martin Eden* (1909). A socialist, London expressed his views in many tracts and in several novels, e.g., *The Iron Heel* (1907). In later years he was beset by alcoholism and financial problems, and he committed suicide at 40.

London, capital city (1991 pop. 6,378,600) of Great Britain and chief city of the COMMONWEALTH OF NATIONS, SE England, on both sides of the Thames R. The city is made up of 32 boroughs and the

Corporation of London (The City). The City, 1 sq mi (2.6 sq km), the historical and commercial core of London, has its own constitution and elects its own lord mayor. London is one of the world's foremost financial, commercial, industrial, and cultural centers, and one of its greatest ports. Little is known of the city prior to Queen BOADICEA's revolt against the Romans in A.D. 61. The Roman legions withdrew in the 5th cent. Celts, Saxons, and Danes contested the area, but it was not until 886 that London emerged as an important town under King ALFRED. Under the Normans and Plantagenets the city became self-governing and grew commercially and politically. By the 14th cent. it had become the political capital of England. The reign of ELIZABETH I brought London great wealth, power, and influence as the center of England's RENAISSANCE in the age of SHAKESPEARE. A plague (1665) was followed by a fire (1666) that virtually destroyed the city. Sir Christopher WREN played a large role in rebuilding London, designing over 50 churches, notably SAINT PAUL'S CATHEDRAL. London grew enormously in the 19th cent., acquiring great prestige in the Victorian era as the capital of the BRITISH EMPIRE. The city was heavily bombed during WORLD WAR II in raids that killed thousands of civilians. Many of the bombed areas were subsequently rebuilt with tall, modern buildings. London's cultural institutions include the BRITISH MUSEUM, NATIONAL GALLERY, TATE GALLERY, and VICTORIA AND ALBERT MUSEUM. Among its landmarks are the remains of the city's Roman walls, BUCKINGHAM PALACE, the Houses of PARLIAMENT, the TOWER OF LONDON, Trafalgar Square, and WESTMINSTER ABBEY.

London, city (1991 pop. 303,165), SE Ontario, Canada, on the Thames R. An important industrial and commercial center, with manufactures including electrical goods and automotive parts, the city has streets and bridges named for those of London, England. London was settled in 1826. Earlier (1792), Governor John Simcoe had tried unsuccessfully to have the capital of Upper Canada (now Ontario) located at the site.

London, Declaration of, international code of MARITIME LAW, especially as related to war, proposed in 1909. At Britain's invitation, the leading European powers, the U.S., and Japan met at London in 1908. The declaration they issued comprised 71 articles dealing with such controversial points as blockade and contraband. It was primarily a restatement of existing law, but in its high regard for neutrals it represented an advance. The code never went into effect officially.

London Bridge, granite bridge formerly over the Thames in London. It replaced (1831) earlier wood (10th cent.) and stone (12th cent.) bridges. In 1968 it was dismantled and moved to Lake Havasu City, Ariz. A new concrete bridge replaced it.

London Conference, any of numerous international meetings held at London, England, only some of which are discussed here. **1** 1830–31, at which the chief powers of Europe discussed the status of GREECE and later the Belgian revolt against the Dutch king. Greece was recognized as a fully independent nation, and the conference ordered the separation of BELGIUM and the NETHERLANDS. **2** 1838–39, followed up on the 1830–31 conference by preparing the final Dutch-Belgian separation treaty. Luxembourg and Limburg were divided between the Dutch and Belgian crowns. **3** 1908, see LONDON, DECLARATION OF. **4** 1933, also known as the World Monetary and Economic Conference. Its purpose was to check the world depression by stabilizing the world's currencies. It was a total failure. **5** 1954, see PARIS PACTS.

Londonderry, Robert Stewart, 2d marquess of: see CASTLEREAGH, ROBERT STEWART, 2D VISCOUNT.

Londonderry, city (1989 est. pop. 100,000), NW Northern Ireland, on the Foyle R. Northern Ireland's second largest city, it is a naval base and seaport and is known for its linen manufactures. It grew up around an abbey founded (546) by St. COLUMBA. When it was turned over (1613) to the corporations of the City of LONDON, its name was changed from Derry. The city underwent a 105-day siege by JAMES II in 1689 and in recent years has been the scene of Protestant-Catholic conflict.

Long, Huey Pierce, 1893–1935, American politician; b. Winnfield, La. As LOUISIANA governor (1928–31), the "Kingfish" used ruthless and demagogic methods to establish dictatorial power and achieve his program of social and economic reform. Elected to the U.S. Senate in 1930, he continued to control the Louisiana government from Washington through his hand-picked successor as governor. A presidential aspirant, he gained national support for his "Share the Wealth" program. He was assassinated in Baton Rouge, La., by Dr. Carl A. Weiss in Sept. 1935. His son, **Russell Billiu Long,** 1918–, b. Shreveport, La., served (1948–87) as U.S. senator from Louisiana.

Long Beach, city (1990 pop. 429,433), S Calif., on San Pedro Bay, S of Los Angeles; inc. 1888. With an excellent harbor, it is one of the largest U.S. ports and a tourist center. Oil (discovered 1921) is found both underground and offshore. Diverse manufactures include aircraft, missiles, and electronics equipment, and there is a large shipyard and drydock. Points of interest include the ocean liner *Queen Mary,* which has been converted into a museum, hotel, and tourist center.

Longfellow, Henry Wadsworth, 1807–82, American poet; b. Portland, Me. A professor of modern languages, he taught at Bowdoin College (1829–35) and Harvard Univ. (1836–54). One of the most popular poets of his time, Longfellow created a body of romantic American legends in such long narrative poems as *Evangeline* (1847), *The Song of Hiawatha* (1855), *The Courtship of Miles Standish* (1858), and *Paul Revere's Ride* (1861). Among his best-known shorter poems are "The Village Blacksmith," "Excelsior," and "A Psalm of Life." His often sentimental and moralizing verse has a unique metrical quality produced by his use of unorthodox, "antique" rhythms.

Longinus, fl. 1st cent.? A.D., Greek writer of *On the Sublime,* a monument of literary criticism defining the qualities that would now be called "loftiness of style." It is the source for SAPPHO's second ode.

Long Island, in SE New York, largest island of the coterminous U.S. (1,723 sq mi/4,463 sq km). It is 118 mi (190 km) long and 12–20 mi (19–32 km) wide. Its western end, site of the American defeat in the Battle of Long Island (Aug. 27, 1776), is part of New York City. The southern shore, fringed by sandy barrier beaches, is a popular recreation area.

Long Island, battle of, Aug. 27, 1776, in the AMERICAN REVOLUTION. To protect New York City and the lower Hudson valley from the British on Staten Island, Gen. WASHINGTON sent troops to defend Brooklyn Heights, on Long Island. The British under Sir William Howe (see under HOWE, RICHARD HOWE, EARL) laid siege, and Washington, seeing the position was hopeless, evacuated his army to Manhattan.

longitude, angular distance on the earth's surface measured along the EQUATOR east or west of the PRIME MERIDIAN, which is at 0°. All other points have longitudes from 0° to 180° east or west. Meridians of longitude (imaginary lines drawn from pole to pole) and parallels of LATITUDE form a grid by which any position on the earth's surface can be specified.

Long March, the journey of c.6,000 mi (9,660 km) undertaken by the Red Army of China in 1934–35. Escaping from Nationalist forces in Jiangxi prov., some 90,000 men and women marched W to Guizhou prov. Led by MAO ZEDONG, they then pushed on to Shaanxi prov. in the north, despite natural obstacles and harassment by Nationalist troops. More than half the marchers were lost in this almost incredible one-year trek.

Long Parliament: see ENGLISH CIVIL WAR.

Longstreet, James, 1821–1904, Confederate general in the U.S. CIVIL WAR; b. Edgefield dist., S.C. He fought at FREDERICKSBURG and ANTIETAM, and in the WILDERNESS CAMPAIGN. His delay in taking the offensive at GETTYSBURG is said to have cost Gen. R.E. LEE the battle. He participated in the defense of Richmond and surrendered at APPOMATTOX.

Longueuil, [lôNgö'yə], city (1991 pop. 129,874), S Quebec, E Canada, on the St. Lawrence R. The city, now a residential suburb of MONTREAL, is at the eastern end of the Jacques Cartier Bridge. It was originally settled as a seigniory in 1657.

Longus, fl. 3d cent. A.D., Greek writer. The popular PASTORAL romance *Daphnis and Chloë,* about the love of a goatherd and shepherdess, is attributed to him.

Lon Nol, 1913–85, Cambodian general and political leader. As premier, he led (1970) a coup that deposed NORODOM SIHANOUK and assumed control of the government. His government was over-

thrown (1975) by Communist guerrillas in a bloody civil war. Lon Nol fled and settled in Hawaii.

loofah: see GOURD.

loon, migratory aquatic BIRD, found in fresh and salt water in the colder parts of the Northern Hemisphere. Its strange, laughing call carries for great distances. Expert swimmers and divers, loons walk on the land with difficulty. Their long, sharp beaks are well adapted for catching fish.

Lope de Vega Carpio, Félix [lō'pā dā vā'gä kär'pyō], 1562–1635, Spanish dramatist, poet, and novelist, founder of modern drama, one of the great figures of Spain's GOLDEN AGE. As a peasant boy of 12 he wrote the first of some 1,800 plays, of which almost 500 are extant. His turbulent life included countless love affairs, scandals, and service in the Spanish ARMADA. His masterworks are such *comedias* as *Peribáñez* (c.1607) and *Fuenteovejuna* (c.1613), which combine the serious and the comic in treating themes of honor, justice, and the conflict between peasant and nobleman. He expounded his dramatic precepts in *The New Art of Writing Plays* (1609): he kept his plays fairly short to hold the audience's attention, invented startling turns of plot, and wrote so as to be understood by ordinary people. In 1614 Lope took religious orders. He completed *La Dorotea* (1632), a novel partly based on his life and amorous adventures, in his last years.

López de Mendoza, Iñigo, marqués de Santillana: see SANTILLANA.

López Portillo y Pacheco, José [lō'pēz pôrtē'yō ē pächā'kō], 1920–, Mexican political leader and president (1976–82). A lawyer and university professor, he wrote novels and works on political theory. He served (1973–75) as finance minister under Pres. ECHEVERRÍA, whom he succeeded. As president, López Portillo developed Mexico's oil reserves, but faced a national financial crisis at the end of his term. He also served as a mediator in Pan-American disputes.

loran [*lo*ng-*ra*nge *n*avigation], long-range, accurate radio navigational system used by a ship or aircraft to determine its geographical position. The measured time-of-arrival difference between signals transmitted from two geographically separated ground stations determines the hyperbolic curve on which the receiver is situated. By taking a similar time-difference reading from a second pair of stations whose curve intersects that of the first pair, a definite geographical fix may be obtained. Loran will eventually be replaced by the Global Positioning System (see NAVIGATION SATELLITE.

Lorca, Federico García: see GARCÍA LORCA.

Lord's Prayer or **Our Father,** principal Christian prayer taught by Jesus to his disciples (Mat. 6.9–13; Luke 11.2–4). English translations vary. After the Second VATICAN COUNCIL, Roman Catholics added a version of the doxology ("For thine is the kingdom," etc.) adopted earlier by most Protestants.

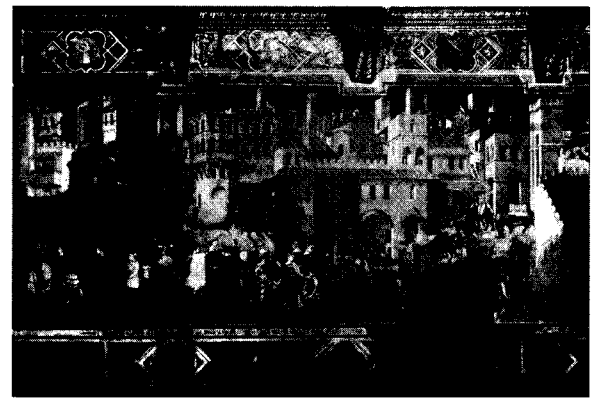
Lord's Supper: see COMMUNION.

Loren, Sophia, 1934–, Italian film actress; b. Sophia Scicoloni. A beautiful leading lady, she has appeared in such films as *Two Women* (1961; Academy Award), *Yesterday, Today, and Tomorrow* (1963), and *A Very Special Day* (1977).

Lorentz, Hendrik Antoon, 1853–1928, Dutch physicist. For his explanation of the Zeeman effect (a change in spectral lines in a magnetic field), which was based on his postulating the existence of ELECTRONS, he shared with Pieter Zeeman the 1902 Nobel Prize in physics. He extended the hypothesis of George Fitzgerald, an Irish physicist, that a body's length contracts as its speed increases (the Fitzgerald-Lorentz contraction) and formulated the Lorentz transformation, by which space and time coordinates of one moving system can be correlated with the known space and time coordinates of any other system. This work influenced, and was confirmed by, Albert EINSTEIN's special theory of RELATIVITY.

Lorenz, Konrad, 1903–89, Austrian zoologist and ethologist. For his work in ETHOLOGY, particularly his studies of the organization of individual and group behavior patterns, he shared the 1973 Nobel Prize in physiology or medicine with Karl von FRISCH and Nikolaas TINBERGEN. With Oscar Heinroth, Lorenz discovered imprinting, a rapid and nearly irreversible learning process occurring early in life. His controversial book *On Aggression* (1966) maintains that aggressive impulses are to a degree innate, and draws analogies between human and animal behavior.

Lorenzetti, two brothers who were major Sienese painters. **Pietro Lorenzetti,** c.1280–c.1348, was influenced by Giovanni Pisano (see under PISANO, NICOLA) and by GIOTTO's profound emotion and simple grandeur of form. His works include the magnificent *Birth of the Virgin* (c.1342; Opera del Duomo, Siena). **Ambrogio Lorenzetti,** d. 1348?, was the more inventive brother. Also influenced by Pisano and Giotto, he had a remarkable ability to depict spatial depth. His greatest work is the cycle of FRESCOES (1337–39) in the Palazzo Pubblico, Siena, which consists of allegories of good and bad government and is a revealing portrait of 14th-cent. Italian life.



Ambrogio Lorenzetti's fresco Good Government in the City, *14th cent.*

Lorenzo de' Medici: see under MEDICI, family.

Lorenzo Monaco [mō'näkō], c.1370–1425?, a leading early 15th-cent. Italian painter; b. Siena as Piero di Giovanni. His *Adoration of the Magi* (Uffizi), with its elongated figures and rich pageantry, reflects the international Gothic style.

Loria, Isaac ben Solomon: see LURIA, ISAAC BEN SOLOMON.

loricifer, member of a phylum (Loricifera) of microscopic animals that live in marine gravel and sand. The sexes are separate and they have a large brain and a spiny head, which can be retracted into the body.

Lorrain, Claude: see CLAUDE LORRAIN.

Los Alamos, uninc. town (1990 pop. 11,455), north-central N.Mex., on a long mesa extending from the Jemez Mts. It was chosen (1942) for atomic research, and the first atomic bombs were produced there. Government control ended in 1962. The Los Alamos National Laboratory is now operated by the Univ. of California and is a national historic landmark.

Los Angeles, city (1990 pop. 3,495,398; met. area 8,863,164; 1992 greater met. area est. 15,000,000), seat of Los Angeles co., S Calif., on the Pacific Ocean, with a harbor at San Pedro Bay. The second largest city in the U.S., it is the shipping, communications, and financial hub of a rich agricultural area. The Spanish visited the site in 1769 and founded a town in 1781. At times the capital of Alta California, it was captured by the U.S. from Mexico in 1846 and incorporated in 1850. Late-19th-cent. railroad development and the discovery of oil in the 1890s spurred growth. In the 20th cent., the motion-picture industry and, later, the radio and television industry have been important. Today Los Angeles is a major industrial, technological, and research center, as well as the largest U.S. port. The city is especially important in the area of electronic and aerospace products; other manufactures include drugs, military ordnance, processed food, and chemicals. Its greater metropolitan area, which ranks second only to that of New York in size, covers five counties and 34,000 sq mi (88,000 sq km). Automobile density is high, and SMOG has been a major problem. Los Angeles grew by absorbing neighboring communities; it now surrounds the independent municipalities of Santa Monica, Beverly Hills, and San Fernando. The city, which attracts thousands of tourists yearly, is noted for its parks; for many and varied museums; for its enormous

Music Center and Convention Center; for the fossil-rich La Brea Tar Pits; for its ethnic communities; for its climate and beaches; and for its educational institutions, including the Univ. of Southern California and the Univ. of California at Los Angeles. The 1932 and 1984 summer Olympics were held in the city. In 1992 the city was torn by rioting following not-guilty verdicts in a local police brutality trial. An earthquake centered in Northridge in N Los Angeles damaged many structures in the city and surrounding areas in 1994.

Los Angeles County Museum, Los Angeles, Calif.; opened 1913. Its holdings, which include the collection of William Randolph HEARST, contain French and English furnishings, and paintings by FRAGONARD, MATISSE, and other masters.

lost tribes: see ISRAEL, TRIBES OF.

lost-wax casting: see CIRE PERDUE.

Lot, nephew of ABRAHAM. Warned of Sodom's coming destruction (see SODOM AND GOMORRAH), Lot fled with his family. His wife, disobeying God's orders, looked back at the city and was turned into a pillar of salt.

Lothair, Frankish and German emperors. **Lothair I,** 795–855, emperor of the West (840–55), was the son and successor of LOUIS I, with whom he was coemperor after 817. A grandson of CHARLEMAGNE, he was in almost constant territorial wars with his father and his three brothers, Pepin, CHARLES II (Charles the Bald), and LOUIS THE GERMAN. Eventually, the Treaty of Verdun (843) subdivided Charlemagne's empire among the brothers. **Lothair II,** also called **Lothair III,** 1075–1137, Holy Roman emperor (1133–37) and German king (1125–37), was the first elected monarch. With the help of his son-in-law, Henry the Proud, he defeated the antiking Frederick of HOHENSTAUFEN and Frederick's brother Conrad (who succeeded him as CONRAD III), thereby clearing the way to being crowned emperor. He Christianized NE Germany.

Lotharingia [lōthərĭn'jə], name given to the northern portion of the lands assigned (843) to Emperor of the West LOTHAIR I in the first division of the CAROLINGIAN empire. it comprised roughly the present Netherlands, Belgium, Luxembourg, Lorraine, Alsace, and NW Germany, including Aachen and Cologne. Lothair I, in turn, gave the land to his son King Lothair (d. 869), for whom the kingdom was named. After King Lothair died, Lotharingia was divided between the East Frankish and West Frankish kingdoms (i.e., Germany and France). Throughout history the territories composing Lotharingia have been contested between Germany and France. Only one part of it, the duchy of Lorraine (the modern form of Lotharingia), has remained a consistent political entity.

Loti, Pierre [lôtē'], pseud. of **Julien Viaud,** 1850–1923, French novelist. His most enduring novels are *An Iceland Fisherman* (1886), a tale of Breton fishermen, and *Ramuntcho* (1897), a story of French Basque peasant life.

lotus: see WATER LILY.

loudspeaker or **speaker,** device used to convert electrical energy into sound. It consists essentially of a thin flexible sheet called a diaphragm that is made to vibrate by an electric signal from an AMPLIFIER. The vibrations create sound waves in the air around the speaker. In the common dynamic speaker, the diaphragm has a cone shape and is attached to a wire coil suspended in a magnetic field. A signal current in the suspended coil creates another magnetic field that interacts with the already existing field, causing the coil and the diaphragm attached to it to vibrate. Quality sound systems employ three different sized speakers. The largest one, the woofer, reproduces low frequencies; the medium-sized one, called a mid-range speaker, reproduces middle frequencies; the smallest one, called a tweeter, reproduces high frequencies. They are typically contained in a single cabinet (used in pairs for STEREOPHONIC SOUND), but a pair of small cabinets with a mid-range speaker and tweeter and a third cabinet with a single woofer is also now common, and some home entertainment systems use five such small cabinets for more realistic sound reproduction.

Louganis, Greg E., 1960–, American diver; b. San Diego, Calif. He won gold medals in springboard diving and platform diving in the 1984 Olympics and repeated in both categories in 1988 despite a head injury during the competition.

Louis, Frankish and German emperors. **Louis I** or **Louis the Pious,** 778–840, emperor of the West (814–40), son and successor of CHARLEMAGNE, tried to create a kingdom for Charles (later Emperor CHARLES II), his son by a second marriage, and thereby caused several revolts by his elder sons, Pepin I, LOTHAIR I, and LOUIS THE GERMAN. Eventually he partitioned his empire between Lothair and Charles. **Louis II,** d. 875, emperor of the West (855–75) and king of Italy (844–75), was the son of Emperor Lothair I. His title as emperor had little meaning since he ruled only in Italy, and even there his reign was constantly challenged by independent Lombard dukes and by Arab invaders of S Italy. He supported his brother Lothair, king of LOTHARINGIA, in a dispute with the pope and briefly (864) occupied Rome; but he subsequently submitted to the pope. He unsuccessfully tried to claim Lotharingia after Lothair's death. **Louis IV** or **Louis the Bavarian,** 1287?–1347, Holy Roman emperor (1328–47) and German king (1314–47), was in constant struggle with the papacy. When he was elected German king, a minority faction elected Frederick the Fair of Hapsburg. Louis defeated Frederick in 1322, but the pope refused to recognize or crown him, so Louis had himself crowned emperor by "representatives of the Roman people." In 1346 Pope Clement VI declared him deposed and secured the election of CHARLES IV. Louis was successfully resisting his rival when he died in a hunting accident.

Louis, Frankish kings and kings of France of the Carolingian, Capetian, Valois, and Bourbon dynasties.

Carolingian dynasty. **Louis I:** see Louis I under LOUIS, Frankish and German emperors. **Louis II** (the Stammerer), 846–79, son of CHARLES II, emperor of the West, was the king of France (r.877–79). His succession was shared by his sons Carloman and **Louis III,** c.863–882, (r.879–882), who defeated the Normans at Saucourt (881). **Louis IV** or **Louis d'Outremer** [Fr., = Louis from overseas], 921–54, (r.936–54), was the son of King CHARLES III. He spent his youth in exile in England and was recalled by the nobles under the duke Hugh the Great at the death of King Raoul. His energy and independence displeased Hugh, who waged war on the king but was forced to submit in 950. Louis was succeeded by his son Lothair, whose own son **Louis V** (the Sluggard), c.967–987 (r.986–87), was the last French king of the CAROLINGIAN dynasty. He died childless and was succeeded by HUGH CAPET.

Capetian dynasty. **Louis VI** (the Fat), 1081–1137 (r.1108–37), succeeded his father, PHILIP I. He was almost continuously at war with HENRY I of England in Normandy, and in 1124 resisted an invasion by Holy Roman Emperor HENRY V. Louis strengthened royal authority by suppressing robber barons, favoring the church, and issuing royal charters to towns to gain their support. His son and successor, **Louis VII** (the Young), c.1120–1180 (r.1137–80), married ELEANOR OF AQUITAINE before his accession. He quarreled with the papacy over an appointee to the archbishopric of Bourges but capitulated in 1144. Louis left (1147) on the Second CRUSADE but returned (1149) when the enterprise failed. In 1152 he had his marriage annulled, and Eleanor's subsequent marriage to Henry Plantagenet (later HENRY II of England) resulted in Henry's claim to Aquitaine and recurrent warfare between Louis and Henry. Louis's son PHILIP II succeeded him. Philip II's son **Louis VIII,** 1187–1226 (r.1223–26), was invited by English lords in rebellion against their king, JOHN, to become king of England. He invaded (1216) England, but was defeated in 1217 and withdrew. He seized (1224) Poitou from the English and resumed (1226) the crusade against the ALBIGENSES. His son and successor, **Louis IX** or **Saint Louis,** 1214–70 (r.1226–70), began his reign under the regency of his mother, Blanche of Castile. In 1240–43 he secured the submission of Poitou and Toulouse, and repulsed a weak invasion by HENRY III of England. Louis left on the Seventh Crusade against Egypt in 1248, but was captured in 1250. Ransomed, he remained in the Holy Land until 1254 to strengthen Christian defenses. Returning to France, he reached peaceful agreements with England's HENRY III and with James I of Aragón. In 1270 he undertook the Eighth Crusade, but he died after landing in Tunis. He was succeeded by his son, PHILIP III. Under Louis IX, France enjoyed unprecedented prosperity and peace. He curbed private warfare, simplified administration, improved tax distribution, and encouraged the use of ROMAN LAW. Louis was an ideal Christian monarch, pious and ascetic, yet a good administrator and diplomat. He was canonized in 1297. Feast: Aug. 25. **Louis X,** Fr. **Louis le Hutin** [the quarrelsome], 1289–1316 (r.1314–16), was the son and successor of PHILIP IV.

Dominated by his uncle, Charles of Valois, Louis made concessions to the barons in the form of charters. His posthumous son, John I, died soon after birth, opening the succession to PHILIP V.

Valois dynasty. **Louis XI,** 1423–83 (r.1461–83), was the son and successor of CHARLES VII. As DAUPHIN, he was involved in a revolt against his father called the Praguerie (1440), and his constant intrigues led to his exile from court. His measures as king to curb the power of the great nobles aroused (1465) the League of the Public Weal, headed by CHARLES THE BOLD, Francis II of Brittany, and others, against the crown. Louis successfully defended Paris but in Oct. 1465 granted the demands of the rebels. Soon he ignored the settlement, and in 1467 a new coalition against the king was formed by Charles the Bold, now duke of Burgundy, and Francis II, with the support of EDWARD IV of England. Louis forced Francis to sign (1468) a peace, but fell prisoner to Charles, who exacted important concessions from him. After his release, Louis involved himself in English affairs against Edward IV. He aided the restoration of HENRY VI and, after Edward regained the throne, halted Edward's invasion (1475) of France by buying him off. Louis also united the enemies of Charles the Bold and, after Charles's death (1477), took Burgundy, Picardy, Boulogne, Artois, and Franche-Comté from Charles's daughter, Mary of Burgundy. Despite his revocation (1461) of his father's PRAGMATIC SANCTION of Bourges, he intervened freely in church affairs. A born diplomat, Louis checked his foreign and domestic enemies and set up an efficient central administration. He also encouraged industry and expanded trade. Fearing assassination, he spent his last years in virtual self-imprisonment near Tours. He was succeeded by his son, CHARLES VIII. **Louis XII,** 1462–1515 (r.1498–1515), succeeded his cousin Charles VIII and ensured the continuation of the personal union of France and Brittany by having his first marriage annulled and marrying ANNE OF BRITTANY, Charles VIII's widow. Thereafter Louis tried to assert his claims in Italy (see ITALIAN WARS). He conquered Milan and Genoa, but failed to secure Naples, which he had conquered with the Spanish king FERDINAND V. His Italian territories were attacked (1511) by the HOLY LEAGUE of Pope JULIUS II. Louis abandoned Milan, and in 1513 his armies were defeated at Novara and Guinegate. In 1514 he made a truce with all his enemies save Holy Roman Emperor MAXIMILIAN I. Louis tried to rule France with justice and moderation, and was known as the Father of the People. He was succeeded by his cousin and son-in-law, FRANCIS I.

Bourbon dynasty. **Louis XIII,** 1601–43 (r.1610–43), succeeded his father, HENRY IV, under the regency of his mother, MARIE DE' MEDICI, and married (1615) ANNE OF AUSTRIA. Even after being declared of age in 1614, he was excluded from state affairs by his mother. In 1617 he caused the assassination of her minister, Concino Concini, with the help of his own favorite, the duc de Luynes. Marie was forced into retirement, but was temporarily reconciled with Louis when he entrusted the government to her protégé, Cardinal RICHELIEU. Melancholy and retiring by nature, Louis gave full support to Richelieu and to his successor, Cardinal MAZARIN. His son and successor, **Louis XIV,** 1638–1715 (r.1643–1715), began his reign under the regency of his mother, Anne of Austria, but real power was in the hands of Cardinal Mazarin. Although Louis's majority was declared (1651), he did not take control of the government until the cardinal's death (1661). The centralizing policies of Richelieu and Mazarin had prepared the ground for Louis, under whom absolute monarchy, based on the theory of divine right, reached its height. Gathering power into his own hands, he forced the nobility into financial dependence on the crown, curtailed local authorities, and used the bourgeoisie to build a centralized administration. Under his minister, Jean Baptiste COLBERT, industry and commerce were expanded according to MERCANTILISM. Under the war minister, the marquis de LOUVOIS, the foundations of French military greatness were laid. In foreign policy Louis strove for supremacy. His marriage (1660) to the Spanish princess Marie Thérèse served as a pretext for the War of DEVOLUTION (1667–68), which netted him part of Flanders. In the Third Dutch War (1672–78), Louis gained Franche-Comté, but depleted his treasury. Over the next 10 years he seized, on various pretexts, a number of cities, notably Strasbourg (1681). Fear of Louis's rapacity resulted in two great European wars, the War of the GRAND ALLIANCE and the War of the SPANISH SUCCESSION. These left France in debt and weakened it militarily. In religion, Louis resorted in the 1680s to the persecution of French Protestants, or HUGUENOTS, which culminated (1685) in the revocation of the Edict of NANTES, after which many Huguenots fled France. Despite his orthodoxy, Louis resisted papal interference in France, and his quarrels with the papacy neared schism (1673–93). He had many mistresses, among them Mlle de La Vallière and Mme de MONTESPAN. In 1684 he married Mme de MAINTENON, who was a great influence on him in later years. Louis was a supporter of the arts and was a patron of writers and artists such as MOLIÈRE and LE BRUN. The architect Jules MANSART supervised the building of Louis's lavish palace at VERSAILLES. Because of the brilliance of his court, Louis is often called the Sun King. His great-grandson **Louis XV,** 1710–74 (r.1715–74), succeeded him under the regency of Philippe II d'ORLÉANS. André Hercule de FLEURY was the young king's chief adviser from 1726. After Fleury's death (1743), Louis was influenced by a succession of favorites, such as Mme de POMPADOUR. As a result of the king's marriage (1725) to the Polish princess Marie Leszcynska, France took part in the War of the POLISH SUCCESSION (1733–35), and eventually obtained the duchy of Lorraine. Louis was also involved in the War of the AUSTRIAN SUCCESSION (1740–48) and in the SEVEN YEARS WAR (1756–63). In the latter, France lost most of its colonial empire and reached a low point in its prestige on the continent. The expense of the wars and Louis's extravagant court left the government nearly bankrupt. The failure by the monarchy to solve its fiscal problems and to effect needed reforms led directly to the French Revolution. The saying "Après moi le déluge" [after me, the flood], though wrongly attributed to Louis, aptly sums up his reign. His grandson and successor, **Louis XVI,** 1754–93 (r.1774–92), was unsuited to provide the leadership needed to control the situation he inherited. Shy, dull, and corpulent, he preferred hunting and working in his locksmith's workshop to council chambers. Reforms begun by his minister A.R.J. TURGOT were opposed by the court faction and by the PARLEMENT, which had been revived by Louis to pacify the privileged classes. Louis was forced to dismiss (1776) Turgot and replaced him with Jacques NECKER, but the costly French involvement in the AMERICAN REVOLUTION increased the debt greatly and led to Necker's resignation (1781). His successors were unable to ward off bankruptcy, and Louis recalled Necker in 1788. In 1789 the king called the STATES-GENERAL, an act which led to the FRENCH REVOLUTION. Louis's mismanagement of this assembly caused the third, or lowest, estate to declare itself the National Assembly, and when the king sent troops to Paris, rumors began that he intended to suppress it. After the dismissal of Necker, violence erupted as Parisians stormed (July 1789) the BASTILLE. Although outwardly accepting the revolution, Louis refused to approve the abolition of feudal rights and allowed the reactionary plotting of his queen, MARIE ANTOINETTE. In Oct. 1789 a mob marched on Versailles and forced the royal family to move to the TUILERIES palace in Paris. Louis's position was definitely ruined when the royal family attempted to escape (June 1791) and was caught at Varennes. Its flight was considered proof of treasonable action. Louis was forced to accept the constitution of 1791, which reduced him to a figurehead. Early French losses in the war with Austria and Prussia increased suspicion of the king. The royal family was imprisoned in the Temple (Aug. 1792), and the monarchy was abolished (Sept.). Incriminating evidence against Louis was discovered, and he was tried by the Convention, which had replaced the National Assembly. Condemned to death by a majority of one, he was guillotined on Jan. 21, 1793, facing death with steadfast courage. His son **Louis XVII,** 1785–1795?, was titular king of France (1793–95) and is known in popular legend as the "lost dauphin." In 1792 revolutionaries imprisoned him with the royal family in the Temple. After the execution of Louis XVI, the comte de Provence (later Louis XVIII) proclaimed Louis king, but he remained imprisoned until his death. Various stories of his escape and fate opened the way to a series of impostors who claimed to be the lost DAUPHIN. Most historians disregard their claims because evidence indicates that the boy died in prison. **Louis XVIII,** 1755–1824 (r.1814–24), was the brother of Louis XVI. Known as the comte de Provence, he fled (1791) from the French Revolution and intrigued against the revolutionaries from abroad. After the death of

Louis XVII (1795), he was proclaimed king by French émigrés. With the assistance of Charles de TALLEYRAND, he was restored (1814) to the French throne by the allies after their entry into Paris, and he granted a constitutional charter. Forced to flee on the return of NAPOLEON I from Elba, Louis returned with the allies after Napoleon's defeat at Waterloo. His chief ministers were at first moderates, but he later relied on ultraroyalists. This reactionary trend was continued by his successor, CHARLES X.

Louis I or **Louis the Great,** 1326–82, king of HUNGARY (1342–82) and of POLAND (1370–82). He succeeded his father, CHARLES I, in Hungary and his uncle, CASIMIR III, in Poland. Two successful wars (1357–58, 1378–81) against Venice gained him Dalmatia and Ragusa, and the rulers of Serbia, Walachia, Moldavia, and Bulgaria became his vassals. Louis brought Hungarian power to its peak, and fostered art and learning. In Poland, however, he was unable to prevent revolts. His daughter Mary succeeded him in Hungary, his daughter Jadwiga in Poland.

Louis I, 1838–89, king of Portugal (1861–89). His reign was marked by political turmoil over a growing republican movement, but Portugal progressed considerably in its commercial and industrial development.

Louis, Joe, 1914–81, American boxer; world heavyweight champ (1937–49); b. Lafayette, Ala., as Joseph Louis Barrow. He turned professional in 1934 and in 1937 won the world heavyweight championship over James J. Braddock. He avenged (1938) his only early defeat with a first-round knockout of Max Schmeling. The "Brown Bomber" defended his title a record 25 times, scoring 21 knockouts. After a brief retirement he returned to the ring in 1950 but lost to Ezzard Charles and Rocky MARCIANO. He lost only 3 of 71 professional bouts.

Louis, Morris, 1912–62, American painter; b. Baltimore. Associated with COLOR FIELD PAINTING, Louis is noted for soaking poured paint through unsized canvas, often in transparently colored columns or muted organic patterns.

Louisburg, town (1991 pop. 1,261), Nova Scotia, E Canada, on CAPE BRETON ISLAND. Its ice-free port, guarded by the great fortress of Louisbourg (built 1720–40), served as headquarters for the French fleet in ACADIA. The stronghold played a major role in the struggle for control of North America between France and England until it was captured and destroyed by the British in 1758. The restored fort is a popular tourist attraction.

Louisiana, state in the S central U.S.; bounded by Mississippi, with the Mississippi R. forming about half of the border (E), the Gulf of Mexico (S), Texas (W), and Arkansas (N).

Area, 48,523 sq mi (125,675 sq km). *Pop.* (1990) 4,219,973, a 0.4% increase over 1980. *Capital,* Baton Rouge. *Statehood,* Apr. 30, 1812 (18th state). *Highest pt.,* Driskill Mt., 535 ft (163 m); *lowest pt.,* New Orleans, 5 ft (2 m) below sea level. *Nickname,* Pelican State. *Motto,* Union, Justice and Confidence. *State bird,* Eastern brown pelican. *State flower,* magnolia. *State tree,* cypress. *Abbr.,* La.; LA.

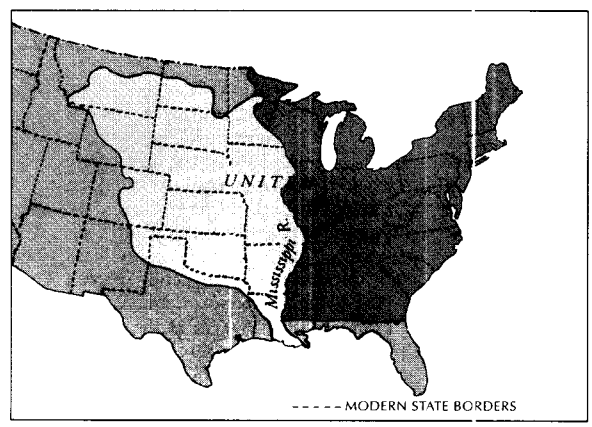
Land and People. Most of Louisiana consists of lowlands: the Gulf coastal zone, threaded by bayous and marshy rivers, and the MISSISSIPPI delta plains, in the southwest. Inland are rolling prairies and pine-covered hills. The state has long, hot summers and brief, cool winters. Over 68% of the population lives in urban areas. NEW ORLEANS, the largest city, is the leading U.S. port and a major regional industrial and commercial center. Other important cities are BATON ROUGE and SHREVEPORT. Louisiana has an unusually diverse population: the Cajuns of the delta region are descendants of French-speaking Acadians (see ACADIA) expelled (1755) from NOVA SCOTIA; the Creoles are descended from the original Spanish and French settlers; and the state has the second-highest percentage of African Americans (30.8% in 1990), after Mississippi.

Economy. A mild climate and rich alluvial soil make Louisiana one of the country's leading producers of soybeans, sugarcane, rice, corn, and cotton; sweet potatoes and cattle are also important. Louisiana is the third largest U.S. oil producer and a leading producer of natural gas; most wells are offshore. Rich in minerals, Louisiana leads the nation in the production of salt and sulfur. The state is also a leader in the fur and pelt industry. Industry is dominated by oil refining and chemical manufacturing; food processing and the manufacture of transportation and electronic equipment are also important. Fishing and lumbering are also important. Louisiana is popular with tourists, especially during the annual MARDI GRAS festival in New Orleans.

Government. The constitution (adopted 1974) provides for a governor serving a four-year term. The legislature consists of a 39-seat senate and 105-seat house, with members of both bodies elected to four-year terms. Louisiana is represented in the U.S. Congress by two senators and seven representatives and has nine electoral votes.

History. Present-day Louisiana was part of the region claimed (1682) by Robert Cavelier, sieur de LA SALLE, for France. The first permanent European settlement was founded (1714) at NATCHITOCHES, and subsequently New Orleans thrived as an important port city. The area was ceded (1763) to Spain before the U.S. acquired it by the LOUISIANA PURCHASE (1803). Huge sugar and cotton plantations based on slavery were developed, and in 1861 Louisiana seceded from the Union and joined the CONFEDERACY. The state's economy was dramatically changed by the discovery of oil and natural gas early in the 20th cent. A vast federal flood-control system was constructed on the Mississippi R. after the devastating flood of 1927. For much of the 20th cent. the controversial Long family (see LONG, HUEY PIERCE) dominated Louisiana politics. An increase in the state's industrial development, begun at the end of World War II, slowed in the 1980s. The collapse of the oil market in 1986 led to attempts to diversify Louisiana's economy, and the state has recently confronted environmental problems largely caused by degradation of its freshwater marshlands.

Louisiana Purchase, 1803, U.S. acquisition from France of the region of LOUISIANA. Uneasy at news that Spain had secretly retroceded Louisiana to aggressive Napoleonic France, Pres. JEFFERSON in 1802 dispatched Robert R. LIVINGSTON and James MONROE to purchase NEW ORLEANS and West FLORIDA for $2 million. The French, to whom Louisiana was of diminishing importance, offered to sell the entire territory to the surprised envoys for $15 million. The treaty of cession was dated Apr. 30, 1803, and the U.S. flag was raised over New Orleans on Dec. 20. The Louisiana Purchase, extending from the Mississippi R. to the Rocky Mts. and from the Gulf of Mexico to British North America, doubled the area of the U.S.



Louisiana Purchase (1803)

Louis Napoleon: see NAPOLEON III.

Louis period styles, 1610–1793, series of modes of interior decoration and architecture in France. The Louis XIII (1610–43) style was a transition from the Italian-influenced BAROQUE to the classical dignity of the Louis XIV [*Louis Quatorze*] (1643–1715) style. Colbert, Louis's chief minister, set up manufactories of textiles, furniture, and ornaments, and chose Charles LE BRUN to direct the Gobelins tapestry works and to decorate the palace of Versailles. Le Brun and J.H. Mansart (see under MANSART, FRANÇOIS) created splendid interiors filled with massive furniture. The Régence style, named for the regency of Philippe II, duc d'Orléans (1715–23), used delicate, curved lines and bronze reliefs. The Louis XV [*Louis Quinze*] period (1723–74) was noted for ROCOCO ornament and

chinoiserie. In the Louis XVI [*Louis Seize*] period (1774–93) the CLASSIC REVIVAL style replaced excess with simplicity.

Louis Philippe, 1773–1850, king of the French (1830–48), the son of Philippe Égalité (see Louis Philippe Joseph, duc d'Orléans, under ORLÉANS, family). Known as the duc d'Orléans before his accession, he joined the army of the FRENCH REVOLUTION, but deserted (1793) and remained in exile until the Bourbon restoration (1814). He figured in the liberal opposition to LOUIS XVIII and CHARLES X, and after the JULY REVOLUTION of 1830 he was chosen king. Although a constitutional monarch, Louis Philippe gained considerable personal power by splitting the liberals, and eventually a conservative ministry to his liking came to power. It was dominated (1840–48) by François GUIZOT. The king promoted friendship with Britain by supporting (1831) Belgian independence, but the Spanish marriages (1846) of ISABELLA II and her sister violated an earlier Franco-British agreement. In France, Louis Philippe became increasingly unpopular with both the right and the left. His opponents began a banquet campaign against the government that led to the FEBRUARY REVOLUTION of 1848. The king abdicated in favor of his grandson, but a republic was declared. Louis Philippe fled to England, where he died. He was known as the "citizen king" because of his bourgeois manner and dress.

Louis the Bavarian: see Louis IV under LOUIS, Frankish and German emperors.

Louis the German, c.804–876, king of the East Franks (817–76), son of Emperor LOUIS I, who gave him BAVARIA in 817. In the shifting conflict among his father and his brothers, LOTHAIR I, Pepin I, and CHARLES II, he sided first with one, then with the other. Eventually the Treaty of Verdun (843) gave him the kingdom of the East Franks (roughly modern Germany). Later, part of Lothair's territory of LOTHARINGIA came to him. He survived several revolts by his sons, Louis the Younger, Carloman, and Charles the Fat (later Emperor CHARLES III).

Louis the Great: see LOUIS I, king of Hungary.

Louis the Pious: see Louis I under LOUIS, emperors.

Louisville, city (1990 pop. 269,063), seat of Jefferson co., NW Ky., at the falls of the Ohio; settled 1778, inc. 1828. Named for LOUIS XVI of France, Louisville developed as a fort, portage place, river port, and commercial center. During the CIVIL WAR it was a base for federal forces. It is the largest city in Kentucky, and an important industrial, financial, marketing, and shipping center, with large distilleries and cigarette factories as well as many other plants. Churchill Downs, scene of the Kentucky Derby, is there.

Lourdes, town (1982 pop. 17,425), SW France. Each year, millions visit the Roman Catholic shrine where the Virgin Mary is said to have appeared (1858) to St. Bernadette.

Louvois, François Michel Le Tellier, marquis de [lōō vwä'], 1641–91, French statesman under LOUIS XIV. With his father, **Michel Le Tellier,** 1603–85, whom he replaced (1677) as war minister, Louvois shared in the reforms that made France the most powerful military force in Europe. They closely coordinated the infantry, artillery, and corps of engineers, and introduced the bayonet and the flintlock rifle. After the death (1683) of J.B. COLBERT, Louvois became Louis's chief adviser and helped to shape France's aggressive policies.

Louvre [lōō'vrə], Paris, foremost French museum of art. The building was a royal fortress built by PHILIP II in the late 12th cent. In 1546 a new building was erected on the site by FRANCIS I, designed by Pierre Lescot. LEONARDO's *Mona Lisa* and other works by Italian artists came into the royal collections. In 1606, under HENRY IV, the Grande Galerie was completed. Art was collected with state funds, and more buildings were constructed, including the colonnade, completed in 1670 by Louis Le Vau and Claude Perrault. In 1793 the Grande Galerie was officially opened, with the area beneath serving as artists' studios and workshops. A new entrance complex beneath the main courtyard, designed by I.M. PEI and crowned by a glass pyramid, opened in 1989, and the exhibition space and underground facilities were greatly expanded in 1993. The museum is famous for its collection of Greek, Roman, and Egyptian antiquities, and old masters such as REMBRANDT, RUBENS, TITIAN, and LEONARDO. Its famous sculptures include the NIKE, or *Victory of Samothrace,* and the *Venus of Milo.* The Jeu de Paume, which formerly housed impressionist art, is an exhibition hall for contemporary art.

Lovelace, Richard, 1618–1657?, English Cavalier poet. An ardent royalist, he was imprisoned under Oliver CROMWELL and died in extreme poverty. He is remembered chiefly for two much-quoted lyrics, "To Althea, from Prison" and "To Lucasta, Going to the Wars." His poems were published in 1649 and 1660.

Lovell, Sir (Alfred Charles) Bernard, 1913–, English radio astronomer. He was the leader of the team that built at Jodrell Bank, near Manchester, England, what was then the largest steerable radio telescope (completed 1957). The telescope (since been surpassed in size) is now a part of the NUFFIELD RADIO ASTRONOMY LABORATORIES, which Lovell directed (1945–81).

Lowell, Abbott Lawrence, 1856–1943, American educator; b. Boston; brother of Percival LOWELL and Amy LOWELL. As president (1909–33) of HARVARD UNIV. he developed the undergraduate college, modifying (1914) the elective system, establishing (1917) a general examination in the major subject, and instituting (1917) the tutorial system for upperclassmen. He also established (1931) a "house plan" like that in English universities. A defender of academic freedom, he wrote *Essays on Government* (1889, new ed. 1969) and *Conflicts of Principle* (1932).

Lowell, Amy, 1874–1925, American poet; b. Brookline, Mass.; sister of Percival LOWELL and Abbott Lawrence LOWELL. After writing the conventional verse in *A Dome of Many-Colored Glass* (1912), she went to England (1913), where she became a leader of the IMAGISTS. Notable for its rendering of sensuous images, her poetry is included in such volumes as *Sword Blades and Poppy Seeds* (1914) and *What's o'Clock* (1925; Pulitzer). Lowell also wrote perceptive literary criticism and a two-volume biography of KEATS (1925).

Lowell, Francis Cabot, 1775–1817, pioneer American cotton manufacturer; b. Newburyport, Mass. A Boston merchant, he studied (1810) textile machinery in England, then designed the first power loom in America and built the first U.S. factory, at Waltham, Mass., to perform all operations involved in converting raw cotton into cloth. LOWELL, Mass., was named for him.

Lowell, James Russell, 1819–91, American man of letters; b. Cambridge, Mass. His poetry ranges from the didactic—*The Vision of Sir Launfal* (1848)—to the satiric—*The Bigelow Papers* (1848; 2d series, 1867)—to the critical—*A Fable for Critics* (1848). A professor of modern languages at Harvard (1855–76), he was also the editor of the *Atlantic Monthly* (1857–61) and the *North American Review* (1864–72). He later turned to scholarship and criticism, and his essays were collected in *Fireside Travels* (1864), *Among My Books* (1870; 2d series, 1876), and *My Study Windows* (1871). As U.S. minister to London (1877–85), Lowell did much to increase European respect for American letters and institutions, and his speeches in England, published as *Democracy and Other Addresses* (1887), are among his best work.

Lowell, Percival, 1855–1916, American astronomer; b. Boston; brother of Abbott Lawrence LOWELL and Amy LOWELL. His contention that there was a planet beyond Neptune was confirmed (1930) by the discovery of Pluto. The observations that he and his assistants made at the Lowell Observatory (Flagstaff, Ariz.), which he founded in 1894, led him to interpret certain linear features seen on the planet Mars as artificial waterways, or canals, and thus to believe that Mars was inhabited.

Lowell, Robert, 1917–77, American poet; b. Boston. His poetry is intense, richly symbolic, and often autobiographical. Volumes include *Lord Weary's Castle* (1946; Pulitzer), *Life Studies* (1959), *The Dolphin* (1973; Pulitzer), and *Day by Day* (1977). His other works include translations, e.g., Racine's *Phèdre* (1969), and plays.

Lowell, city (1990 pop. 103,439), a seat of Middlesex co., NE Mass, at the confluence of the Merrimack and Concord rivers; settled 1653, inc. as a city 1836. The city developed around its great textile mills. Its modern manufactures include electronic equipment, chemicals, machine parts, and rubber and plastic products. It is the site of Lowell National Historic Park, which contains industrial and historical museums. James WHISTLER, whose birthplace is preserved, was born there.

Lower Saxony, state (1990 est. pop. 7,239,000), 18,295 sq mi (47,384 sq km), N Germany. HANOVER is the capital. Lower Saxony

was formed (1946) by the merger of the former Prussian province of Hanover with the former states of Brunswick, Oldenburg, and Schaumburg-Lippe. The state is drained by the Weser, Ems, Aller, Leine, and Elbe rivers and has several North Sea ports. Farming and cattle-raising are important occupations. Manufactures include iron and steel, textiles, and machinery. The region, although considered a geographic entity, had no historic unity after the dissolution of the duchy of HENRY THE LION of Saxony in 1180.

Lowie, Robert Harry or **Robert Heinrich,** 1883–1957, American anthropologist; b. Vienna. Lowie was known for his ethnological studies of indigenous North American peoples, especially the Plains tribes. His other works include the theoretical classics *Primitive Society* (1920, 2d ed. 1947) and *Social Organization* (1948).

Lowry, (Clarence) Malcolm, 1909–57, English novelist. He is famous for *Under the Volcano* (1947), a subtle, complex, highly autobiographical study of dissolution, set in Mexico. After his death, a reworking of his first novel, *Ultramarine* (1933), poetry, and short stories appeared.

low-temperature fusion: see COLD FUSION.

low-temperature physics or **cryogenics,** branch of physics concerned with the production and maintenance of extremely low temperatures, and with the effects that occur under such conditions. Low temperatures are achieved by removing energy from a substance. By using a succession of liquefied gases, a substance may be cooled to as low as 4.2K, the boiling point of liquid helium. Still lower temperatures may be reached by successive magnetization and demagnetization. Temperatures as low as about one millionth of a degree above absolute zero on the Kelvin scale were attained in 1991 by using infrared lasers first to reduce the energy level of cesium atoms in a vacuum and then to induce further energy loss in the atoms. Some unusual conditions, notably SUPERCONDUCTIVITY, SUPERFLUIDITY, and large-scale quantum mechanical effects, prevail at cryogenic temperatures.

Loyang: see LUOYANG.

Loyola, Ignatius of: see IGNATIUS OF LOYOLA, SAINT.

Lr, chemical symbol of the element LAWRENCIUM.

LSD or **lysergic acid diethylamide,** HALLUCINOGENIC DRUG, an extremely potent drug causing physiological and behavioral changes. Reactions to LSD, such as heightened sense perceptions, anxiety, and hallucinations, are influenced by the amount of the drug taken and the user's personality and expectations. Prolonged psychic disturbances have been reported with LSD use, and there is some evidence linking it with chromosome damage.

Lu, chemical symbol of the element LUTETIUM.

Luanda, city (1989 est. pop. 1,460,000), capital of Angola, a port on the Atlantic Ocean. Angola's largest city, Luanda is an administrative and manufacturing center that produces a variety of consumer goods. A refinery processes petroleum from nearby wells. Founded (1575) by the Portuguese, it was the center (16th–19th cent.) of a slave trade to Brazil. A modern city, it is the seat of the Univ. of Angola. The 17th-cent. fort of São Miguel is among its points of interest.

Lubbock, city (1990 pop. 186,206), seat of Lubbock co., NW Tex.; settled 1879, inc. 1909. On a branch of the Brazos R., it is a trade center for a grain and cotton region of W Texas and E New Mexico. Lubbock's growing industry includes the manufacture of electronic and oil-field equipment.

Lübeck, city (1989 est. pop. 211,000), Schleswig-Holstein, N Germany, on the Trave R. near its mouth on the Baltic Sea. It is a major port and has such industries as shipbuilding and food processing. Chartered c.1158, it headed (13th–17th cent.) the HANSEATIC LEAGUE. Its medieval Gothic architecture, damaged during WORLD WAR II, has been restored. The writers Thomas and Heinrich MANN were born in Lübeck.

Lubumbashi, city (1984 pop. 543,268), capital of Shaba region, SE Zaïre, near the Zambian border. It is a commercial and industrial center, situated on a transcontinental railroad. Founded in 1910 as Elisabethville, it prospered from the region's copper-mining industry. As capital of the secessionist state of Katanga (now SHABA), it was the scene of heavy fighting in the early 1960s.

Lucan (Marcus Annaeus Lucanus), A.D. 39–65, Latin poet, nephew of SENECA. Ten books of his epic *Bellum civile* (on the civil war between POMPEY and CAESAR), wrongly called *Pharsalia,* survive; they were esteemed by later writers.

Lucas, George W., Jr., 1944–, American film director and producer. His early successes included *American Graffiti* (1973). He wrote and directed *Star Wars* (1977), produced its two sequels (and co-wrote one of them), and produced *Raiders of the Lost Ark* (1981) and the two subsequent Indiana Jones films. His films are noted for the innovative use of special effects. He owns film production, special effects, and other entertainment companies.

Lucas van Leyden [vän lī'dən], 1494–1533, Dutch historical and Genre painter and engraver. Dutch paintings of daily life begin with Lucas. His art is noted for its realism, dramatic power, and careful execution. Lucas produced more than 200 ETCHINGS, ENGRAVINGS, and designs for woodcuts, e.g. *Adam and Eve* (1519). His paintings include *Virgin Enthroned* (Berlin).

Luce, Henry Robinson, 1898–1967, American publisher; b. China. In 1923, with Briton Hadden, he founded *Time,* a weekly news magazine featuring capsulated news accounts written in a brisk, adjective-laden style. His other periodicals included *Fortune* (1930), *Life* (1936), and *Sports Illustrated* (1954). His wife, **Clare Booth Luce,** 1903–87, b. N.Y.C., was a playwright and diplomat. She was best known for her witty, satirical play *The Women* (1936). She was a U.S. representative from Connecticut (1943–47) and later served (1953–56) as ambassador to Italy.

Lucian (Lucianus), b. c.125, d. after 180, Greek prose writer. Most characteristic of his vigorous and witty satire are his dialogues (*Dialogues of the Gods, Dialogues of the Dead, The Sale of Lives*) dealing with ancient mythology and contemporary philosophy. His fantastic *True History* influenced SWIFT and RABELAIS.

Luciani, Sebastiano: see SEBASTIANO DEL PIOMBO.

Lucifer: see SATAN.

Lucilius, Gaius, c.180–102? B.C., the father of Latin SATIRE. He influenced HORACE, PERSIUS, and JUVENAL.

Lucretius (Titus Lucretius Carus), c.99–c.55 B.C., Roman poet and philosopher. His poetry constitutes one great didactic work in six books, *De rerum natura* [on the nature of things]. In dignified hexameter verse he set forth arguments based on the philosophy of DEMOCRITUS and EPICURUS. Using the so-called atomic theory of the ancients, he argued that a person need not fear gods or death because everything, even the soul, is made up of atoms controlled by natural laws; thus there is no immortality, consciousness ending with death. Though not the same as modern atomic theory, Lucretius' teachings have been upheld in many respects by later investigation.

Lucullus (Lucius Licinius Lucullus Ponticus), c.110 B.C.–56 B.C., Roman general. He served in the Social War (90–88 B.C.) under Sulla, who made him his favorite. Lucullus defeated MITHRIDATES VI of Pontus. He then provoked great unpopularity in Rome by reforming the provincial finances. In 66 B.C. POMPEY replaced Lucullus, who retired to Rome and became known for showy elegance; hence the term *Lucullan.*

Lüda: see DALIAN.

Luddites, bands of laborers who rioted (1811–16) in the industrial areas of England; named for the mythical Ned Ludd or King Ludd. Starting in Nottinghamshire, rioters destroyed textile machines, to which they attributed high unemployment and low wages. The riots were harshly suppressed.

Ludendorff, Erich, 1865–1937, German general. As chief of staff to Field Marshal HINDENBURG in WORLD WAR I, he was largely responsible for German military strategy. After 1916 he also intervened in civilian matters. He supported the Nazis in the 1920s and wrote pamphlets idealizing the "Aryan" race and attacking the pope, Jews, Jesuits, and Freemasons.

Ludwig: for German rulers thus named, see LOUIS.

Ludwig, Christa, 1928–, German mezzo-soprano. She starred at the Vienna State Opera (from 1955) and the METROPOLITAN OPERA (1959–93). Possessing an expressive voice of considerable range, she is a noted interpreter of MAHLER.

luffa: see GOURD.

luge, type of small sled in which one or two persons race down snowy hillsides or steeply banked, curving chutes. Steering is accomplished by shifting weight, pulling straps attached to the run-

ners, and use of the feet. Lugeing is an Olympic event for both men and women.

Lugones, Leopoldo [lo͞ogō'nās], 1874–1938, Argentine poet. He expressed his adherence to MODERNISMO in *The Golden Mountains* (1897) and *Twilight in the Garden* (1905). His prose includes history and short stories.

Lu Hsun, 1881–1936, Chinese author; b. Chou Shu-jen. Lu sought to awaken the Chinese to the values of Western science and philosophy. His gift for satire and his use of the vernacular made him popular. At first attacked as bourgeois by the Communists, he was later called the GORKY of China.

Luke, Saint, early Christian, traditional author of the third GOSPEL and of the ACTS OF THE APOSTLES. A Gentile called by St. PAUL "the beloved physician," he accompanied Paul to Rome.

Luke, Gospel according to Saint, third book of the NEW TESTAMENT, composed late in the 1st cent. A.D., ascribed since the 2d cent. to St. LUKE. A literary composition, it shows the thoughtful use of several sources, including MARK. Luke contains a unique account of the birth and boyhood of JESUS. The GOSPEL shows Pauline influences, e.g., with regard to the equality of human beings and the universality of salvation.

Luks, George Benjamin [lo͞oks], 1867–1933, American painter; b. Williamsport, Pa. One of the EIGHT, he is known for his portraits, painted with dash and verve, and his genre scenes, e.g., *The Spielers* (Addison Gall., Andover, Mass.).

Lully, Jean Baptiste [lülē'], 1632–87, French operatic composer; b. Italy. After 1652 he was a chamber composer and conductor for LOUIS XIV. He wrote BALLETS and in 1672 obtained a patent for the production of OPERA. Among his operas are *Cadmus et Hermione* (1673), *Alceste* (1674), and *Amadis* (1684). He established the form of the French OVERTURE and set French operatic style until GLUCK.

Lumière, Louis Jean [lümyĕr'], 1864–1948, and **Auguste Lumière,** 1862–1954, French inventors, brothers. In 1895 they patented and demonstrated the Cinématographe, the first documented device for photographing, printing, and projecting films.

luminescence, the emission of light by sources other than a hot, incandescent body. It is caused by the movement of electrons within a substance from more energetic states to less energetic states. Among several types are chemiluminescence, electroluminescence, and triboluminescence, which are produced, respectively, by chemical reactions, electric discharges, and the rubbing or crushing of crystals. See also BIOLUMINESCENCE; FLUORESCENCE; PHOSPHORESCENCE.

luminism, American art movement of the 19th cent., related to IMPRESSIONISM, that sought to render the mystical effect of diffused light on the landscape. Luminists included KENSETT, FitzHugh Lane, and Frederick E. CHURCH.

luminosity, the rate at which energy of all types is radiated by a STAR in all directions. A star's luminosity varies approximately as the square of its radius and the fourth power of its absolute surface temperature. See MAGNITUDE; SPECTRAL CLASS.

Lumumba, Patrice Emergy, 1925–61, 1st prime minister of the Republic of the Congo (now ZAÏRE). Shortly after becoming (1960) prime minister, he clashed with KASAVUBU and MOBUTU. He was arrested and died under mysterious circumstances.

Luna, Pedro de, 1328?–1423?, Spanish cardinal, antipope (1394–1417) as Benedict XIII. He supported the election of URBAN VI, but deserted him for Robert of Geneva, who as Antipope Clement VII, launched the Great SCHISM. On Robert's death, Luna was elected to succeed him. He refused to abdicate at the Council of Pisa (1409), but was deposed by the Council of Constance (1417). To his death he continued to claim he was the rightful pope.

Luna, in space exploration: see SPACE PROBE, table.

Lunar Orbiter: see SPACE PROBE, table.

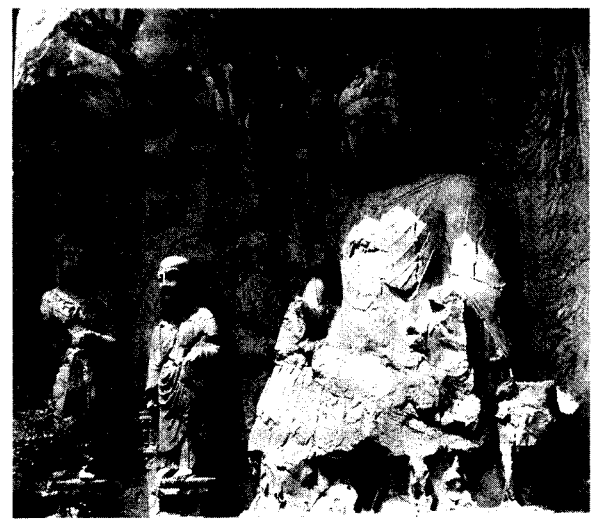
Lunar Rover: see SPACE EXPLORATION, table.

lungfish, lung-bearing FISH, often resembling an EEL, found in rivers in South America, Africa, and Australia. Like the LOBEFIN, it is ancestrally related to the four-footed land animals. The most primitive living lungfish is a stout-bodied Australian species, 5 ft (150 cm) long with paired fins set on short stumps. African species, which hibernate in hard clay during the dry season, breathe through gills in water. Other species will drown if held under water.

lungs, pair of elastic organs used for breathing in vertebrate animals. In humans, they are located on either side of the heart, filling much of the chest cavity. Air enters each lung through a large tube, or bronchus, which divides and subdivides into a network of bronchioles. These tiny tubules lead to cup-shaped air sacs known as alveoli, each of which is surrounded by a net of capillaries. As blood flows through the capillary net, carbon dioxide passes into the alveoli and oxygen diffuses into the bloodstream. Covered by a thin membrane, the pleura, which allows them to move freely during breathing, the lungs are expanded (inhalation) and contracted (exhalation) by the combined movement of the diaphragm and the rib cage. Diseases of the lungs include bronchitis, pleurisy, and pneumonia. See RESPIRATION.

Lunt, Alfred, 1893–1977, b. Milwaukee, **and Lynn Fontanne** [fŏntăn'], 1887–1983, b. England, American acting team. Married in 1922, they appeared together from 1924, excelling in sophisticated comedy, e.g., *Design for Living* (1933).

Luoyang or **Loyang,** city (1990 est. pop. 1,190,000), NW Henan prov., China, on the Luo R. Since 1949 it has become an important industrial city producing mining machinery, tractors, ball bearings, and other products. A major cultural center, it was the capital of several ancient dynasties, e.g., the Eastern Chou kingdom (770–256 B.C.) and the T'ang dynasty (A.D. 618–906). The famous Buddhist caves of Longmen (6th cent. A.D.), with their stone carvings, are nearby.



Buddhist caves of Luoyang

lupus erythematosus: see AUTOIMMUNE DISEASE.

Luria or **Loria, Isaac ben Solomon,** 1534–72, Jewish cabalist, surnamed Ashkenazi, called Ari [lion]; b. Jerusalem. He settled (c.1570) at Safed, Palestine, where he led an important school of mysticism that combined Messianism with older cabalistic doctrines (see CABALA). Luria was concerned with the nature of, and the connection between, earthly redemption and cosmic restoration.

Lusaka, largest city (1987 est. pop. 819,000) and capital of Zambia, S central Zambia. Located in a productive farm area, it is a commercial center and a transportation hub, at the junction of highways to Tanzania, Malawi, and Zimbabwe. Founded in 1905, the city developed after 1935, when it became the capital of what was then the British protectorate of Northern Rhodesia.

Lusitania, British liner sunk off the Irish coast by a German submarine on May 7, 1915. Of the 1,195 lives lost, 128 were U.S. citizens. Even though the Germans had warned Americans not to take passage on British ships, the incident contributed to the rise of American sentiment in favor of entering WORLD WAR I on the side of the Allies.

lute: see STRINGED INSTRUMENT.

lutetium (Lu), metallic element, discovered independently by Georges Urbain in 1907 and by Carl Auer von Welsbach in 1908. A

silver-white RARE-EARTH METAL and LANTHANIDE-SERIES element with few commercial uses, it is found in MONAZITE. See ELEMENT (table); PERIODIC TABLE.

Luther, Martin, 1483–1546, German leader of the Protestant REFORMATION. In 1505, Luther completed his master's examination and began the study of law. Several months later, after what seems to have been a sudden religious experience, he entered an Augustinian monastery at Erfurt, was ordained (1507) a priest, and was assigned (1508) to the Univ. of Wittenberg. In 1510, on a mission to Rome, he was shocked by the spiritual laxity in high ecclesiastical places. Returning to Wittenberg, he developed a great spiritual anxiety about his salvation, but in his study (1513) of the Scriptures, especially St. Paul, he found a loving God who bestowed upon sinful humans the free gift of salvation, received by faith alone, and not by works. This resolved his turmoil. From 1516 he protested the dispensation of INDULGENCES, then being preached by John Tetzel, whose arrival in Saxony in 1517 prompted Luther to post his historic 95 theses on the door of the castle church. While these were appreciated by many within Germany, they were a threat to the church. Several attempts at reconciliation failed, and Luther broadened his position to include widespread reforms. He supported the new nationalism by advocating German control of the German church. When a bull of condemnation (*Exsurge Domine*) was issued, he burned it publicly and was excommunicated in 1521. Summoned before the Diet of Worms (1521), Luther was forced to take refuge in the Wartburg after the diet ordered his seizure. There, under the protection of Elector Frederick III of Saxony, Luther translated the New Testament into German and began a translation of the entire Bible. He then returned to Wittenberg, where he stayed for most of the remainder of his life. His opposition to the Peasants' War (1524–25) cost him some popular support. Nevertheless, through his forceful writings and preaching, his doctrines spread. He married (1525) a former nun, Katharina von Bora, and raised six children. Luther worked to build a competent educational system and wrote extensively on church matters, including a liturgy, hymns, and two catechisms, but his uncompromising attitude in doctrinal matters helped break the unity of the Reformation. Controversies with Huldreich ZWINGLI and John CALVIN eventually divided the Protestants into the Lutheran and the Reformed churches. Under his sanction, Philip MELANCHTHON wrote a Lutheran confession of faith, the Augsburg Confession, at the Diet of Augsburg in 1530. About this time control of the Lutheran Church passed further into the hands of the Protestant princes, and Luther's last years were troubled with ill health and the plagues of political and religious disunion. He left behind an evangelical doctrine that spread throughout the Western world. In Germany his socio-religious concepts laid a new basis for German society, and his writings helped to fix the standards of the modern German language.

Lutheranism, branch of Protestantism that arose as a result of the REFORMATION, whose religious faith is based on the principles of Martin LUTHER, although he opposed such a designation. Luther's conservative attitudes, as distinguished from those of Calvinists, held that the Scriptures contained all that was necessary for salvation, which came by faith alone. His two catechisms contain the principal statements of faith. Baptism is necessary for spiritual regeneration, and the sacrament of the Lord's Supper (see COMMUNION) was also retained, although transubstantiation was replaced by consubstantiation. Some churches are episcopal, e.g., in Sweden, and others have a synodal form of organization, but unity is based on doctrine rather than structure. In Germany, Lutheranism has had close associations with political life, and it is the established church of the Scandinavian countries. Lutherans in America first formed (1638) a congregation at Fort Christina (Wilmington, Del.). In the 18th cent. exiles from the Palatinate established German Lutheran churches throughout the mid-Atlantic colonies, and Heinrich Melchior MÜHLENBERG formed (1748) the first American synod in Pennsylvania. The American Lutheran Church, the Lutheran Church-Missouri Synod, and the Lutheran Church in America comprise most of the nearly 8.4 million American Lutherans. World membership in the Lutheran church is more than 70 million.

Luthuli, Albert John, 1898?–1967, South African political leader. A ZULU chief and a Christian, he opposed racial discrimination in South Africa and advocated nonviolence and passive resistance against APARTHEID. He was banished by the white government, but he retained the loyalty of black South Africans. He won the 1960 Nobel Peace Prize.

Lutyens, Sir Edwin Landseer, 1869–1944, English architect. His sprawling Edwardian country house designs, such as Deanery Garden, Sonning (1899–1902), combined the best features of open planning with traditional forms and exquisite craftsmanship. In collaboration with landscape designer Gertrude JEKYLL, Lutyens laid out many romantic English gardens, which serve as ideal settings for his houses. Along with Herbert Baker, Lutyens began the planning and design of the imperial capital of New Delhi, India, in 1912. His monumental Viceroy's House (1912–31) is considered his masterpiece, with Asian motifs superimposed on an overall Beaux-Arts classicism. Lutyens has been particularly admired by postmodern architects for his ability to manipulate traditional forms in an inventive manner.

Luxembourg or **Luxemburg,** officially Grand Duchy of Luxembourg, constitutional monarchy (1992 est. pop. 392,000), 998 sq mi (2,586 sq km), W Europe; bordered by Belgium (W and N), Germany (E), and France (S). The city of LUXEMBOURG is the capital. The grand duchy is drained by tributaries of the Moselle R. The ARDENNES Mts. extend into N Luxembourg. Part of the Luxembourg-Lorraine iron-mining basin is in the southwest, and Luxembourg is a major iron and steel producer. Other manufactures include food products, leather goods, textiles, and chemicals. Grains and potatoes are grown, and livestock, especially cattle, are raised. Luxembourg is an important financial center. The people, chiefly Roman Catholic, speak French (the official language), Letzeburgesch (a Low German dialect), and German. The ruling house of NASSAU came to the throne in 1890; the present grand duke, Jean, succeeded his mother in 1964.

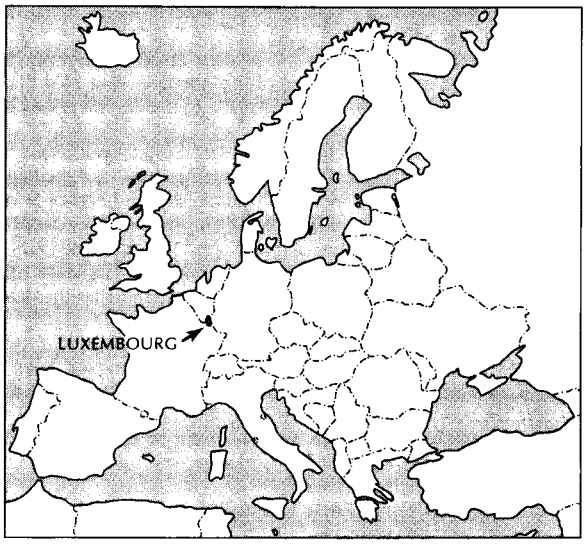
History. The medieval county of Luxembourg (originally Lützelburg), which lay between the Meuse and Moselle rivers and included parts of present-day BELGIUM, was one of the largest fiefs of the HOLY ROMAN EMPIRE. It rose to prominence when its ruler was elected emperor as Henry VII in 1308, and it was raised to the status of duchy in 1354. Conquered by PHILIP THE GOOD of Burgundy in 1443, the duchy passed in 1482 to the Hapsburgs and in 1797 to the French. The Congress of Vienna (1814–15) made Luxembourg a grand duchy under the king of the Netherlands. Luxembourg joined Belgium in revolt (1830) against the Netherlands, and after Belgian independence the greater part of the grand duchy became (1839) part of Belgium (the present Belgian Luxembourg prov.). The remainder became autonomous in 1848. Although neutral, Luxembourg was occupied by the Germans in both world wars. Since World War II Luxembourg has played an active role in fostering Western European integration, joining the Benelux Economic Union and the Common Market (see EUROPEAN UNION). It is a member of NATO.

Luxembourg or **Luxemburg,** capital (1987 est. pop. 77,000) of the Grand Duchy of Luxembourg. A commercial, industrial, administrative, and cultural center, the picturesque city developed around a 10th-cent. castle. Of note are the Cathedral of Notre Dame and the city hall (both 16th cent.). Several EUROPEAN COMMUNITY institutions are there.

Luxemburg, Rosa, 1871–1919, German revolutionary; b. Russian Poland. While a student, she helped to found (1892) the Polish Socialist party. After 1898 she was a leader in the German Social Democratic party, and became a brilliant writer and orator. She and Karl Liebknecht founded (c.1916) the Marxist SPARTACUS PARTY, forerunner to the German Communist party. Arrested in the Spartacist uprising of 1919, she and Liebknecht were murdered by soldiers.

Luxor, city (1986 pop. 125,404), central Egypt, on the Nile R., 1 mi (1.6 km) E of KARNAK. The temple of Luxor (623 ft/190 m long), the city's greatest monument of antiquity, was built under Amenhotep III and altered by later pharaohs. Many temples and burial grounds, including the Valley of the Tombs of the Kings, are nearby.

Luzon, island (1980 est. pop. 23,900,000), Philippines, largest (40,420 sq mi/104,688 sq km) and most populous of the Philippine Islands. Much of it is mountainous, rising to a high point of 9,606 ft (2,928 m) at Mt. Pulog. Most of the population is concentrated in



the MANILA metropolitan area and between the mountains in the low-lying central Luzon Plain, c.100 mi (160 km) long and 40 mi (65 km) wide, along the Pampanga and Agno rivers. Rice, sugarcane, coconuts, tobacco, and corn are important crops. Manufacturing is centered around Manila, where the major industries produce textiles, chemicals, and metal products. During WORLD WAR II Japan invaded Luzon in 1941, and in early 1942 the Allied forces made their last stand there on BATAAN peninsula and the offshore island of CORREGIDOR.

Lviv, Rus. *Lvov,* city (1991 est. pop. 600,000), W Ukraine, at the watershed of the Western Bug and Dniester rivers and in the northern foothills of the Carpathian Mts. Chief city of the W UKRAINE, it has such industries as oil refining and automobile manufacturing. Founded c.1256, it became a commercial center on the trade route from VIENNA to KIEV. Its famous university was established in 1661. Lviv was held by the Poles, Turks, and Swedes (14th–18th cent.). In 1772 it passed to Austria and, as Lemberg, became the capital of the region of GALICIA. Held by Poland (and known as Lwów) after 1919 and by the USSR after 1939, it was occupied for much of WORLD WAR II by the Germans, who exterminated most of the Jewish population. In 1945, Poland formally ceded the city to the USSR.

Lvov, Georgi Yevgenyevich, Prince [lyəvôf'], 1861–1925, Russian public official. He headed the provisional government formed after the Feb. 1917 RUSSIAN REVOLUTION but resigned in favor of KERENSKY in July. Lvov later emigrated to Paris.

Lvov: see LVIV.

Lwoff, André, 1902–, French microbiologist. In the 1920s his study of the morphogenesis of protozoa led to the discovery of extranuclear inheritance in these organisms. After World War II he conducted experiments that enabled him to explain the phenomena of lysogenic bacteria (see BACTERIOPHAGE). For his contributions to molecular biology, Lwoff shared with François JACOB and Jacques MONOD the 1965 Nobel Prize in physiology or medicine.

Lyallpur: see FAISALABAD.

lycanthropy, in folklore, assumption by a human, through witchcraft or magic, of the form and nature of an animal. Belief in lycanthropy has been widespread since ancient times. One of the best-known superstitions is a belief in werewolves, persons who consume human flesh or blood and change to and from wolves. The term *lycanthropy* also applies to a psychosis in which victims believe themselves to be animals.

lyceum, 19th-cent. American association for popular instruction of adults by lectures, concerts, and other methods. The National American Lyceum (1831) developed from lectures given by Josiah Holbrook, and soon leaders of the time lectured to lyceum audiences on the arts, sciences, history, and public affairs, stimulating interest in general education. The movement became a powerful force in social and educational reform. After the Civil War, the CHAUTAUQUA MOVEMENT took its place.

lycopodiophyte, member of a division (Lycopodiophyta or Lycophyta) that comprises the primitive vascular plants known as CLUB MOSSES, spike-moss, and quillworts. Some species are known only as fossils.

Lydgate, John, c.1370–c.1450, English poet, one of the most versatile and prolific medieval writers. He wrote Chaucerian poems, e.g., *Complaint of the Black Knight;* long translations; and fables and other short poems.

lye: see SOAP.

Lyell, Sir Charles, 1797–1875, English geologist. He helped win acceptance of James HUTTON's theory of UNIFORMITARIANISM and of Charles DARWIN's theory of EVOLUTION. Lyell's *Principles of Geology* (3 vol., 1830–33) went into 12 editions in his lifetime. His research led him to divide the Tertiary period into the Eocene, Miocene, and Pliocene epochs.

Lyly or **Lilly, John,** 1554?–1606, English dramatist and prose writer, best known for his novel *Euphues,* published in two parts (*The Anatomy of Wit,* 1578; *Euphues and His England,* 1580), in which he tried to establish an ideal prose style, actually artificial and convoluted. Lyly's plays introduced prose as a vehicle for comic dialogue.

Lyme disease, bacterial infection that causes symptoms ranging from a rash, fever, and headache to a painful swelling of the joints that resembles arthritis. First identified in 1975 in Lyme, Conn., the disease is caused by the spirochete *Borrelia burgdorferi* and is transmitted by the deer tick, *Ixodes dammini.* The disease is usually successfully treated with antibiotics, especially in its early stages. If untreated it can cause permanent damage to the heart and nervous system.

lymphatic system, network of vessels carrying lymph, or tissue fluid, from the TISSUES into the veins of the CIRCULATORY SYSTEM. Lymph, a colorless fluid similar to blood but containing no red blood cells or platelets and considerably less protein, is continuously passing through the walls of the capillaries. It transports nutrients and oxygen to the cells and collects waste products. It also transports large molecules, such as proteins, and bacteria, which cannot enter the small pores of the circulatory system. Most of the lymph passes back into the venous capillaries; however, a small amount is returned to the blood via the lymphatic system. The lymphatic system is composed of fine capillaries that lie adjacent to the blood capillaries. These merge first into larger tributaries called trunks, and then into two still larger vessels called ducts. Ducts feed into the circulatory system in the region of the collarbone, returning the lymph to the bloodstream there. Along the lymphatic network, in the neck, armpit, groin, abdomen, and chest, are small reservoirs, the lymph nodes, which collect bacteria and other deleterious agents and act as a barrier against the entrance of these substances into the blood. The lymphatic system, like the circulatory system, absorbs nutrients from the small intestine. Enlarged lymph nodes may be a sign of infection or various kinds of cancer, including breast cancer and Hodgkin's disease.

Lynch, John, 1917–, prime minister of the Republic of Ireland (1966–73, 1977–79). He entered the Dáil (parliament) in 1948 as a member of the FIANNA FÁIL party and later served as minister for education (1957–59) and minister for industry and commerce (1959–65). Lynch led Fianna Fáil from 1966 until 1979, when he resigned the party leadership and was replaced as prime minister by Charles HAUGHEY.

Lynd, Robert Staughton, 1892–1970, American sociologist; b. New Albany, Ind. A teacher at Columbia Univ. (1931–61), he was noted for his studies of Muncie, Ind. (*Middletown,* 1929; *Middletown in Transition,* 1937).

Lynn, Loretta, 1935–, American singer and songwriter; b. Butcher Hollow, Ky. One of the most successful modern country-music singers, she had 22 top-ten hits from 1962 to 1971. *Coalminer's Daughter* (1978) is her autobiography.

lynx, any of several small, ferocious CATS found in N North America and N Eurasia. Lynxes have small heads with tufted ears and heavy bodies with long legs and short tails; they have yellow-brown to grayish fur. Nocturnal hunters, they prey mainly on small animals. The Canadian lynx may be over 3 ft (90 cm) in length and weigh

up to 40 lb (18 kg). The smaller North American spotted lynx (*Felis rufa*) is also known as a bobcat.

Lyons, Fr. *Lyon* [both: lyôN'], city (1990 pop. 415,487), capital of Rhône dept., E central France. A leading city in European silk and rayon production, it has many industries, e.g., metal and machine, and is a leader in banking and education. There, during Roman rule, Christianity was introduced into Gaul. Lyons was ruled by its archbishops until c.1307, when it passed to the French crown. In the 12th cent. the WALDENSES were organized there. During World War II the French resistance movement was based (1940–44) in Lyons.

Lyons, Councils of: see COUNCIL, ECUMENICAL.

lyre: see STRINGED INSTRUMENT.

lyric, in ancient Greece, a poem accompanied by music, usually a lyre. The term now refers to any short poem expressing personal emotion: SONNET, ODE, song, or ELEGY. The Greek monody or individual song was developed by SAPPHO and ALCAEUS, the choral lyric by PINDAR, the Latin lyric by CATULLUS and HORACE. The lyric became common in Christian hymns, in FOLK SONGS, and in TROUBADOUR songs. Renaissance lyric reached a peak in the sonnets of PETRARCH and SHAKESPEARE, and the short poems of RONSARD and DONNE. The lyric was a popular form for the expression of personal emotion among 19th-cent. poets in Europe (e.g., KEATS, LAMARTINE) and the U.S. (e.g., WHITMAN, DICKINSON). Among the lyric poets of the 20th cent. are W.B. YEATS, Edna St. Vincent MILLAY, Dylan THOMAS, and Robert LOWELL.

Lysander [līsăn'dər], d. 395 B.C., Spartan naval commander. He was responsible for the capture of the Athenian fleet (405 B.C.) and the final submission (404) of ATHENS to SPARTA that ended the PELOPONNESIAN WAR.

Lysenko, Trofim Denisovich, 1898–1976, Soviet agronomist. As president (1938–56, 1961–62) of the Lenin Academy of Agricultural Science, he was the scientific and administrative head of Soviet agriculture; he also directed (1940–65) the Institute of Genetics of the Soviet Academy of Sciences. He rejected Mendel an genetics in favor of the doctrine of ACQUIRED CHARACTERISTICS. His ideas were presented and accepted as Marxist orthodoxy until after the death of Joseph STALIN, when they were severely criticized.

lysergic acid diethylamide: see LSD.

Lysippos [līsĭp'əs], fl. late 4th cent. B.C., Greek sculptor, head of the Sicyon school. He modified the proportions for the human figure set by POLYKLEITOS, and Hellenistic sculpture was based on this more slender form with its new sense of movement. Many copies were made of the 1,500 works he was said to have produced, but no originals remain.

Lytton, Edward George Earle Lytton Bulwer-Lytton, 1st Baron: see under BULWER-LYTTON.

Lytton, Edward Robert Bulwer-Lytton, earl of, pseud. **Owen Meredith:** see under BULWER-LYTTON.

M

Ma, Yo-Yo, 1955–, American cellist; b. Paris. A prodigy who gave a public recital in Paris at age six, he studied in New York with the cellist Leonard Rose and appeared at Carnegie Hall in 1964. He is noted for his interpretive power and stage presence.

Maas, river, Europe: see MEUSE.

Maastricht Treaty: see EUROPEAN UNION.

Mabinogion, collective title given medieval Welsh stories found in two manuscripts, the *White Book of Rhydderch* (c.1300–1325) and the *Red Book of Hergest* (c.1375–1425). *The Four Branches of the Mabinogi* includes three Arthurian romances—*Geraint, The Lady of the Fountain,* and *Peredur*—and other material making it an invaluable source of ARTHURIAN LEGEND.

Mabuse, Jan de [mäbüz'], c.1478–c.1533, Flemish painter; b. Jan Gossaert or Gossart. He was among the first Flemish painters to represent the nude and classical mythology in the Italian manner. *A Donor and His Wife* (Brussels) and *Neptune and Amphitrite* (Berlin) are characteristic paintings.

Mac, Mc, or **M'** [Irish, = son], element in names derived from Irish and Scottish Gaelic patronymics. In most of these names the second element was a forename (e.g., *Macdonald,* in various spellings). Notions that some forms of the prefix are more typically Scottish or Irish are fallacious.

macadamia, edible fruit of an evergreen tree (*Macadamia ternifolia*) native to Australia but also grown in other tropical regions. The small, edible kernel of the nut is white and crisp.

Macao [məkou'], Port. *Macau,* Chinese *Aomen,* Portuguese administered territory (1992 est. pop. 473,000), 6 sq mi (15.5 sq km), adjoining Guangdong prov., SE China, on the estuary of the Pearl R., 40 mi (64 km) W of HONG KONG and 65 mi (105 km) S of GUANGZHOU. It consists of a rocky, hilly peninsula (c.2 sq mi/5 sq km), connected by a 700-ft wide isthmus to China; and two small islands. Macao is a free port and a leading trade, tourist, and gambling center. Fishing and textiles are also important. The population is overwhelmingly Chinese and adheres mainly to traditional Chinese beliefs. Portuguese is the official language but Cantonese is the native and commercial language. The oldest permanent European settlement in Asia, it became a Portuguese trading post in 1557. In 1849 Portugal proclaimed it a free port. Macao has many Chinese refugees. Historic structures, including fine examples of Italian and Portuguese architecture, dot the city. Macao will revert to China in 1999, becoming a special administrative region with an independent capitalist economy for a period of 50 years.

macaroni: see PASTA.

MacArthur, Douglas, 1880–1964, American five-star general; b. Little Rock, Ark. He fought in France in WORLD WAR I and was army chief of staff (1930–35). During WORLD WAR II he commanded the Allied forces in the Southwest Pacific and directed the postwar occupation of Japan. In the KOREAN WAR, as commander of the UN military forces, he became involved in a policy dispute with Pres. TRUMAN, who removed him from command in April 1951. He was an unsuccessful contender for the Republican presidential nomination in 1948 and 1952.

Macaulay, Thomas Babington, 1800–1859, English historian. He sat in Parliament (1830–34, 1839–47, 1852–56), served in India with the EAST INDIA CO. (1834–38), and was secretary of war (1839–41). His greatest work is his *History of England from the Accession of James the Second* (5 vol., 1849–61), a vivid recreation of the social world of the 17th cent. An unprecedented success, it was also criticized for its Whig and Protestant bias. Macaulay was elevated to the peerage in 1857.

Macbeth, d. 1057, king of Scotland (1040–57). Macbeth seized the Scottish throne by killing Duncan I in battle, but was himself defeated and killed by Duncan's son, who reigned as MALCOLM III. He is the subject of Shakespeare's *Macbeth.*

Maccabees, also called **Hasmoneans** and **Asmoneans,** Jewish family (in Palestine) of the 2d and 1st cent. B.C. who restored Jewish political and religious life. When the Syrian ruler Antiochus IV stripped and desecrated the Temple of Jerusalem and began a religious persecution, **Mattathias of Modin** and his five sons,

together with many HASIDIM, began a guerrilla war. On Mattathias' death (166 B.C.), leadership passed to his son **Judas Maccabeus** (from whose surname the family name derives), who occupied Jerusalem and rededicated the Temple; the feast of Hanukkah (see JEWISH HOLIDAYS) celebrates this event (165 B.C.). Judas was defeated by DEMETRIUS I of Syria and killed (161? B.C.). The Maccabees remained in power—mostly peacefully—until 63 B.C., when Pompey conquered Palestine for Rome.

Maccabees, two books included in the OLD TESTAMENT of the Western canon, but not in the Hebrew Bible, and placed in the APOCRYPHA in the Authorized Version. First Maccabees is an account of the struggles of the house of Maccabees against Antiochus IV of Syria. Second Maccabees is a devout history of the persecutions of Antiochus and the career of Judas Maccabeus.

McCarthy, Joseph Raymond, 1908–57, U.S. senator from Wisconsin (1947–57); b. near Appleton, Wis. He achieved national prominence and power with his sensational and unsubstantiated accusations against those U.S. officials (frequently in high positions) he termed "Communists." After the Senate "condemned" him (1954), his influence steadily declined.

McCarthy, Mary Therese, 1912–89, American writer; b. Seattle, Wash. Her novels, known for their wit, intellect, and acerbity, include *The Groves of Academe* (1952) and *The Group* (1963). Among her nonfiction works are *Venice Observed* (1956), *Vietnam* (1967), and *How I Grew* (1987). She was married to Edmund WILSON.

McClellan, George Brinton, 1826–85, Union general in the U.S. CIVIL WAR; b. Philadelphia. Appointed general in chief (1861), he was criticized for overcaution in the unsuccessful PENINSULAR CAMPAIGN and removed from command. Called on again (1862), he checked Lee in the ANTIETAM CAMPAIGN, but he allowed the Confederates to withdraw across the Potomac and was again removed. He ran against LINCOLN for president in 1864 but was soundly defeated.

McClintock, Barbara, 1902–92, American geneticist. She discovered that certain genetic material, called "transposable elements," could shift position on a chromosome from generation to generation, altering the expression of a gene, and thus provided a key for understanding cell differentiation. At first ignored, her research was later recognized as a major contribution to DNA research. In 1983 she was awarded the Nobel Prize for physiology or medicine.

McClure, Sir Robert John Le Mesurier, 1807–73, British arctic explorer. As commander (1850–53) of one of two ships searching the Arctic Archipelago for the lost party of Sir John FRANKLIN, he discovered McClure Strait and proved the existence of the NORTHWEST PASSAGE.

McClure, Samuel Sidney, 1857–1949, American editor and publisher; b. Ireland. He established (1884) the McClure Syndicate, the first newspaper syndicate in the U.S. As editor, he made *McClure's Magazine* (which he founded in 1893) a great success, publishing articles by the MUCKRAKERS.

McCormack, John, 1884–1945, Irish-American tenor; b. Ireland. Coming to the U.S. in 1909, he sang with the Boston and Chicago operas, appeared in concerts, and made many famous recordings, often of simple, sentimental songs.

McCormick, Cyrus Hall 1809–84, American inventor; b. Rockbridge co., Va. The reaper that he invented in 1831 contained the straight reciprocating knife, guards, reel, platform, divider, main-drive wheel, and other innovations that are essential features of every harvesting machine.

McCullers, Carson, 1917–67, American author; b. Columbus, Ga. She often explored spiritual isolation in her fiction, using outcasts and misfits as main characters. Her works include the novels *The Heart Is a Lonely Hunter* (1940) and *The Member of the Wedding* (1946; dramatized, 1950), and the short-story collection *The Ballad of the Sad Cafe* (1951; dramatized by Edward ALBEE, 1963).

McCulloch v. Maryland, case decided in 1819 by the U.S. SUPREME COURT. A Maryland tax on all banks not chartered by the state had been levied on operations of the Second BANK OF THE UNITED STATES. Chief Justice MARSHALL found that the power to charter a bank was implied from Congress's power over federal fiscal operations; the state could not impede it. This exposition of the doctrine of implied powers, based on a "loose constructionist" interpretation of the U.S. CONSTITUTION, expanded the scope of federal power.

MacDiarmid, Hugh, pseud. of **Christopher Murray Grieve,** 1892–1978, Scottish poet and critic. A Communist and Scottish nationalist, he rejuvenated indigenous literature. His works include the long poem *A Drunk Man Looks at the Thistle* (1962). His *Complete Poems, 1920–76* (2 vol., 1978) was published posthumously.

Macdonald, Sir John Alexander, 1815–91, 1st prime minister of the Dominion of CANADA. A Conservative leader of Upper Canada, he was prime minister of the Liberal-Conservative coalition that brought about confederation (1867) of the Canadian provinces. As dominion prime minister (1867–73, 1878–91) he established strong links with Britain. Although he resigned (1873) over the PACIFIC SCANDAL, he was returned (1878) to office.

Macdonald, Ramsay, 1866–1937, British statesman. An organizer of the LABOUR PARTY, he was elected (1906) to the House of Commons, where he was party leader (1911–14). Discredited for his pacifism during World War I, he was defeated (1918), but returned to Parliament in 1922. In Jan. 1924 he became prime minister in the country's first Labour government, but in December Labour was defeated amid charges it was pro-Communist. In 1929 Macdonald again became prime minister in a Labour government, but in 1931 formed the coalition National government, which leaned on Conservative support. He resigned the premiership to Stanley BALDWIN in 1935.

Macdonald, Ross, pseud. of **Kenneth Millar,** 1915–83, American author; b. Los Gatos, Calif. Featuring the tough but compassionate private detective Lew Archer, his novels include *The Galton Case* (1959), *The Chill* (1964), *The Good-bye Look* (1969), *The Underground Man* (1971), and *Sleeping Beauty* (1973).

Macdonald-Wright, Stanton, 1890–1973, American painter; b. Charlottesville, Va. With the artist Morgan Russell, he founded synchromism (1912), an American abstract movement related to ORPHISM that employed harmonizing colors and geometric forms.

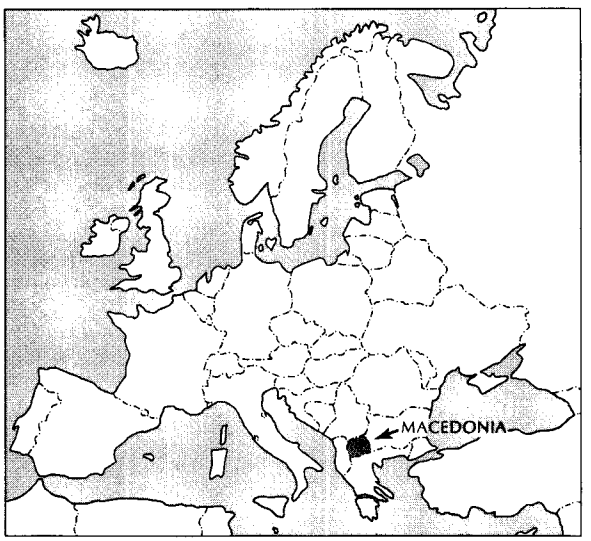
MacDowell, Edward Alexander, 1861–1908, American composer; b. N.Y.C. His outstanding works are four piano sonatas and his *Indian Suite* (1897) for orchestra. *Woodland Sketches* (1896) and *Sea Pieces* (1898) for piano are popular. The MacDowell Colony for artists, writers, and composers (Peterborough, N.H.) was founded by his widow.

mace: see NUTMEG.

Macedon [măs'ədŏn], ancient country of N GREECE, the modern region of MACEDONIA. The first known population included Anatolian and Hellenic peoples. By the 7th cent. B.C. a Greek-speaking family had set themselves up as rulers of a state in W Macedon. Hellenic influences grew, and the state became stronger until, with the great victory of PHILIP II at Chaeronea (338 B.C.), Macedon became master of Greece. Expanding upon Philip's conquests, his son, ALEXANDER THE GREAT, forged his fabulous empire, at the same time spreading Hellenistic civilization. When Alexander died (323 B.C.) his successors, the DIADOCHI, engaged in incessant warfare that split the empire and drained Macedon. Finally Antigonus II (r.277–239 B.C.) restored Macedon economically, and Antigonus III (r.229–221 B.C.) reestablished Macedonian hegemony. But PHILIP V and PERSEUS were defeated in the Macedonian Wars (215–168 B.C.) by Rome, which divided Macedon into four republics. After a pretender, Andriscus, tried to revive a Macedonian kingdom, Macedon was made the first Roman province (146 B.C.). It never again had political importance in ancient times.

Macedonia, region, SE Europe, on the BALKAN PENINSULA, divided among Greece, Bulgaria, and the republic of Macedonia (formerly part of Yugoslavia). It extends north from the Aegean Sea between Epirus (W) and Thrace (E) and includes parts of the Pindus and Rhodope mountains. Tobacco and other crops are grown, livestock is raised, and iron and other metals are mined. Site of the ancient kingdom of MACEDON, the region fell under Roman control in 146 B.C. With Rome's division (A.D. 395) Macedonia came under Byzantine rule. The Slavs settled there in the 6th cent. The region was contested (9th–14th cent.) by Constantinople, Bulgaria, Serbia, and others, before falling to the Ottoman Turks. In the 19th cent. Macedonia was claimed by Greece, Serbia, and Bulgaria; the latter supported terrorist bands opposing Ottoman rule. The BALKAN WARS (1912–13) established roughly the present boundaries, although

disputes over the region continued. Bulgaria, an Axis power in World War II, occupied (1941–44) all of Macedonia. The prewar boundaries were later restored. In 1992 Yugoslav Macedonia declared its independence, but international recognition came slowly when Greece opposed the new nation's use of the name *Macedonia*. See also MACEDONIA, republic.



Macedonia, Macedonian *Makedoniya*, officially Republic of Macedonia, independent republic (1992 est. pop. 2,174,000), 9,925 sq mi (25,713 sq km) in the S central Balkan peninsula; formerly a constituent republic of Yugoslavia. Macedonia is bordered by Yugoslavia (N), Albania (W), Greece (S), and Bulgaria (E). The largest cities are SKOPJE (the capital), Bitola (Bitolj), and Prilep. The country is largely mountainous and is bisected by the Vardar R. valley. After Albania, Macedonia is the poorest and most economically underdeveloped nation in the Balkans. The chief crops are grains, tobacco, and cotton. Sheep and goats are raised, and chromium is mined. Industries include metallurgy, timbering, and the manufacture of chemicals, cement, and textiles. The population is about two-thirds Macedonian, and many belong to the Orthodox Church. There is a sizable Albanian Muslim minority, concentrated mainly in W Macedonia. Macedonian (related to Bulgarian) is the official language.

History. For Macedonian history prior to independence, see MACEDONIA, region, and YUGOSLAVIA. Macedonian leaders did not initially favor independence for their constituent republic, but after SLOVENIA and CROATIA left the federation Macedonians grew wary of Serbian domination in a smaller Yugoslavia. In 1991 Macedonians voted for independence from Yugoslavia, and the government sought (1992) international recognition of its independence when the European Community (EC) recognized Croatia and Slovenia. Greece, fearing possible Macedonian claims on Greek Macedonia, sought a change in the new nation's name and was able to slow, but not prevent, international recognition of Macedonia. In 1992 a small group of UN peacekeepers were sent to the country to discourage possible fighting in KOSOVO from spilling into Macedonia.

McEnroe, John (Patrick, Jr.), 1959–, American tennis player; b. West Germany. With three straight U.S. Open victories by 1981 and a Wimbledon title that year, he gained top world ranking. He also won the 1984 U.S. Open and the 1983–84 Wimbledon titles and has been a leading doubles player. The young McEnroe was known for his on-court temper displays.

McGillivray, Alexander, 1759–93, CREEK chief; b. Ala., son of a Scots trader and French-Creek mother. Educated in Charleston, S.C., he returned to Creek country as a British agent during the AMERICAN REVOLUTION. He signed (1784) a treaty with Spain to gain an annuity and arms, which he used against American settlers until Pres. Washington made him a brigadier general by the Treaty of New York (1790). A skilled diplomat, he acknowledged U.S. sovereignty and promised peace, but in 1792 he resumed Spanish-subsidized attacks.

McGovern, George Stanley, 1922–, U.S. senator from South Dakota (1963–81); b. Avon, S.D. He was among the first senators to oppose the VIETNAM WAR. He ran for president on the Democratic ticket in 1972, on a platform promising to end the war, cut defense spending, and provide a guaranteed annual income for all Americans, but he was defeated by Richard M. NIXON.

McGraw, John J(oseph), 1873–1934, American baseball manager; b. Cortland co., N.Y. He starred (1891–1900) at third base for the Baltimore Orioles. As manager (1902–32) of the New York Giants, the fiery McGraw became one of the outstanding figures of baseball, leading the Giants to 10 pennants and 3 World Series victories (1905, 1921–22).

MacGregor, Robert: see ROB ROY.

McGuffey, William Holmes, 1800–1873, American educator; b. near Claysville, Pa. He helped organize the Ohio public schools but is now chiefly remembered as the compiler of the first four of the six McGuffey Eclectic Readers. Estimated sales of six editions from 1836 to 1920 totaled 122 million copies. Concerned with traditional morality, they greatly influenced the shaping of the mid-19th-cent. American mind.

Mach, Ernst [mäkh], 1838–1916, Austrian physicist and philosopher. He did his major work in the philosophy of science, striving to rid science of metaphysical assumptions, and influenced the development of LOGICAL POSITIVISM. He also did work in ballistics; the MACH NUMBER is named for him.

Mácha, Karel Hynek [mä'khä], 1810–36, Czech poet. The romantic EPIC *May* (1836), considered the finest lyric work in Czech, reveals his fatalism, love of nature, and national pride. His only novel is *Gypsies* (1835–36).

Machado, Antonio [mächä'thō], 1875–1939, Spanish poet, essayist, and dramatist. His poetry, including *Solitudes* (1902), *Castilian Fields (1912)*, and *Poesías completas* (1917, 1928), was influenced by Castilian life and the death of his young wife. He also wrote philosophical and literary essays, and, with his brother, the poet and dramatist **Manuel Machado,** 1874–1947, several plays. In the SPANISH CIVIL WAR, however, they were on opposing sides; in 1939 Antonio, a Loyalist, fled to France, where he died.

Machado, Gerardo, 1871–1939, Cuban president (1925–33). He tried to free CUBA from political and economic dependence on the U.S. by taxing U.S. investments and developing Cuba's economy. When he resorted to terrorism to crush opposition, the U.S. intervened (1933), and he fled.

Machado de Assis, Joaquim Maria [məshä'dōō dĭ əsēz'], 1839–1908, Brazilian novelist, considered Brazil's greatest writer. In this subtly ironic novels he displayed his keen psychological insight and his pessimistic vision. His novels include *Epitaph of a Small Winner* (1881), *Philosopher or Dog* (1891), and *Dom Casmurro* (1900).

Machaut, Guillaume de [mäshō'], c.1300–1377, French poet and composer. His chivalric experience is seen in *Le livre du voir dit* (1361–65), a long poem of courtly love with musical interpolations. He wrote lais, ballads, rondeaux, and virelais, and used COURTLY LOVE texts for his secularized MOTETS. His innovative, polyphonic MASS led to the great masses of JOSQUIN DESPREZ and PALESTRINA.

Machel, Samora Moïsés, 1933–86, president of Mozambique (1975–86). He was army commander (1966–74) and president (1970–86) of Frelimo, a revolutionary group that fought to free Mozambique from Portuguese rule. The first president of independent Mozambique (1975), he worked to convert the nation into a Marxist society and attempted to gradually end fighting with South Africa through a non-aggression treaty (1984).

Machiavelli, Niccolò, 1469–1527, Italian political philosopher and statesman. As defense secretary of the Florentine republic he substituted a citizens' militia for the mercenary system. Through diplomatic missions he became acquainted with power politics, meeting such leaders as Cesare BORGIA. When the MEDICI family returned to power (1512) he was dismissed, and briefly imprisoned and tortured. He then retired to his country estate, where he wrote on politics. His most famous work, *The Prince* (1532), describes the means by which a leader may gain and maintain power. His "ideal"

The key to pronunciation appears on page xiii.

prince is an amoral and calculating tyrant capable of unifying Italy. Despite the ruthless connotation of the term *Machiavellian,* such works as the *Discourses* (1531) and the *History of Florence* (1532) express republican principles. Machiavelli also wrote poems and plays, notably the comedy *Mandragola* (1524).

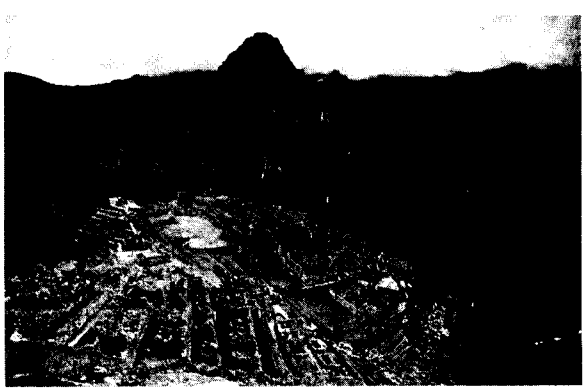
machine, any arrangement of stationary and moving mechanical parts used to perform some useful WORK or a specialized task. By means of a machine, a small force can be applied to move a much greater resistance or load; the force, however, must be applied through a much greater distance than it would if it could move the load directly. The mechanical advantage of a machine is the factor by which it multiplies any applied force. The simplest machines are (1) the *lever,* consisting of a bar supported at some stationary point (the fulcrum) along its length, and used to overcome resistance at a second point by application of force at a third point; (2) the *pulley,* consisting of a wheel over which a rope, belt, chain, or cable runs; (3) the *inclined plane,* consisting of a sloping surface, whose purpose is to reduce the force that must be applied to raise a load; (4) the *screw,* consisting essentially of a solid cylinder around which an inclined plane winds spirally, whose purpose is to fasten one object to another, to lift a heavy object, or to move an object by a precise amount; and (5) the *wheel and axle,* consisting of a wheel mounted rigidly upon an axle or drum of smaller diameter, the wheel and axle having the same axis. The more complicated machines are merely combinations of these simple machines. Machines used to transform other forms of energy (as heat) into mechanical energy are known as engines, e.g., the STEAM ENGINE or the INTERNAL COMBUSTION ENGINE. The electric MOTOR transforms electrical energy into mechanical energy; its operation is the reverse of that of the electric GENERATOR. In the past, the first machines, e.g., the catapult, were built to improve war-making capacity. The first manufacturing machines, powered by steam engines, appeared during the 18th cent., causing the onset of the INDUSTRIAL REVOLUTION.

machine gun: see SMALL ARMS.

machine tool, power-operated tool used for shaping or finishing metal parts by removing chips, shavings, large pieces, or extremely small particles. Machine tools vary in size from hand-held devices used for drilling and grinding to large stationary machines that perform a number of different operations. The lathe, for example, can turn, face, thread, and drill. The working surfaces of a machine tool are made of such substances as high-speed steels, sintered carbides, and diamonds—substances that can withstand the great heat generated by the action of the working surface against the workpiece. Modern machine tools are often numerically or computer controlled.

Mach number, ratio between the speed of an object, usually an airplane, and the speed of SOUND in the medium in which the object is traveling. A plane traveling at Mach 3.0 is traveling at three times the speed of sound.

Machu Picchu, fortress city of the ancient INCAS, in a high saddle between two peaks c.50 mi (80 km) NW of Cuzco, Peru. The extraordinary pre-Columbian ruin, 5 sq mi (13 sq km) of terraced stonework linked by 3,000 steps, was probably the last Inca stronghold after the Spanish Conquest; it was virtually intact when discovered by Hiram BINGHAM in 1911.



Machu Picchu, Peru

McIntire, Samuel, 1757–1811, American architect and woodcarver; b. Salem, Mass. He designed houses for the ship-owning aristocracy of Salem. The interiors featured beautifully carved cornices and mantelpieces, inspired by the style of Robert ADAM. His public buildings include Assembly Hall, Salem. He also produced many works of sculpture.

McKay, Claude, 1890–1948, African-American writer; b. Jamaica. A major figure in the HARLEM RENAISSANCE, he is best known for poems on racial themes, e.g., *Harlem Shadows* (1922). He also wrote the novels *Banjo* (1929) and *Banana Bottom* (1933).

Macke, August [mä'kə], 1887–1914, German painter. A brilliant colorist, he exhibited with the BLAUE REITER group. In 1914 he went to Tunisia with Paul KLEE, doing watercolors of prismatic patterns. His works include *Farewell* (Cologne).

Mackenzie, Sir Alexander, 1764?–1820, Scottish explorer in Canada. A fur trader, he followed (1789) an unknown river (later named after him) to the Arctic Ocean. He discovered (1793) the Fraser River while pioneering the first overland route through the Canadian Rockies to the Pacific.

Mackenzie, Alexander, 1822–92, prime minister of CANADA (1873–78). A Scottish immigrant (1842), he was elected (1861) to the Canadian assembly and headed (from 1867) the Liberal opposition to the J.A. MACDONALD dominion government; when it fell (1873) because of the PACIFIC SCANDAL he became the first Liberal prime minister. He strengthened the provincial governments, expanded trade, and encouraged immigration.

Mackenzie, Sir William, 1849–1923, Canadian railroad builder. A railroad construction contractor, he and Sir Donald Mann began (c.1888) to organize the Canadian Northern Railway, which became (1918) part of Canadian National Railways.

Mackenzie, William Lyon, 1795–1861, Canadian insurgent leader. A Scottish immigrant (1820), he published (1824–34) the *Colonial Advocate,* which attacked the FAMILY COMPACT clique. As leader of the Reform party he became (1834) the first mayor of TORONTO. After the Reform party's defeat he led (1837) an armed rebellion in Toronto that was quickly put down. He fled to the United States but was imprisoned for violating the neutrality laws. After a general amnesty (1849) he returned to Canada and served in the assembly.

Mackenzie, one of the world's great rivers, NW Canada, flowing c.1,120 mi (1,800 km) generally NW from Great Slave Lake to enter the Arctic Ocean through a vast delta. Navigable only in summer (June-October), it drains the northern portion of the GREAT PLAINS and is the main channel of the c.2,600 mi (4,180 km) Finlay-Peace-Mackenzie river system. Oil, discovered at Norman Wells in the 1930s, and natural gas, found in the delta region in the 1970s, are major resources of the area.

Mackenzie King, William Lyon: see KING, WILLIAM LYON MACKENZIE.

mackerel, open-sea FISH of the family Scombridae, including the albacore, bonito, and TUNA. Mackerel have deeply forked tails, narrowed where they join the body, finlets behind the dorsal and anal fins, and streamlined bodies. They are superb, swift swimmers of generally large size and are important commercially as food. They travel in schools feeding on fish, especially HERRING, and SQUID, and migrate between deep and shallow waters. The largest mackerel is the tuna (up to ¾ ton/680 kg); among the smallest (1½ lb/0.675 kg) is the common mackerel of the Atlantic. Stocks of many mackerel species have been depleted through overfishing.

McKim, Charles Follen, 1847–1909, American architect; b. Chester co., Pa., a founder of the firm that became (1879) McKim, Mead, and White. The firm adhered to classical architecture and its Renaissance derivatives, and McKim's spirit and taste guided it. Among the firm's best-known buildings are the Boston Public Library (1888–95) and the Pierpont Morgan Library in New York City.

McKinley, William, 1843–1901, 25th president of the U.S. (1897–1901); b. Niles, Ohio. As congressman from Ohio (1877–91), he strongly advocated a protective tariff, and the McKinley Tariff Act of 1890 cost him his congressional seat. With the support of Ohio political boss Marcus A. HANNA, McKinley was elected governor in 1891 and 1893. Again with Hanna's help, he won the Republican nomination for president in 1896. Running against William Jennings BRYAN on a platform advocating a protective tariff and en-

dorsing the gold standard, McKinley was elected. His administration was marked by adoption of the highest tariff rate in U.S. history, annexation of Hawaii, the OPEN DOOR policy in China, and the Currency Act of 1900, which consolidated the gold standard. Foreign affairs were dominated by the brief SPANISH-AMERICAN WAR, from which the U.S. emerged a world power. McKinley was re-elected in 1900. He was shot in Buffalo, N.Y., by Leon Czolgosz, an anarchist, on Sept. 6, 1901, and died on Sept. 14.

McKinley, Mount, 20,320 ft (6,194 m), S central Alaska, the highest point in North America. The snow-capped peak was part of Mount McKinley National Park (est. 1917) before becoming part of Denali National Park and Preserve (see NATIONAL PARKS, table) in 1980. It was first scaled in 1913 by American explorer Hudson Stuck.

Mackintosh, Charles Rennie, 1868–1928, Scottish architect, artist, and furniture designer. His decorative and graphic works epitomize the sumptuous ART NOUVEAU. His few buildings, however, display Scottish simplicity and subtlety.

MacLeish, Archibald, 1892–1982, American poet; b. Glencoe, Ill. His early poems range from expressions of postwar disillusionment, e.g., *The Pot of Earth* (1925), to a long narrative on Mexico's conquest, *Conquistador* (1932; Pulitzer). His 1930s work reflects his concern with the rise of fascism, e.g., *Frescoes for Mr. Rockefeller's City* (1933) and the verse play *Panic* (1935). His later works include the verse drama *J.B.* (1958; Pulitzer), a retelling of the story of Job; and volumes of poetry, including *Collected Poems 1917–1952* (1952; Pulitzer). During the administration of Franklin D. ROOSEVELT, MacLeish was librarian of Congress (1939–44) and undersecretary of state (1944–45).

MacLennan, Hugh, 1907–90, Canadian writer. His novels, including *Two Solitudes* (1945), *The Watch That Ends the Night* (1959), and *Return of the Sphinx* (1967), use Canadian life as a paradigm of the human condition.

Macleod, John James Rickard, 1876–1935, Scottish physiologist. For their discovery of INSULIN (together with Charles BEST) and studies of its use in treating diabetes, he and Sir Frederick BANTING shared the 1923 Nobel Prize in physiology or medicine.

McLuhan, (Herbert) Marshall, 1911–80, Canadian communications theorist and educator. He taught in Canada and the U.S., gaining fame in the 1960s with his proposal that electronic media, especially television, were creating a "global village" in which "the medium is the message," i.e., the means of communications has a greater influence on people than the information itself. His books include *The Gutenberg Galaxy* (1962) and *Understanding Media* (1964).

Macmillan, (Maurice) Harold, 1894–1986, British statesman. A Conservative, he entered Parliament in 1924 and later served as minister of housing and local government (1951–54), minister of defense (1954–55), foreign secretary (1955), and chancellor of the exchequer (1955–57). As prime minister (1957–63) he strove to improve East-West relations and to gain Britain's entry into the Common Market. In 1963 a scandal linked his minister of war, John Profumo, to a call girl and a Soviet official. He served as chairman (1963–74) of the Macmillan publishing house. In 1984 he was made an earl.

McNamara, Robert Strange, 1916–, U.S. secretary of defense (1961–68); b. San Francisco. He was president (1960–61) of the Ford Motor Co. At the Defense Dept. he modernized management techniques and deemphasized nuclear weapons. His doubts about the VIETNAM WAR led him to resign (1968) from the cabinet. He later served (1968–81) as president of the World Bank.

McNaughton, Andrew George Latta 1887–1966, Canadian general. He was Canadian chief of staff (1929–35) and commander of Canadian forces in Britain during WORLD WAR II. He served as defense minister (1944–46) and in other posts.

MacNeice, Louis, 1907–63, Irish poet and classicist. A poet of social protest in the 1930s, he later wrote with irony of the futility of modern life. His books of poetry include *Springboard* (1945), *Ten Burnt Offerings* (1952), and *Solstices* (1961). He also translated AESCHYLUS and GOETHE.

Macon, city (1990 pop. 106,612), seat of Bibb co., central Ga., on the Ocmulgee R.; inc. 1823, named for Nathaniel Macon. It is the processing and shipping center for an agricultural area. It produces textiles, insulation, explosives, and other manufactures. Sidney LANIER was born there.

McPherson, Aimee Semple, 1890–1944, U.S. evangelist; b. Ontario. She opened (1923) the Angelus Temple in Los Angeles and was a founder (1927) of the International Church of Foursquare Gospel. In 1926 her disappearance and reappearance, with a bizarre tale of kidnapping, led to a trial for fraud. Although she was acquitted, her business dealings resulted in numerous other legal actions. She died from an accidental overdose of sleeping pills.

Macpherson, James, 1736–96, Scottish author. He wrote *Fragments of Ancient Poetry Collected in the Highlands of Scotland* (1760), supposedly translations from Gaelic, and two epic poems, *Fingal* (1761) and *Temora* (1763), represented as the work of OSSIAN, a 3d-cent. bard. The works were mainly Macpherson's own, and they strongly influenced romanticism.

macramé, decorative knotting technique. Named for an Arabic word for knotted fringe, it arose in the 13th cent. and reached Europe during the next hundred years. A traditional sailors' pastime, after decades of obscurity it was revived in the 1960s for wall hangings, jewelry, and other objects.

Macready, William Charles, 1793–1873, English actor and manager. His portrayal of Richard III (1819) established him as a major tragedian. His 1849 U.S. tour was marred by a riot by supporters of his rival Edwin FORREST.

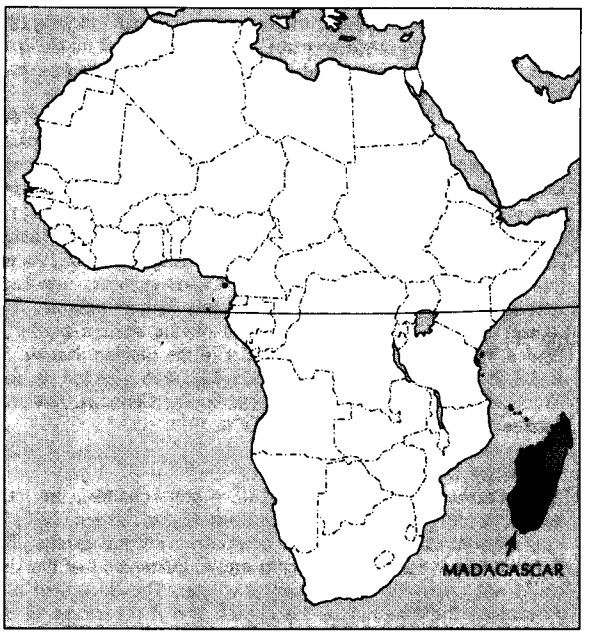
macroeconomics: see under ECONOMICS.

Macy, Anne Sullivan, 1866–1936, American educator; b. Feeding Hills, Mass. Partially blinded by a childhood infection, she attended Perkins Institution for the Blind, learned the manual alphabet, and was chosen (1887) to teach Helen KELLER. Macy based her instruction on a system of touch teaching, pioneering in techniques of education for the handicapped, and helped promote the newly founded (1921) American Foundation for the Blind.

Madagascar, officially Democratic Republic of Madagascar, formerly Malagasy Republic, republic (1992 est. pop. 12,596,000), 226,658 sq mi (587,045 sq km), in the Indian Ocean, separated from E Africa by the Mozambique Channel. The nation comprises Madagascar, the world's fourth largest island, and several small islands. ANTANANARIVO (Tananarive) is the capital. The island of Madagascar is a largely deforested highland plateau fringed by a lowland coastal strip; mountains in the north rise to more than 9,000 ft (2,745 m). The economy is predominantly agricultural, producing rice (the staple crop), coffee, vanilla, cloves, cassava, and sugarcane. Large numbers of livestock and poultry are raised. Manufacturing, mostly confined to food-processing and textiles, is becoming more diversified. Chromite, graphite, and phosphates are extracted. The two main population groups are of Indonesian and African descent. French and Malagasy, an Indonesian tongue spoken by all the people, are the official languages. About 40% of the population is Christian, 5% is Muslim, and the rest follow traditional beliefs.

History. Africans and Indonesians first reached Madagascar about 2,000 years ago; they were joined in the 9th cent. A.D. by Muslim traders from E Africa and the COMORO Islands. The first Europeans to visit the island were the Portuguese (1500), but it was the French who established footholds, beginning in 1642. In the 19th cent. the rulers of the Merina kingdom, one of several that had developed on the island, opened the island to European traders and Christian missionaries who, in return, helped spread Merina control and culture; by the end of the century the Merina kingdom included almost the entire island. In 1885 France established a protectorate over Madagascar, but the Merina resisted fiercely, and it was not until 1904 that the French fully controlled the island. In WORLD WAR II Madagascar was aligned with Vichy France until taken (1942) by the British and turned over to a Free French regime (1943). A major uprising against the French in 1947–48 was crushed, but the independence movement gained momentum in the 1950s, and in 1958 the country, renamed the Malagasy Republic, gained autonomy. Full independence came in 1960, with Philibert Tsiranana as president. In 1972 widespread protests over economic failures prompted the autocratic president to step aside. Political strife continued, however. In 1975 power was seized by a military directorate, headed by Pres. Didier Ratsiraka, a Marxist one-party state was established, and the country was renamed the Democratic Repub-

lic of Madagascar. Economic failure led the government to permit the return of a free-market economy in 1987, and growing opposition to Ratsiraka's rule in the 1980s led to the legalization (1990) of opposition political parties. After demonstrations and a lengthy general strike (1991), Ratsiraka agreed to share power with opposition leader Albert Zafy in a transitional government. In a free election (1993) Zafy defeated Ratsiraka for the presidency.



Madariaga, Salvador de [mäthäryä'gä], 1886–1978, Spanish writer and diplomat. He headed the disarmament section of the League of Nations (1922–27); later he was the Spanish Republic's ambassador to the U.S. (1931) and France (1932–34) and chief delegate to the League of Nations (1931–36). After the SPANISH CIVIL WAR he exiled himself to England. His many books include *The Genius of Spain* (1923), *Don Quixote* (1934), *Bolívar* (1951), *Anatomy of the Cold War* (1955), novels, poetry, plays, historical and psychological studies, and memoirs (1974).

madder, common name for the family Rubiaceae, chiefly tropical and subtropical trees, shrubs, and herbs, especially abundant in N South America. The family is important economically for several tropical crops, e.g., COFFEE and QUININE (from CINCHONA), and for many ornamentals, e.g., the madder, GARDENIA and bedstraw. True madder (*Rubia tinctorum*), also called turkey red, is a dye plant native to S Europe. The herb's long, fleshy root was the principal source of various brilliant red dye pigments until artificial production of alizarin, the pigment chemical in madder. The bedstraws (genus *Galium*), formerly used for mattress filling because of their pleasing odor, have clusters of tiny white or yellow flowers.

Madeira Islands, archipelago (1990 est. pop. 290,000), 308 sq mi (798 sq km), coextensive with Funchal dist., Portugal, in the Atlantic Ocean c.350 mi (560 km) off Morocco. Madeira, the largest island, and Porto Santo are inhabited; the Desertas and Selvagens are not. Madeira is a scenic, year-round resort. The islands produce sugarcane and Madeira wine. Known to the Romans, they were rediscovered (15th cent.) under HENRY THE NAVIGATOR.

Madero, Francisco Indalecio, 1873–1913, president of MEXICO (1911–13). A champion of democracy and social reform, he led (1910) the revolution that swept through Mexico and overthrew (1911) the DIAZ regime, but he failed to implement notable reforms. Revolts broke out, and Gen. HUERTA treacherously assassinated Madero's brother, seized power, and arrested and imprisoned Madero. He was killed while allegedly attempting to escape.

Madison, James, 1751–1836, 4th president of the U.S. (1809–17); b. Port Conway, Va. An early opponent of British colonial measures, he helped draft the Constitution for the new state of VIRGINIA (1776), served in the Continental Congress (1780–83, 1787), and was a member of the Virginia legislature (1784–86). He was active in the call for the ANNAPOLIS CONVENTION (1786), and his contributions at the FEDERAL CONSTITUTIONAL CONVENTION (1787) earned him the title "master builder of the Constitution." A principal contributor to the *Federalist Papers,* he was largely responsible for securing ratification of the Constitution in Virginia. As a congressman from Virginia (1789–97), he was a strong advocate of the Bill of Rights. A steadfast enemy of the financial measures of Alexander HAMILTON, he was a leading Jeffersonian and drew up the Virginia resolutions protesting the Alien and Sedition Acts (see KENTUCKY AND VIRGINIA RESOLUTIONS). After Jefferson triumphed in the presidential election of 1800, Madison became (1801) his secretary of state. He succeeded Jefferson as president in 1809. The unpopular and unsuccessful WAR OF 1812, known disparagingly as "Mr. Madison's War," was the chief event of his administration. His term in office witnessed the beginning of postwar national expansion and the rise of Jacksonian democracy. Retiring in 1817, he lived quietly at Montpelier with his wife, **Dolley Madison,** 1768–1849, b. Guilford, co., N.C., as Dolley Payne. She married Madison in 1794 (her first husband had died in 1793). As official White House hostess for Thomas Jefferson (who was a widower) and for her husband, she was noted for the magnificence of her entertainments, as well as for her charm, tact, and grace.

Madison, city (1990 pop. 191,262), state capital and seat of Dane co., S central Wis., on an isthmus between Lakes Monona and Mendota; inc. 1856. It is a trading center in a rich agricultural area, and produces meat products, machinery, medical equipment, and other goods. The city, noted for its parks along the attractively wooded lakeshore and for the elaborate capitol building, is the seat of the Univ. of Wisconsin.

Madonna (Madonna Louise Ciccione), 1958–, American singer and actress: b. Rochester, Mich. Her albums, and the music videos from them, e.g., *Madonna* (1983) and *Like a Virgin* (1984), secured her position as a sexual and pop icon.

Madras, city (1991 pop. 5,361,468), capital of Tamil state, SE India, on the Bay of Bengal. An industrial center, it has chemical and automobile plants, tanneries, and textile mills. It was largely built around a 17th-cent. British outpost and became a trade center. The city's cultural institutions include the Univ. of Madras (est. 1857).

Madrid, city (1988 est. 3,103,000), capital of Spain and of Madrid autonomous region and prov., central Spain, on the Manzanares R. A modern city of broad, tree-lined avenues, Madrid also has old quarters with picturesque winding streets. The city is Spain's chief transportation and administrative center and the focus of modern industrial development. It became the capital of Spain in 1561 under PHILIP II but remained small until expanded in the 16th cent. under the Bourbons (especially CHARLES III). Two of the city's most famous landmarks—the royal palace and the PRADO—date from that period. Madrid's resistance against the French in the PENINSULAR WAR in 1808 was immortalized in two of GOYA'S best-known paintings (now in the Prado), and the city again played an heroic role in the SPANISH CIVIL WAR (1936–39) by holding out against an Insurgent siege for 29 months.

madrigal, name for two different forms of Italian music. The poetic madrigal of the 14th cent. consisted of one to four strophes of three lines each, followed by a two-line strophe (ritornello). These early examples were restrained and featured three or four voices in homophony, i.e., with one voice carrying the melody. The 16th-cent. madrigal was a musically unrelated, free poetic imitation of the earlier form. The classic madrigals of Giovanni Gabrieli, Orlando di LASSO, and others were polyphonic and usually written for five voices, with their musical expression closely allied to the text. A final phase, exemplified by Carlo Gesualdo and Claudio MONTEVERDI, featured use of the chromatic scale of twelve tones and special effects (such as multiple choirs) devised to intensify the expression of the text. The polyphonic madrigal also flourished in Elizabethan England.

Maecenas (Caius Maecenas), d. 8 B.C., Roman statesman and patron of letters under AUGUSTUS. His famous literary circle included HORACE, VERGIL, and PROPERTIUS. His name is the symbol of the wealthy benefactor of the arts.

maenads, in Greek and Roman mythology, female devotees of DIONYSUS or BACCHUS. Waving the thyrsus, they roamed the mountains and forests, and performed frenzied, ecstatic dances. They are also known as Bacchae.

Maerlant, Jacob van [mär'länt], c.1235–c.1300, Flemish poet, the earliest important figure of Dutch literature. He wrote lyric poems and chivalric verse romances as well as long didactic poems, chief of which is *The Mirror of History*.

Maeterlinck, Maurice [mätĕrlăNk'], 1862–1949, Belgian author who wrote in French. His 60-odd volumes, with their suggestion of universal mystery and sense of impending doom, can be read as a SYMBOLIST manifesto. Major works include the plays *Pelléas et Mélisande* (1892) and *Monna Vanna* (1902); the allegorical fantasy *The Blue Bird* (1909); and the essay *The Life of the Bee* (1901). He was awarded the Nobel Prize in literature in 1911.

Mafia, name given, probably in the 1800s, to organized, independent groups of brigands in Sicily. Following a feudal tradition, the Mafia disdained all legal authorities, sought justice through direct action (as in the vendetta), and observed a rigid code of secrecy, practices that enabled Mafiosi to rise in ORGANIZED CRIME after coming to the U.S. as Italian immigrants in the late 19th and early 20th cent. The Mafia survived MUSSOLINI's attempt to stamp it out in Italy before World War II, and it and other Italian organized crime organizations remained influential in Sicily and S Italy, often assassinating justice officials who prosecuted them in the 1980s and 1990s. In the U.S., the Mafia was reputedly active in both illegal and legal (or "front") operations in the 1980s.

Mafikeng, formerly Mafeking, town (1970 pop. 6,900), N central South Africa. It is the market for a cattle-raising and dairy-farming area and is an important railroad depot. In the SOUTH AFRICAN WAR (1899–1902), a British garrison here withstood a 217-day Boer siege. Formerly in Cape Province, Mafikeng was incorporated into BOPHUTHATSWANA in 1980.

Magdalen: see MARY, in the Bible, 2.

Magdeburg, city (1989 est. pop. 291,000), capital of Saxony-Anhalt, central Germany, on the Elbe R. It is a large inland port and an industrial center producing metal products, textiles, processed food, and other goods. Founded by the 9th cent., it accepted the REFORMATION in 1524. During the THIRTY YEARS WAR it was sacked and burned by imperial forces; 85% of the population perished. Rebuilt under the electorate of BRANDENBURG, it became a Prussian fortress in the 17th cent. During WORLD WAR II it was badly damaged. Landmarks include an 11th-cent. Romanesque church.

Magellan, Ferdinand, c.1480–1521, Portuguese navigator, leader of the first expedition to circumnavigate the globe. Of noble birth, he was backed by CHARLES I of Spain to reach the MOLUCCAS by sailing west. He began in 1519 with five ships and explored the Río de la Plata, wintering in PATAGONIA. He then sailed through the straits which bear his name and headed NW across the Pacific, reaching the Marianas and the PHILIPPINES, where he was killed by natives. His voyage proved the roundness of the earth and revealed the Americas as a new world.

Magellan, Strait of, c.330 mi (530 km) long and 2½–15 mi (4–24 km) wide, N of Cape HORN. Separating TIERRA DEL FUEGO from mainland South America, it was important in the days of sailing ships. The strait was discovered (1520) by Ferdinand MAGELLAN.

Magellan, in space exploration: see SPACE PROBE (table).

Magellanic Clouds, two irregular GALAXIES that are the nearest extragalactic objects (nearly 200,000 LIGHT-YEARS distant). They are visible to the naked eye in the southern skies. The Large Magellanic Cloud, about 7° in angular diameter, is located mostly in the constellation Dorado; in 1987 it became the site of the first supernova visible to the naked eye since 1604. The Small Magellanic Cloud, about 4° in diameter, is almost completely in the constellation Tucana.

Maghreb or **Magrib,** Arabic term for NW Africa. It is generally applied to all of MOROCCO, ALGERIA, and TUNISIA, but more specifically it pertains only to the area of the three countries that lies between the Atlas Mts. and the Mediterranean Sea. The **Arab Maghreb Union** was established in 1989 and includes Algeria, Libya, Mauritania, Morocco, and Tunisia. Envisioned initially by Muammar al-QADDAFI as an Arab superstate, it is eventually expected to function as a N African common market.

Magi [mā'jī], priestly caste of ancient Persia. Magian priests headed ZOROASTRIANISM. The Magi were revered by classic authors as wise men, and their reputed power over demons gave rise to the word *magic*. For the Magi of Mat. 2, see WISE MEN OF THE EAST.

magic, practice of manipulating the course of nature by controlling supernatural forces through ritual and spell. The spell, or incantation, unlocks the full power of the ritual. Black magic is intended to harm or destroy; white magic is to benefit the community (as in fertility rites) or an individual, especially one suffering the effects of black magic. Sympathetic magic treats an image (sticking pins in a doll representing one's enemy), while contiguous magic deals with things that have touched a person (clothing, hair, or even a footprint); the two can be used together.

magic realism, primarily Latin American literary movement that arose in the 1960s. Magic realist writers mingle realistic portrayals of events and characters with elements of fantasy and myth, creating a world that is at once familiar and dreamlike. Its best-known proponent is the Colombian novelist Gabriel GARCÍA MÁRQUEZ, notably in his *One Hundred Years of Solitude* (1967). Other magic realist writers include Guatemala's Miguel Ángel ASTURIAS, Argentina's Julio CORTÁZAR, and Mexico's Carlos FUENTES; non–Latin American writers include Italo CALVINO and Salman RUSHDIE.

Maginot Line [măzh'ĭnō], fortifications on the eastern border of France, running from the Swiss border to the Belgian. Named for André Maginot, minister of war (1929–32), who directed its construction, it was considered impregnable. The Germans, however, flanked it in 1940 during WORLD WAR II.

maglev: see MAGNETIC LEVITATION.

magma: see LAVA.

Magna Carta or **Magna Charta** [Lat., = great charter], the most famous document of British constitutional history, issued (1215) by King JOHN at Runnymede under compulsion by the barons. The purpose was to insure feudal rights and to guarantee that the king could not encroach on baronial privileges. The document also guaranteed the freedom of the church and the customs of the towns; implied laws protecting the rights of subjects and communities, which the king could be compelled to observe; and vaguely suggested—at least to later generations—guarantees of trial by jury and HABEAS CORPUS. After John's death (1216) the charter was reissued with significant omissions. In later centuries parliamentarians portrayed it as a democratic document, but in the 19th cent. some scholars maintained that it was reactionary in that it merely guaranteed feudal rights. It is now generally recognized that the charter showed the viability of opposition to the excessive use of royal power. There are four extant copies of the original.

Magna Graecia [măg'nə grē'shə] [Lat., = great Greece], Greek colonies in S Italy, founded in the 8th cent. B.C., on both coasts, S of the Bay of Naples and the Gulf of Taranto. They included Tarentum, Cumae, and Heraclea, and brought the Etruscans and Romans into early contact with Greek civilization. Unlike the related cities of Greek Sicily, Magna Graecia did not thrive and by 500 B.C. had begun a rapid decline.

Magnasco, Allessandro [mägnäs'kō], 1667–1749, Italian painter. His gloomy, storm-torn landscapes and ruins with small figures and flickering light are primarily religious, e.g., *The Baptism of Christ* (National Gall., Wash., D.C.).

magnesia, common name for the chemical compound magnesium oxide (MgO). The fine powder is used in soaps, cosmetics, pharmaceuticals, and as a filler for rubber goods. Because of its refractory properties (it melts at c.2800°C), it is used in crucibles and ceramics. Crude magnesia is prepared by roasting DOLOMITE or MAGNESITE. Magnesia is also extracted from seawater.

magnesite, white, yellow, or gray magnesium carbonate mineral ($MgCO_3$). It is formed through the alteration of olivine or SERPENTINE by waters carrying carbon dioxide; through the replacement of calcium by magnesium in DOLOMITE or LIMESTONE; and through precipitation from magnesium-rich water that has reacted with sodium chloride. It is used for floorings, as a stucco, and to make firebrick, Epsom salts, face powder, boiler wrappings, and disinfectants.

magnesium (Mg), metallic element, discovered as an oxide by Sir Humphry DAVY in 1808. A ductile, silver-white, chemically active ALKALINE-EARTH METAL, it is the eighth most abundant element in the earth's crust. Its commercial uses include lightweight alloys in

aircraft fuselages, jet-engine parts, rockets and missiles, cameras, and optical instruments. The metal is used in pyrotechnics. Magnesium is found in plant chlorophyll and is necessary in the diet of animals and humans. See ELEMENT (table); PERIODIC TABLE.

magnesium hydroxide: see MILK OF MAGNESIA.

magnesium oxide: see MAGNESIA.

magnet: see MAGNETISM.

magnetic levitation or **maglev,** support and often propulsion of objects or vehicles by magnetic fields. Magnetic levitation suspends an object free of contact with any surface, making it particularly appropriate for high-speed (275–300 mph/435–475 kph) transportation, where it greatly reduces friction and allows for fast, quiet operation. In a typical maglev train, the vehicle, which resembles a railroad or monorail car, travels along a guideway. Lifting force is produced by arrays of electromagnets in both the train and guideway. In one version, magnets of like polarity repel each other to lift the train above the guideway; in another, magnets of opposite polarity attract the part of the car suspended below the guideway up toward the guideway, raising the rest of the car above it. Continuously changing the polarity of alternate magnets along the guideway generates a series of attractions and repulsions that moves the train. The enormous amount of electrical power needed by a maglev train is an obstacle to its wide use, but the use of superconducting magnets (see SUPERCONDUCTIVITY) reduces energy needs. First proposed in 1909 by Robert GODDARD, maglev trains have been the subject of research since the 1960s in the U.S., Britain, Japan, Germany, and South Korea, and Japan has begun construction on the first leg of a Tokyo-Osaka maglev line.

magnetic pole, either of two points on the earth, one in the Northern Hemisphere and one in the Southern; each point attracts one end of a compass needle and repels the opposite end. Studies of magnetism in rocks indicate that in the geological past the earth's magnetic field has reversed its polarity often and that rock movement (due to CONTINENTAL DRIFT and PLATE TECTONICS) relative to the magnetic poles has occurred.

magnetic resonance, in physics and chemistry, absorption or emission of ELECTROMAGNETIC RADIATION in the electrons or atomic nuclei of a sample of atoms in response to simultaneous adjustments in a magnetic field and electromagnetic radiation (usually radio waves) applied to the sample. The resonance refers to the enhancement of the absorption that occurs when the correct combination of field and frequency is reached. Most magnetic resonance phenomena depend on the fact that both the proton and the electron behave like microscopic magnets—a property that can be ascribed to an intrinsic rotation, or spin. Types of magnetic resonance include electron paramagnetic resonance (EPR), also known as electron spin resonance (ESR), involving the magnetic effect of electrons, and nuclear magnetic resonance (NMR), involving the magnetic effects of protons and neutrons in the nuclei of atoms. The NMR resonant frequency provides information about the molecular material in which the nuclei reside, and NMR is used in chemistry and physics to analyze samples of solids and liquids, as well as in medicine to analyze tissues removed from the body. **Magnetic resonance imaging** (MRI) is a noninvasive diagnostic technique that uses NMR to image the structure of the body. The patient is placed in the field of an electromagnet, which causes the nuclei of certain atoms in the body (especially those of hydrogen) to align magnetically. The patient is then subjected to radio waves, which cause the aligned nuclei to "flip"; when the radio waves are withdrawn the nuclei return to their original positions, emitting radio waves that are then detected by a receiver and analyzed by computer. Unhampered by bone and capable of producing images in a variety of planes, MRI is used in the diagnosis of brain tumors and disorders, spinal disorders, multiple sclerosis, and cardiovascular disease. The procedure is considered to be without risk to the patient.

magnetic resonance imaging (MRI): see under MAGNETIC RESONANCE.

magnetism, FORCE of attraction or repulsion between various substances, especially those containing iron and certain other metals, such as nickel and cobalt; ultimately it is due to the motion of electric charges. Any object that exhibits magnetic properties is called a magnet. An ordinary magnet has two poles where the magnetic forces are the strongest; these poles are designated as a north (north-seeking) pole and a south (south-seeking) pole, because a magnet freely rotating in the earth's magnetic field tends to orient itself along a north-south line. The like poles of different magnets repel each other, and the unlike poles attract each other. Whenever a magnet is broken, a north pole appears at one of the broken faces and a south pole at the other, such that each piece has its own north and south poles. It is impossible to isolate a single magnetic pole, regardless of how small the fragments become. (The possibility of the existence of a single magnetic pole, or monopole, is still unresolved, but experiment has failed so far to detect one.) In the 18th cent. Charles COULOMB found that the magnetic forces of attraction and repulsion are directly proportional to the product of the strengths of the poles and inversely proportional to the square of the distances between them. As with electric charges, the effect of this magnetic force acting at a distance is expressed in terms of a field of force. A picture of the magnetic field lines can be obtained by placing a piece of paper over a magnet and sprinkling iron filings on it. The individual pieces of iron become magnetized by entering a magnetic field, i.e., they act like tiny magnets, lining themselves up along the magnetic field lines. The connection between magnetism and ELECTRICITY was discovered in the early 19th cent. Hans OERSTED found (1820) that a wire carrying an electrical current deflects the needle of a magnetic compass because a magnetic field is created by the moving electric charges constituting the current. André AMPÈRE showed (1825) that magnets exert forces on current-carrying conductors. In 1831 Michael FARADAY and Joseph HENRY independently discovered electromagnetic INDUCTION—the production of a current in a conductor by a change in the magnetic field around it. The magnetic properties of matter are also explained by the motion of charges. Because the electron has both an electric charge and a spin, it can be considered a charge in motion, giving rise to a tiny magnetic field. In many atoms, all the electrons are paired within energy levels, so that the electrons in each pair have opposite (antiparallel) spins, and their magnetic fields cancel. In some atoms there are more electrons with spins in one direction than the other, resulting in a net magnetic field for the atom as a whole. Placed in an external field, the individual atoms will tend to align their fields with the external one. Because of thermal vibrations the alignment is not complete, and materials, called paramagnetic substances, that contain such atoms react only weakly to a magnetic field. Materials such as iron, nickel, or cobalt that respond strongly to a magnetic field are called ferromagnetic. In a ferromagnetic substance there are also more electrons with spins in one direction than in the other. The individual magnetic fields of the atoms in a given region, called a domain, tend to line up in one direction, so that they reinforce each other. Materials such as bismuth and antimony that are repelled by a magnetic field are called diamagnetic. In a diamagnetic substance, an external magnetic field accelerates the electrons moving in one direction and retards those moving in the opposite direction; this situation produces an induced magnetization opposite indirection to the external field. See also ELECTROMAGNET; ELECTROMAGNETIC RADIATION.

magnetite, lustrous, black, magnetic iron mineral (Fe_3O_4), occurring as crystals, masses, and sand in Sweden, South Africa, Italy, and parts of the U.S. It is an important ore of IRON. Lodestone is a naturally magnetic variety that exhibits polarity.

magnetohydrodynamics (MHD), study of the motions of electrically conducting fluids and their interactions with magnetic fields. The principles of magnetohydrodynamics are of particular importance in PLASMA physics.

magneto-optical disk: see OPTICAL DISK.

magnetosphere: see ATMOSPHERE; VAN ALLEN RADIATION BELTS.

magnitude, measure of the brightness of a celestial object. Apparent magnitude is that determined on the basis of an object's relative brightness as seen from the earth. Objects differing by one magnitude differ in brightness by a factor of 2.512 (the 5th root of 100). The brightest stars have a magnitude of about +1; the sun's magnitude is −26.8. Absolute magnitude, a measure of the intrinsic luminosity, or true brightness, of an object, is the apparent magnitude an object would have if located at a standard distance of 10 PARSECS.

magnolia, common name for the genus *Magnolia*, and for the Magnoliaceae, a family of deciduous or evergreen trees and shrubs, often with showy flowers, chiefly found in temperate regions. Native American species of the chiefly Asian genus *Magnolia* include the umbrella tree (*M. tripetala*), the cucumber tree (*M. acuminata*), the sweet, or swamp, bay (*M. virginiana*), and the bull bay (*M. grandiflora*), also called southern magnolia. Many other, imported magnolias are also cultivated in the U.S. The tulip tree, or yellow poplar (*Liriodendron tulipfera*), the only other member of the family native to the U.S., is prized for cabinetwork and furniture because of its yellowish soft wood.

Magnus, Norwegian kings. **Magnus I** (the Good), 1024–47, king of Norway (1035–47) and Denmark (1042–47), was the son of OLAF II. He succeeded CANUTE's sons Sweyn of Norway and Harthacanute of Denmark. In 1046 he was forced to share the Norwegian crown with his uncle, HAROLD III, who became sole king on his death. **Magnus VI** (the Law Mender), 1238–80, king of Norway (1263–80), was the son of HAAKON IV. He made peace with ALEXANDER III of Scotland by ceding (1266) the Hebrides and the Isle of Man for a large sum. His legal reforms introduced the concept of crime as an offense against the state rather than the individual, thus discouraging personal vengeance and making the king the source of justice; defined the limits of church and state power; and created a new royal council and nobility. His sons, Eric II (r.1280–99) and Haakon V (r.1299–1319), succeeded him. **Magnus VII** (Magnus Ericsson), 1316–73?, king of Norway (1319–43) and Sweden (1319–63), succeeded his grandfather, Haakon V of Norway, and was elected by the Swedish nobles to succeed his exiled uncle, King Birger of Sweden. He was declared of age in 1332. Educated in Sweden, he neglected Norway and was forced to recognize (1343) his son, later Haakon VI, as his successor as king of Norway. He lost part of Sweden (1356) to his son Eric but regained it on Eric's death (1359). After Haakon married MARGARET I, daughter of WALDEMAR IV of Denmark, the Swedish nobles deposed Haakon and Magnus, choosing Albert of Mecklenburg as king (1363). Magnus was imprisoned until 1371.

magpie, name for certain BIRDS of the CROW and JAY family. The black-billed magpie (*Pica pica*), of W North America, has iridescent black plumage and white wing patches and abdomen. Other species are found in Europe, Asia, and Africa. Magpies are scavengers and often collect small, bright objects. In captivity they can learn to imitate some words.

Magrib: see MAGHREB.

Magritte, René [mägrēt'], 1898–1967, Belgian surrealist painter. Influenced by CHIRICO, he developed a style in which a misleading realism is combined with mocking irony. Works such as *The Red Model* (1935; Modern Mus., Stockholm) are elaborate fantasies constructed around common situations.

Magyars, the dominant people of Hungary, who speak a Finno-Ugric language. The nomadic Magyars migrated c.460 from the Ural Mts. to the N Caucasus, where they remained until forced into present-day Romania late in the 9th cent. by the Pechenegs, a Turkic group. Under their leader Arpad, the Magyars defeated the Bulgars but were pushed northward (c.895) into Hungary. They conquered Moravia and penetrated Germany until checked (955) by Holy Roman Emperor OTTO I. In the 11th cent. they adopted Christianity.

Mahabharata [məhä'bär'ətə], classical Sanskrit epic, probably composed between 200 B.C. and A.D. 200. Traditionally ascribed to the sage Vyasa, the 18-book work is the longest poem in world literature and the foremost source on classical Indian civilization. Although there are many subplots and irrelevant tales, the *Mahabharata* is primarily the fabulous account of a dynastic struggle and great civil war in the kingdom of Kurukshetra. The BHAGAVAD-GITA, a religious classic of Hinduism, is contained within the epic.

Mahan, Alfred Thayer, 1840–1914, American naval officer and historian; b. West Point, N.Y. In works like *The Influence of Sea Power upon History, 1660–1873* (1890), he argued that naval power was the key to success in international politics. His works had a major influence on the growth of world naval power.

Mahdi [Arab., = he who is divinely guided], in Sunni ISLAM, the restorer of faith. It is believed that he will appear at the end of time to restore justice on earth and establish universal Islam. Among SHIITES the concept of the Mahdi centers on the IMAM. Throughout Islamic history, many reformers claiming to be the Mahdi have arisen. One such was **Muhammad Ahmad,** 1844–85, a Muslim religious leader in the Anglo-Egyptian Sudan. In 1881 he declared himself to be the Mahdi, but he died soon after capturing KHARTOUM. Lord KITCHENER defeated his followers at Omdurman in 1898.

Mahfuz, Naglb, or **Naguib Mahfouz,** [both: mäkhfōōs'], 1911–, Egyptian novelist and short-story writer. One of Egypt's major contemporary writers, he was awarded the 1988 Nobel Prize for literature. He depicts urban life in such novels as *Midaq Alley* (1947), *Palace of Desire* (1957), *The Search* (1964), *Miramar* (1967), and *Children of Gebelawi* (1969). Among his volumes of short stories is *God's World* (tr. 1973).

Mahicans, a confederacy of Native Americans of the Eastern Woodlands (see NORTH AMERICA, INDIGENOUS PEOPLES OF) with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). They occupied both banks of the Hudson R., almost to Lake Champlain. The MOHEGANS were a tribe of the Mahican group; both have been called Mohicans. By 1664 the Mohawk had driven the Mahicans E to Massachusetts. Their complete dispersal was hastened when their enemies were armed by the Dutch.

Mahler, Gustav [mä'lər], 1860–1911, Austrian composer and conductor; b. Austrian Bohemia. In Budapest, Hamburg, Vienna, and in New York (1908–11) he set conducting standards that have become legendary. He wrote nine symphonies; songs; and song cycles, mostly with orchestral accompaniment. Of the cycles, *Songs of a Wayfarer* (1883–85), *Kindertotenlieder* [songs of dead children] (1901–4), and *Das Lied von der Erde* [song of the earth] (1907–10) are most notable. Following BRUCKNER in the Viennese symphonic tradition, he added folk elements and expanded the form in length, emotional contrast, and orchestral size.

Mahmud II, 1784–1839, Ottoman sultan (1808–39). An able ruler, he was unable to halt the disintegration of the OTTOMAN EMPIRE (Turkey). During his reign the EASTERN QUESTION assumed increasing importance. He was a vigorous reformer who began the Westernization of Turkey and ruthlessly destroyed (1826) the JANISSARIES. He was unable to defeat the Greek rebels in their War of Independence or to prevent Egypt from attaining virtual independence.

mahogany, common name for the Meliaceae, a family of chiefly tropical shrubs and trees, from which the valuable hardwood called mahogany is obtained. Principal sources of the hardwood, often used for furniture, are trees of the American genus *Swietenia* and the W African genus *Khaya*. Varying in color from golden to deep red-brown, the woods are usually scented, close-grained, and resistant to termites.

Mahrattas or **Marathas,** Marathi-speaking people of W central India. From their homeland in Maharashtra (see INDIA) these Hindu warriors rose to power in the 17th cent. Led by SIVAJI they resisted the MOGULS under AURANGZEB. Expanding into the DECCAN and S India, they became the strongest rival to British supremacy but then split into several warring groups. The British conquered them in 1818.

maidenhair tree: see GINKGO.

Mailer, Norman, 1923–, American writer; b. Long Branch, N.J. He won early renown with his World War II novel *The Naked and the Dead* (1948). His sharp views of American society are reflected not only in such semiautobiographical novels as *An American Dream* (1966) but also in *The Armies of the Night* (1968; Pulitzer), a journalistic account of the 1967 peace march on Washington, and *The Executioner's Song* (1979; Pulitzer), a novelistic treatment of the convicted killer Gary Gilmore. *Harlot's Ghost,* a long novel about the CIA, was published in 1991.

Maillol, Aristide [mäyôl'], 1861–1944, French sculptor, WOODCUT artist, and painter. Allied with the NABIS, he later turned to sculpture. His idealized, massive female nudes, e.g., *The River* (Mus. Mod. Art, N.Y.C.), show classical influence.

Maimonides [mīmŏn'ĭdēz] or **Moses ben Maimon,** 1135–1204, Jewish rabbi, physician, and philosopher, one of the greatest Hebrew scholars; b. Spain. He is sometimes called Rambam (from *R*abbi *M*oses *B*en *M*aimon). His great work *Mishneh Torah,* known in English as the *Strong Hand,* represents his effort to organize for the layman as well as for rabbis and judges the vast mass of Jewish oral law, or MISHNA. His contribution to Western philosophy, how-

The key to pronunciation appears on page xiii.

ever, rests on his influential *Guide to the Perplexed,* in which he attempted to reconcile Aristotle's theories with those of Jewish theology and thereby helped to introduce Aristotle to the Christian philosophers of the Middle Ages (see SCHOLASTICISM).

Maine, largest of the New England states of the NE U.S.; bordered by New Hampshire (W), the Canadian provinces of Quebec (NW) and New Brunswick (NE), and the Atlantic Ocean (S, SE).

Area, 33,215 sq mi (86,027 sq km). *Pop.* (1990) 1,227,928, a 9.2% increase over 1980 pop. *Capital,* Augusta. *Statehood,* Mar. 15, 1820 (23d state). *Highest pt.,* Mt. Katahdin, 5,268 ft (1,607 m); *lowest pt.,* sea level. *Nickname,* Pine Tree State. *Motto, Dirigo* [I Direct]. *State bird,* chickadee. *State flower,* white pine cone and tassel. *State tree,* Eastern white pine. *Abbr.,* Me.; ME.

Land and People. Located within the forested New England upland, Maine occupies a glacially smoothed plateau that slopes gradually south and east toward the Atlantic Ocean from higher lands in the north and west. Occasional peaks such as Mt. Katahdin and the mountains of Mt. Desert Island rise above the surrounding plateau. Waterfalls and lakes, relics of the Pleistocene Ice Age, interrupt many of the more than 5,000 rivers and streams. Winters are cold, with heavy snow over the northern interior; summers are cool. Most of the largely rural (over 55%) population lives in the south and the southwest. PORTLAND is the largest city. In 1990 the population was over 98% white.

Economy. Maine is a predominantly industrial state; the leading manufactures are wood and paper products, textiles, leather goods (especially shoes), sardines and other canned goods, and transportation and electrical equipment. During the 1980s, service and financial industries, many centered in the Portland area, became more important. Potatoes, dairy products, eggs, broiler chickens, blueberries, and apples are the major farm products. Picturesque coastal resorts and Mt. Desert Island, in Acadia National Park (see NATIONAL PARKS, table), attract a large summer tourist population. There are lobster, sardine, and other fisheries along the coast.

Government. The 1820 constitution provides for a governor elected every four years and a legislature of 35 senators and 151 representatives elected every two years. Maine sends two senators and two representatives to the U.S. Congress and has four electoral votes.

History. Short-lived settlements were established by the French (1604) on the St. Croix R. and by the English (1607–8) under George Popham at Fort St. George (site of Phippsburg). Further French settlement was prevented after Sir Samuel Argall destroyed a colony (1613) on Mt. Desert Island. Ferdinando Gorges attempted settlement after receiving a grant (1620) and royal charter (1639). The Massachusetts Bay Colony claimed jurisdiction (1647) and purchased (1677) proprietary rights from Gorges's heirs. As part of Massachusetts, Maine developed early fishing, lumbering, and shipbuilding industries, and was designated (1775) one of three admiralty districts of that state in the AMERICAN REVOLUTION. Commerce expanded rapidly after the war, followed by industry after commercial activity was interrupted by the EMBARGO ACT of 1807 and the WAR OF 1812. Statehood was achieved in 1820 through the MISSOURI COMPROMISE. The WEBSTER-ASHBURTON TREATY of 1842 ended the chronic Northeast Boundary Dispute. Economic and population growth, slowed after the Civil War as the nation expanded to the west, accelerated in the 1970s as new highways attracted commuters and industries to the southwest from the nearby Boston area. The economy received a boost when long-standing land claims against the state by Native Americans were settled (1980) for $81.5 million, and the tribes began to buy land and make investments. Maine's population grew by 13.2% in the 1970s and 9.2% in the 1980s, the largest increases since the 1840s.

Maine, U.S. battleship sunk (Feb. 15, 1898) in Havana harbor, killing 260, in an incident that helped precipitate the SPANISH-AMERICAN WAR. The cause of the explosion was never satisfactorily explained, and separate American and Spanish inquiries produced different results. But the American jingoistic press blamed the Spanish government, and "Remember the Maine" became the rallying cry of the war.

Maintenon, Françoise d'Aubigné, marquise de [mĂNtə nôN'], 1635–1719, second wife of LOUIS XIV of France. Educated as a Protestant, she later became a devout Roman Catholic and at 16 married the poet Paul Scarron. After his death (1660) she was the governess of the children of Louis XIV and Mme de MONTESPAN. She gained considerable influence over Louis, and in 1684 she was morganatically married to the king.

Mainz [mīnts], (1989 est. pop. 175,000), capital of Rhineland-Palatinate, W Germany, on the Rhine R., opposite the mouth of the Main R. It is an industrial center with such manufactures as chemicals, drugs, and machinery, and a trade center for Rhine wines. The site (1st cent. B.C.) of a Roman camp, it became (746) the seat of the first German archbishop, St. BONIFACE. Johann GUTENBERG made it (15th cent.) the first printing center of Europe. It was (1873–1918) a fortress of the German Empire. Badly damaged during WORLD WAR II, it has been rebuilt since 1945. Historic buildings include the 10th-cent. Romanesque cathedral.

Maisonneuve, Paul de Chomedey, sieur de [māzônnöv'], 1612–76, founder and first French governor of MONTREAL (1642–63). Commanding a detachment of French soldiers, he landed (1642) on Montreal Island and founded the city of Ville Marie, later Montreal.

maize: see CORN.

majolica, type of glazed pottery often associated with Spain, Italy, and Mexico. A tin enamel is applied to a fired piece of earthenware, forming a white, opaque, porous surface on which a design is then painted. After a transparent glaze is applied, the piece is fired again. Used since Babylonian days, majolica was made by 14th-cent. Hispano-Moresque potters and popularized in mid-15th-cent. Italy by the DELLA ROBBIA family. It is still used in folk art.

Major, John, 1943–, British political leader. From a working-class background and lacking a university education, he made a successful career in banking and was elected to Parliament as a Conservative in 1979. A protégé of Margaret THATCHER, he served as her foreign secretary (1989) and chancellor of the exchequer (1989–90). In Nov. 1990 he was elected to succeed Thatcher as prime minister and leader of the CONSERVATIVE PARTY. He has been more cautious and pragmatic than his predecessor. In 1992 he led the Conservatives to victory in parliamentary elections.

Majorca [məjôr'kə], Span. *Mallorca,* island (1987 est. pop. 606,000), 1,405 sq mi (3,639 sq km), Spain, largest of the BALEARIC ISLANDS, in the W Mediterranean. Palma is the chief city. A separate kingdom (1276–1343), the island is now a popular resort noted for its fine scenery and architecture.

Majorian, d. 461, West Roman emperor (457–61). He tried to protect the people from unfair taxation. His expedition (461) against GAISERIC failed. His general RICIMER, who had enthroned him as puppet emperor, became jealous of his power and murdered him. This began the decline of the empire.

Majuro, atoll (1986 est. pop. 12,800), c.3.5 sq mi (9 km), capital (comprising over 60 islets) of the MARSHALL ISLANDS.

Makarios III, 1913–77, Orthodox Eastern archbishop and first president of CYPRUS (1960–77). As archbishop of Cyprus he led the movement that culminated in the island's independence in 1960. As president he maintained a policy aimed at reducing conflict between the Greek and Turkish populations on the island. He survived four assassination attempts and was turned out of office briefly in 1974.

Makarova, Natalia, 1940–, Russian ballet dancer. She studied in Leningrad (Saint Petersburg) and danced (1959–70) with the KIROV BALLET in such classic ballets as *Giselle* and *Swan Lake.* She also danced (1970–72) with the AMERICAN BALLET THEATRE. After 1972, she made guest appearances in London and the U.S., retiring in 1989.

Makemie, Francis [məkĕ'mē], c.1658–1708, American clergyman, considered the founder of Presbyterianism in America; b. Ireland. Ordained (c.1682) as a missionary to America, he preached from the Carolinas to New York and organized two Presbyterian churches in Maryland. In 1706 he formed the first presbytery in the country in Philadelphia.

Malabo, formerly Santa Isabel, city (1983 pop. 31,630), capital of Equatorial Guinea, on Bioko Island (formerly Fernando Po), in the Gulf of Guinea. The island's chief port and commercial center, Malabo exports cacao, coffee, and other agricultural products. The city was founded in 1827 by the British as a base for the suppression of the slave trade and was called Port Clarence, or Clarencetown.

Malacca, Strait of, c.500 mi (800 km) long and c.30 to 200 mi (50 to 320 km) wide, between Sumatra and the Malay Peninsula. SINGAPORE is the chief port. The strait, one of the world's most important sea passages, links the INDIAN OCEAN and the SOUTH CHINA SEA.

Malachi [măləkī, -kē], **Malachias** [măl"əkī'əs], or **Malachy** [măl'əkē], book of the OLD TESTAMENT, 39th and last in the Authorized Version and 12th of the Minor PROPHETS. The anonymous author (probably c.460 B.C.) rebukes the people and the priests and prophesies the Day of Judgment.

malachite, green copper carbonate mineral $Cu_2CO_3(OH)_2$, found in crystal and, more commonly, massive form. It is used as a gem, a COPPER source, and, when ground, a pigment. It occurs associated with other copper ores in the U.S., Chile, Russia, Zimbabwe, Zaïre, and Australia.

Malamud, Bernard, 1914–86, American author; b. Brooklyn, N.Y. Often reflecting a concern with Jewish tradition, his works include the novels *The Natural* (1952; made into a movie in 1984), *The Fixer* (1966; Pulitzer), *Dubin's Lives* (1979), and *God's Grace* (1982) and such short-story collections as *The Magic Barrel* (1958).

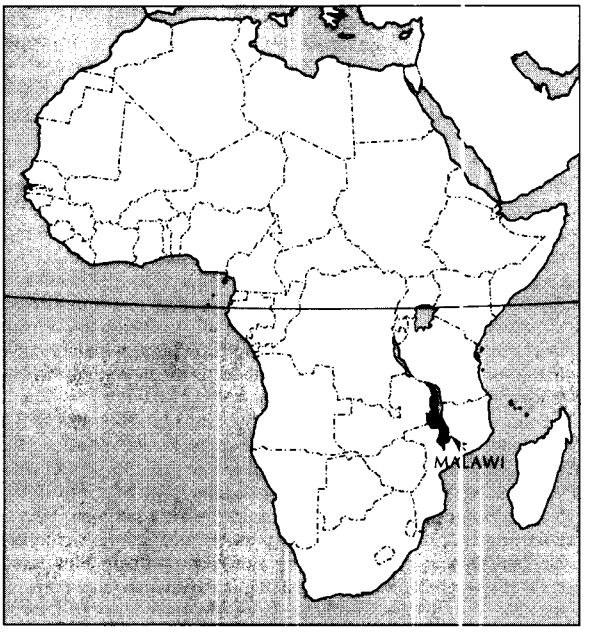
malamute: see ALASKAN MALAMUTE.

malaria, infectious parasitic disease characterized by high fever, severe chills, enlargement of the spleen, and sometimes ANEMIA and JAUNDICE. It can be acute or chronic and is frequently recurrent. Widespread throughout tropical and subtropical areas of the world, malaria is transmitted by the *Anopheles* mosquito, which picks up the causative *Plasmodium* parasite from the blood of an infected person and transfers it to that of a healthy person. Quinine, the traditional treatment, has largely been replaced by modern antimalarials, including chloroquine, primaquine, and mefloquine. In strains that have developed resistance to the new antimalarials, quinine is again the drug of choice.

Malatesta, Italian family that ruled Rimini and neighboring cities from the 13th to 16th cent. Among its members was the hunchback Gianciotto Malatesta, who killed his wife, Francesca da Rimini, when he learned of her love affair with his brother, Paolo. Their story was immortalized in DANTE's *Divine Comedy.* **Sigismondo Pandolfo Malatesta,** (1417–68), was a patron of the arts and a bitter enemy of the papacy.

Malawi [məlä'wē], officially Republic of Malawi, republic (1992 est. pop. 9,605,000), 45,200 sq mi (117,068 sq km), E central Africa, bordered by Zambia (W), Tanzania (N), and Mozambique (E, S, and SW). Principal cities are LILONGWE (the capital) and BLANTYRE. About one fifth of the country is occupied by Lake Malawi (Lake Nyasa), in the Great Rift Valley; the remainder is largely a high plateau. The economy is overwhelmingly agricultural, and per capita income is very low. Most of the farmland is given to subsistence crops, but large estates produce tobacco, tea, sugar, peanuts, cotton, and corn for export. Large numbers of poultry, goats, cattle, and pigs are raised. Malawi's extensive mineral resources, including uranium, coal, and bauxite, are largely unexploited. Most of the population are members of various Bantu-speaking ethnic groups. Many follow traditional beliefs, although 75% are nominally Christian. Chichewa and English are the official languages.

History. The Malawi kingdom, established in the Shire R. valley in the 15th cent., conquered much of modern Rhodesia and Mozambique in the 18th cent. It declined shortly thereafter, and a flourishing slave trade developed. Missionary activity and the threat of Portuguese annexation led Britain in 1889 to proclaim a protectorate in the area (known from 1907 to 1964 as Nyasaland). The British ended the slave trade and established large coffee-growing estates. In 1915 a small-scale revolt against British rule was easily suppressed, but it was an inspiration to other Africans intent on ending foreign domination. In 1953 the Federation of Rhodesia and Nyasaland (linking Nyasaland, Northern Rhodesia, and Southern Rhodesia) was formed despite the protests of Nyasaland's natives, who feared the white-dominated policies of Southern Rhodesia (now ZIMBABWE). The Federation was dissolved in 1963, and Nyasaland became independent as Malawi in 1964. It became a republic in 1966 under Hastings Kamuzu BANDA, president for life and the autocratic ruler of a one-party state. Malawi alienated its black neighbors by maintaining friendly relations with white-run governments in S Africa, but its relations with black African nations have improved since. In 1992 there were violent protests against Banda's rule, and Western nations suspended aid to the country. In a 1993 referendum Malawians voted for an end to one-party rule, and parliament passed legislation establishing a multiparty democracy and abolishing the life presidency.



Malawi, Lake, or **Lake Nyasa,** freshwater lake, c.360 mi (580 km) long, bounded by steep mountains, in the GREAT RIFT VALLEY of E Africa. It is drained in the south by the Shire R., a tributary of the Zambezi.

Malayalam [mä"ləyä'ləm], Dravidian language of India. See LANGUAGE (table).

Malay language: see MALAYO-POLYNESIAN LANGUAGES.

Malayo-Polynesian languages, family of languages spoken in the Malay Peninsula; Madagascar; Taiwan; Indonesia; New Guinea; the Melanesian, Micronesian, and Polynesian Islands; the Philippine Islands; and New Zealand. See LANGUAGE (table).

Malay Peninsula, southern extremity (c.70,000 sq mi/181,300 sq km) of the continent of Asia, between the Andaman Sea of the Indian Ocean and the Strait of Malacca (W), and the Gulf of Thailand and the South China Sea (E). It forms part of Thailand (N) and part of Malaysia (S); at its southern tip is the island of Singapore. A mountain range (7,186 ft/2,190 km at its highest point), from which many swift rivers flow east and west, forms the backbone of the peninsula. More than half its area is covered by tropical rain forest. It is a major rubber and tin producer; other products include timber, rice, and coconut products. Malays, who probably came from S China c.2,000 B.C., form a majority of the population. Chinese are almost as numerous. Indians and Thais are important minorities, and aborigines are found in the hills and jungles. Thais, Indians, and Indonesians invaded the peninsula periodically from the 8th cent. until the primacy of a Malay state was established c.1400. Later in the 15th cent. the Malays were converted to Islam. European contacts began in the 16th cent. In 1511 the Portuguese seized the prime Malay state of Malacca, which fell to the Dutch in 1641. The British dominated the southern part of the peninsula from 1826 and acquired suzerainty over much of the central portion from Siam in 1909. In 1948 the British part of the peninsula became the Federation of Malaya (see MALAYSIA).

Malaysia, independent federation (1992 est. pop. 18,411,000), 128,430 sq mi (332,633 sq km), SE Asia, consisting of **Peninsular Malaysia** (also called West Malaysia or Malaya), on the Malay Peninsula; and, about 400 mi across the SOUTH CHINA SEA, **East Malaysia** (made up of the states of SABAH and SARAWAK), on the

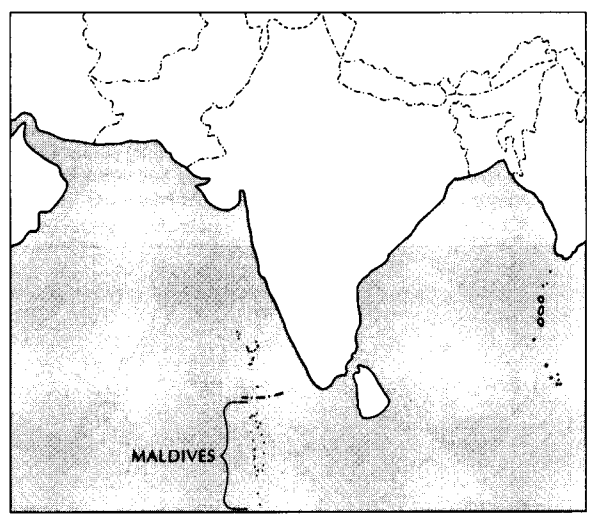
island of BORNEO. Peninsular Malaysia is bordered by Thailand (N), the South China Sea (E), Singapore (S), and the Strait of Malacca and the Andaman Sea (W); East Malaysia is bordered by the South China and Sulu seas (N), Brunei (NE), the Celebes Sea (E), and Indonesia (S and W). The capital of Malaysia is KUALA LUMPUR. Both Peninsular and East Malaysia have densely forested, mountainous interiors flanked by coastal plains; the climate is tropical. Politically the country is a federal parliamentary democracy with a constitutional monarch elected by the hereditary rulers of the sultanates from which the country was formed. Malaysia has a high standard of living by SE Asian standards, largely due to a steadily expanding industrial sector. The country is a major world producer of tin and rubber; steel, electronics equipment, palm oil, lumber, and petroleum are other important products. PRIVATIZATION of many state-owned businesses began in 1992 as part of a plan to cut government expenditures and expand free enterprise. Although it has only 31% of the country's area, Peninsular Malaysia has more than 80% of its people. The majority of the polyglot population are ethnic Malays and Chinese; there is a sizable Indian (mainly Tamil) minority. The official language is Malay, but Chinese, English, Tamil, Hindi, and tribal dialects are widely spoken. Islam, practiced by the Malays, is the established religion. Many Chinese follow traditional beliefs, and the Indian minority is mainly Hindu.

History. The region may have been part of the Buddhist Sri Vijaya kingdom (8th–13th cent.), converted (15th cent.) to Islam as part of a Muslim Malay state. The Malayan Peninsula was first visited by Europeans in the 16th cent. Malacca, on the west coast, was occupied by Portugal (1511) and the Dutch (1641). The British acquired Pinang island in 1786, uniting it in 1826 with Malacca and Singapore as the STRAITS SETTLEMENT. By the beginning of the 20th cent. Britain had established many protectorates on the Malayan Peninsula, as well as in North Borneo (Sabah) and Sarawak. After the Japanese occupation during World War II, Britain united all its territories on the peninsula in the Union of Malaya (1946); Sabah and Sarawak became crown colonies. In 1948, in response to pressure from the ethnic Malays, who feared the reorganization would increase Chinese and Indian influence, Britain created the Federation of Malaya. A largely Chinese-led Communist insurrection was not fully suppressed until 1960. Meanwhile, the Federation of Malaya became an independent state within the Commonwealth in 1957. In 1963 it formed the Federation of Malaysia with SINGAPORE, Sarawak, and Sabah; Singapore was forced to withdraw in 1965. The struggle between the Muslim Malays and the ethnic Chinese continued, and bloody riots in 1969 led to a 22-month suspension of parliament. Since then, political balance has been maintained by a multiracial National Front coalition, led since 1981 by Prime Min. Mahathir Mohamad, but there have been restraints on personal and political freedoms and the independence of the judiciary has been compromised.

Malcolm III (Malcolm Canmore), d. 1093, king of Scotland (1057–93); son of Duncan I; successor to MACBETH. In aid of Edgar Atheling, pretender to the English throne, Malcolm waged wars against England that helped ensure Scottish independence and made possible church reorganization by his wife, Margaret of Scotland.

Malcolm X, 1925–65, African-American religous and political leader, also known as El-Hajj Malik El-Shabazz; b. Malcolm Little in Omaha, Neb. Convicted of burglary (1946), he adopted the BLACK MUSLIM faith in prison, and on his release (1952) became a Muslim minister and charismatic advocate of black separatism. Following a split (1963) with Black Muslim leader Elijah MUHAMMAD and a pilgrimage to Mecca, he converted to orthodox Islam and founded (1964) the Organization of Afro-American Unity, which promoted black nationalism but admitted the possibility of interracial brotherhood. In 1965 he was assassinated in Harlem, N.Y.C., purportedly by Black Muslims. The *Autobiography of Malcolm X* (1964) is a classic of the 1960s black power movement.

Maldives [môl'dīvz], officially Republic of Maldives, formerly Maldive Islands, republic (1992 est. pop. 234,000), 115 sq mi (298 sq km), 19 atolls in the N Indian Ocean, about 420 mi (675 km) SW of Sri Lanka. They comprise nearly 2,000 coral islands, of which about 200 are inhabited. Malé is the capital and largest island. The islands are covered with tropical vegetation, particularly coconut palms. Although some fruit, corn, and other grains are cultivated, most food staples must be imported. The chief sources of revenue are fishing, tourism, coconut products (especially copra), and shipping. There is some fish processing and limited industrial development. The inhabitants are of mixed Indian, Sinhalese, and Arab descent. ISLAM is the official religion. Divehi (a Sinhalese dialect) is spoken; English is also widely used.



History. The Maldives were originally settled by peoples from S Asia; Islam was introduced in the 12th cent. From the arrival of the Portuguese in the 16th cent., the islands were intermittently under European influence. In 1887 they became a British protectorate and military base but retained internal self-government. The Maldives achieved full independence as a sultanate in 1965, but in 1968 the ad-Din dynasty, which had ruled since the 14th cent., was ended, and a republic was declared. In 1976 Britain closed its air force base on the island of Gan, but a Soviet offer to lease the facility was rejected. In 1978 Maumoon Abdul Gayoom was elected president. A coup attempt (1988) by Tamil mercenaries was quashed with the help of Indian forces.

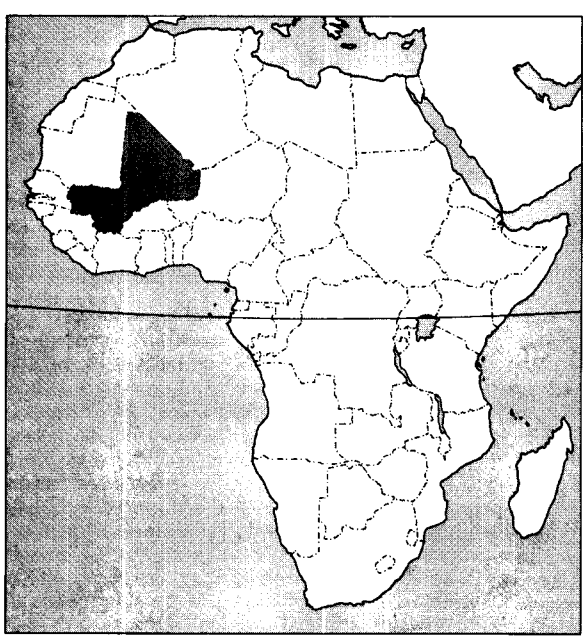
Malé, city (1990 est. pop. 55,100), capital of MALDIVES.

Malenkov, Georgi Maksimilianovich, 1902–1988, Soviet leader. An aide of STALIN, he became a full member of the politburo and a deputy premier in 1946. As premier (1953–55) he pursued a conciliatory foreign policy and curtailed the power of the secret police. He was forced to resign as premier (1955) in favor of BULGANIN; removed from other posts in 1957; and expelled from the party in 1961.

Malevich, Casimir or **Kasimir** [mälyä'vĭch], 1878–1935, Russian painter, the founder (1913) of SUPREMATISM. His nonobjective paintings are geometric forms on a flatly painted surface, e.g., *White on White* (Mus. Mod. Art, N.Y.C.).

Mali, officially Republic of Mali, republic (1992 est. pop. 8,641,000), 478,764 sq mi (1,240,000 sq km), the largest country in W Africa, bordered by Algeria (N), Niger (E and SE), Burkina Faso and Côte d'Ivoire (S), and Guinea, Senegal, and Mauritania (W). BAMAKO is the capital. With the SAHARA desert in the north, much of the country is arid and barely supports grazing (mainly cattle, sheep, and goats). The south, watered by the NIGER and Senegal rivers (both important transportation arteries), contains fertile areas where peanuts and cotton, the chief cash crops, are grown. Subsistence crops include rice, corn, sorghum, and millet. Fish from the Niger and livestock are exported. Industry is limited mainly to food processing, cotton ginning, and textile production. Salt, gold, and phosphates are mined on a small scale, but extensive mineral resources remain unexploited. Six ethnic groups make up most of the population. There are also TUAREG and Moor minorities who, with Tuaregs in NIGER, fought for autonomy in the early 1990s. About 90% of the people are Muslims; most of the remainder are animists. French is the official language, but Bambara is spoken by most of the population.

History. Several extensive empires and kingdoms dominated the early history of the region. Among them, the medieval empire of Mali, a powerful state and one of the world's chief gold suppliers, reached its peak in the early 14th cent. Such cities as TIMBUKTU and Djenné became important centers of trade and culture. The SONGHAI empire of Gao rose to prominence in the late 15th cent. but was shattered by a Moroccan army in 1590, after which the vast region broke up into petty states. Despite a resurgence of Islam and the opposition of Muslim emperors, French conquest of the Mali area was virtually complete by 1898, and Mali, then called French Sudan, became part of FRENCH WEST AFRICA. Between the two World Wars a nationalist movement developed, and the militant Sudanese Union, led by Modibo Keita, emerged as the leading political force. A 1958 referendum created the autonomous Sudanese Republic, which joined (1959) with Senegal in the Mali Federation. The union ended in 1960, when the new Republic of Mali obtained full independence and broke with the FRENCH COMMUNITY. With Keita as president, Mali became a one-party, socialist state. It withdrew from the franc zone in 1962 but was forced by financial problems to return to the French bloc in 1967. Keita was overthrown by junior army officers in 1968, and Lt. Moussa Traoré assumed power as head of a military regime. In the early 1970s Mali's agrarian economy was devastated by a severe drought that struck the SAHEL region of Africa. The resulting famine contributed to the deaths of nearly 100,000 people. In 1979 a new constitution established a one-party state, and Traoré was reelected president. Mali fought a brief border war with Burkina Faso in 1985. Traoré was overthrown in 1991, and in 1992 Alpha Oumar Konaré became Mali's first democratically elected president.



Malinowski, Bronislaw [mälĭnôf'skē], 1884–1942, English anthropologist; b. Poland. He was the founder of "functionalism," the theory that cultures should be studied in terms of their particular internal dynamics. After studying (1914–18) Trobriand Islanders he did research in Africa and the Americas. His writings include *Argonauts of the Western Pacific* (1922), *Crime and Custom in Savage Society* (1926), and *Magic, Science and Religion* (1948).

Mallarmé, Stéphane [mällärmā'], 1842–98, French poet. The chief forebear of the SYMBOLISTS, he held that poetry should be transcendental, approaching the abstraction of music. His language defies traditional syntax and is exceedingly obscure. Major works include *Herodias* (1869) and *The Afternoon of a Faun* (1876). Mallarmé was the center of a literary group that gathered every Tuesday, and his theories had a major influence on modern French writing.

Malle, Louis, 1932–, French film director. His varied work includes *The Lovers* (1958), *Murmur of the Heart* (1971), *Atlantic City* (1980), *My Dinner with André* (1980), *Au Revoir les Enfants* (1988), and *Damage* (1992).

Mallea, Eduardo [mäyā'ä], 1903–82, Argentine writer. His novels, many dealing with alienation, include *The Bay of Silence* (1940), *Posesión* (1958), and *Gabriel Andaral* (1971). Also of note are the *History of an Argentine Passion* (1935) and the stories collected in *City on the Motionless River* (1936).

mallow, common name for the Malvaceae, a family of widely distributed shrubs and herbs, abundant in the American tropics and typified by mucilaginous sap and showy flowers with a prominent column of fused stamens. The family includes the true mallows (genus *Malva*) of the Old World, and the false mallows (genus *Malvastrum*), and rose, or swamp, mallows (genus *Hibiscus*) of North America. Introduced *Hibiscus* species include the rose of Sharon (*H. syriacus*), a popular ornamental, and okra, or gumbo (*H. esculentus*), whose mucilaginous pods are used as a vegetable. The most popular ornamental of the family, the hollyhock (*Althea rosea*), originally a Chinese perennial, is widely cultivated in many varieties and colors. The European marsh mallow (*A. officinalis*) is used medicinally and was formerly used in the confection marshmallow, now usually made from syrup, gelatin, and other ingredients. Economically the most important plant of the family is COTTON.

Malmö, city (1988 pop. 230,785), capital of Malmöhus co., S Sweden, on the Øresund. It is a major naval and commercial port. Founded in the 12th cent., it was an important trade center in Danish hands until it passed to Sweden in the mid-17th cent. Its castle is now a museum.

malnutrition, insufficiency of one or more nutrients necessary for health. Primary malnutrition is caused by a lack of essential foodstuffs (usually VITAMINS, MINERALS, or PROTEINS) in the diet. Such a lack can be caused by regional conditions such as drought and overpopulation or by poor eating habits. Secondary malnutrition is caused by failure to absorb or utilize nutrients, as in disease of the gastrointestinal tract, KIDNEY, or LIVER; by failure to satisfy increased nutritional requirements, as during PREGNANCY; or by excessive excretion, as in diarrhea. Malnutrition can cause such conditions as ANEMIA and KWASHIORKOR.

Malory, Sir Thomas, d. 1471, English author of *Morte d'Arthur,* originally called *The Book of King Arthur and His Knights of the Round Table* and consisting of eight romances. The printer William CAXTON gave it the misleading title in 1485. It became the standard source for later versions of the ARTHURIAN LEGEND.

The key to pronunciation appears on page xiii.

Malpighi, Marcello [mälpē'gē], 1628–94, Italian anatomist. A pioneer in the use of the MICROSCOPE, he made many valuable observations on the structure of plants and animals. He completed William HARVEY's theory of circulation by his observation of the movement of blood through capillaries; this and his study of lung structure appeared in *De pulmonibus* (1661). He is noted also for studies of gland structure, of the brain and other organs, of the embryology of the chick, and of the anatomy of the silkworm.

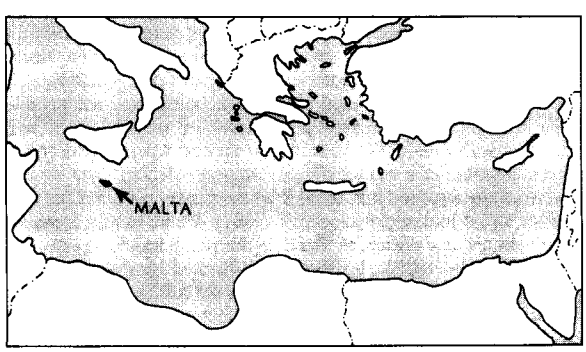
malpractice, a failure to provide professional services with the skill exhibited by careful, responsible providers, resulting in injury, loss, or damage to the contracting party. Claims of malpractice are most common against medical professionals, and most suits are for negligence in providing the expected level of care. In recent decades such suits have increased, leading to vastly higher malpractice insurance rates. Proposed solutions to the increased cost burden of such rates include compensation review boards, no-fault statutes, and limits on awards for damages.

Malraux, André [mälrō'], 1901–76, French man of letters and statesman. He participated with the Communists in the Chinese civil war (1925–27) and with the Loyalists in the Spanish civil war (1936–39); these experiences are the source for his outstanding social novels, *Man's Fate* (1933) and *Man's Hope* (1937). An intellectual with a broad knowledge of archaeology, art history, and anthropology, he wrote extensively on art and civilization in such works as *The Voices of Silence* (1951) and *The Metamorphosis of the Gods* (1957). Malraux was a resistance leader during World War II, and he served under Charles DE GAULLE as minister of information (1945) and minister of cultural affairs (1958–68).

malt, a grain (usually BARLEY) steeped in water, partially germinated, then dried and cured. It is used in brewing to convert cereal starches to sugars by means of the ENZYMES (chiefly diastase) produced during germination.

Malta, officially Republic of Malta, republic (1992 est. pop. 359,000), 122 sq mi (316 sq km), in the Mediterranean Sea S of Sicily, comprising the islands of Malta, Gozo (Ghawdex), and Comino (Kemmuna). Valletta is the capital. The economy is supported by tourism, light industry, agriculture, and shipbuilding. The polyglot population is a mixture of Arab, Sicilian, Norman, Spanish, Italian, and English. Maltese (a Semitic language) and English are the official languages, but Italian is widely spoken. Roman Catholicism is the state religion. Malta is governed by a unicameral parliament, a prime minister, and a cabinet.

History. In ancient times Malta belonged successively to the Phoenicians, Greeks, Carthaginians, Romans, and Saracens. The Normans of SICILY occupied it c.1090, and in 1530 Holy Roman Emperor CHARLES V granted Malta to the KNIGHTS HOSPITALERS, who held it until it was surrendered (1798) to NAPOLEON I. Taken (1800) by the British, the island became of great strategic importance as a military and naval base after the opening (1869) of the SUEZ CANAL. In WORLD WAR II Malta sustained heavy Axis bombing but was never subdued. Limited self-government began in 1921, and Malta became fully independent in 1964. The last British forces withdrew in 1979. In elections in 1987, the Nationalist party came into power, with Edward Fenech Adami as prime minister; the 1992 elections returned the Nationalists to office. In foreign affairs Malta has policy of neutrality and has sought to maintain good relations with both Libya and Italy.



Maltese, very small TOY DOG; shoulder height, c.5 in. (12.7 cm); weight, 2–7 lb (.9–1.4 kg). Its silky white coat hangs down almost to the ground. Probably an ancient breed, closely resembling lap dogs of ancient Greece and Rome, it was very popular in Europe by the 19th cent.

Malthus, Thomas Robert [măl'thəs], 1766–1834, English economist, sociologist, and pioneer in modern population study. In *An Essay on the Principle of Population* (1798; rev. ed. 1803) he contended that poverty and distress are unavoidable because population increases faster than the means of subsistence. As checks on population growth, he accepted only war, famine, and disease but later added "moral restraint" as well. His controversial theory was adapted by neo-Malthusians and influenced such classical economists as David RICARDO.

maltose or **malt sugar** (empirical formula: $C_{12}H_{22}O_{11}$), crystalline SUGAR involved in brewing beer. Maltose can be produced from STARCH by HYDROLYSIS in the presence of diastase, an enzyme found in MALT. A disaccharide (see CARBOHYDRATE), maltose is hydrolyzed to GLUCOSE by maltase, an enzyme present in YEAST. The glucose thus formed can be fermented by another enzyme in yeast to produce ETHANOL.

Malvinas, Islas: see FALKLAND ISLANDS.

Mamelukes: see MAMLUKS.

Mamet, David, 1947–, American playwright; b. Chicago. He taught drama and produced some of his early plays at Goddard College. His work, which deals with the success and failure of the American dream, has sharp and insightful dialogue. He wrote *American Buffalo* (1975), *Glengarry Glen Ross* (1984, Pulitzer; screenplay, 1992), and *Oleanna* (1992), as well as screenplays for *The Postman Always Rings Twice* (1981) and *Homicide* (1991).

Mamluks or **Mamelukes,** Egyptian warrior caste dominant for over 700 years. They were originally slaves brought to Egypt by Fatimid caliphs in the 10th cent. Many were freed and rose to high rank. Aybak was the first Mamluk to actually become ruler (1250). For 250 years after that, Egypt was ruled by Mamluk sultans chosen from the caste of warriors. In 1517 the Ottoman Turks captured Cairo and put an end to the Mamluk sultanate. The Mamluks maintained their vast landholdings and their private armies, however, and remained provincial governors. As Turkish rule weakened, they reasserted their power, and by the 18th cent. they were virtual rulers again. NAPOLEON I defeated them in 1798, but their final defeat came in 1811 when they were massacred by MUHAMMAD ALI.

mammal, warm-blooded animal of the class Mammalia, the highest class of VERTEBRATES, found in terrestrial and aquatic habitats. The female has mammary glands, which secrete milk for the nourishment of the young after birth. In most mammals the body is partially or wholly covered with hair, the heart has four chambers, and a muscular diaphragm separates the chest from the abdominal cavity. Except for the egg-laying MONOTREMES (e.g., the PLATYPUS), mammals give birth to live young. In some MARSUPIALS and higher mammals the young receive prenatal nourishment through a placenta. Terrestrial mammals include carnivores (e.g., CAT, DOG, BEAR); rodents (e.g., BEAVER, SQUIRREL); hoofed animals (e.g., HORSE, RHINOCEROS, DEER, SWINE, CATTLE); primates (e.g., human being, MONKEY, LEMUR); and others, such as the BAT and ELEPHANT. Aquatic mammals include the carnivorous SEAL and WALRUS and the omnivorous WHALE and DOLPHIN.

mammary gland or **breast,** organ of the female mammal that produces milk for nourishment of the young. Mammary glands develop during puberty and distend during pregnancy in preparation for nursing. They are sometimes considered part of the REPRODUCTIVE SYSTEM.

mammoth, name for several prehistoric ELEPHANTS of the extinct genus *Mammuthus,* found in Eurasia and North America in the Pleistocene epoch. The imperial mammoth of North America was about 13½ ft (4.1 m) high at the shoulder. As depicted in Cro-Magnon cave paintings in S France, the mammoth had a shaggy coat, complex molar teeth, slender tusks, and a long trunk.

Mammoth Cave National Park: see NATIONAL PARKS (table).

Man, Isle of, island (1991 pop. 69,788), 227 sq mi (588 sq km), off Great Britain, in the Irish Sea. The capital is Douglas. The coast is rocky, with precipitous cliffs, the scenery varied and beautiful, and the climate very mild, making the island a popular resort. It was

variously ruled until 1765, when it became a dependency of the British crown. It is, however, not subject to acts of the British Parliament and has its own legislature, the Tynwald.

man, prehistoric: see HUMAN EVOLUTION.

managed health care, system of health care delivery that aims to control costs by assigning set fees for services, monitoring the need for such procedures as tests and surgical operations, and stressing preventive care. Managed health care systems include HEALTH MAINTENENCE ORGANIZATIONS; preferred provider organizations (PPOs), networks of doctors and hospitals that adhere to given guidelines and fees in return for recieving a certain number of patients; and point of service (POS) plans, which are similar to PPOs but allow patients to go outside the network for treatment, usually at a higher cost. The term is also used to describe more traditional health insurance plans that require that more expensive procedures be reviewed and approved by a plan official before they are performed.

Managua, city (1985 est. pop. 650,000), W Nicaragua, capital of Nicaragua, on the southern shore of Lake Managua. The nation's largest city and commercial and industrial center, it became the capital in 1855 to end a feud between the cities of LEÓN and Granada. There has been much rebuilding since 1972, when earthquakes almost leveled the city and took some 10,000 lives, but the old city center has been largely unrestored.

Manassas, battle of: see BULL RUN.

Manasseh or **Manasses.** **1** First son of Joseph and eponymous ancestor of one of the 12 tribes of ISRAEL. **2** King of Judah (c.696–c.642 B.C.). He fostered foreign cults. The **Prayer of Manasses,** one of the pseudepigrapha, placed in the APOCRYPHA in the Authorized Version, is given as his penitential prayer.

Manasseh ben Israel, 1604–57, Jewish scholar and communal leader; b. Portugal. A Marrano (see SEPHARDIM), he returned to Judaism in Holland, where he served as a rabbi and started (1627) the first Hebrew press. He obtained Oliver CROMWELL's unofficial assent for Jews to settle in London, where they had been forbidden to live since 1290.

manatee: see SIRENIAN.

Manaus, city (1990 est. pop. 1,114,000), NW Brazil, capital of Amazonas state, on the Rio Negro. Surrounded by jungle, it is the westernmost of Brazil's major cities, the commercial center of the upper AMAZON region, and a major river port accommodating oceangoing vessels. Founded in 1669, it grew rapidly during the rubber boom of the late 19th cent. Since the 1970s, increased interest in development of the Amazon basin has brought Manaus new importance. Its opera house is renowned.

Manchester, city (1991 pop. 404,861), Greater Manchester, NW England, on the Irwell, Medlock, Irk, and Tib rivers. The Manchester Ship Canal provides access to oceangoing vessels. The center of England's most densely populated area, Manchester was long the nation's leading textile city, but other industries, including chemicals and pharmaceuticals, are now more important. A Celtic and Roman town, it was chartered in 1301. Parliamentary representation was achieved in 1832. Important in liberal thought, the city was the center of the MANCHESTER SCHOOL of economics in the 19th cent. and the site of the founding (1821) of the influential daily the *Manchester Guardian.*

Manchester, city (1990 pop. 99,567), S N.H., on the Merrimack R.; settled 1722, inc. as a city 1846. Now the state's largest city, it was a major 19th-cent. textile producer. Since the Depression and the shift of much industry to the South, the city has diversified its manufactures, which include electronic and electrical equipment and shoes.

Manchester school, group of 19th-cent. English economists, led by Richard COBDEN and John BRIGHT, who advocated free trade and held that the state should interfere as little as possible in economic matters (see LAISSEZ FAIRE).

Manchu, inhabitants of Manchuria descended from the Jurchen, a tribe known in Asia since the 7th cent. Originally pastoral nomads, they swept into N China in the 12th cent., but were driven out in the 13th cent. by the MONGOLS. They settled in the Sungari valley, developing an agrarian civilization and increasing their territory. In 1644 they conquered China and founded the Ch'ing dynasty. When the dynasty ended (1912), they merged with the Chinese.

Manchuria [mănchŏŏr'ēə], Mandarin *Dongbei* [northeast], region (1988 est. pop. 94,781,000), c.600,000 sq mi (1,554,000 sq km), NE China. Comprising (since 1956) the provinces of Hei ongjiang, Jilin, and Liaoning—it had previously included part of Inner Mongolia—Manchuria is bordered by Russia, North Korea, and Mongolia. It has timber resources and mineral deposits, including oil, coal, gold, magnesium, and uranium. A major manufacturing and agricultural center, Manchuria produces steel, heavy machinery, motor vehicles, chemicals, and aircraft in the highly industrialized cities and grains, beans, soybeans, and sweet potatoes in the fertile Manchurian plain. It is the traditional home of peoples that have invaded and sometimes ruled N China, notably the MANCHU. Controlled successively by Russia, Chinese warlords, Japan, and the Soviet Union in the 20th cent., Manchuria was occupied by the Communists in 1948. Important strategically, it was developed as a major industrial region, but its huge state enterprises stagnated during the economic reforms of the 1980s.

Manco Capac, legendary founder of the INCA dynasty of Peru; one of four brothers who, with their four sisters, conquered the peoples of the Cuzco valley. Manco Capac's son may be the Sinchi Roca who authorities accept as the first historical Inca chief (c.1105–c.1140). **Manco Capac** was also the name of the last Inca ruler. A puppet emperor crowned in 1534 by the Spanish conqueror Francisco PIZARRO, he raised a huge army and in 1536 besieged Spanish-occupied CUZCO. Abandoning the siege after ten months, he fought a bloody guerrilla war against the Spanish until he was murdered in 1544.

Mandalay, city (1983 pop. 532,985), central Myanmar, on the Irrawaddy R. Myanmar's second largest city, it is a major transportation hub. It dates from c.1850 and was the capital of the Burman kingdom from 1860 until Britain annexed the kingdom in 1885. Mandalay is a center of Burmese Buddhism. Much of the city was destroyed by British bombing in World War II, but numerous Buddhist monuments, notably the Arakan pagoda, remain.

Mandan, indigenous people of the Plains (see NORTH AMERICA, INDIGENOUS PEOPLES OF), who spoke a Siouan language of the Hokan-Siouan stock (see NATIVE AMERICAN LANGUAGES). Said to have come from the east, by mid-18th cent. they lived in North Dakota. The Mandan were agricultural people with distinctive cultural traits, including a myth of origin in which their ancestors climbed from beneath the earth on the roots of a grapevine. Their numbers were severely depleted in the 19th cent. by war and epidemics; in 1990 there were 1,207 Mandans in the U.S. Today, Mandans, Arikaras, and Hidatsas (a band of GROS VENTRE) live together on reservations in North Dakota.

Mandarin, a high official of imperial China. Mandarin Chinese, the language spoken by the official class, was based on the Beijing dialect. It is now the official language of China.

mandates, system of national trusteeships established (1920) under the LEAGUE OF NATIONS to administer former territorial possessions of Germany and Turkey after WORLD WAR I. Its long-term goal was self-government in the administered territories, which included Iraq, Syria, Lebanon, Palestine, several African countries, and various Pacific islands. The mandates system was superseded by the TRUSTEESHIP system of the UNITED NATIONS.

Mandela, Nelson Rolihlahla, 1918–, South African political leader. A lawyer, he joined (1944) the AFRICAN NATIONAL CONGRESS (ANC), co-founded the Congress Youth League, and was prominent in the nonviolent "defiance campaign" against South Africa's APARTHEID laws. After the shooting of demonstrators at Sharpeville (1960), he organized a paramilitary group to engage in guerrilla warfare against the government. Although acquitted (1961) of treason, he was subsequently convicted (1964) of sabotage and sentenced to life imprisonment. Released in 1990, he led the ANC in its negotiations with Pres. F.W. DE KLERK for an end to apartheid and the establishment of a multiracial government. Mandela and de Klerk were jointly awarded the Nobel Prize for peace in 1993. After South Africa's first multiracial elections (1994), Mandela was elected as the nation's new president. Mandela married his second wife, **Winnie Mandela,** 1936?–, b. Nomzamo Winifred Madikizela, in 1958. A social worker, she became active in the ANC and was her husband's principal champion while he was in prison. She herself was (1962–85) imprisoned and declared a "banned" person several

Nelson Mandela

times. She was convicted (1991) in the 1988 kidnapping and beating of four young men, one of whom died. In 1992 the Mandelas separated.

Mandelbrot, Benoit B., 1924–, French mathematician; b. Poland. Largely self-taught and considered something of a maverick, he did pioneering work in the area of CHAOS theory and conceived, developed, and applied FRACTAL geometry.

Mandelstam, Osip Emilyevich [män'dĭlshtəm], 1891–1938?, Russian poet. A leader of the ACMEISTS, he wrote fatalistic, meticulously constructed lyrics, collected in *Stone* (1913) and *Tristia* (1922). He died a political prisoner.

Mandeville, Bernard, 1670–1733, English author; b. Holland. A physician, he wrote on medical and ethical subjects. His argument in *The Fable of the Bees* (1714), an expansion of his poem *The Grumbling Hive* (1705), that the efforts of self-seeking individuals are the mainspring of commercial-industrial society, influenced 19th-cent. UTILITARIANISM.

mandolin: see STRINGED INSTRUMENT.

mandrake, herbaceous perennial plant (genus *Mandragora*) of the NIGHTSHADE family, native to the Mediterranean and Himalayan regions. True mandrakes contain several ALKALOIDS of medicinal value, and they have been used as pain-killers. Magical powers have often been attributed to the root, which crudely resembles the human form.

mandrill, large MONKEY (*Mandrillus sphinx*) found in the forests of central W Africa, related to the BABOON. The fur of the mandrill is mostly dark brown, but the bare face and buttocks are patterned in colors particularly spectacular in the adult male—bright red, blue, black, purple, and pale yellow.

man-eater: see SHARK.

Manet, Édouard [mänā'], 1832–83, French painter. He was influenced by VELÁZQUEZ and GOYA, and later by Japanese printmakers. In 1861 the Salon accepted his *Guitarist.* Two years later, with the exhibition of *Luncheon on the Grass* (Louvre), he was violently attacked; the painting depicts a nude woman enjoying a picnic in the woods with two fully clothed men. Manet's masterpiece, *Olympia* (1863; Louvre), an arresting portrait of a courtesan, elicited outrage and abuse from critics and public. This hostility from the art establishment attended his work throughout his life. His subject matter and technical innovations were considered heresy, but he profoundly influenced IMPRESSIONISM. Although often called an impressionist, he did not employ broken color, or sketchy brush strokes. All his work was a successful attempt to describe the natural immediacy of the eye's perception, and he worked in broad, flat areas of color. His major works include *The Balcony* (1869) and *The Fife Player* (1866; both Louvre).

Manfred, c.1232–1266, last HOHENSTAUFEN king of Sicily (1258–66); illegitimate son of Holy Roman Emperor FREDERICK II. He was regent in Sicily for his brother, CONRAD IV, and for his nephew, Conradin. In 1254 he was forced to restore the kingdom of the papacy, but he soon rebelled. Assuming the leadership of antipapal forces, Manfred reconquered Sicily and S Italy, and had himself crowned (1258) at Palermo. Pope Urban IV reacted by investing Charles of Anjou with Sicily as CHARLES I. Manfred was defeated by Charles and killed at Benevento (1266), and Conradin was later captured and executed (1268).

manganese (Mn), metallic element, first isolated by J.G. Gahn in 1774. It is pinkish-gray and chemically active, and resembles iron. It is a unique deoxidizing and desulfurizing agent in the manufacture of steel, is widely used in making other alloys, and is used as an octane-enhancing gasoline additive. Manganese nodules found on the deep ocean floor are a potentially rich and extensive resource. They form when manganese oxides and other metallic salts precipitate around a rock or shell nucleus. See ELEMENT (table); PERIODIC TABLE.

Mangas Coloradas, c.1797–1863, chief of the Mimbrenos APACHE of SW New Mexico. Noted for his intelligence and great stature, he united the tribes (1837) against white scalp-hunters paid by Mexico. When the U.S. acquired the area in 1846, he pledged peace, but after a flogging by gold miners he led his people in continuous warfare until he was killed by Union soldiers.

mange, contagious skin disease of animals, caused by parasitic MITES that burrow into the skin, HAIR follicles, or sweat glands. This leads to itching, inflammation, hair loss, and secondary bacterial infection. The disease is also called scabies, scab, and barn itch.

mango, evergreen tree of the SUMAC family, native to tropical E Asia but now grown in both hemispheres. The trees grow rapidly and can attain heights of up to 90 ft (27 m); they are densely covered with glossy leaves and bear small, fragrant yellow or red flowers. The aromatic, slightly acid fruit, a fleshy drupe with a thick, greenish to yellow-red skin, is an important food in the tropics.

mangrove, large, tropical evergreen tree (genus *Rhizophora*) found on muddy tidal flats and along shorelines, most abundant in tropical Asia, Africa, and the SW Pacific. Aerial roots, produced from the trunk, become embedded in the mud and form a tangled network that serves as a prop for the tree and a means of aerating the roots. The fruit is a conical, reddish-brown berry with a single seed; it germinates inside the fruit while it is still on the tree, forming a primary root that quickly anchors the seedling in the mud.

Manhattan: see NEW YORK CITY.

Manhattan Project, the wartime effort to design and build the first nuclear weapons (see ATOMIC BOMB). A $2-billion effort, centered at Oak Ridge, Tenn., and Hanford, Wash., was required to obtain sufficient amounts of the two necessary isotopes, uranium-235 and plutonium-239. The design and building of the bombs took place at Los Alamos, N.Mex., where J. Robert OPPENHEIMER directed a large group of American and European-refugee scientists. Following the test explosion of a plutonium device on July 16, 1945, near Alamogordo, N.Mex., a uranium bomb and a plutonium bomb were dropped on, respectively, HIROSHIMA (Aug. 6) and NAGASAKI (Aug. 9).

manic-depression or **bipolar disorder,** severe mental disorder involving manic episodes (characterized by an abnormally elevated or irritable mood, grandiosity, sleeplessness, extravagance, and a tendency toward irrational judgment) that are usually accompanied by episodes of DEPRESSION (possibly including lethargy, a sense of worthlessness, lack of concentration, and guilt). It occurs in males and females equally and is found more frequently in close relatives of people with the disorder. Therapy includes LITHIUM (to control mania and stabilize mood swings) and ANTIDEPRESSANTS. ELECTROCONVULSIVE THERAPY has been useful in cases where other treatments have had little success.

Manichaeism or **Manichaeanism,** religion founded by Mani (A.D. c.216–c.276), a visionary prophet, probably of Persian origin. After his martyrdom, his religion spread rapidly throughout the Roman Empire and Asia. Manichaeism synthesized elements from earlier religions such as GNOSTICISM, ZOROASTRIANISM, and Christianity; it taught dualism between good and evil, the transmigration of souls, and the possibility of salvation. St. Augustine was a Manichee until his conversion. The religion survived in the West until the 6th cent. and in the East until about the 13th cent.

Manifest Destiny, 19th-cent. doctrine that the U.S. had the duty and right to expand its territory and influence throughout North America. It reflected a growing spirit of confidence during a period of

population increase and westward movement. The concept was invoked as justification for the SPANISH-AMERICAN WAR (1898).

Manila, city (1990 pop. 1,587,000), capital of the Philippines, SW Luzon, on Manila Bay. The Philippine capital before 1948 and after 1976, it is the country's second largest city, its chief port and transport center, and the focus of its commercial, industrial, and cultural activities. Manufactures include automobiles, textiles, and chemicals. Founded in 1571 and developed by Spanish missionaries, Manila was taken (1898) by the U.S. in the SPANISH-AMERICAN WAR. During WORLD WAR II it was occupied (1942) by the Japanese; many 17th-cent. buildings were destroyed in the Allied assault (1945); only the Church of San Agustin (1606) survived. Among the city's outstanding modern buildings is the Philippine Cultural Center complex.

Manila hemp, plant (*Musa textilis*) of the BANANA family, native to the Philippines, and the cordage fiber obtained chiefly from it. Manila hemp, or abacá, yields exceptionally strong, durable, saltwater-resistant fibers, useful for cordage and fabrics. It is unrelated to true HEMP.

manioc: see CASSAVA.

Manitoba, province (1991 pop. 1,091,942), 251,699 sq mi (651,900 sq km), west-central Canada, bordered by the Northwest Territories (N), Hudson Bay and Ontario (E), Minnesota and North Dakota (S), and Saskatchewan (W). Manitoba is the easternmost of the Prairie Provinces. The northern section, around HUDSON BAY, is a treeless tundra, and central and S Manitoba contain numerous lakes (Winnipeg, Manitoba, Winnipegosis) and rivers (Nelson, Churchill, Hayes), which flow northeast into the bay. In the south, where most of the population is centered, are extensive fields of wheat, barley, oats, and flax. Grain is shipped in quantity from the port of Churchill, on Hudson Bay. Vegetables, sugar beets, and sunflowers are also grown, and dairying has become significant. Although agriculture remains important, manufacturing has replaced it as the leading provincial industry. Foods, clothing, refined oil, transportation and electrical equipment, fabricated metals, chemicals, and pulp and paper are major products. WINNIPEG is the capital and largest city.

History. In 1670 the area of present-day Manitoba was given to the HUDSON'S BAY COMPANY, which built fur-trading posts on Hudson Bay. The French also established posts, but British claims to the area were confirmed in 1763. Rivalry between the NORTH WEST COMPANY and the Hudson's Bay Company led to violence after Lord SELKIRK established the RED RIVER SETTLEMENT. Immigration to the area increased after the two companies merged (1821) and after the area was sold (1870) to the confederation of Canada. This purchase was unsuccessfully resisted by a revolt led by Louis RIEL, and Manitoba became a province in 1870; it was enlarged in 1881 and 1912. In the 20th cent. many immigrants, notably Ukrainians, settled in the province. Control of the provincial government has alternated between the New Democrats and the Progressive Conservatives since the late 1960s. In 1988 the New Democrats again lost power to the Conservatives. Manitoba sends 6 senators (appointed) and 14 representatives (elected) to the national parliament.

Manley, Norman, 1893–1969, prime minister of Jamaica (1959–62). An internationally known lawyer of Irish and African descent, he, with his cousin Alexander BUSTAMANTE, dominated Jamaican politics for many years. Manley was chief minister (1955–59) before being designated prime minister. His son, **Michael Norman Manley,** 1923–, was prime minister from 1972 to 1980, and partially nationalized foreign-owned industry and established close ties with Cuba and the USSR. In 1989 he again became prime minister when his party won control of the government with a moderate program. Manley resigned in 1992 due to poor health.

Mann, family of German writers. **Heinrich Mann,** 1871–1950, wrote novels of sharp social criticism such as *Professor Unrat* (1905; tr. *The Blue Angel*) and the trilogy *The Poor* (1917), *The Patrioteer* (1921), and *The Chief* (1925). His brother, **Thomas Mann,** 1875–1955, is an outstanding German literary figure of the 20th cent. whose novels developed themes relating inner problems to changing European cultural values. His first novel, *Buddenbrooks* (1901), brought him fame. Translations of his shorter fiction, collected in *Stories of Three Decades* (1936), including *Tonio Kröger* (1903) and the classic *Death in Venice* (1912), reflect Mann's preoccupation with the proximity of creative art to neurosis, with the affinity of genius and disease, and with the problem of artistic values in bourgeois society. These themes are featured in his major work, *The Magic Mountain* (1924). His tetralogy *Joseph and His Brothers* (1933–43) is a brilliant study of psychological and mythological elements in the biblical story. Later works include *Doctor Faustus* (1947), *The Holy Sinner* (1951), and *Confessions of Felix Krull* (1954). Translations of Mann's major political writings denouncing fascism are published in *Order of the Day* (1942); his major literary essays are collected in *Essays of Three Decades* (1947). He left HITLER'S Germany in 1933 and lived in the U.S. after 1938, moving to Switzerland in 1953. He received the Nobel Prize in literature in 1929. Thomas Mann's daughter, **Erika Mann** (1905–69), was an actress and author and was married to the poet W.H. AUDEN. His son, **Klaus Mann** (1906–49), was a novelist, essayist, and playwright. His works include *Alexander* (1929), *Pathetic Symphony* (1936), and the autobiographical *Turning Point* (1942).

Mann, Horace, 1796–1859, American educator; b. Franklin, Mass. While serving as secretary of the Massachusetts state board of education, he started a movement for better teaching and better-paid teachers, established state normal schools, and improved schoolhouses and equipment. After serving (1848–53) in the U.S. House of Representatives, he became (1853) the first president of Antioch College, where he demonstrated the practicality of coeducation and set high academic standards.

Mannerheim, Baron Carl Gustav Emil, 1867–1951 Finnish field marshal and president (1944–46). He fought the Bolsheviks in 1918 and was briefly regent (1919). In 1939–40 and 1941–44 he headed the Finnish forces against the USSR. The **Mannerheim Line** of defense, across the Karelian Isthmus, was planned by him; Soviet forces broke through it in 1940.

mannerism, a style in art and architecture (c.1520–1600), originating in Italy as a reaction against the equilibrium of form and proportion characteristic of the High RENAISSANCE. Artists such as PONTORMO, Il ROSSO, and PARMIGIANO created elongated, elegant figures, contorted into uncomfortable poses. Mannerists confused scale and spatial relationships and created strange tunnel-like spaces, e.g., in the works of TINTORETTO and El GRECO. Lighting was harsh, and color, acrimonious. Sculptors such as Giovanni BOLOGNA, CELLINI, and Jean Goujon of France created sinuous, bizarre forms. In architecture, the style used unbalanced proportions and arbitrary arrangements of decorations, e.g., in the Laurentian Library (Florence), designed (c.1525) by MICHELANGELO, and the UFFIZI, planned by VASARI. The ZUCCARO brothers gave mannerism an academic formalism, but by the end of the 16th cent. it gave way to the BAROQUE.

Manning, Henry Edward, 1808–92, English Roman Catholic churchman. An Anglican pastor, he became an adherent of the OXFORD MOVEMENT and in 1851 followed John Henry NEWMAN into the Roman Catholic Church; he was later ordained. Made archbishop of Westminster (1865) and a cardinal (1875), he disagreed violently with Newman over the enunciation of papal infallibility, which Manning favored. A strong advocate of social reform, he was influential in the labor movement, and in 1889 he supported the London dock strike and then single-handedly settled it.

manorial system or **seignorial system,** a socio-economic system of medieval Europe (fl. 11th–15th cent.), which regulated the landholding and production of peasants. It was based on the holding of lands from a lord *(seigneur)* in return for fixed dues in kind, money, and services. Unlike FEUDALISM, the manorial system lacked the military or political concept of the fief, and it declined with the emergence of towns, a money economy, and centralized monarchies. In its simplest form the system consisted of the division of land into self-sufficient estates, each held by a lay or ecclesiastical lord, who lent it to peasants for cultivation. The peasant might be personally free although his land was not (see VILLEIN), or servile (see SERF). The estate was divided into arable land held by peasants, meadow held in common, and woodland held by the lord. The manor was an administrative and political unit, with a court presided over by the lord and systems of taxation and public works.

Mansard: see MANSART.

mansard roof, type of roof so named because it was frequently used by François MANSART, but used earlier, e.g., at the LOUVRE (early 16th cent.). It was characteristic of French Renaissance and, later, of European and American Victorian architecture. The roof's two-section slope, with the lower slope almost vertical, allows a higher, more useful, interior.

Mansart or **Mansard, François** [mänSär'], 1598–1666, French classical architect. His Hôtel de la Vrillière (1635) was long a model for the elegant Paris house. Surviving works include the château of Maisons and, in Paris, the alterations to the Hôtel Carnavalet. His pupil and grand-nephew **Jules Hardouin Mansart,** 1646–1708, was also an architect. In 1699 he was named chief architect for the royal buildings for LOUIS XIV. At VERSAILLES he built the Galérie des Glaces, the Grand Trianon, the palace chapel, and the vast orangery. As a town planner he designed in Paris the Place des Victoires (1684–86) and the Place Vendôme (1699). The Dôme des Invalides (1706) in Paris is perhaps his greatest achievement.

Mansfeld, Peter Ernst von, 1580?–1626, commander in the THIRTY YEARS WAR. In the service of FREDERICK THE WINTER KING he defeated TILLY (1622). He became a Dutch mercenary in 1623. With an English subsidy (1625) he recruited a force to fight on the Protestant side but was defeated by WALLENSTEIN.

Mansfield, Katherine, 1888–1923, English author; b. New Zealand as Kathleen Beauchamp. Considered a master of the short story, she shows the influence of CHEKHOV in her stories, which are simple in form and evocative in substance. Collections include *Bliss* (1920), *The Garden Party* (1922) and *Something Childish* (1924).

Mansfield, Michael Joseph, 1903–, U.S. senator from Montana (1953–77); b. N.Y.C. He served as a Democrat from Montana in the U.S. House of Representatives (1943–53). As Senate majority leader (1961–77), a position he held longer than any other senator, he helped win passage of major civil-rights legislation and liberal reform programs. He also served as ambassador to Japan from 1977 to 1989.

Manship, Paul, 1885–1966, American sculptor; b. St. Paul, Minn. His works, often taking subjects from classical mythology, are noted for their emphatic musculature and polished contours, e.g., *Prometheus* (Rockefeller Center, N.Y.C.).

manslaughter: see HOMICIDE.

Mansur, al- (Muhammad ibn Abi-Amir al-Mansur billah), 914–1002, Moorish regent of CÓRDOBA. Known in Spanish as Almanzor, he became royal chamberlain (978) and controlled the caliphate. He campaigned against the Christian states of N Spain, sacking BARCELONA (985) and razing the city of LEÓN (988).

manta: see RAY.

Mantegna, Andrea [mäntĕ'nyä], 1431–1506, Italian painter of the Paduan school. Married to the daughter of Jacopo Bellini (see BELLINI, family), he was the greatest artist in N Italy outside of Venice. His passion for the antique is evidenced in all his work, and he was one of the first artists to collect Greek and Roman works. A rigorous draftsman and anatomist and a perfectionist in perspective, he nevertheless gave his statuesque forms intense life. Among his celebrated early works is the St. Luke altarpiece (Milan). His illusion of sky on the ceiling of the bridal chamber of the Gonzaga palace (Mantua) was widely imitated in the BAROQUE period. About 1497 he did *Parnassus* and *Triumph of Virtue* (Louvre) for Isabella d'Este. His *Adoration of the Shepherds* is in the Metropolitan Museum. Mantegna is also noted for his drawings and copper-plate engravings. He recaptured the art of Roman inscriptions in his initial letters for STRABO's *Geography,* and his lettering influenced the development of printing.

mantis: see PRAYING MANTIS.

Mantle, Mickey (Charles), 1931–, American baseball player; b. Spavinaw, Okla. A switch-hitter and one of the great sluggers in baseball history, he played center field during most of his career (1951–68) with the New York Yankees. His 536 home runs place him among the leaders in that category, and he was named the American League's most valuable player in 1956 (when he led the American League in batting average, home runs, and runs batted in), 1957 (when he batted .365, his highest average), and 1962. Mantle hit a record 18 home runs in World Series play.

mantra, in HINDUISM and BUDDHISM, mystic word used in ritual and MEDITATION. It is believed to have power to bring into being the reality it represents. The *bija-mantra* seed-sounds used in TANTRA are syllables having occult affinity for particular deities; use of such mantras usually requires initiation by a guru, or spiritual teacher.

Mantua, city (1990 pop. 54,808), in LOMBARDY, N Italy. It is an agricultural, industrial, and tourist center. A Roman town, it was a free commune (12th–13th cent.) and flourished (1328–1708) under the GONZAGA family. Italy regained it (1866) after Austrian and French rule. Its splendid Gonzaga palace (13th–18th cent.) has many outstanding works of art.

Manu, in Hindu legend, a divinely inspired lawgiver. Traditionally ascribed to him are the *Laws of Manu,* compiled (probably between 200 B.C. and A.D. 200) from diverse ancient sources and providing detailed rules, presumably for Brahmans (priests), governing ritual and daily life. See also HINDUISM.

Manuel, Byzantine emperors. **Manuel I** (Comnenus), c.1120–80 (r.1143–80) was the son of John II. In the Second CRUSADE (1147–49) he made a truce with the Turks to protect his western provinces. Later he made peace (1158) with William I of Sicily. Manuel supported Pope ALEXANDER III against Holy Roman Emperor FREDERICK I, and tried to reunite the empires and churches of the East and West. His neglect of Asia Minor brought a crushing defeat (1176) by the Turks. Manuel encouraged Western merchants in Constantinople. His son, ALEXIUS II, succeeded him. **Manuel II** (Palaeologus), 1348?–1425, (r.1391–1425), reigned over an empire reduced by the Turks to CONSTANTINOPLE and its environs. TIMUR's victory over the Ottoman sultan BEYAZID I (1402) temporarily saved Constantinople. Manuel's son, JOHN VIII, ruled during his father's last years.

Manuel, kings of Portugal. **Manuel I,** 1469–1521 (r.1495–1521), had a reign notable for Portugal's advances in overseas exploration, especially Vasco da GAMA's epochal voyage (1497–99) to India. Wealth from the Indies made Portugal the West's leading commercial nation. In order to marry the Spanish princess Isabel, Manuel agreed (1496) to expel the JEWS, but he first attempted their forcible conversion. He was unable to prevent the departure of some Jews and their massacre in Lisbon (1506). **Manuel II,** 1889–1932, (r.1908–10), became king after the assassination of his father and brother. In 1910 a republican revolution deposed him. He was the last king of Portugal.

Manx, virtually extinct language belonging to the Goidelic or Gaelic group of the Celtic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Manx cat: see under CAT.

Manzoni, Alessandro, 1785–1873, Italian novelist and poet. His most famous work, *The Betrothed* (1825–26), a romantic novel of 17th-cent. Milan, had gone through 118 editions by 1875, and greatly influenced the development of Italian prose. He also wrote tragedies and poetry, including the celebrated *Fifth of May* (1821), on the death of Napoleon. VERDI's *Requiem* commemorates the poet's death.

Maori, Polynesian people of New Zealand, making up about 8% of the nation's population. They speak a language related to Tahitian and Hawaiian. Believed to have migrated from POLYNESIA in canoes in early times, the Maori established an agricultural society. In the 19th cent., after wars against European encroachment, they were reduced to 100,000 and later even fewer. Their population has since increased to 250,000; today, they are economically self-sufficient while maintaining their cultural identity.

Maori language, spoken by the MAORI people of New Zealand, belonging to the Polynesian subfamily of the Malayo-Polynesian family of languages. See LANGUAGE (table).

Mao Zedong or **Mao Tse-tung** [both: mou dzŭ-dōōng], 1893–1976, founder of the People's Republic of China. Born in Hunan prov., he was one of the original members of the Chinese Communist party. Mao organized unions for the KUOMINTANG, but after the Communist-Kuomintang split (1927) he worked to establish rural soviets and to build the Red Army. He led (1934–35) the LONG MARCH from Jiangxi N to Yan'an in Shaanxi prov. and became head of the Chinese Communist party. In 1949, when the Communists had seized most of the mainland, Mao became the first chairman of the People's Republic of China. In 1958 he launched the Great Leap Forward, a program for industrial growth; after it failed he was

replaced (1959) as chairman by LIU SHAOQI, but still retained his party leadership. Mao successfully attacked Liu by directing the CULTURAL REVOLUTION (1966–69), a period of widespread agitation. In the 1970s he consolidated his position as China's most powerful figure. Mao's policies often strained relations with the USSR, but his ideas on revolutionary struggle became very influential in the Third World. In 1972 he developed closer ties with the West by meeting U.S. Pres. NIXON in Beijing.

maple, common name for the genus *Acer* of the Aceraceae, a family of deciduous trees and shrubs of the Northern Hemisphere, characterized by winged seeds. Maples are popular as shade trees and noted for their brilliant fall colors. Several species provide close-grained, hardwood timber, e.g., the sugar maple (*A. saccharum*) and the black maple (*A. nigrum*); these trees are also the main source of maple syrup. In the spring, their sap is drawn off, strained, and concentrated by boiling to produce syrup and sugar. Other well-known species include the box elder (*A. negundo*), a shade tree, and the swamp, or red, maple (*A. rubrum*).

maple sugar: see SUCROSE.

map projection, transfer of the features of the earth's surface or those of another spherical body onto a flat sheet of paper. Only a globe can represent surface features correctly with reference to area, shape, scale, and direction. Projection from a globe to a flat map always causes some distortion. A grid or net of two intersecting systems of lines corresponding to parallels and meridians must be drawn on a plane surface. Some projections (equidistant) aim to keep correct distances in all directions from the center of the map. Others show areas (equal-area) or shapes (conformal) equal to those on the globe of the same scale. Projections are cylindrical, conical, or azimuthal in geometric origin. See also MERCATOR MAP PROJECTION.

Mapp v. Ohio, case decided in 1961 by the U.S. SUPREME COURT, overturning a conviction based on evidence gained by entering a house without a search warrant. The Court held that the exclusionary rule (based on the 4th amendment to the U.S. CONSTITUTION), which bars the use in federal courts of EVIDENCE obtained through illegal searches and seizures, extended also to the state courts.

Maputo, formerly **Lourenço Marques,** city (1991 est. pop. 1,215,000), capital of Mozambique, a port on the Indian Ocean. The country's largest city and economic center, it is linked by rail with South Africa and Zimbabwe. Manufactures include food products, cement, and furniture; the chief exports are coal, cotton, sugar, and chrome. The city's excellent beaches are a tourist attraction. Founded in the late 18th cent., it became the capital in 1907 and was renamed (1976) after independence.

maquiladoras, assembly plants along the U.S.-Mexico border, generally owned by non-Mexican corporations, that produce finished goods for the U.S. market. Originating in the 1960s but significant only since the 1980s, they depend on low-cost labor, advantageous tariffs, and their proximity to the U.S. A multibillion dollar industry, maquiladoras constitute one of Mexico's primary sources of export income and have stimulated migration to the border cities.

Maracaibo, city (1991 pop. 1,207,513), NW Venezuela, capital of Zulia state, at Lake MARACAIBO's outlet to the Caribbean Sea. It is the nation's oil capital and a major commercial and industrial center, exporting textiles, soap, and lumber and other inland products. Founded in 1571, Maracaibo developed slowly until 1918, when foreign interests began to exploit the vast petroleum resources of the area. Lake Maracaibo bridge, one of the world's longest bridges, is south of the city.

Maracaibo, Lake, large, brackish lake, c.5,100 sq mi (13,210 sq km), NW Venezuela, extending c.110 mi (180 km) inland from the Caribbean. It is one of the world's richest oil-producing regions. The city of Maracaibo is at the lake's outlet to the sea.

Marat, Jean Paul [märä'], 1743–93, French revolutionary. A doctor, he turned to politics when the FRENCH REVOLUTION began (1789) and founded the journal *L'Ami du peuple,* in which he bitterly attacked all who were in power. Outlawed, he fled to England (1790, 1791) and also hid in the Paris sewers, thereby worsening a skin disease; it required treatments in warm baths. He continued to publish in secret and helped to inflame the public. Elected (1792) to the Convention, he supported the JACOBINS against the GIRONDISTS. Marat was murdered in his bath by an admirer of the Girondists, Charlotte CORDAY.

Marathi [mərä'tē], language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See LANGUAGE (table).

Marathon, village and plain of ancient Greece, NE of ATHENS, site of an Athenian victory (490 B.C.) in the PERSIAN WARS. In legend, the plain was the scene of the victory of THESEUS over a great bull. See also MARATHON RACE.

marathon race, long-distance endurance race, named for MARATHON, Greece, from which, in 490 B.C., the runner Pheidippides carried news to Athens of a Greek victory over the Persians. Included in the first modern Olympic games (1896), the marathon was standardized at 26 mi, 385 yd (42.2 km) in 1908. Annual marathons in Boston, New York City, and elsewhere attract thousands of distance runners.

Boston Marathon, 1937

marble, a ROCK formed by the METAMORPHISM of LIMESTONE. The term is loosely applied to any limestone or DOLOMITE that takes a good polish and is otherwise suitable as a building or ornamental stone. Its color varies depending on the types of impurities present. It has been used since ancient times for statuary, monuments, and facing stones. Like all limestones, it is corroded by water and acid fumes and is therefore ultimately uneconomical for use in exposed places.

Marbury v. Madison, case decided in 1803 by the U.S. SUPREME COURT. In a dispute over federal appointments, Chief Justice MARSHALL held that the statute that was the basis for the remedy sought gave the Court authority denied it by Article III of the U.S. CONSTITUTION. This decision, the first to invalidate an act of Congress, established the doctrine of judicial review, vastly expanding the judiciary's power.

Marc, Franz, 1880–1916, German painter. A leader of the BLAUE REITER group, he developed a rich chromatic symbolism to depict a mystical world of animals. *Blue Horses* (Walker Art Center, Minneapolis) is representative.

Marc Antony: see ANTONY.

marcasite or **white iron pyrites,** mineral closely resembling and having the same chemical composition (FeS_2) as PYRITE; paler in color, it becomes darker upon oxidation. Marcasite occurs worldwide in marls, clays, and limestones.

Marceau, Marcel [märsō'], 1923–, French mime. Famed for his sad-faced clown character, Bip, he has performed frequently with his company in the U.S. since 1955.

Marcellus, Marcus Claudius, c.268–208 B.C., Roman consul. He besieged Syracuse in the Second PUNIC WAR and took the city in 212. He also captured (211) the town of Capua. Earlier (222), he had killed the king of the Insubrian Gauls in single combat.

March, earl of: see MORTIMER, ROGER DE, EARL OF MARCH.

March: see MONTH.

The key to pronunciation appears on page xiii.

Marcian, 396–457, the last Theodosian to be East Roman emperor (450–57). He called the Council of CHALCEDON (451). By refusing tribute to ATTILA he brought on the HUN invasion.

Marciano, Rocky, 1924–69, American boxer; b. Brockton, Mass., as Rocco Francis Marchegiano. He turned professional (1947) and won the world heavyweight championship (1952) by knocking out Jersey Joe Walcott. A powerful puncher, he won 43 of his 49 professional bouts by knockouts. He retired in 1956 as the only heavyweight champion who never lost a professional bout. He died in a plane crash.

Marcion, fl. A.D. 144, early Christian bishop, founder of the Marcionites, the first great Christian heresy to rival Catholic Christianity. He taught that there were two gods, the stern creator God of the OLD TESTAMENT and the superior merciful God of the NEW TESTAMENT, and he rejected the Old Testament entirely. Marcionism, which stressed ascetic practices, influenced and was later absorbed by MANICHAEISM.

Marcomanni: see GERMANS.

Marconi, Guglielmo, Marchese, 1874–1937, Italian physicist. For his development of wireless telegraphy (see RADIO), he shared with Karl Braun the 1909 Nobel Prize in physics. Marconi sent (1895) long-wave signals over a distance of more than a mile and received (1901) the first transatlantic wireless signals.

Marco Polo: see POLO, MARCO.

Marcos, Ferdinand Edralin, 1917–89, president and prime minister of the PHILIPPINES (1965–1986). He maintained close ties with the U.S. and attempted to suppress Muslim rebels and Communist and liberal opposition to his rule. Marcos proclaimed (1972) martial law, and assumed (1973) virtual dictatorial rule under a new constitution. Opposition strength continued to grow, despite the lifting of martial law in 1981. After defeating Corazon AQUINO in the controversial 1986 election, he was accused of election fraud and forced by a popular uprising to leave the Philippines.

Marcus Aurelius (Marcus Aelius Aurelius Antoninus), 121–180, Roman emperor and philosopher. He was adopted by the emperor Antoninus Pius and succeeded him in 161, ruling jointly with his adoptive brother, Lucius Verus. Sole emperor after 169, he spent most of his reign repressing rebellions and attacks by the Parthians, Germans, and Britons. He was a humanitarian ruler who nevertheless accepted the then-prevalent view of the Christians as the empire's chief enemies. His spiritual reflections, the *Meditations,* are considered a classic work of STOICISM. They were strongly influenced by the thought of EPICTETUS.

Marcuse, Herbert, 1898–1979, American political philosopher; b. Germany. A founder of the Frankfurt Institute of Social Research, he fled from Nazis (1934) to the U.S. He taught at Harvard and other universities before becoming (1965) professor of philosophy at the Univ. of California at San Diego. He is known for his synthesis of Marxist and Freudian theory, expounded in *Eros and Civilization* (1954), *One Dimensional Man* (1964), and other books. He was a hero to American radicals of the 1960s.

Mardi Gras, last day before the fasting season of Lent. It is the French name for Shrove Tuesday. Carnivals are held in some countries, usually lasting a week or more before Mardi Gras itself. Among the most celebrated carnivals are those of New Orleans, Rio de Janeiro, Nice, and Cologne.

Margaret, Danish queens. **Margaret I,** 1353–1412, queen of Denmark, Norway, and Sweden, was the daughter of WALDEMAR IV of Denmark. Married (1363) to Haakon VI of Norway (d. 1380), the son of MAGNUS VII, she was regent for her son OLAF V in Denmark (1375–87) and Norway (1380–87). After he died (1387), she defeated and captured (1389) the Swedish king, Albert, and persuaded the Danish, Norwegian, and Swedish diets to accept her grandnephew, Eric of Pomerania, as king. He was crowned (1397), and the Kalmar Union was established. Margaret remained the actual ruler of all three kingdoms until her death. **Margaret II** (Margrethe), 1940–, queen of Denmark (r.1972–), is the daughter of King FREDERICK IX and Queen Ingrid (daughter of GUSTAVUS VI of Sweden). She became queen under a new constitution (1953) allowing female succession. She and her husband, Comte Henri de Laborde de Monpezat, have two sons.

Margaret, 1930–, British princess; sister of ELIZABETH II. Her 1960 marriage to Antony Armstrong-Jones (later earl of Snowdon) produced two children: Viscount Linley (b. 1961) and Sarah (b. 1964). It ended in divorce in 1978.

Margaret Maid of Norway, 1283–90, infant queen of Scotland (1286–90); daughter of Eric II of Norway; granddaughter of ALEXANDER III of Scotland, whom she succeeded. Her early death led to an English attempt to subjugate Scotland.

Margaret Maultasch [moul'täsh] [Ger., = pocket mouth], 1318–69, countess of Tyrol, called the Ugly Duchess. She expelled her first husband from Tyrol, received a secular annulment, and married (1342) his son. The act offended the nobles, who rebelled. Margaret eventually abdicated (1363), and Tyrol passed to the HAPSBURGS. Lion FEUCHTWANGER used her story in his novel *The Ugly Duchess.*

Margaret of Angoulême: see MARGARET OF NAVARRE.

Margaret of Anjou, 1430?–1482, queen consort of HENRY VI of England. In the first 16 years of the Wars of the ROSES, she defended the cause of her husband and her son Edward against the house of YORK. Captured (1471) by the Yorkist EDWARD IV, she returned (1476) to France where she died in poverty.

Margaret of Austria, 1480–1530, Hapsburg princess, regent of the NETHERLANDS; daughter of MAXIMILIAN I. First betrothed to the future CHARLES VIII of France, she was married (1497) to John of Spain (d. 1497) and (1501) to Philibert of Savoy (d. 1504). In 1507 she became guardian of her nephew, the future Holy Roman Emperor CHARLES V, and regent of the Netherlands, mediating between her father and his Dutch subjects.

Margaret of Navarre or **Margaret of Angoulême** [äNgo͞olām'], 1492–1549, sister of FRANCIS I of France. Married (1527) to Henri d'Albret, king of Navarre, she was a patron of writers such as François RABELAIS. She wrote the *Heptaméron,* an original collection of 72 stories in the manner of Boccaccio.

Margaret of Parma, 1522–86, Spanish regent of the NETHERLANDS; illegitimate daughter of Holy Roman Emperor CHARLES V. She was married (1536) to Alessandro de' Medici (d. 1537) and (1538) to Ottavio Farnese (see FARNESE, family), duke of Parma. In 1559 she became regent of the Netherlands under her half brother, PHILIP II. She resigned in 1567, opposing the duke of ALBA's harsh suppression of the nationalist revolt led by WILLIAM THE SILENT.

Margaret of Valois [välwä'], 1553–1615, queen of France and Navarre; daughter of HENRY II. Her marriage (1572) to the Protestant Henry of Navarre (later HENRY IV of France) was a prelude to the massacre of Protestants on SAINT BARTHOLOMEW'S DAY. She became estranged from her husband and her brother, HENRY III, and took up arms against them. Captured (1586) by royal troops, she was confined (1587–1605) at Usson, where she assembled a literary circle. In 1599 Margaret agreed to have her marriage annulled, and she spent her last years in Paris. Her writings show much literary ability.

Margaret Tudor, 1489–1541, queen consort of JAMES IV of Scotland; sister of HENRY VIII of England. She married James in 1503, and after his death (1513) their infant son, JAMES V, became king. Margaret remarried twice and played a large part in Scottish politics, her affiliation varying with her personal interest. JAMES I of England was her descendant.

Mari, ancient city of Mesopotamia, on the middle Euphrates R. Discovered in the 1930s, the site has since been excavated. Evidence of habitation dates to the 3d millennium B.C. Mari was the commercial and political focus (c.1800 B.C.) of W Asia, and the inhabitants were referred to as Amorites in the Old Testament. HAMMURABI conquered (c.1700 B.C.) Mari, which never regained its former status.

Maria, queens of PORTUGAL. **Maria I,** 1734–1816 (r.1777–1816), was married (1760) for political reasons to her uncle, PETER III, who ruled jointly with her. Together they brought down the powerful minister POMBAL and freed his enemies from jail or exile. The deaths of Peter (1786) and her eldest son, Joseph (1788), contributed to unhinging her mind, and her second son, later JOHN VI, assumed power (1792) and became regent (1799). **Maria II,** 1819–53 (r.1834–53), was designated queen by her father, PEDRO I of Brazil, on condition that she marry her uncle, Dom Miguel, but he usurped the throne (1828) before she could return to Portugal. Her father led an invading army into Portugal and deposed Miguel

in the Miguelist Wars (1832–34), restoring Maria as queen. Her reign was torn by dissent and revolutions.

Marianas trench, Marianas trough, or **Marianas deep,** depression in the Pacific Ocean, 210 mi (338 km) SW of Guam. The deepest (36,198 ft/11,033 m) part of any ocean, it was reached (1960) by two men in a U.S. navy bathyscape.

Maria Theresa, 1717–80, Austrian archduchess, queen of Bohemia and Hungary (1740–80); consort of Holy Roman Emperor FRANCIS I. The daughter of Emperor CHARLES VI, she succeeded (1740) to the HAPSBURG lands by the PRAGMATIC SANCTION of 1713. Her succession was contested in the War of the AUSTRIAN SUCCESSION, in which she lost Silesia to Prussia but secured (1745) the election of her husband as emperor. Aided by her chancellor, Wenzel Anton Kaunitz, she allied Austria with France in the SEVEN YEARS WAR (1756–63) and joined in the partition (1772) of Poland. With her son, JOSEPH II (with whom she jointly ruled after 1765), Maria Theresa carried out agrarian reforms and centralized the administration. During her reign Vienna developed as a center for music and the arts. Among her 16 children were Emperors JOSEPH II and LEOPOLD II, and MARIE ANTOINETTE of France.

Marie Antoinette, 1755–93, queen of France, wife of LOUIS XVI; daughter of Holy Roman Emperor FRANCIS I. In 1770 she married the DAUPHIN, who became king in 1774. The marriage, made to strengthen France's ties with Austria, was not popular and was unconsummated for seven years. Unhappy, the queen surrounded herself with a dissolute clique and threw herself into a life of pleasure and extravagance. Her notorious reputation led to several scandals. The famous solution to the bread famine, "Let them eat cake," is unjustly attributed to the queen. Although she contributed to the downfall of A.R.J. TURGOT in 1776, her influence on Louis in the first two years of the FRENCH REVOLUTION has been exaggerated. She was brought (Oct. 1789) to Paris with the king from VERSAILLES and was seized at Varennes when the royal family tried to escape (1791). The king's apathy led her to negotiate first with the comte de MIRABEAU and later with Antoine Barnave, and she secretly urged Austrian intervention in France. After the TUILERIES palace was stormed (Aug. 1792), the king and queen were imprisoned and charged with treason. The king was executed in Jan. 1793; Marie Antoinette's son (see LOUIS XVII) was taken from her. In October she was tried by a revolutionary tribunal and guillotined (Oct. 16).

Marie de' Medici, 1573–1642, queen of France; daughter of Francesco de' MEDICI, grand duke of Tuscany. She became the second wife of HENRY IV in 1600 and after his assassination (1610) became regent for her son LOUIS XIII. She chose as minister her favorite, Concino Concini, who dissipated the treasury by extravagance. Exiled after Concini's murder (1617), Marie was reconciled with her son in 1622. She tried (1630) to gain the dismissal of her former protégé and the king's minister, Cardinal RICHELIEU, but Louis exiled her again. Her daughter, HENRIETTA MARIA, married CHARLES I of England.

Marie Louise, 1791–1847, empress of the French (1810–15), as consort of NAPOLEON I; daughter of Holy Roman Emperor FRANCIS II. She married Napoleon in 1810 and was the mother of NAPOLEON II. After her husband's defeat the Congress of VIENNA awarded her the duchies of Parma, Piacenza, and Guastalla, which she ruled (1816–47) ineptly. She remarried twice.

marigold, plant (genus *Tagetes*) of the COMPOSITE family, mostly Central and South American herbs cultivated as garden flowers. Two common annuals are the large-flowered, strong-scented, yellow or orange African marigold (*T. erecta*) and the smaller, yellow or orange and red French marigold (*T. patula*). Both are native to Mexico and Guatemala.

marijuana or **marihuana,** relatively mild, nonaddictive drug with hallucinogenic properties, obtained from the flowering tops, stems, and leaves of the HEMP plant. Resins found on the surface of the female plant are used to prepare the most potent form of marijuana, hashish. The primary active substance is tetrahydrocannabinol (THC). Marijuana produces a dreamy, euphoric state of altered consciousness, with feelings of detachment and gaiety. The appetite is usually enhanced, while the sex drive may increase or decrease. Adverse reactions are relatively rare, and most can be attributed to adulterants frequently found in marijuana preparations. Marijuana has been used experimentally to reduce nausea from cancer CHEMOTHERAPY and in the treatment of GLAUCOMA, but in 1992 the Drug Enforcement Administration declined to reclassify marijuana so that it could be prescribed by doctors. Marinol, a synthetic form of THC, is approved for use in reducing the nausea caused by chemotherapy. In the U.S. there were a number of successful efforts, especially in the 1970s, to reduce criminal penalties for possession and use of marijuana, but many of the resulting laws have since been modified or repealed.

Marin, John, 1870–1953, American painter; b. Rutherford, N.J. A leading watercolorist, he frequently painted scenes of New York and Taos and Maine seascapes. He rendered these with powerful zigzag strokes, often enclosed by angular abstract forms, and used a wide variety of color effects.

marine biology, study of ocean plants and animals and their ecological relationships. Marine organisms are classified according to their mode of life as nektonic (free-swimming), planktonic (floating), or benthic (bottom-dwelling). Their distribution depends on the chemical and physical properties of seawater (e.g., temperature, salinity, and dissolved nutrients), ocean current, and penetration of light. See also OCEANOGRAPHY.

Mariner, in space exploration: see SPACE PROBE, table.

marines, troops that serve on board ships of war or in conjunction with naval operations. A British marine corps was established in 1664, reflecting the need for skilled riflemen aboard military vessels. The present U.S. marine corps was created by Congress in 1798 and now functions as a complete operating unit within the U.S. navy. It has been prominent in all U.S. wars, beginning with the TRIPOLITAN WAR (1800–1815) in North Africa. Highly trained in amphibious landing operations, it has also been used between wars to quell disturbances abroad and to serve as a temporary occupying force, notably in the Caribbean and Central America. The corps won special distinction during the Pacific island invasions of WORLD WAR II and in the KOREAN WAR and VIETNAM WAR.

Maris, Roger (Eugene), 1934–85, American baseball player; b. Hibbing, Minn. With the New York Yankees in 1961 he hit 61 home runs, surpassing Babe RUTH's major-league record by one. At the time, baseball commissioner Ford C. Frick ruled that Ruth's record would stand because it was achieved in a 154-game schedule, compared with a 162-game schedule for Maris, but in 1991 major-league baseball recognized Maris as the official home-run record holder. In 12 seasons (1957–68) Maris had 275 home runs.

maritime law, body of law governing navigation and overseas commerce. It is based on customs and usages that developed between trading nations and were compiled beginning in the late Middle Ages. It is part of the international law only insofar as it determines relations between nations. In the U.S., maritime cases (except for collision at sea) are under exclusive federal jurisdiction. See also SEA, LAW OF THE.

Maritime Provinces, Canada, term applied to NOVA SCOTIA, NEW BRUNSWICK, and PRINCE EDWARD ISLAND, which, before the formation of the Canadian confederation (1867), were politically distinct from Canada proper.

Marius, Caius, 155 B.C.–86 B.C., Roman general. He was seven times consul and won a reputation in wars against the Germans. The rival of SULLA, he fled Rome when Sulla got the command against MITHRIDATES VI. With the help of CINNA, Marius returned to Rome and fought Sulla in a bloody civil war that Sulla won.

marjoram or **sweet marjoram,** Old World perennial aromatic herb (*Marjorana hortensis*) of the MINT family, cultivated for flavoring and for origanum oil, used in perfumed soaps. The closely related European wild marjoram (*Origanum vulgare*) is the spice usually sold as OREGANO.

Mark, Saint, Christian apostle, traditional author of the 2d GOSPEL. Christians in Jerusalem met at his mother's house. He accompanied St. PAUL and St. BARNABAS to Cyprus. Traditionally he was an associate of St. PETER, who is thought to have provided him with many of his facts. The Alexandrian church claims Mark as its founder; he is patron saint of Venice.

Mark, Gospel according to Saint, second book of the NEW TESTAMENT, simplest and earliest of the GOSPELS (probably A.D. c.70), used as a source by MATTHEW and LUKE. It may be divided into the beginning of the ministry of JESUS (1.1–1.13), his first two years of

The key to pronunciation appears on page xiii.

preaching (1.14–6.56), his third year (7–13), and the Passion and RESURRECTION (14–16).

Markham, Edwin, 1852–1940, American poet; b. Oregon City, Oreg. He is best known for his poem "The Man with the Hoe" (1899), inspired by MILLET's painting. His other work includes the verse in *Lincoln and Other Poems* (1901).

Markova, Dame Alicia [märkō'vä], 1910–, English ballerina. She joined (1925) DIAGHILEV and became (1932) prima ballerina with the Vic-Wells Ballet in London. She formed (1935) her own dance company with Anton DOLIN and appeared with other companies in such classic roles as *Giselle*.

Alicia Markova

Marlborough, John Churchill, 1st duke of, 1650–1722, English general and statesman, one of the greatest military commanders in history. Under JAMES II he crushed the rebellion (1685) of the duke of MONMOUTH. During the GLORIOUS REVOLUTION he supported WILLIAM III against JAMES II but later (1692–98) fell into William's disfavor. Marlborough's power peaked in the reign of Queen ANNE. Created duke (1702), he was involved in many victories in the War of the SPANISH SUCCESSION, including Blenheim (1704), Ramillies (1706), Oudenarde (1708), and Malplaquet (1709). Politically he favored the WHIGS during the war; when they fell he was dismissed (1711). On the accession of GEORGE I in 1714, Marlborough resumed chief command of the army. His wife, **Sarah Churchill, duchess of Marlborough,** 1660–1744, was a favorite of Queen Anne. Born Sarah Jennings, she married John Churchill in 1677. She wielded great influence at Anne's court until they quarreled in 1705. After her husband's death she supervised the building of Blenheim Palace.

Marley, Bob, 1945–81, Jamaican reggae musician. As a member of the Wailers, and later on his own, he propelled REGGAE to worldwide popularity. His songs often express his commitment to nonviolence and to RASTAFARIANISM.

marlin, open-sea FISH related to the SAILFISH and SWORDFISH (family Istiophoridae), prized by sportsmen. The blue marlin (genus *Makaira*) of the Gulf Stream may reach 1,000 lb (454 kg) in weight. The marlin's upper jaw extends into a long spike, which it uses to club the fish on which it feeds.

Marlowe, Christopher, 1564–93, English dramatist and poet. A major Elizabethan figure, he broke with TRAGEDY modeled on SENECA. His dramas have heroic themes, usually that of a great character destroyed by his own passions and ambition. Marlowe introduced blank verse as the medium for drama, paving the way for SHAKESPEARE. His most important plays are *Tamburlaine the Great* (c.1587), *Dr. Faustus* (c.1588), *The Jew of Malta* (1589), and *Edward II* (c.1592). His best-known nondramatic works are the long poem *Hero and Leander* (1598, finished by George CHAPMAN) and the lyric "Come live with me and be my love."

Marne, battle of the, two WORLD WAR I battles that took place at the Marne River, in France. In the first (Sept. 6–9, 1914), the German advance on Paris was halted by the Allies. In the second (July 1918), the last great German advance of the war was decisively repulsed by the Allies.

Marprelate controversy, a 16th-cent. English religious argument. Under the pseudonym Martin Marprelate, several Puritan pamphlets appeared (1588–89), satirizing the Church of England's authoritarianism and starting a flood of literature from both Martinist and anti-Martinist factions.

Marquand, J(ohn) P(hilips), 1893–1960, American author; b. Wilmington, Del. His gently satirical novels, often dealing with the rich in NEW ENGLAND, include *The Late George Apley* (1937; Pulitzer) and *Point of No Return* (1949).

Marquette, Jacques, 1637–75, French missionary and explorer in NORTH AMERICA, a Jesuit priest. He accompanied (1673) Louis JOLLIET on a journey down the MISSISSIPPI R., proving the existence of a water highway from the ST. LAWRENCE to the GULF OF MEXICO.

Marrakesh, city (1990 est. pop. 1,517,000), W central Morocco. The city is renowned for leather goods and is a principal commercial center of Morocco. It was founded (1062) by the ALMORAVIDS. The French captured the city in 1912. Beautifully situated near the ATLAS Mts., Marrakesh has extensive gardens, a 14th-cent. palace, and a former palace of the sultan, now a museum of Moroccan art. The minaret of the famous Koutoubya mosque dominates the city.

marriage, socially sanctioned union of one or more men with one or more women, called monogamy when only one partner of each sex is involved and polygamy when the marriage includes more than one wife or (more rarely) more than one husband. In many societies, marriage has been the focus of creating and consolidating ties between families, with marriages often arranged by parents and the partners sometimes pledged in childhood. In the West; marriage has traditionally been supervised by the churches; in the Roman Catholic Church it has been declared a SACRAMENT. Civil unions are now permitted in most societies. In Anglo-American LAW, marriage differs from other CONTRACTS in that it may be terminated by a court (through DIVORCE), but not by the partners agreeing between themselves. Most marriages are solemnized by some ritual that conforms to law, but in the U.S. a few states still recognize "common-law" marriages entered into by partners without any ceremony. All states establish age and other requirements for marriage, as well as conditions for legal dissolution of a marriage that detail certain rights and obligations of the partners, particularly with regard to PROPERTY. Anglo-American law was formerly characterized by the view that husband and wife were one legal personality, in effect, that of the husband. Since the mid-19th cent. the rights of married women to own property, enter into contracts, bring legal suits, and otherwise act independently of their husbands have gradually expanded. See also KINSHIP. In part because of economic advantages of marriage (coverage by a spouse's health insurance, tax advantages) and the rights and recognition afforded one considered next-of-kin, many GAY RIGHTS advocates are pressing for laws that would allow gay couples to marry.

Marryat, Frederick [măr'ēăt], 1792–1848, English novelist. His 24 years of service in the British navy provided background for his thrilling tales of sea adventure, e.g., *Frank Mildmay* (1829) and *Mr. Midshipman Easy* (1836).

Mars, in astronomy, 4th PLANET from the sun, at a mean distance of 141.6 million mi (227.9 million km). It has a diameter of 4,223 mi (6,796 km) and a thin atmosphere composed largely of carbon dioxide. The surface of Mars is highly diverse: the younger, lower terrain of the northern hemisphere is sparsely cratered, whereas the older, higher terrain of the southern hemisphere is often densely cratered and contains numerous channels tens of miles wide and hundreds of miles long. It also has numerous volcanoes—including Olympus Mons (c.370 mi/600 km in diameter and 16 mi/26 km tall), the largest in the solar system—and lava plains. Dust storms, often local but sometimes global in extent, have been observed moving across the Martian surface. Mars has two known satellites, **Phobos** and **Deimos,** both discovered by

the American astronomer Asaph Hall in 1877; both are very small, irregular ellipsoids. SPACE PROBES that have encountered Mars include *Mariners 4, 6, 7,* and *9* (1965, 1969, 1971); *Vikings 1* and *2* (1976); and several Soviet Mars spacecraft. Experiments on the Viking landing craft detected no definite evidence of life.

Mars, in Roman mythology, god of war and of the state; originally an agricultural god; father of ROMULUS and husband of Bellona. The martial Romans considered him second in importance only to JUPITER. His festivals were held in March (named for him) and October. Mars was identified with the Greek ARES.

Mars, Soviet space probe: see SPACE PROBE, table.

Marsalis, Wynton, 1961–, African-American jazz trumpeter and bandleader; b. New Orleans. He early acquired a reputation for astounding technique and emerged as a leading jazz and classical player. His older brother, **Branford Marsalis**, 1960–, b. New Orleans, is a brilliant jazz, rock, pop, and classical saxophonist and bandleader, known for his improvisations and technique.

Marseilles [märsā'], city (1990 pop. 800,550), capital of Bouches-du-Rhône dept., SE France. France's second city and a major seaport, it is an important industrial center and produces many food products. It is the oldest French town, settled (c.600 B.C.) by Phocaean Greeks and annexed by Rome in 49 B.C. During the CRUSADES (11th–14th cent.), Marseilles was a commercial center and transit port for the Holy Land. Taken by Charles I of Anjou (13th cent.), it was absorbed by PROVENCE and bequeathed to the French crown in 1481. It grew as a port in the 19th cent., with the opening of the SUEZ CANAL and the conquest of Algeria. It is known for its great avenue, the Canebière, and for the Chateau d'If (1524), a castle in its harbor.

Marsh, Dame Ngaio, 1899–1982, New Zealand detective novelist. Her many books, acute in characterization and literary in style, include *A Man Lay Dead* (1934), *Artists in Crime* (1938), *False Scent* (1959), and *Photo Finish* (1980).

Marsh, Reginald, 1898–1954, American painter; b. Paris. An illustrator, scene designer, and easel and mural painter, he is known for his lively paintings of Manhattan street life, e.g., *"Why Not Use the 'L'?"* (1930; Whitney Mus., N.Y.C.).

marsh: see SWAMP.

Marshall, Alfred, 1842–1924, English economist. While a professor (1885–1908) at Cambridge Univ., he systematized the classical economic theories and made new analyses of his own, thus laying the foundation of the neoclassical school of economics. He was concerned with theories of cost, value, and distribution, and developed a concept of marginal utility. His *Principles of Economics* (1890) became a standard work.

Marshall, George Catlett, 1880–1959, American army officer and statesman; b. Uniontown, Pa. He was a staff officer in WORLD WAR I, an aide to Gen. PERSHING (1919–24), and army chief of staff (1939–45). He helped direct Allied strategy in WORLD WAR II and was named general of the army (five-star general) in 1944. As secretary of state (1947–49), he organized and directed the European Recovery Program (the MARSHALL PLAN) to promote postwar recovery in Europe, for which he received the 1953 Nobel Peace Prize. He also served briefly as secretary of defense (1950–51).

Marshall, John, 1755–1835, 4th chief justice of the U.S. SUPREME COURT (1801–35); b. Virginia. A noted lawyer and a delegate to the Virginia assembly, Marshall defended the new U.S. Constitution. As a special envoy to France (1797–98), he was involved in the XYZ AFFAIR. Returning home, he served in Congress (1799–1800) and as secretary of state in Pres. John ADAMS's beleaguered Federalist administration. Appointed chief justice, Marshall established the prestige and independence of the Supreme Court and formulated basic principles of constitutional law. In MARBURY V. MADISON he established the Court's power to determine the constitutionality of legislation; in the Dartmouth College Case he dealt with the inviolability of contract; and, as an opponent of STATES' RIGHTS, in MCCULLOCH V. MARYLAND and Gibbons v. Ogden he established the superiority of federal authority under the Constitution. In these and many other cases, the breadth and wisdom of his interpretations earned him the appellation the Great Chief Justice.

Marshall, Thurgood, 1908–93, associate justice of the U.S. SUPREME COURT (1967–91); b. Baltimore, Md.; grad. Howard Law School (1933). As chief counsel for the NAACP Legal Defense and Educational Fund, he became an influential civil-rights lawyer, arguing 32 cases before the Supreme Court and winning 29 of them, including BROWN V. BOARD OF EDUCATION OF TOPEKA, KANSAS, which led to the end of de jure segregation in public schools. He was appointed to the U.S. Court of Appeals for the Second Circuit by Pres. Kennedy in 1961 and served (1965–67) as solicitor general of the U.S. under Pres. Johnson. In 1967 he became the first African-American Supreme Court justice when Johnson appointed him to the Court. During his tenure as associate justice he was particularly concerned with civil rights and economic justice and was a strong opponent of CAPITAL PUNISHMENT.

Marshall Islands, officially Republic of the Marshall Islands, independent island group (1991 pop. 48,091), c.70 sq mi (181 sq km), consisting of c.1,225 atolls and reefs, in the central Pacific; formerly part of the U.S. Trust Territory of the PACIFIC ISLANDS. The U.S. is responsible for their defense. The main atolls are MAJURO, the capital; Arno; Ailinglaplap; Jaluit; and Kwajalein, site of a U.S. military missile range. The predominantly Micronesian mainly Protestant population depends for the most part on U.S. aid, tourism, fishing, and subsistence farming. English is the official and Marshallese, a Malayo-Polynesian tongue, the native language; Japanese is also spoken.

History. The islands were named after a British captain who visited them in 1788. They were annexed (1885) by Germany and were seized (1914) by Japan, which received (1920) a League of Nations mandate over them. In WORLD WAR II, U.S. forces occupied (1943–44) the islands and they were included (1947) in the U.S.-administered trust territory. After the war both ENEWETAK and BIKINI atolls were used as U.S. nuclear-weapons test sites, and Kwajalein is presently used for testing U.S. intercontinental ballistic missiles. In 1983 the U.S. gave $183.7 million to the Marshall Islands for damages caused by the tests. The Marshalls became self-governing in 1979 and achieved free-association status in 1986. See PACIFIC OCEAN map.

Marshall Plan or **European Recovery Program,** a coordinated effort by the U.S. and many nations of Europe to foster European economic recovery after WORLD WAR II. First urged (June 5, 1947) by U.S. Secy. of State George C. MARSHALL, the program was administered by the Economic Cooperation Administration (ECA) and from 1948 to 1951 dispensed more than $12 billion in American aid.

marsh mallow: see MALLOW.

Marsilius of Padua, d. c.1342, Italian political philosopher. His tract *Defender of the Peace* (1324), written for Holy Roman Emperor LOUIS IV in his struggle with Pope John XXII, argued that the power of kings and of the church comes from the people and is subject to their control, and that the church should be under the civil ruler. The work was repeatedly condemned by the Holy See.

Marston, John, 1576–1634, English satirist and dramatist. After his early verse satires were suppressed (1599), he turned to drama, writing *Antonio and Mellida* (1599); *Antonio's Revenge* (1599); *The Malcontent* (1604), his masterpiece; and *The Dutch Courtezan* (1605). He collaborated (1605) with JONSON and CHAPMAN on *Eastward Ho!*

marsupial, member of the order Marsupialia, the pouched MAMMALS (sometimes considered a subclass, Metatheria). All but the New World OPOSSUMS and an obscure South American family are found only in Australia, Tasmania, and New Guinea and on nearby islands. Unlike that of higher mammals, the marsupial embryo is generally not connected to its mother by a placenta. The young are born in an undeveloped state and crawl to the mother's nipples, which are in a pouch (marsupium) formed by a fold of abdominal skin. The order includes the KANGAROO, KOALA, TASMANIAN DEVIL, and WOMBAT.

Martha: see MARY, in the Bible, 3.

Martha's Vineyard, island (1990 pop. 11,541), c.100 sq mi (260 sq km), SE Massachusetts, off the southern coast of CAPE COD. Settled in 1642, it was an important whaling and fishing center in the 18th and early 19th cent. before developing as a summer resort in the late 1800s.

Martí, José [märtē], 1853–95, Cuban poet and patriot. He achieved fame with his modernist poetry, e.g., *Ismaelillo* (1882) and *Plain Verses* (1891). A lifelong advocate of Cuban independence, he

lived in other Latin American countries and in the U.S. (1881–95), where he founded the Cuban Revolutionary party. He was killed at the start (1895) of the final Cuban insurrection against Spain.

Martial (Marcus Valerius Martialis), A.D. c.40–c.104, Roman poet; b. Spain. His verses, characterized by a twist of wit at the end of each and by original meter and form, became models for the modern EPIGRAM.

martial arts, any of various forms of self-defense, usually weaponless, based on techniques originally developed in ancient China, India, and Tibet. In modern times they have come into wide use for self-protection and as competitive sports. The basic system, jujitsu, teaches skills that enable one to overcome a physically superior opponent. Judo, a Japanese sport created in 1882, makes use of jujitsu principles. Other popular forms include kung fu, karate, and tae kwon do, all of which emphasize blows with the feet and the side of the hand, and kendo, in which bamboo "swords" covered with leather are used.

Martin, Saint, c.316–397, bishop of Tours. Born a heathen, he was converted (c.360) and was a hermit until acclaimed (371) bishop against his will. St. Martin's summer, occurring in mid-November, is the English counterpart of American Indian summer. Feast: Nov. 11.

Martin I, Saint, d. 655?, pope (649–55?), an Italian. Defying Byzantine Emperor Constans II, he called a council that condemned MONOTHELETISM. The emperor banished him to the Crimea, where he died. He was acclaimed a martyr. Feast: Apr. 13.

Martin V, 1368–1431, pope (1417–31), a Roman named Oddone Colonna. His election at the Council of Constance ended the Great SCHISM. Martin rehabilitated Rome and papal power and restored church unity. He rejected the view that councils are supreme in the church, but at the request of the Council of Constance he did call a council at Pavia (1423–24). Later, he summoned another council that began (1431) at Basel. Martin was ineffectually opposed by the Spanish antipope Benedict XIII (Pedro de LUNA) and his successor.

Martin, Homer Dodge, 1836–97, American painter; b. Albany, N.Y. Influenced first by the HUDSON RIVER SCHOOL, then by the BARBIZON SCHOOL, Martin painted melancholy, poetic landscapes, subtle in color and treatment of light. A typical example is *Sea at Villerville* (Kansas City Art Inst.).

Martin, William McChesney, Jr., 1906–, American banker; b. St. Louis. In 1938 he became the first salaried president of the New York Stock Exchange. Appointed chairman of the board of governors of the FEDERAL RESERVE SYSTEM by Pres. Truman, Martin served (1951–70) under six successive administrations. He opposed an excessive expansion of the monetary supply and fought to keep the CENTRAL BANK free of political control.

Martin du Gard, Roger [märtăN' də gär], 1881–1958, French novelist. His fame rests on *The World of the Thibaults* (1922–40), an eight-part novel cycle that explores the conflicts of French society in the early 20th cent. He was awarded the Nobel Prize in literature in 1937.

Martineau, Harriet [mär'tĭnō], 1802–76, English writer. She is best known for her *Illustrations of Political Economy* (9 vol., 1832–34) and *Illustrations of Taxation* (1834), collections of stories that interpret economics to the layman.

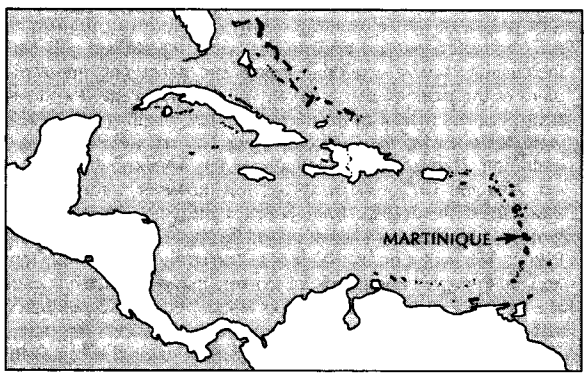
Martínez de la Rosa, Franciso [märtē'nĕth dā lä rō'sä], 1787–1862, Spanish dramatist, poet, statesman, and historian. His play *The Conspiracy of Venice* (1834) is a landmark of romantic drama in Spain.

Martínez Ruiz, José [rōōēth'], pseud. **Azorín,** 1873?–1967, Spanish writer. Collections of his descriptive essays include *España* (1909) and *Castilla* (1912). Among his other works are the autobiographical novels *Antonio Azorín* (1903) and *The Writer* (1942), plays, and short stories.

Martínez Sierra, Gregorio [syä'rä], 1881–1947, Spanish dramatist, novelist, and poet. His best-known play is *The Cradle Song* (1911); his most popular novel is *Ana María* (1907). He often wrote with his wife, the poet María Lejárraga.

Martini, Simone, or **Simone di Martino,** c.1283–1344, major Sienese painter. His work is admired for its Gothic spirituality combined with a vibrancy and a great elegance of line. His earliest known work (1315) is the *Maestà (Madonna and Child Enthroned with Saints and Angels),* in the Palazzo Pubblico, Siena. He painted (1328) one of the first commemorative portraits, the impressive image of the soldier Guidoriccio da Fogliano (Palazzo Pubblico, Siena). Simone's *Annunciation* (1333; Uffizi) is famous for its refined use of outline. His FRESCOES at Assisi include lively scenes from the life of St. Martin.

Martinique, overseas department of France (1992 est. pop. 372,000), 425 sq mi (1,101 sq km), in the Windward Islands. Sugar and rum are exported. This rugged volcanic island, discovered (c.1502) by Columbus, was settled (from 1635) by the French, who eliminated the native Caribs and introduced African slaves. It became a French department in 1946.



Martins, Peter, 1946–, Danish ballet dancer and choreographer. He performed with the ROYAL DANISH BALLET (1965–69), then joined the NEW YORK CITY BALLET. In 1983 Martins retired from dancing and became joint (now sole) artistic director of the City Ballet.

Martinson, Harry, 1904–78, Swedish writer. He is best known for his long narrative poem *Aniara* (1956), about a journey in space, and his novel *The Road* (1948). He shared the 1974 Nobel Prize in literature with Eyvind JOHNSON.

Marvell, Andrew, 1621–78, English METAPHYSICAL POET. Marvell, who served as MILTON's assistant in the Latin secretaryship and was a member of Parliament, was a leading wit and satirist of his time. Today he is known for his brilliant lyric poetry, including "The Garden," "Bermudas," and "To His Coy Mistress," and for his "Horatian Ode" to CROMWELL.

Marx, Karl, 1818–83, German social philosopher and revolutionary; with Friedrich ENGELS, a founder of modern SOCIALISM and COMMUNISM. The son of a lawyer, he studied law and philosophy; he rejected the idealism of G.W.F. HEGEL but was influenced by Ludwig FEUERBACH and Moses Hess. His editorship (1842–43) of the *Rheinische Zeitung* ended when the paper was suppressed. In 1844 he met Engels in Paris, beginning a lifelong collaboration. With Engels he wrote the *Communist Manifesto* (1848) and other works that broke with the tradition of appealing to natural rights to justify social reform, invoking instead the laws of history leading inevitably to the triumph of the working class. Exiled from Europe after the REVOLUTIONS OF 1848, Marx lived in London, earning some money as a correspondent for the New York *Tribune* but dependent on Engels's financial help while working on his monumental work *Das Kapital* (3 vol., 1867–94), in which he used DIALECTICAL MATERIALISM to analyze economic and social history; Engels edited vol. 2 and 3 after Marx's death. With Engels, Marx helped found (1864) the International Workingmen's Association, but his disputes with the anarchist Mikhail BAKUNIN eventually led to its breakup. MARXISM has greatly influenced the development of socialist thought; further, many scholars have considered Marx a great economic theoretician and the founder of economic history and sociology.

Marx Brothers, American comedy team. The major members were **Groucho** (Julius), 1895–1977; **Harpo** (Arthur), 1893–1964; and **Chico** (Leonard), 1891–1961; all b. N.Y.C. Their anarchic brand of humor depended on slapstick, sight gags, and outrageous puns and wisecracks. They starred in such films as *Horse Feathers* (1932), *Duck Soup* (1933), and *A Night at the Opera* (1935). **Zeppo**

(Herbert), 1901–79, left the team in 1935; **Gummo** (Milton), 1893–1977, left after their vaudeville days.

Marxism, economic and political philosophy originated by Karl MARX and Friedrich ENGELS. The *Communist Manifesto* (1848), by Marx and Engels, suggests many of the premises rigorously developed in Marx's *Das Kapital* (3 vol., 1867–94). The Marxist philosophical method, DIALECTICAL MATERIALISM, reverses the dialectical idealism of G.W.F. HEGEL. Marxism holds that the primary determinant of history is economics. It views the history of society as "the history of class struggle" in which the bourgeoisie, or capitalist class, which replaced the feudal nobility, will inevitably by supplanted by the proletariat, or working class. The capitalist class flourishes by extracting surplus value, or profit, from the commodities produced by the working class. Marxist theory predicts that the contradictions and weaknesses within capitalism will cause increasingly severe economic crises and deepening impoverishment of the working class, which will ultimately revolt and seize control of the means of production. In the resulting classless society, the coercive state will be replaced by rational economic cooperation. Marxism greatly influenced the development of SOCIALISM. After the 1917 RUSSIAN REVOLUTION, however, many socialists dissociated themselves from Soviet COMMUNISM. Communist regimes, while claiming Marxist orthodoxy, have often veered sharply from it. The evolution of laissez faire CAPITALISM in its various forms and the improved conditions for workers in industrialized societies are believed by some to discredit Marxist economic predictions, and Marxism's close association with Communism has already popularly discredited it. Aspects of Marxist theory have, nonetheless, powerfully influenced Western philosophy, history, art, literary criticism, and sociology.

Mary, queens of England. **Mary I** (Mary Tudor), 1516–58 (r.1553–58), was the daughter of HENRY VIII and KATHARINE OF ARAGÓN. Following her parents' divorce, Mary was forced to acknowledge herself illegitimate and to renounce the Roman Catholic Church. The pope later absolved her from these statements, and she remained loyal to Rome. Mary succeeded her half brother, EDWARD VI, after the unsuccessful attempt to put Lady Jane GREY on the throne. Her marriage (1554) to Philip of Spain (later PHILIP II), a consequent Spanish alliance, and the reestablishment of papal authority followed. All this, together with the religious persecution of Protestants, which earned her the name "Bloody Mary," and the loss (1558) of Calais to France, gained her the hostility of the English people. **Mary II,** 1662–94, queen of England, Scotland, and Ireland (1689–94), was the daughter of JAMES II and Anne Hyde. Reared as a Protestant, she married (1667) William of Orange and became joint sovereign with him (see WILLIAM III) after the GLORIOUS REVOLUTION. She actually ruled only during William's absences.

Mary, 1867–1953, queen consort of GEORGE V of England. Married in 1893, she was the mother of EDWARD VIII and GEORGE VI.

Mary, in the Bible. **1 The Virgin,** mother of JESUS, the principal saint, called Our Lady. Her name is the Hebrew *Miriam.* The events of her life mentioned in the NEW TESTAMENT include the archangel GABRIEL'S annunciation to her of Jesus' birth; her visitation to Elizabeth, mother of JOHN THE BAPTIST; Jesus' nativity; and her station at the Cross upon which Jesus was crucified. According to Scripture she was first betrothed, then married, to St. JOSEPH and was the cousin of Elizabeth. Tradition has it that Mary was the daughter of Saints Joachim and Anne. From ancient times she has been highly honored by Christians. The Orthodox, Roman Catholic, and Anglican churches all teach the perpetual virginity of Mary, placing a nonliteral interpretation on New Testament references to Jesus' "brothers." The Roman Catholic Church has also proclaimed (1854) the dogma of the Immaculate Conception, which states that Mary was conceived and born without original sin. From earliest times her intercession was believed to be efficacious, and she is called upon to meet every kind of need. Her principal feasts are the Assumption (Aug. 15), the Birthday of Our Lady (Sept. 8), the Immaculate Conception (Dec. 8), the Purification (Feb. 2), and the Annunciation or Lady Day (Mar. 25). Apparitions of the Virgin have been reported at Guadalupe Hidalgo, Mexico (1531), Paris (1830), LOURDES, France (1858), and Fatima, Portugal (1917). **2 Mary Magdalene** [măg'dələn; formerly, môd'lən, hence *maudlin,* i.e., tearful], Christian saint. She appears in the NEW TESTAMENT as a woman whose evil spirits are cast out by JESUS, as a watcher at the CROSS, as an attendant at Jesus' burial, and as one of those who found the tomb empty. A universal tradition identifies her with the repentant prostitute who annointed Jesus' feet. Some also identify her with Mary of Bethany. Feast: July 22. **3 Mary of Bethany,** sister of LAZARUS and Martha. She sat at Jesus' feet while Martha served. She has come to symbolize the life of contemplative love of God.

Maryland, one of the mid-Atlantic states of the U.S.; bounded by Delaware and the Atlantic Ocean (E), the District of Columbia (S), Virginia and West Virginia (S, W), and Pennsylvania (N).

Area, 10,577 sq mi (27,394 sq km). *Pop.* (1990) 4,781,468, a 13.4% increase over 1980 pop. *Capital,* Annapolis. *Statehood,* Apr. 28, 1788 (7th of the original 13 states to ratify the Constitution). *Highest pt.,* Backbone Mt., 3,360 ft (1,025 m); *lowest pt.,* sea level. *Nickname,* Old Line State. *Motto, Fatti Maschii, Parole Femine* [Manly Deeds, Womanly Words]. *State bird,* Baltimore oriole. *State flower,* black-eyed Susan. *State tree,* white oak. *Abbr.,* Md.; MD.

Land and People. Maryland is divided by Chesapeake Bay, into which the Susquehanna and POTOMAC rivers empty, and which separates the more rural Eastern Shore from the rest of the state. Much of Maryland is covered by low coastal plains, which give way to the rolling Piedmont plateau and then to the higher hills of the BLUE RIDGE, in the west. The coastal area has mild winters and hot summers, while the uplands are cooler. Almost 50% of the population lives in the greater BALTIMORE area, which forms a continuous urbanized zone with nearby WASHINGTON, D.C.; over 80% of the population lives in urban areas. Other important cities are Frederick and Salisbury. In 1990 the state's population was 71% white and 25% African American.

Economy. Service industries are the largest state employer, ahead of finance, insurance, real estate, and government. Industry, however, is the principal source of income, with processed foods, electronic equipment, chemicals, and primary metals the leading manufactures. Maryland is an important producer of broiler chickens, greenhouse and nursery products, dairy goods, corn, and soybeans. Although fishing in the Chesapeake Bay has declined, primarily due to water pollution, it is still an important resource. Baltimore is one of the country's leading ports. Coal is mined in the west.

Government. The constitution of 1867 provides for a governor elected to a four-year term. The general assembly consists of a 47-seat senate and 141-seat house, with members of both bodies serving four-year terms. Maryland is represented in the U.S. Congress by two senators and eight representatives and has 10 electoral votes.

History. Giovanni da VERRAZANO probably visited (1524) the Chesapeake region. In 1632 Charles I of England granted a royal charter to George CALVERT, 1st Baron Baltimore, whose sons led (1634) settlers to the colony, conceived as a haven for persecuted Catholics. The Algonquian-speaking natives withdrew gradually, and in 1767 the demarcation of the MASON-DIXON LINE ended a long-standing boundary dispute with Pennsylvania. Maryland was one of the 13 colonies to sign the Declaration of Independence, and after the American Revolution, Maryland and Virginia contributed (1791) land for the new national capital in the DISTRICT OF COLUMBIA. Because it was a border state, Maryland's residents were strongly divided over the slavery question, and military rule was imposed to guarantee that the state remain in the Union. After the Civil War, industry revived, and it continues to be the dominant economic force in the state. The opening (1952) of the Chesapeake Bay Bridge spurred development of the Eastern Shore. The expansion of government-related businesses helped to boost the economy in the 1970s and early 80s. Maryland experienced tremendous suburban growth in the 1980s, especially outside Washington, D.C.

Mary Magdalene: see under MARY, in the Bible.

Mary of Burgundy, 1457–82, daughter and heiress of CHARLES THE BOLD of Burgundy. Her marriage (1477) to Maximilian of Austria (later Holy Roman Emperor MAXIMILIAN I) established the HAPSBURGS in the Low Countries. On her father's death (Jan. 1477) LOUIS XI of France seized Burgundy and Picardy, and prepared to annex the Low Countries and the rest of Mary's inheritance. In May she

The key to pronunciation appears on page xiii.

married Maximilian, who came to her aid with an army. Mary's premature death left her young son, Philip (later PHILIP I of Castile), her heir. In 1493 Maximilian regained control of the Low Countries, but Burgundy and Picardy remained French.

Mary of Guise, 1515–60, queen consort of JAMES V of Scotland; mother of MARY QUEEN OF SCOTS. She was regent for her daughter from 1554. Earlier she had aligned herself with France by arranging Mary's marriage to the DAUPHIN. As regent, she began suppressing Protestantism in Scotland, backed by the French. Civil war ensued (1559), and the Protestants, with English support, prevailed.

Mary Queen of Scots (Mary Stuart), 1542–87, daughter of JAMES V of Scotland and MARY OF GUISE. She became queen of Scotland on the death (1542) of her father, just six days after her birth. Mary was sent by her mother to France, where she grew up and married (1558) the French DAUPHIN (later FRANCIS II). After his death in 1560, she returned to Scotland as queen in 1561. Despite harsh attacks by John KNOX, she refused to abandon her Roman Catholicism, and her charm and intelligence won many over. To reinforce her claim to succeed ELIZABETH I on the English throne, she married (1565) her English cousin Lord DARNLEY. Soon despised by Mary, he joined a conspiracy of Protestant nobles who murdered her trusted counselor, David RIZZIO. Mary, however, talked Darnley over to her side and escaped to loyal nobles. Their son, James, was born soon after. At this period she fell in love with the earl of BOTHWELL. Darnley, widely disliked, was murdered in 1567; Bothwell, widely suspected of the murder, was acquitted and married Mary. Outraged Scots flew to arms, and Mary surrendered and abdicated (1567) in favor of her son, James VI (later JAMES I of England), naming the earl of Murray as regent. She escaped (1568) and gathered a large force, but was defeated by Murray and fled to England. Although welcomed by Elizabeth, she became a prisoner and was involved in several ill-fated plots against Elizabeth with English Catholics, the Spanish, and others. In 1586 a plot to murder Elizabeth was reported. Charged with being an accomplice, Mary was brought to trial; she defended herself with eloquence, although there was little doubt of her complicity. Elizabeth reluctantly signed the death warrant, and Mary was beheaded at Fotheringhay Castle on Feb. 8, 1587. Mary's reported beauty and her undoubted courage have made her a particularly romantic figure in history. She is the subject of much literature.

Mary Tudor, queen of England: see Mary I under MARY, queens of England.

Masaccio [mäzät'chō], 1401–1428?, Italian painter, one of the foremost figures of the Florentine RENAISSANCE; b. Tommaso Guidi. Most of his works have perished, but four remain that are his without question: a polyptych (1426) for the Church of the Carmine, Pisa; the great *Trinity* fresco in Santa Maria Novella, Florence, which revolutionized the understanding of perspective in painting; the *Virgin with St. Anne* (Uffizi), an early work in collaboration with MASOLINO DA PANICALE; and his masterpiece, the FRESCOES in the Brancacci Chapel of Santa Maria del Carmine (Florence), a major monument in the history of art. These frescoes were a training school and inspiration to generations of painters such as MICHELANGELO and RAPHAEL. Masaccio imparted a new sense of grandeur and austerity to the human figure. He used light to give dimension and achieved a classic sense of proportion. He also created a diversity of character within a unified group.

Masada, ancient mountaintop fortress in the Judaean Desert, Israel. Ornately renovated (37–31 B.C.) by Herod the Great, it was seized (A.D. 66) by Jewish Zealots in their revolt against Rome. When 1,000 Zealots were overcome (A.D. 73) by 15,000 Roman soldiers, all but two women and five children killed themselves to escape capture. Masada was excavated (1963–65) by Israeli-led international archaeologists.

Masai, largely nomadic pastoral people of E Africa, chiefly in Kenya and Tanzania. Cattle and sheep form the basis of the economy they have maintained in resistance to cultural change. Masai society is patrilineal; polygyny is practiced. Boys are initiated into a warrior age-group responsible for herding and other tribal labors; only after serving as a warrior may a man marry. The Masai, who are characteristically tall and slender, live traditionally in the kraal, a compound within which are mud houses.

Masaryk, Thomas Garrigue, 1850–1937, principal founder and first president of Czechoslovakia (1918–35). A philosophy professor at the Univ. of Prague, he led the Czech independence movement from 1907 and became the first president of the new republic after WORLD WAR I. An ardent liberal and democrat, he was revered by the Czech people, although he was always faced with strong opposition from extremist groups. Edward BENEŠ succeeded him as president. Among Masaryk's writings is *The Making of a State* (1927). His son, **Jan Masaryk,** 1886–1948, became foreign minister of the Czech government-in-exile in London during WORLD WAR II. He kept that post after his government's return to Prague in 1945. His death, shortly after the Communist coup in 1948, was officially described as suicide by leaping from a window, although the exact circumstances have been subject to speculation ever since.

Mascagni, Pietro [mäskä'nyē], 1863–1945, Italian operatic composer. He is known for *Cavalleria rusticana* (1890), a classic example of Italian *verismo,* or realism of plot.

Masefield, John, 1878–1967, English poet. A seaman and journalist, he gained fame with the poetry collections *Salt-Water Ballads* (1902), containing "Sea Fever" and "Cargoes," and *Ballads* (1903). His major works are long narrative poems, including *The Everlasting Mercy* (1911), *Dauber* (1913), and *Reynard the Fox* (1919). Masefield also wrote plays, in both verse and prose; novels; literary studies; war sketches; and adventure stories for boys. He was POET LAUREATE from 1930 to 1967.

maser acronym for *m*icrowave *a*mplification by *s*timulated *e*mission of *r*adiation, device, first operated in 1954, for the creation and amplification of high-frequency radio waves. The waves produced by the maser are coherent, i.e., all of the same frequency, direction, and phase relationship. Used as an oscillator, the maser provides a very sharp, constant signal and thus serves as a time standard for atomic clocks. The maser can also serve as a relatively noise-free amplifier. The optical maser is now called a LASER.

Maseru, city (1986 pop. 109,382), capital of Lesotho, on the Caledon R. It is a trade and transportation hub linked with South Africa's rail network. Manufactures include candles and carpets. Maseru was a small trading town when Moshesh I, paramount chief of the Basuto, chose it for his capital in 1868 and placed the kingdom under British protection.

Mashhad, city (1986 pop. 1,463,508), NE Iran. It is an industrial and trade center and a transportation hub. Formerly known as Tus, the city was attacked by the Oghuz Turks (12th cent.) and by the Mongols (13th cent.). It recovered by the 14th cent. and prospered under the Safavids. Shah ABBAS I embellished Mashhad with many fine buildings, and NADIR SHAH made it the capital of Persia in the 18th cent.

Masinissa or **Massinissa** [both: măsĭnĭs'ə], c.238–148 B.C., king of NUMIDIA. He fought with the Romans in the Second PUNIC WAR and led his cavalry to victory at the battle of ZAMA. His goading of CARTHAGE brought on the Third Punic War.

Masolino da Panicale [pänēkä'lā], 1383–c.1447, Florentine painter of the early RENAISSANCE; b. Tommaso di Cristoforo Fini. His paintings incorporated his feeling for decorative color with strong modeling and spatial organization. He began the FRESCOES in the Brancacci Chapel that were continued by his pupil MASACCIO. Among the works attributed to him are a *Madonna and Christ in Glory* (Naples) and *Saints* (Philadelphia Mus.).

Mason, George, 1725–92, American Revolutionary statesman; b. Fairfax, Va. He wrote the Virginia declaration of rights (1776), the model for the first part of Jefferson's DECLARATION OF INDEPENDENCE. He was active in drafting the U.S. Constitution (1787), but, unhappy with several provisions, he campaigned against its ratification. The bill of rights he advocated was the basis for some of the first 10 amendments to the Constitution. His grandson, **James Murray Mason,** 1798–1871, was a U.S. senator from Virginia (1847–61). As Confederate commissioner to England, he was one of the principals in the TRENT AFFAIR (1861).

Mason-Dixon Line, boundary between Pennsylvania and Maryland, surveyed (1763–67) by the English astronomers Charles Mason and Jeremiah Dixon and extended (1779) to present-day West Virginia. Before the Civil War it was popularly designated as the boundary between the "slave states" and the "free states," and it is still used on occasion to distinguish the South from the North.

Masons, Free and Accepted: see FREEMASONRY.

Maspero, Gaston Camille Charles, 1846–1916, French Egyptologist, founder of the French School of Oriental Archaeology at Cairo. He was noted for excavations at LUXOR and KARNAK, and for his works *The Dawn of Civilization* (1884), *The Struggle of Nations* (1897), and *The Passing of the Empires* (1900).

masque, courtly form of dramatic spectacle popular in 17th-cent. England. Characterized by the use of masks and the mingling of actors and spectators, it employed pastoral and mythological themes, with an emphasis on music and dance. The foremost writer of masques was Ben JONSON.

Mass, religious service of the Roman Catholic Church, a performance of the SACRAMENT of the Eucharist (see COMMUNION). The Mass was traditionally based on the Latin rite of Rome, which became the official rite of most Roman Catholic churches. Since the Second VATICAN COUNCIL (1962–65) the Roman Mass liturgy has undergone extensive revision, including the use of vernacular languages in place of Latin. Mass is usually said in a church at an altar containing relics, and two lighted candles are essential. Among the types of Masses are High Mass, celebrated in its full form by a priest, assisted by a deacon and choir; Low Mass, much commoner, said by one priest; and a REQUIEM, a proper Mass said for the dead. Some of the sung portions of the Mass are chanted solo at the altar with choral response. There are also nine hymns for the choir; four of these change with the occasion and are related in theme, with texts usually from the PSALMS; there are also five invariable choral pieces: Kyrie eleison, Gloria in excelsis, Credo, Sanctis, and Agnus Dei. PLAINSONG is permitted for all texts, but latitude is granted the choir. A musical setting for the five ordinary hymns, called a Mass, has been an important musical form. Among the composers who have produced masses are PALESTRINA, J.S. BACH, HAYDN, MOZART, VERDI, and STRAVINSKY.

mass, in physics, the quantity of matter in a body regardless of its volume or of any forces acting on it. There are two ways of referring to mass, depending on the laws of physics defining it. The *gravitational mass* of a body may be determined by comparing the body on a beam balance with a set of standard masses; in this way the gravitational factor is eliminated (see GRAVITATION; WEIGHT). The *inertial mass* of a body is a measure of the body's resistance to acceleration by some external force. All evidence seems to indicate that the gravitational and inertial masses are equal. According to the special theory of RELATIVITY, mass increases with speed according to the formula $m = m_0/\sqrt{1-v^2/c^2}$, where m_0 is the rest mass (mass at zero velocity) of the body, v its speed, and c the speed of light in vacuum. The theory also leads to the Einstein mass-energy relation $E = mc^2$, where E is the energy and m the relativistic mass.

Massachusetts, most populous of the New England states of the NE U.S.; bordered by New York (W), Vermont and New Hampshire (N), the Atlantic Ocean (E), and Rhode Island and Connecticut (S).

Area, 8,257 sq mi (21,386 sq km). *Pop.* (1990) 6,016,425, a 4.9% increase over 1980. *Capital,* Boston. *Statehood,* Feb. 6, 1788 (6th of original 13 states to ratify the Constitution). *Highest pt.,* Mt. Greylock, 3,491 ft (1,065 m); *lowest pt.,* sea level. *Nickname,* Bay State. *Motto, Ense Petit Placidam Sub Libertate Quietem* [By the Sword We Seek Peace, But Peace Only under Liberty]. *State bird,* chickadee. *State flower,* mayflower. *State tree,* American elm. *Abbr.,* Mass.; MA.

Land and People. The state's heavily indented coastline has many natural harbors. Offshore are the resort islands of MARTHA'S VINEYARD and NANTUCKET. The low coastal plain gives way inland to gently rolling uplands bisected by the fertile Connecticut R. valley. In the west are the Berkshire Hills. The temperate climate is variable. Massachusetts is the country's third most densely populated state; over 84% of the population lives in urban areas. BOSTON, the largest city, is one of the country's leading commercial and educational centers. WORCESTER and SPRINGFIELD are also important cities. In 1990 the state was 90% white and 5% African American.

Economy. By the early 1990s services and trade had become the most important sectors of the economy, although industry remains economically important. Chief among the state's manufactures are electrical, electronic, and industrial equipment; machinery; plastic products; fabricated metals; leather goods; and textiles. Shipping, printing, and publishing are also important. Leading agricultural products include cranberries, greenhouse and nursery items, vegetables, dairy products, and eggs. Fishing fleets bring in a varied catch. The Atlantic coast, including CAPE COD National Seashore, and the Berkshires attract many visitors.

Government. According to the constitution of 1780, the governor is elected to a four-year term. The legislature is composed of a 40-member senate and 160-member house, both with two-year terms. The state sends ten representatives and two senators to the U.S. Congress and has 12 electoral votes.

History. The PILGRIMS landed in 1620. Despite early difficulties, the PLYMOUTH COLONY took firm hold and was followed by the MASSACHUSETTS BAY COMPANY colony. The early Puritan settlers (see PURITANISM) were primarily agricultural, although a merchant class soon formed. By the mid-18th cent. the colony had become the center of a lively and prosperous seagoing traffic in molasses, rum, and African slaves—the so-called triangular trade. The colonists sorely felt British restrictions imposed by the STAMP ACT (1765) and TOWNSHEND ACTS (1767). Following the BOSTON MASSACRE (1770) and the BOSTON TEA PARTY (1773), the AMERICAN REVOLUTION started with fighting at LEXINGTON AND CONCORD in April 1775. After independence, the industrial revolution took hold in Massachusetts, with the development of a thriving textile industry. During the 19th cent. the state was the center of many of the country's religious, philosophical, and social movements, including TRANSCENDENTALISM, UNITARIANISM, and abolitionism (see ABOLITIONISTS). Following the Civil War, there began a huge influx of immigrants, of whom the Irish were a dominant group. The early 20th cent. was marked by intense labor strife, including the unsuccessful Boston police strike (1919). The decline of the state's textile and shoe industries since World War II was largely offset by the growth of computer- and defense-related industries into the 1980s. In 1989, however, Massachusetts was hit by the nationwide recession and the burden of a huge state budget, and the state struggled to regain economic prosperity in the 1990s.

Massachusetts Bay Company, English chartered company (1628) that established the Massachusetts Bay colony on a grant of land between the Charles and Merrimack rivers and extending westward to "the South Sea." Puritan colonists sailed for New England in 1630 and founded their chief settlement at Boston as a religious and political refuge. The company and colony were synonymous until 1684, when the company was dissolved.

Massasoit, c.1580–1661, powerful chief of the Wampanoags of New England. Faithful to his treaty (1621) with the PILGRIMS, he befriended Roger WILLIAMS. Massasoit's son, Metacomet, was the leader of KING PHILIP'S WAR.

Masséna, André [mäsänä'], 1758–1817, marshal of France. He won the battle of Rivoli (1797) in NAPOLEON I's Italian campaign and defeated (1799) the Russians at Zürich. He was later defeated in the PENINSULAR WAR (1808–14). Napoleon made him duke of Rivoli and prince of Essling. After Napoleon's fall, Masséna supported LOUIS XVIII. He was neutral during the HUNDRED DAYS.

Massenet, Jules [mäsənā'], 1842–1912, French composer. Among his 20 OPERAS, *Manon* (1884) exemplifies his sensuous style and contains accompanied spoken dialogue instead of traditional recitative. Others are *Werther* (1892) and *Thaïs* (1894).

mass extinction, the EXTINCTION of a large percentage of the earth's species, opening ecological niches for other species to fill. There have been at least ten such events. The worst occurred approximately 250 million years ago, at the end of the Permian period, when more than 60% of all the earth's plant and animal species were lost. The most famous mass extinction was that of the Cretaceous period, 65 million years ago, when the dinosaurs and many other plants and animals disappeared. Scientists theorize that mass extinctions result from drastic environmental changes (e.g. fire, acid rain, global cooling) that follow events such as meteorite or comet impacts or massive volcanic eruptions.

Massif Central, diverse mountainous plateau, c.33,000 sq mi (85,470 sq km), occupying almost one sixth of France. It rises to a high point of 6,187 ft (1,866 m) in the Puy de Sancy of the once-volcanic Auvergne Mts. and also includes the rugged Cévennes Mts. (SE) and the plateaus of the Causses (SW). Clermont-Ferrand and St. Étienne are major cities.

The key to pronunciation appears on page xiii.

Massine, Léonide [mäsēn'], 1895–1979, Russian–American choreographer and ballet dancer; b. Moscow. He was the principal dancer and choreographer for DIAGHILEV (1914–21, 1925–28) and the Ballet Russe de Monte Carlo (1932–42). His works include *Parade* (1917) and *Jeux d'Enfants* (1943).

Massinger, Philip, 1583–1640, English dramatist. Many of his plays, largely collaborations, are lost. He is best known for two realistic domestic comedies, *A New Way to Pay Old Debts* (1625) and *The City Madam* (1632). A harsh moralist, he attacked the evils of a frivolous society.

mass number, represented by the symbol *A*, the total number of nucleons (NEUTRONS and PROTONS) in the nucleus of an ATOM. All atoms of a chemical ELEMENT have the same ATOMIC NUMBER but may have different mass numbers (from having different numbers of neutrons in the nucleus). Atoms of an element with the same mass number make up an ISOTOPE of the element. Isotopes of different elements may have the same mass number but different numbers of protons.

Masson, André [mäsôN'], 1896–1987, French painter and graphic artist. An exponent of SURREALISM until 1928, he developed "automatic writing"—spontaneous linear expressions of his personal mythology.

Massys, Matsys, Messys, or **Metsys, Quentin** [mäsīs', mätsīs', mĕ–, mĕt–], c.1466–1530, Flemish painter. Influenced by Italian art and Jan van EYCK, he developed a calm, measured style with solid figures and soft textures. The influence of LEONARDO DA VINCI's grotesque head studies is seen in the *Ugly Duchess* (National Gall., London). His son **Jan Massys,** c.1509–1575, did satirical and elegant works, e.g., *Judith* (Mus. Fine Arts, Boston). Another son, **Cornelis Massys,** d. after 1560, a landscape painter and engraver, did *Arrival in Bethlehem* (Metropolitan Mus.).

mastaba, in EGYPTIAN ARCHITECTURE, a sepulchral structure built above ground. Mastabas of the early dynastic period (3200–2680 B.C.), evidently modeled on contemporary houses, were elaborate and had many compartments. Better known are those of the Old Kingdom (2680–2181 B.C.), which elaborated on the predynastic burial-pit and mound form. The typical mastaba was rectangular and flat-roofed, with inward sloping walls. The superstructure was solid except for the offering chamber—a decorated chapel—and the serdab—a smaller chamber containing a portrait statue of the deceased.

mastectomy, surgical removal of breast tissue, usually done as treatment for breast cancer. There are many types of mastectomy. In general, the farther the cancer has spread, the more tissue is taken. The radical mastectomies of the past (which removed not only the breast, but underlying chest muscle and lymph nodes) have largely been replaced by less drastic, but equally effective procedures. For small tumors, lumpectomy, removing just the tumor and a margin of tissue, may be performed. A partial, or segmental, mastectomy removes the cancer, some breast tissue, the lining over the chest, and usually some lymph nodes from under the arm; total or simple mastectomy removes the whole breast; modified radical mastectomy takes the breast, lining over the chest muscles, and lymph nodes. Breast reconstruction can be done using the patient's own tissue or breast implants. Saline implants are currently used; controversial SILICONE-gel implants are undergoing further testing.

Masters, Edgar Lee, 1869–1950, American poet; b. Garnett, Kans. He is best known for *The Spoon River Anthology* (1915), a group of free-verse epitaphs revealing the secret lives of small-town Americans. He also wrote such biographies as *Lincoln the Man* (1931) and *Whitman* (1937).

Masters and Johnson, pioneering research team in the field of human sexuality, consisting of the gynecologist **William H(owell) Masters,** 1915–, b. Cleveland, and the psychologist **Virginia E(shelman) Johnson,** 1925–, b. Springfield, Mo. Authors of *Human Sexual Response* (1966), *Human Sexual Inadequacy* (1970), and *Homosexuality in Perspective* (1979), they established a sex-therapy program in St. Louis (1970), which became a model for clinics elsewhere, and trained other therapists in clinical counseling. They were married from 1971 to 1993.

mastiff, very large, powerful WORKING DOG; shoulder height, 27–33 in. (68.6–83.8 cm); weight, 165–185 lb (74.9–83.9 kg). Its short coat may be silver-fawn, apricot, or dark fawn brindle with black markings. It was developed as a fighting dog and guardian in England over 2,000 years ago.

mastodon, name for several prehistoric MAMMALS of the extinct genus *Mammut*, from which ELEPHANTS are believed to have evolved. Long-jawed mastodons about 4½ ft (137 cm) high, with four tusks, lived in Africa during the Oligocene epoch. Later forms were larger, with long flexible trunks and two tusks. Forest dwellers, mastodons fed by browsing.

Masudi [mäsōō'dē], d. 956, Arab historian, geographer, and philosopher; b. Baghdad. He traveled in many lands and wrote the comprehensive *Muruj adh-Dhahab* [meadows of gold], a history of the world from the creation to A.D. 947.

Masur, Kurt, 1927–, German conductor. He is noted for his performances of the German composers whose works form the core of the symphonic repertoire and of modern E European and Russian composers. Beginning in 1948 he held a series of positions as conductor and musical director in East Germany; in 1970 he became conductor of the Leipzig Gewandhaus Orchestra. He succeeded Zubin MEHTA as musical director of the New York Philharmonic Orchestra (see ORCHESTRA, table) in 1991. Masur played a prominent part in the events in Leipzig (1989) that contributed to the collapse of Communist East Germany.

Matabele: see NDEBELE.

Mata Hari, 1876–1917, Dutch dancer and spy for Germany in WORLD WAR I; b. Margaretha Geertruida Zelle. A member of the German secret service in Paris, she obtained military secrets from high Allied officers. The French tried and executed her.

maté, yerba maté, or **Paraguay tea,** name for a South American evergreen tree (*Ilex paraguensis* and related species) of the HOLLY family and for a tea brewed from the young leaves and tender shoots. Less astringent than genuine TEA, maté is a stimulant containing considerable caffeine. It is the most popular beverage in much of South America.

materialism, in philosophy, a widely held system of thought that explains the nature of the world as entirely dependent on matter, the final reality. Early Greek teaching, e.g., that of DEMOCRITUS, EPICURUS, and the proponents of STOICISM, conceived of reality as material in nature. The theory was renewed and developed beginning in the 17th cent., especially by HOBBES, and in the 18th cent. LOCKE's investigations were adapted to the materialist position. The system was developed further from the middle of the 19th cent., particularly in the form of DIALECTICAL MATERIALISM and in the formulations of LOGICAL POSITIVISM.

mathematics, deductive study of numbers, geometry, and various abstract constructs.

Branches. Mathematics is very broadly divided into foundations, algebra, analysis, geometry, and applied mathematics. The term *foundations* is used to refer to the formulation and analysis of the language, AXIOMS, and logical methods on which all of mathematics rest (see LOGIC); SET theory, originated by Georg CANTOR, now constitutes a universal mathematical language. ALGEBRA, historically, is the study of solutions of one or several algebraic equations, involving POLYNOMIAL functions of one or several variables; ARITHMETIC and NUMBER THEORY are areas of algebra concerned with special properties of the integers. ANALYSIS applies the concepts and methods of the CALCULUS to various mathematical entities. GEOMETRY is concerned with the spatial side of mathematics, i.e., the properties of and relationships between points, lines, planes, figures, solids, and surfaces. TOPOLOGY studies the structures of geometric objects in a very general way. The term *applied mathematics* loosely designates a wide range of studies with significant current use in the empirical sciences. It includes COMPUTER science, mathematical physics, PROBABILITY theory, and mathematical STATISTICS.

History. The earliest records indicate that mathematics arose in response to the practical needs of agriculture, business, and industry in the 3d and 2d millennia B.C. in Egypt and Mesopotamia and, possibly, India and China. Between the 6th and 3d cent. B.C., the Greeks THALES, PYTHAGORAS, PLATO, ARISTOTLE, EUCLID, ARCHIMEDES, and Zeno of Elea profoundly changed the nature of mathematics, introducing abstract notions such as INFINITY and irrational NUMBERS and a deductive system of proof. Their work was

carried on in the 2d and 3d cent. A.D. by HERO OF ALEXANDRIA, PTOLEMY, and Diophantus. With the decline of learning in the West, the development of mathematics was continued in the East by the Chinese, the Indians (who invented the numerals now used throughout the civilized world), and the Arabs. Their writings began to reach the West in the 12th cent., and by the end of the 16th cent. Europeans had made advances in algebra, TRIGONOMETRY, and such areas of applied mathematics as mapmaking. In the 17th cent. decimal fractions (see DECIMAL SYSTEM) and LOGARITHMS were invented, and the studies of projective geometry and probability were begun. Blaise PASCAL, Pierre de FERMAT, GALILEO, and Johannes KEPLER made fundamental contributions. The greatest advances of the century, however, were the invention of ANALYTIC GEOMETRY by René DESCARTES and of the calculus by Sir Isaac NEWTON and, independently, G.W. LEIBNIZ. The history of mathematics in the 18th cent. is dominated by the development of the methods of the calculus and their application to physical problems, both terrestrial and celestial, with leading roles being played by the BERNOULLI family, Leonhard EULER, Joseph LAGRANGE, and Pierre de LAPLACE. The modern period of mathematics dates from the beginning of the 19th cent., and its dominant figure is Carl GAUSS, who made fundamental contributions to algebra, arithmetic, geometry, number theory, and analysis. In that century NON-EUCLIDEAN GEOMETRY was invented independently by Nikolai LOBACHEVSKY, Janós Bolyai, and, in another form, G.F.B. RIEMANN, whose work was of great importance in the development of the general theory of relativity. Number theory and abstract algebra received significant contributions from Sir William Rowan HAMILTON, M.S. Lie, Georg Cantor, Julius DEDEKIND, and Karl WEIERSTRASS. Weierstrass and Augustin CAUCHY brought new rigor to the foundations of the calculus and of analysis. In the 20th cent. there have been two main trends. One is toward increasing generalization and abstraction, exemplified by investigations into the foundations of mathematics by David HILBERT, Bertrand RUSSELL and Alfred North WHITEHEAD, and Kurt GÖDEL. The other trend is toward concrete applications to such areas as linguistics and the social sciences, as well as computer science, made possible by the work of John VON NEUMANN, Norbert WIENER, and others.

Mather, Richard, 1596–1669, English Puritan clergyman. He fled (1635) to Massachusetts because of his Puritan beliefs and was pastor of Dorchester until his death. His son, **Increase Mather,** 1639–1723, b. Dorchester, Mass., became (1664) pastor of North Church, Boston, where he was an outstanding upholder of the old Puritan theocracy. During the Restoration period he was a bitter opponent of Edward Randolph and Sir Edmund ANDROS over the withdrawal of the Massachusetts charter. He was president of Harvard College (1685–1701). His son, **Cotton Mather,** 1663–1728, b. Boston, assisted his father and succeeded him as pastor of North Church, Boston. By his writings he became one of the most celebrated New England Puritan ministers. Although his works helped stir up hysteria during the Salem witch trials of 1692, he was also a promoter of learning and a power in the state.

Mathewson, Christy (Christopher Mathewson), 1880–1925, American baseball player; b. Factoryville, Pa. One of the game's great right-handed pitchers, he played (1900–1916) for the New York Giants and later managed the Cincinnati Reds. During his career he won 373 games and struck out 2,499 batters. He was a victim of poison gas in France in World War I, but survived until his death from tuberculosis.

Matilda or **Maud,** 1102–67, queen of England, daughter of HENRY I. In 1114 she married Holy Roman Emperor HENRY V. After his death she married (1128) Geoffrey IV of Anjou. At her father's death (1135) her cousin STEPHEN seized the English throne. In 1139 Matilda and her half brother Robert, earl of Gloucester, challenged Stephen, and she was elected "Lady of the English" in 1141. Unable to establish her rule, she withdrew her claim in 1148 in favor of her son Henry (later HENRY II).

Matisse, Henri, 1869–1954, French painter, sculptor, and lithographer, considered, with PICASSO, one of the two foremost artists of the modern era. His contribution to 20th-cent. art is inestimable. He explored IMPRESSIONISM, e.g., *The Dinner Table* (1897; Niarchos Coll., Athens); neo-impressionism, e.g., *Luxe, calme et volupté* (1905, private coll.) (see POSTIMPRESSIONISM); and made variations on the old masters in the Louvre. In 1905 he began using pure primary color as a significant structural element, e.g., *The Green Line* (1905; State Mus., Copenhagen). A leader of FAUVISM, he always used color in bold patterns and different sorts of expressive abstraction, e.g., *The Blue Nude* (1907; Baltimore Mus. of Art). In his last years he made brilliant paper cutouts, e.g. *Jazz* (Philadelphia Mus. of Art), and decorated the Dominican chapel at Vence, France, with fresh, joyous windows and murals.

matriarchy, familial and political rule by women. Many anthropologists now reject the claims of Lewis MORGAN and others that early society was matriarchal, although some contemporary feminists have theorized that a primitive matriarchy once existed. Claims for such a matriarchy are based largely on research on societies in which women are the major contributors to subsistence, on societies with matrilineal descent, and on myths of ancient female rule. Such societies and myths have many aspects, however, that cast doubt on the validity of the claims. Most anthropologists have also concluded that patriarchy, or male dominance, is not natural or biological but culturally constructed because of the diverse forms it takes across cultures.

Matsu and Quemoy, islands off the coast of China, c.100 to 150 mi (160 to 240 km) W of Taiwan, which controls them. Matsu is a single island, while Quemoy is a group consisting of Quemoy, Little Quemoy, and 12 islets in Xiamen Bay. The islands remained Chinese Nationalist outposts after the Communist victory in mainland China in 1949 and were bombarded several times from the mainland.

Matsuo Basho: see BASHO.

Matsys, Quentin: see MASSYS, QUENTIN.

Mattathias: see MACCABEES.

matter, anything that has mass. Because of its mass, all matter has WEIGHT, if it is in a gravitational field, and INERTIA. The three common STATES OF MATTER are solid, liquid, and gas; scientists also recognize a fourth, PLASMA. Ordinary matter consists of ATOMS and MOLECULES. See also ELEMENT; ELEMENTARY PARTICLES.

Matterhorn, distinctive pyramidal peak, 14,690 ft (4,478 m) high, in the Alps, on the Swiss-Italian border, near Zermatt. It was first climbed in 1865 by Edward Whymper.

Matthew, Saint, one of the Twelve APOSTLES, also called Levi, a publican (tax collector) from Capernaum. The attribution to him of the first GOSPEL is most likely incorrect.

Matthew, Gospel according to Saint, 1st book of the NEW TESTAMENT, now generally accepted as postdating MARK. Containing more allusions to the OLD TESTAMENT than the other GOSPELS, it was clearly written for Jewish Christians, to prove that JESUS was the promised Messiah.

Matthew of Paris or **Matthew Paris,** d. 1259, English historian, a monk of St. Albans. He wrote *Chronica majora* great chronicle, a history of the world (containing a hostile portrait of King JOHN), and *Historia Anglorum,* a history of England.

Matthias, Saint, APOSTLE chosen by lot to replace JUDAS ISCARIOT by the remaining disciples.

Matthias, 1557–1619, Holy Roman emperor (1612–19), king of Bohemia (1611–17) and of Hungary (1608–18); son of Emperor MAXIMILIAN II. The ill health of his brother Emperor Rudolf II gave Matthias the opportunity to increase his political authority, and he was recognized as head of the house of HAPSBURG in 1606 and as emperor in 1617. His conciliatory policy toward the Protestants gave rise to an opposing Catholic faction led by his brother the Archduke Maximilian and by the Archduke Ferdinand (later Emperor FERDINAND II). Old and ailing, Matthias was unable to prevent their takeover, and he was succeeded by Ferdinand.

Matthias Corvinus, 1443?–1490, king of Hungary (1458–90) and Bohemia (1478–90), son of John Hunyadi. After succeeding LADISLAUS V in Hungary, he took up arms against George of Podebrad, king of Bohemia, and the latter's successor, Ladislaus II. Matthias had himself crowned (1469) king of Bohemia, but the Bohemian diet did not recognize him. In 1478 a compromise allowed both Matthias and Ladislaus to keep the title of king. Matthias made war (1477, 1479, 1482) on Holy Roman Emperor FREDERICK III, but most of his conquests were lost after his death.

Matthiessen, F(rancis) O(tto), 1902–50, American critic; b. Pasadena, Calif. An American literature scholar, he taught at Harvard

Univ. (1929–50). His books include *American Renaissance* (1941), *Henry James* (1944), and *Theodore Dreiser* (1951).

Maugham, W(illiam) Somerset, 1874–1965, English author. An expert storyteller, he wrote with irony and, frequently, cynicism. His first success was the humorous play *Lady Frederick* (1907), followed by *The Circle* (1921) and others. His masterpiece, the partly autobiographical novel *Of Human Bondage,* appeared in 1915. Other novels include *The Moon and Sixpence* (1919), based on the life of GAUGUIN, and the satirical *Cakes and Ale* (1930). He also wrote many well-known short stories (e.g., "Miss Thompson") and literary essays.

Maui [mou'ē], second largest island (1990 est. pop. 82,500), 728 sq mi (1,886 sq km), of HAWAII, consisting of two mountainous peninsulas joined by an isthmus. The highest point is Haleakala volcano (10,023 ft/3,055 m) in Haleakala National Park. Wailuku (1990 pop. 10,688) is the largest town. Tourism and sugarcane and pineapple farming are economically important.

Mauldin, Bill (William Henry Mauldin), 1921–, American cartoonist; b. Mountain Park, N.Mex. Famous during World War II for his sardonic cartoons depicting the enlisted man's life, he won two Pulitzer Prizes (1945, 1959). Since 1962 he has worked at the Chicago *Sun-Times.* His books of cartoons include *Up Front* (1945) and *Brass Ring* (1971).

Mau Mau, secret terrorist organization in KENYA, comprising chiefly members of the Kikuyu tribe. In 1952 the Mau Mau began bloody reprisals against the Europeans. By 1956 British troops had driven the Mau Mau into the hills, and later the entire Kikuyu tribe was relocated.

Mauna Kea, dormant volcano, Hawaii island, 13,796 ft (4,205 m) high, highest point in the Hawaiian Islands. It has many cinder cones on its flanks and a great crater at the summit. At the peak of Mauna Kea, where the dry air is ideal for optical and infrared astronomical observations, are several major telescopes, including the 150-in (3.8-m) United Kingdom Infrared Telescope, the largest such designed expressly for infrared observations, and the 142-in (3.6-m) Canada-France-Hawaii reflector.

Mauna Loa, intermittently active volcano, Hawaii island, 13,680 ft (4,170 m) high, in Hawaii Volcanoes National Park (see NATIONAL PARKS, table). One of its many craters is KILAUEA.

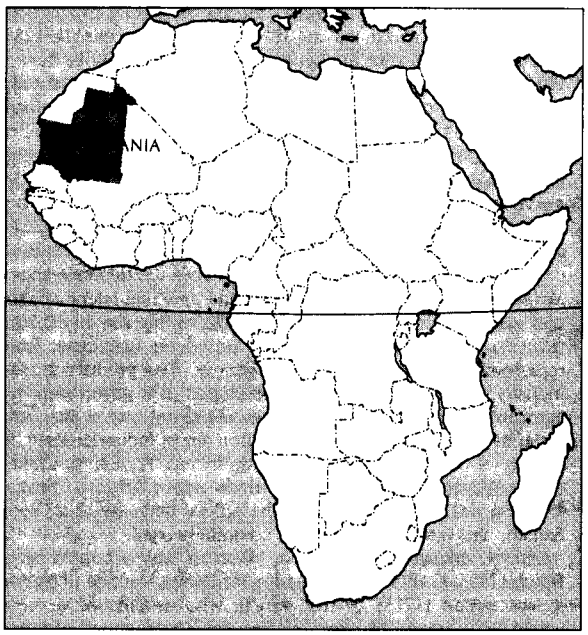
Maupassant, Guy de [mōpäsäN'], 1850–93, French author. He poured out a prodigious number of short stories, novels, plays, and travel sketches until 1891, when he went mad; he died in a sanitarium. Writing in a simple, objective style reminiscent of FLAUBERT, Maupassant is an exemplar of French psychological realism. His influence on all European literature was enormous. His best works are some 300 short stories, many unsurpassed in their genre. Among his masterpieces are "Tallow Ball," "The Necklace," and "The Piece of String." His novels include *A Life* (1883), *Bel-Ami* (1885), and *Pierre et Jean* (1888).

Maurer, Alfred Henry, 1868–1932, American painter; b. N.Y.C. Influenced by FAUVISM and CUBISM, he generally painted female heads and balanced, restrained still lifes, e.g., *Still Life with Pears* (Addison Gall., Andover, Mass.).

Mauretania, ancient district of Africa in Roman times, usually including most of present-day N Morocco and W Algeria. In the 2d cent. B.C. Bocchus, father-in-law of Jugurtha of Numidia, established the kingdom of Mauretania. The Roman Emperor AUGUSTUS put Juba II on the throne in 25 B.C., and the Emperor CLAUDIUS I made the region into two Roman provinces, but the native chiefs were never wholly subdued. By the end of the 5th cent. A.D., Roman control over Mauretania had ended.

Mauriac, François [mōryäk'], 1885–1970, French author. Imbued with a profound but nonconformist Catholicism, his novels include *The Desert of Love* (1925), *Thérèse* (1927), and *Vipers' Tangle* (1932). Other works include lives of Racine (1928) and of Jesus (1936); the play *Asmodée* (1938); several collections of essays; and memoirs. Mauriac received the 1952 Nobel Prize in literature.

Maurice of Nassau, 1567–1625, prince of Orange (1618–25); son of WILLIAM THE SILENT. In the independence struggle of the NETHERLANDS he took the offensive against the Spanish under Alessandro Farnese (see FARNESE, family). His victories led (1609) to a 12-year truce, making the United Provinces virtually independent. He broke with his chief adviser, OLDENBARNEVELDT, over the split between the Calvinists and the more liberal Remonstrants; Oldenbarneveldt, a leader of the Remonstrants, was executed in 1619. Maurice's campaigns against Spain after hostilities resumed (1621) had little success. His brother FREDERICK HENRY succeeded him.



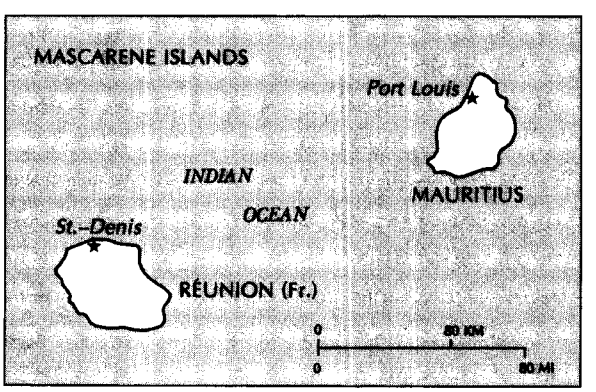
Mauritania, officially Islamic Republic of Mauritania, republic (1992 est. pop. 2,059,000), 397,953 sq mi (1,030,700 sq km), NW Africa. It is bordered by the Atlantic Ocean (W), Morocco (N), Algeria (NE), Mali (E and SE), and Senegal (SW). NOUAKCHOTT is the capital. Most of the country is low-lying desert, forming part of the SAHARA, but some fertile soil is found in the semiarid SAHEL of the southwest, along the Senegal R. The economy is divided between a traditional agriculture sector and a modern mining industry developed in the 1960s. Irrigated crops include millet, dates, rice, and sorghum. Stock raising (cattle, sheep, goats, and camels) was sharply reduced by the great drought of the 1970s and 80s. The fishing industry, based in the Atlantic, is growing, and fish processing is now important. Shipments of iron ore account for a large portion of export earnings. Nearly a third of the population are nomadic Moors, of Berber and Arab background; another third are mostly Africans, many of whom live as agriculturalists near the Senegal R.; and the rest are of mixed Moor and African descent. Islam is the state religion; Arabic and Wolof are official languages.

History. Settled by Berbers in the 1st millennium A.D., the region was the center of the ancient empire of GHANA (700–1200) and later became part of the empire of MALI (14th–15th cent.). By this time the Sahara had encroached on much of Mauritania, limiting agriculture and reducing the population. In the 1440s Portuguese navigators established a fishing base, and from the 17th cent. European traders dealt in gum arabic along the southern coast. France gained control of S Mauritania in the mid-19th cent., declared a protectorate over the region in 1903, and made it a separate colony in FRENCH WEST AFRICA in 1920, but did little to develop the economy. Nationalist political activity began after World War II, and Mauritania gained full independence in 1960. A Muslim state was created in 1961 under Makhtar Ould Daddah as president. His rule was troubled by ethnic tensions between the Fulani and the Arab-Berber group, by economic problems aggravated by the severe drought in the Sahel, and by worker-student protests. The military deposed Ould Daddah in 1978, and military governments subsequently ruled the country. A 1975 agreement with Spain and Morocco giving Mauritania control over the southern third of the Spanish (Western) Sahara ignited a conflict in the former colony. The Polisario Front, a pro-independence guerrilla group backed by Algeria, waged war against Mauritanian troops until 1979, when Mauritania renounced its claims to the area and signed a peace treaty

with the front. Slavery was only officially abolished in 1980, and racial unrest erupted in the late 1970s and persisted into the 1980s, aggravated by government repression of black Mauritanians. In 1984 Col. Maouiya Ould Sidi Ahmed Taya became president after a coup. A new constitution approved in 1991 called for an elected president and national assembly, and the government legalized political parties. In 1992 Taya won election as president in balloting marred by widespread cheating.

Mauritius [môrĭsh'ēəs, -rĭsh'əs], island country (1992 est. pop. 1,092,000), 790 sq mi (2,046 sq km), in the SW Indian Ocean, c.500 mi (800 km) E of Madagascar. The capital is PORT LOUIS. The island of Rodrigues and two groups of small islands are dependencies of Mauritius. Surrounded by coral reefs, the principal island consists of a central plateau and volcanic mountains that rise to c.2,700 ft (820 m). The one-crop economy is based on sugarcane, which represents about 40% of export earnings. Tea production, light industry, and tourism are being developed in a government program to diversify the economy. The fishing industry is also being expanded. About 70% of the population are of Indian descent; the rest are of Creole (mixed French and African), French, or Chinese descent. Over half the people are Hindu, about 30% are Christian, and 17% are Muslim. English is the official language, but Creole, French, and other languages are commonly used.

History. Originally uninhabited, Mauritius was occupied by the Dutch (1598–1710), who named it after Prince Maurice of Nassau. It was settled (1715) by the French, who established a colony called Île de France. The French imported large numbers of African slaves to work the sugarcane plantations. In 1810 the British captured the island and restored the Dutch name. After slavery was abolished in 1833 the British imported indentured laborers from India, whose descendants constitute a majority of the population today. Extension of the franchise in 1947 gave political rights to the Indians, who favored independence. They were opposed by the French and Creoles, who feared domination by the Indian majority. Sir Seewoosagur Ramgoolam's pro-independence Labour party won control of the assembly in 1967, and independence was granted in 1968. In 1982 the left-wing Mauritius Militant Movement (MMM) came to power, and Aneerood Jugnauth became prime minister. The following year a split in the MMM led Jugnauth to form a new party, and he has remained in office at the head of a series of coalition governments.



Maurois, André [mōrwä'], 1885–1967, French author; b. Émile Herzog. He is noted for his biographies of Shelley, Byron, Disraeli, Chateaubriand, Washington, and others. His novel, *The Silence of Colonel Bramble* (1918), about British military life, was also highly successful. His *Memoirs* appeared in 1970.

Maury, Matthew Fontaine, 1806–73, American hydrographer and naval officer; b. near Fredericksburg, Va. His wind and current charts of the Atlantic cut sailing time on many routes, and his *Physical Geography of the Sea* (1855) was the first classic work of modern oceanography. Maury was director of the U.S. Naval Observatory from 1844 to 1861.

Maurya, ancient Indian dynasty, c.325–c.183 B.C., founded by CHANDRAGUPTA. His grandson, ASOKA, brought nearly all of India, along with Afghanistan, under one rule. Under the Maurya dynasty Indian arts and sciences flowered.

Mauss, Marcel, 1872–1950, French sociologist and anthropologist. His contributions to the theory of sacrifice and classification rest on his works with Henri Hubert and his uncle, Émile DURKHEIM. He also contributed to the theory of gift exchange, and played a role in founding the journal *Année Sociologique* and the Institut d'Ethnologie in Paris.

Mavrokordatos or **Mavrocordatos, Alexander,** 1791–1865, Greek statesman and premier (1833–34, 1841, 1843–44, 1854–55). He was a leading patriot in the Greek War of Independence (1821–29) against Turkey and wrote the Greek declaration of independence.

Maxim, family of inventors and munitions makers. **Sir Hiram Stevens Maxim,** 1840–1916, b. near Sangerville, Me., invented the Maxim machine gun (1884; see SMALL ARMS), a smokeless powder, and a delayed-action fuse. He became a British citizen in 1900. His brother **Hudson Maxim,** 1853–1927, b. Orneville, Me., developed a high explosive, smokeless powder, and a propellant for torpedoes. Sir Hiram's son **Hiram Percy Maxim,** 1869–1936, b. Brooklyn, N.Y., created (1908) the Maxim silencer for explosive weapons.

Maximian (Marcus Aurelius Valerius Maximianus), d. 310, Roman emperor, with DIOCLETIAN (286–305). Both emperors abdicated in 305 in favor of Constantius I and Galerius, but the death (306) of Constantius caused a complicated struggle for power. Maximian at first aided his son Maxentius in this struggle. He later revolted against CONSTANTINE I and in 310 was forced to commit suicide.

Maximilian, rulers of the HOLY ROMAN EMPIRE. **Maximilian I,** 1459–1519, emperor and German king (1493–1519), son and successor of Emperor FREDERICK III, attempted to aggrandize his Hapsburg lands, chiefly through marriage diplomacy, thus involving himself in wars through most of his reign. His marriage (1477) to MARY OF BURGUNDY led to war with Louis XI of France over her vast holdings (Burgundy, the Netherland provinces, and Luxembourg) and with Louis's successor, Charles VIII. A later marriage involved him in the ITALIAN WARS. He arranged the marriage of his son Philip, later PHILIP I of Castile, into the Spanish royal family. That marriage later gave his grandson, Emperor CHARLES V, one of the largest territorial inheritances in history. He also arranged the marriages that assured HAPSBURG succession to the Bulgarian and Hungarian thrones. **Maximilian II,** 1527–76, emperor (1564–76), king of Bohemia (1562–76) and of Hungary (1563–76), was the son and successor of FERDINAND I. He was sympathetic to Lutheranism and allowed considerable religious freedom, while at the same time encouraging Catholic reform. In 1568 he made a truce with Turkey whereby he agreed to pay tribute to the sultan for his share of Hungary. He died while preparing to invade Poland, where he had been elected rival king to STEPHEN BÁTHORY.

Maximilian, 1832–67, emperor of Mexico (1864–67). An Austrian archduke, he was escorted (1864) to MEXICO by French soldiers to establish an empire for NAPOLEON III, but the Mexicans were hostile to him and loyal to Pres. JUÁREZ. Although the French drove Juárez's army from the capital, the empire disintegrated when French troops withdrew (1866–67). Maximilian's wife, Carlotta (1840–1927), went to Europe seeking help from Napoleon III. Her pleas were in vain, and Maximilian was captured and executed.

Maxwell, James Clerk, 1831–79, Scottish physicist. In 1871 he became the first professor of experimental physics at Cambridge, where he organized the Cavendish Laboratory. Maxwell's notable work in ELECTRICITY and MAGNETISM was summarized in his *A Treatise on Electricity and Magnetism* (1873). He developed the theory of the electromagnetic field on a mathematical basis and concluded that electric and magnetic energy travel in transverse waves that propagate at a speed equal to that of light; light is thus only one type of ELECTROMAGNETIC RADIATION. Maxwell's theoretical study (1859) of Saturn's rings foreshadowed his later investigations of heat and the kinetic theory of gases.

Maxwell, Robert, 1923–91, British businessman; b. Czechoslovakia as Jan Ludwik Hoch. Fleeing the Nazis (1939), he settled in England, purchased (1951) Pergamon Press, and served (1964–70) in Parliament. In the 1980s he created a diversified media empire, anchored by the Mirror Newspaper Group. After his mysterious drowning, he was found to have bankrupted his companies and

looted their pension plans in an attempt to prop up his debt-ridden businesses.

Maxwell, William (Keepers, Jr.), 1908–, American novelist; b. Lincoln, Ill. Handling traditional themes, e.g., growing up, the impact of death, he writes of Midwesterners in the early 20th cent. His novels include *They Came Like Swallows* (1937), *Time Will Darken It* (1948), *So Long, See You Tomorrow* (1980), and *The Outermost Dream* (1989).

May: see MONTH.

Maya, related tribes of CENTRAL AMERICA (see MIDDLE AMERICA, INDIGENOUS PEOPLES OF) occupying the YUCATÁN and E Chiapas in Mexico, much of Guatemala and Belize, and W Honduras, and speaking Mayan languages (see NATIVE AMERICAN LANGUAGES). They may derive from the OLMEC, or they may have originated c.1000 B.C. among nomadic tribes in N central Petén, Guatemala, where there are evidences of a once-flourishing agricultural people. Among indigenous American cultures the Maya emerge as undisputed masters of abstract knowledge, with a system of hieroglyphic writing that they used to record political and dynastic history. Their system of mathematics was an achievement not equaled for centuries in Europe. The 365-day Mayan year was so divided as to be more accurate than that of the Gregorian CALENDAR. Sculpture, used in architecture, reached a beauty and dignity unequaled in aboriginal America. Most of the population, estimated at 14 million in the 8th cent., lived in suburban agricultural communities. Mayan history is divided into three periods. From early in the Pre-Classic period (1500 B.C.?–A.D. 300), corn was cultivated. Late in that period the calendar, chronology, and hieroglyphic writing developed. In the Early Classic (300–600), Mayan culture spread throughout the area. The greatest Mayan accomplishments in art and science occurred in the Late Classic (600–900) at such centers as Copán, Honduras; Palenque, in Chiapas; and UXMAL, in the Yucatán, all abandoned in the following century. At the beginning of the Post-Classic period (900–1697) an invasion by Kulkulcán (see QUETZALCOATL), who conquered CHICHÉN ITZÁ, brought TOLTEC elements into Mayan culture. The Toltec took Chichén Itzá, but were absorbed c.1200 by the Maya. In 1283 Mayapán became the civil capital. The century preceding the Spanish conquest (1546) was dominated by civil wars and a series of calamities. Today some 4 million Maya retain many elements of their culture combined with that of the CONQUISTADORS. Numerous Mayan-derived dialects are spoken, and agriculture and religious practices owe much to Mayan tradition. A 1994 uprising in Chiapas, Mexico, drew most of its strength from the support of Mayan peasants.

Mayakovsky, Vladimir Vladimirovich [mī"əkôf'skē], 1893–1930, Russian poet and dramatist. *A Cloud in Trousers* (1915), a poem written almost entirely in metaphors, typifies his early style. With the drama *Mystery-Bouffe* (1918) he welcomed the RUSSIAN REVOLUTION (1917), but his satirical plays *The Bedbug* (1928) and *The Bathhouse* (1929) express the disillusionment with Soviet life that contributed to his suicide.

May Day, first day of May. Its celebration probably originated in the spring fertility festivals of India and Egypt. The festival of Flora, Roman goddess of spring, ran from Apr. 28 to May 3. In medieval England, May Day's chief feature was the Maypole, which dancers circled. The Second Socialist International designated (1889) May Day as the holiday for radical labor; it was an important holiday in the USSR.

Mayer, Julius Robert von, 1814–78, German physician and physicist. From a consideration of the generation of animal heat, he was led to determine the relationship between HEAT and WORK. As a result he announced (1842), independently of James JOULE, the mechanical equivalence of heat, a result of the law of conservation of ENERGY.

Mayer, Louis B(urt), 1885–1957, American movie producer; b. Russia. Mayer began his career as a theater operator in Haverhill, Mass. In 1924 he merged his Louis B. Mayer Corp. with Metro Pictures Corp., which he had organized, and eventually with Goldwyn Pictures Corp. to form Metro-Goldwyn-Mayer. One of the most powerful film tycoons in early Hollywood, he was known for his strict paternalistic management of his studio and stars.

Mayflower, ship that in 1620 brought the PILGRIMS from England to New England. Under Capt. Christopher Jones, she sailed from Southampton on Sept. 16, sighted land (Cape Cod) on Nov. 19, and landed at Plymouth on Dec. 26. Before disembarking, the colonists drew up the **Mayflower Compact,** an agreement providing for the temporary government of the colony by the will of the majority.

mayflower, in botany: see TRAILING ARBUTUS.

Mayo, Charles Horace, 1865–1939, b. Rochester, Minn., and his brother, **William James Mayo,** 1861–1939, b. Le Sueur, Minn., American surgeons, specializing, respectively, in goiter and cataract operations and in abdominal surgery. From a small clinic in Rochester opened by their father, William Worrall Mayo, the brothers developed the internationally known **Mayo Clinic.** In 1915 they established the Mayo Foundation for Medical Education and Research as a branch of the graduate school of the Univ. of Minnesota.

Mayotte, island (1991 pop. 94,410), 144 sq mi (374 sq km), French territorial collectivity, Indian Ocean, in the Comoro chain. Dzaoudzi is the capital. It exports seafood, perfume oils, vanilla, coffee, and copra. When the largely Muslim COMOROS republic became independent (1975), Mayotte, mostly Roman Catholic, decided to remain French.

Mayr, Ernst, 1904–, American zoologist, b. Germany. He emigrated to the U.S. in 1932. In 1940 he proposed that *species* be defined as "groups of actually or potentially interbreeding natural populations which are reproductively isolated from other such groups." With T. DOBZHANSKY and G.G. SIMPSON, he helped formulate the *synthetic theory* of EVOLUTION, combining DARWIN's theory with the genetic principles of Gregor MENDEL.

Mays, Willie (Howard, Jr.), 1931–, American baseball player; b. Fairfield, Ala. An outfielder (1951–72) with the New York (later, San Francisco) Giants, he hit 660 home runs (third-highest total on record) and led the National League in home runs four times. He was twice voted (1954, 1965) most valuable player. In his last season (1973) Mays sparked the New York Mets to the pennant.

Mazarin, Jules [mäzärăN'], 1602–61, French statesman. An Italian, born Giulio Mazarini, he was a papal nuncio to France (1634–36) and entered French service under Cardinal RICHELIEU. Although never ordained a priest, Mazarin was made a Roman Catholic cardinal. After the death (1643) of LOUIS XIII, he was the chief minister of the regent, ANNE OF AUSTRIA, to whom he may have been secretly married. He gained favorable terms at the Peace of WESTPHALIA (1648), but his centralizing policy in France provoked the uprisings of the FRONDE. In 1659 he ended the war with Spain by negotiating the Peace of the Pyrenees.

Mazarin Bible, considered the first important work printed by Johann GUTENBERG and the earliest European book printed from movable type. It was completed at Mainz, Germany, not later than 1455. The text was in Latin, in a Gothic type related to Old English, illuminated by hand, on vellum and paper. The first copy to recapture attention was in the library of Cardinal MAZARIN. The book is popularly known as the Gutenberg Bible.

Mazepa, Ivan, c.1640–1709, hetman [leader] of the COSSACKS in the Russian UKRAINE. He tried to maintain Ukrainian autonomy, but the demands of PETER I threatened it. When war began between Russia and Sweden (1700) he secretly contacted pro-Swedish elements in Poland. In 1708 he openly joined CHARLES XII when the Swedes entered Ukraine, but few Cossacks followed him. After the Swedish defeat (1709) Mazepa fled Ukraine.

Mazzini, Giuseppe [mät-sē'nē], 1805–72, Italian patriot and revolutionist, a leading figure in the RISORGIMENTO. A proponent of Italian unity under a republican government, he wrote revolutionary propaganda from exile, chiefly in London after 1837. He believed that unity should be achieved by revolution and war based on direct popular action. His influence on Italian liberals was enormous, and his literary style is remarkably fine. He returned to Italy during the REVOLUTIONS OF 1848 and took part in the Roman republic of 1849. He organized unsuccessful uprisings in Milan (1853) and in S Italy (1857). He supported GARIBALDI's expedition to Sicily (1860) but, unlike Garibaldi, he remained a republican.

Mazzola, Francesco: see PARMIGIANO.

Mbabane [əmbäbä'nä], town (1986 pop. 38,290), administrative capital of Swaziland, in the Mdimba Mts. The city serves as the commercial hub for an agricultural region.

Mboya, Thomas Joseph [mboi'ə], 1930–69, Kenyan political

leader. After KENYA gained (1963) its independence, he held a number of high posts. He was widely regarded as a likely successor to Jomo KENYATTA, but he was assassinated in 1969.

Thomas Mboya

Mc-. Names beginning thus are entered as if spelled Mac-. See MAC.

Md, chemical symbol of the element MENDELEVIUM.

Mead, George Herbert, 1863–1931, American philosopher and psychologist; b. South Hadley, Mass. Mead's philosophy, social behaviorism, was related to that of John DEWEY. It placed great importance on the role of language and conduct. Mead's works include *The Philosophy of the Present* (1932) and *Mind, Self, and Society* (1934).

Mead, Margaret, 1901–78, American anthropologist; b. Philadelphia. A student of Franz BOAS and Ruth BENEDICT, she won world fame through studies of child-rearing, personality, and culture. Her primary field work was among peoples of OCEANIA. Affiliated with the American Museum of Natural History from 1926 until her death, after 1954 she was also adjunct professor of anthropology at Columbia Univ. Some of her widely read books are *Coming of Age in Samoa* (1928), *Growing Up in New Guinea* (1930), *Male and Female* (1949), *Culture and Commitment* (1970), and the autobiographical *Blackberry Winter* (1972).

Mead, Lake, reservoir, 247 sq mi (640 sq km), on the Colorado R. in Arizona and Nevada, the largest in the U.S., chief feature of **Lake Mead National Recreation Area.** Impounded by HOOVER DAM, it is 115 mi (185 km) long, 1–8 mi (1.6–12.9 km) wide, and up to 589 ft (180 m) deep, and has a shoreline of 550 mi (885 km).

Meade, George Gordon, 1815–72, Union general in the U.S. CIVIL WAR; b. Spain. He distinguished himself in 1862 at the SEVEN DAYS BATTLES, BULL RUN, and ANTIETAM, and later at FREDERICKSBURG and CHANCELLORSVILLE. In command of the Army of the Potomac from 1863, he won the important battle of GETTYSBURG, although he was criticized for not following up his victory.

Meade, James Edward, 1907–, British economist. An expert on theories of international trade, he taught (1947–57) at the London School of Economics and later at Cambridge Univ. For his work in the early 1950s on foreign-trade and balance-of-payments problems, he was a co-recipient, with Bertil OHLIN, of the 1977 Nobel Prize in economics.

meadowlark, North American meadow BIRD of the family Icteridae, which includes the BLACKBIRD, ORIOLE, and COWBIRD. Unlike other members of the family, the meadowlark (also called meadow starling) does not travel in flocks, and eats harmful insects rather than grain. The eastern species, *Sturnella magna,* is known for its clear, whistling song. It is c.10 in. (25 cm) long and has black-streaked brown coloring above and yellow below.

meadow saffron or **autumn crocus,** perennial garden ornamental (*Colchicum autumnale*) of the LILY family, native to Europe and N Africa and now naturalized in the U.S. Its poisonous corms and seeds yield the drug colchicine. The purplish fall flowers resemble those of the unrelated true CROCUS and true SAFFRON (of the IRIS family).

Meany, George, 1894–1980, American labor leader, president (1955–79) of the AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS; b. N.Y.C. A plumber, he rose in 1934 to the presidency of the New York State Federation of Labor. Elected secretary-treasurer of the AFL in 1939, he held that post until becoming president in 1952. When the AFL and CIO merged in 1955, he was elected head of the new federation. Angered by Democratic party reforms in 1972, he support neither of the major presidential candidates, a decision that contributed to Pres. Richard Nixon's landslide victory. Meany broke with Nixon, however, and was an early advocate of his removal from office. A supporter of Jimmy Carter in the 1976 election, Meany later denounced Pres. Carter's economic policies.

measles or **rubeola,** highly contagious viral disease spread by droplet spray from the mouth, nose, and throat during the infectious stage (beginning two to four days before the rash appears and lasting two to five days thereafter). Early symptoms (fever, redness of eyes) are followed by characteristic white spots in the mouth and a facial rash that spreads to the rest of the body. Although one attack confers lifelong immunity, immunization is advisable because of the possibility of serious secondary infection. See also RUBELLA.

Mecca, city (1990 est. pop. 689,000), W Saudi Arabia. The birthplace A.D. c.570 of MUHAMMAD, it is the holiest city of ISLAM, and non-Muslims may not enter Mecca. It developed as a caravan city about two centuries before Muhammad's birth. It was an ancient center of commerce. Muhammad's flight (the hegira) from Mecca in 622 is the beginning of the Muslim era. Mecca was taken by the Ottoman Turks in 1517 and fell to IBN SAUD in 1924. At the city's center is the Great Mosque, the Haram, which encloses the KAABA, the most sacred Islamic sanctuary and the goal of Muslim pilgrimage. The commerce of the city depends almost wholly on the nearly 2 million pilgrims each year. In 1979 Muslim fundamentalists seized the Great Mosque; the government retook it by force after a two-week siege.

mechanics, branch of PHYSICS concerned with MOTION and the FORCES causing it. The field includes the study of the mechanical properties of matter, such as DENSITY, elasticity (see STRENGTH OF MATERIALS), and VISCOSITY. Mechanics is divided into STATICS, which deals with bodies at rest or in equilibrium, and DYNAMICS, which deals with bodies in motion. Isaac NEWTON, who derived three laws of motion and the law of universal GRAVITATION, was the founder of modern mechanics. For bodies moving at speeds close to that of light, Newtonian mechanics is superseded by the theory of RELATIVITY, and for the study of very small objects, such as ELEMENTARY PARTICLES, QUANTUM MECHANICS is used.

Mecklenburg Declaration of Independence, document, widely regarded as spurious, alleged to have been adopted at Charlotte, N.C., by the citizens of Mecklenburg co. on May 20, 1775. The anti-British resolutions actually adopted (May 31, 1775) imply, but do not declare, independence.

Medan [mädän'], city (1990 pop. 1,730,752), capital of North Sumatra prov., Indonesia, 15 miles (25 km) from the mouth of the Deli R., site of its port. The largest city in SUMATRA, it is the marketing, commercial, and transportation center of a rich agricultural area with great tobacco, rubber, and palm oil estates. Manufactures include machinery and tile.

Medawar, Peter Brian, 1915–87, British zoologist; b. Brazil. During World War II he developed a method for joining the ends of severed nerves; later he did experimental work in transplanting living tissue from one body to another. Working on a theory of Sir Macfarlane BURNET, he proved that under certain circumstances an organism can overcome its normal tendency to reject foreign tissue or organs. For this work he and Burnet shared the 1960 Nobel Prize in physiology or medicine.

Medea, in Greek mythology, princess of Colchis; famed for her skill in sorcery. She fell in love with JASON and helped him obtain the GOLDEN FLEECE. After marrying Jason she returned with him to Iolcus and bore him two children. Years later, when Jason wished to marry Creusa, the vengeful Medea sent her an enchanted gown,

which burned her to death. Then she killed her own children. Her story was dramatized by EURIPIDES.

Medellín, city (1985 pop. 1,480,382), capital of Antioquia dept., W central Colombia. Virtually isolated in its remote mountain valley until the mid-19th cent., it is now one of Colombia's chief cities and manufacturing centers. Its leading products include textiles, steel, food products, and automobiles. Coal, gold, and silver are mined in the surrounding region. Medellín has three universities and a world-famous orchid garden. In the 1980s and early 90s the city was notorious as the headquarters of a "cartel" of cocaine traffickers.

Media, ancient country of W Asia, in a region now in W Iran and S Azerbaijan. Its inhabitants were the Medes, an Indo-European people, who extended their rule over PERSIA in the reign of Sargon (d. 705 B.C.) and captured NINEVEH in 612 B.C. Their capital was Ecbatana. Media was forcibly annexed (c.550 B.C.) to Persia by CYRUS THE GREAT.

mediation, labor: see under COLLECTIVE BARGAINING.

Medicaid: see HEALTH INSURANCE.

Medicare: see HEALTH INSURANCE.

Medici [mĕ'dĭchē], Italian family that directed the destinies of Florence from the 15th cent. until 1737. Of obscure origin, they gained immense wealth as merchants and bankers, became affiliated through marriage to the major houses of Europe, and produced three popes (LEO X, CLEMENT VII, and Leo XI) and two queens of France (CATHERINE DE' MEDICI and MARIE DE' MEDICI). Until 1532 the democratic constitution of Florence was outwardly upheld, but the Medici exerted actual control over the government without holding any permanent official position. They were exiled from Florence in 1433–34, 1494–1512, and 1527–30. Through their patronage of the arts they helped to make the city a great repository of European culture. The first important member of the family was **Giovanni di Bicci de' Medici,** 1360–1429, whose sons founded the two branches of the family.

Senior Line. His elder son, **Cosimo de' Medici** (Cosimo the Elder), 1389–1464, was the first Medici to rule Florence. Exiled from Florence in 1433, he returned in 1434 and doubled his wealth through banking. He ended Florence's traditional alliance with Venice and supported the SFORZA family in Milan. His chief fame is as a patron to such artists as BRUNELLESCHI, DONATELLO, and GHIBERTI, and as the founder of the Medici Library. He was succeeded as head of the family by his son, **Piero de' Medici,** 1416–69, nicknamed Il Gottoso [the gouty] because of ill health. In 1466 Piero put down a conspiracy against him by the Pitti family. His son and successor, **Lorenzo de' Medici** (Lorenzo the Magnificent), 1449–92, was one of the towering figures of the Italian RENAISSANCE. He had little success in business, however, and his lavish entertainments depleted his funds. In 1478 Pope SIXTUS IV helped to foment the Pazzi conspiracy against him. Lorenzo's brother Giuliano was murdered, but Lorenzo escaped with only a wound, and the plot collapsed. In spite of the attacks of Girolamo SAVONAROLA, Lorenzo allowed him to continue preaching. Lorenzo was a patron of BOTTICELLI and MICHELANGELO. His second son later became pope as Leo X. His successor was his eldest son, **Piero de' Medici,** 1471–1503. Piero was driven (1494) from Florence by the democratic party led by Savonarola during the invasion of Italy by CHARLES VIII of France. Piero's brother, **Giuliano de' Medici,** 1479–1516, duke of Nemours (1515–16), entered Florence in 1512 when the HOLY LEAGUE restored the Medici as rulers. After his death, control over Florence was exercised by Pope Leo X through Piero's son **Lorenzo de' Medici,** 1492–1519, duke of Urbino (1516). Lorenzo was the father of Catherine de' Medici. Giuliano's and Lorenzo's statues by Michelangelo adorn their tombs in the Church of San Lorenzo in Florence. After 1523 Pope Clement VII headed the Medici family and controlled Florence through **Ippolito de' Medici,** 1511–35, Giuliano's illegitimate son, and **Alessandro de' Medici,** 1510?–37, probably the illegitimate son of Lorenzo de' Medici (d. 1519). The Medici were banished (1527) from Florence as a result of the invasion of Italy by Holy Roman Emperor CHARLES V, but Pope Clement restored them to power in 1530. Clement soon favored Alessandro, who became head of the republic (1531) and hereditary duke (1532). In 1535 Ippolito was sent by the Florentines to present their grievances to the emperor, but he died on the way, possibly poisoned at Alessandro's command. Alessandro, who had married Margaret of Austria (see MARGARET OF PARMA), was assassinated by a relative, **Lorenzino de' Medici,** 1515–47, and the leadership of the family passed to Cosimo I de' Medici, of the younger branch.

Younger Line and Grand Dukes of Tuscany. This line descended from **Lorenzo de' Medici,** d. 1440, younger son of Giovanni di Bicci de' Medici. Lorenzo's great-grandson **Giovanni de' Medici,** 1498–1526, called Giovanni delle Bande Nere [of the black bands], was a famous condottiere. He fought for Pope Leo X in the ITALIAN WARS, but later changed sides and fought for FRANCIS I of France. His nickname probably derives from the black bands of mourning he put on his banners after Leo's death. His older son, **Cosimo I de' Medici,** 1519–74, succeeded Alessandro de' Medici as duke of Florence in 1537. He acquired (1555) SIENA and was made (1569) grand duke of Tuscany. His son, **Francesco de' Medici,** 1541–87, grand duke 1574–87, devoted himself to alchemy and allowed the HAPSBURGS of Spain and Austria to establish a virtual protectorate over his kingdom. He was the father of Marie de' Medici. His brother, **Ferdinand I de' Medici,** 1549–1609, grand duke 1587–1609, built the famous Villa Medici at Rome and created a free port at Leghorn. His son, **Cosimo II de' Medici,** 1590–1621, grand duke 1609–21, was a patron of GALILEO. Cosimo's grandson, **Cosimo III de' Medici,** 1642–1723, grand duke 1670–1723, headed a corrupt and bigoted regime. His son, **Gian Gastone de' Medici,** 1671–1737, grand duke 1723–37, was the last male member of the family. He ruled a Tuscany that had fallen from glory into decadence and impoverishment. In 1735 his succession was settled on Francis of Lorraine (later Holy Roman Emperor FRANCIS I).

Medici, Giovanni de', 1475–1521: see LEO X.

Medici, Giulio de': see CLEMENT VII.

medicine, science and art of diagnosing, treating, and preventing disease. For centuries its treatment was coupled with magic and superstition. The more scientific practice of medicine, however, began in ancient Asian civilizations. In Sumer, the Laws of HAMMURABI established the first known code of medical ethics. In China, the ancient practice of ACUPUNCTURE and ideas about the circulation of blood presuppose familiarity with anatomy, vascular systems, and the nervous system. The Greeks advanced medical knowledge in anatomy and physiology, diet, exercise, and other areas, and provided the Hippocratic oath, still used today (see HIPPOCRATES). The Romans improved public health through their sophisticated sanitation facilities, and GALEN provided a final synthesis of the medicine of the ancient world. After a period of decline during the Middle Ages, when medical knowledge was kept alive mainly by Arab and Jewish physicians, VESALIUS proved that there were errors in Galen's work and again opened medicine to discovery. In the 17th cent., William HARVEY demonstrated the circulation of blood and the role of the heart as a pump. With the introduction of the compound microscope, minute forms of life were discovered and a major step was made toward diagnosing disease. In the 18th cent., Edward JENNER introduced the concept of VACCINATION, and surgery was transformed into an experimental science. The beginnings of modern medicine date from the 19th cent., with the development of the germ theory of disease; the use of antiseptics and ANESTHESIA in surgery; and a revival of public-health measures and better sanitation. Medicine in the 20th cent. has been characterized by an increased understanding of IMMUNITY, the ENDOCRINE SYSTEM, and the importance of VITAMINS and nutrition; advances in SURGERY, organ TRANSPLANTATION, and diagnostic techniques (see X RAY; CAT SCAN; ULTRASOUND; MAGNETIC RESONANCE); the use of DRUGS, especially ANTIBIOTICS; and the development of GENE THERAPY. Advances have also been notable in the treatment of mental illness through both PSYCHOTHERAPY and the administration of drugs (see ANTIDEPRESSANTS; PSYCHIATRY). With growing specialization and complex diagnostic and therapeutic technology, modern medicine faces problems in the allocation of both personnel and capital. The cost of medical care in the U.S. has been financed by various forms of private coverage (see HEALTH INSURANCE; HEALTH MAINTENANCE ORGANIZATION; MANAGED HEALTH CARE) and government programs (e.g., Medicare for those over age 65, Medicaid for the poor, and public vaccination programs). The great rise in health care costs in recent years has led to reevalu-

ation of the current system and consideration of a nationwide health insurance plan.

Medina, city (1990 est. pop. 500,000), W Saudi Arabia. It is situated in an oasis c.110 mi (180 km) inland from the Red Sea. Before the flight (the hegira) of MUHAMMAD from MECCA to Medina, the city was called Yathrib. Muhammad used it as a base for converting and conquering Arabia. It came under the sway of the Ottoman Turks in 1517. In 1924 it fell to IBN SAUD. Medina's large mosque contains the tombs of Muhammad and his daughter Fatima.

meditation, religious discipline in which the mind is focused on a single point of reference. It may be a means of invoking divine GRACE, as in the contemplation by Christian mystics of a spiritual theme, question, or problem; or it may be a means of attaining conscious union with the divine, e.g., through visualization of a deity or inward repetition of a prayer or MANTRA (sacred sound). Employed since ancient times in various forms by all religions, the practice gained greater notice in the postwar U.S. as interest in ZEN BUDDHISM rose. In the 1960s and 70s the Indian Maharishi Mahesh Yogi popularized a mantra system called Transcendental Meditation (TM). Meditation is now used by many nonreligious adherents as a method of stress reduction; it is known to lessen levels of cortisol, a hormone released in response to stress. The practice has been shown to enhance recuperation and improve the body's resistance to disease.

Mediterranean fruit fly: see FRUIT FLY.

Mediterranean Sea, strategically important sea between Europe, Africa, and Asia, c.965,000 sq mi (2,499,350 sq km), opening to the Atlantic Ocean through the Strait of GIBRALTAR; to the BLACK SEA through the DARDANELLES, the Sea of Marmara, and the BOSPORUS; and to the RED SEA through the SUEZ CANAL. It is c.2,400 mi (3,900 km) long, up to 1,000 mi (1,600 km) wide, and reaches a maximum depth of c.14,450 ft (4,400 m) off Greece. The sea has little variation in tides. It was the focus of Western civilization from earliest times (see AEGEAN CIVILIZATION) until the 15th cent. when open-ocean shipping around Africa became common. It was revitalized as a trade route in 1869 by the opening of the Suez Canal and since then by its proximity to Middle East and North African oil fields.

Medusa: see GORGON.

medusa, in zoology: see POLYP AND MEDUSA.

meerschaum or **sepiolite,** hydrous magnesium silicate mineral ideally, $Mg_8(H_2O)_4(OH)_4Si_{12}O_{30}$ resembling white clay. It is found in many parts of the world and is used primarily to make pipes and cigar and cigarette holders. Meerschaum pipes, often carved into ornate forms, become dark brown with use.

megalithic monuments, ancient structures of one or more huge stone slabs, mostly in W Europe and the British Isles, dating 2000–1500 B.C. Slabs may be 65 ft (20 m) long and weigh 100 tons. Erected singly, in rows, or in a circle (see STONEHENGE), they probably served religious or funerary purposes. A dolmen, or chamber tomb, was usually covered to form a BARROW.

Megiddo [məgĭd'ō], ancient city, Palestine, on the S edge of the plain of Esdraelon. Inhabited since the 4th millennium B.C., it has been the scene of many battles throughout history, from the victory of THUTMOSE III (c.1468 B.C.) to that of Gen. Edmund ALLENBY in World War I. The plain is called the valley of **Megiddon** in the Bible.

Mehemet. For persons thus named, see MUHAMMAD.

Mehta, Zubin [mā'tə], 1936–, Indian-American conductor; b. Bombay. A flamboyant stylist, he specializes in late romantic and early modern music. After conducting in Montreal and Los Angeles, he was music director of the New York Philharmonic (see ORCHESTRA, table) from 1978 to 1991. He has also been music director of the Israel Philharmonic since 1968.

Meier, Richard (Alan), 1934–, American architect. He was one of the New York "Five" or "white" architects, whose design vocabulary recalls LE CORBUSIER and the modernism of the 1920s. Meier is noted for his country houses, which are often built in dramatic natural settings. At the High Museum (1983) in Atlanta, he has successfully adapted his characteristic design idiom to a public building.

Meiji [mā'jē], 1852–1912, reign name of the emperor of Japan (1867–1912). His given name was Mutsuhito. Just after his accession a revolution called the **Meiji restoration** occurred (1868). The TOKUGAWA shogunate, a military dictatorship that controlled Japan, had declined, and opposition to it had grown. Some daimyo, or barons, disgruntled by foreign intrusions, demanded the creation of a new government and favored using Western armaments to expel the foreigners. In 1867 the shogun finally surrendered to the emperor, and subsequent rebellions were put down. The restoration caused the downfall of feudalism, and a centralized administration was set up. The court was moved from Kyoto to Tokyo, and the emperor entrusted (1868) government to Westernizers such as Shigenobu OKUMA. Soon after a new constitution was adopted (1889), Japan emerged as a modern industrial state.

Meinecke, Friedrich [mī'nĕkə], 1862–1954, German historian. A nationalist and a liberal, he believed that the state must serve cultural needs and promote individualism. His works include *Machiavellism* (1924) and *The German Catastrophe* (1946).

meiosis, process of nuclear division in a cell by which the CHROMOSOMES (genetic material) are reduced to half their original number. Meiosis occurs only during formation of germ cells (OVUM and SPERM). An ordinary body cell contains two of each type of chromosome (diploid). Meiosis produces cells with one chromosome of each pair (haploid). In FERTILIZATION, two haploid cells are united; the resulting zygote then contains a diploid number of chromosomes.

Meir, Golda [māēr'], 1898–1978, Israeli prime minister (1969–74); b. Russia as Golda Mabovitch. After a teaching career in the U.S., she settled in Palestine (1921), where she became active in the labor movement and later served as Israel's minister of labor (1949–56) and of foreign affairs (1956–66). As prime minister she sought peace for Israel and resigned in 1974 after she and Moshe DAYAN were criticized for the country's lack of preparation for the 1973 ARAB-ISRAELI WAR.

meistersinger [Ger., = mastersinger], member of a 15th–16th-cent. German musical and poetical guild. Candidates for the rank of *Meister* were judged in public contests. Richard WAGNER's opera *Die Meistersinger von Nürnberg* faithfully represents guild practices.

Meitner, Lise [mīt'nər], 1878–1968, Austrian-Swedish physicist and mathematician. She discovered the PROTACTINIUM-231 isotope and investigated the disintegration products of radium, thorium, and actinium and the behavior of beta rays (see RADIOACTIVITY). Her conclusion, from experimental research in bombarding the uranium nucleus with slow-speed neutrons, that fission of the nucleus had occurred, contributed to the development of the ATOMIC BOMB.

meitnerium (Mt), artificial radioactive TRANSURANIUM ELEMENT. Report of its production was made by a West German group at Darmstadt, who in 1982 bombarded bismuth with iron ions to obtain the Mt^{267} isotope. It is also called unnilennium (Une). See ELEMENT (table); PERIODIC TABLE.

Meknès [mĕknĕs'], city (1990 est. pop. 750,000), N central Morocco. It has a noted carpet-weaving industry as well as woolen mills, cement and metal works, oil distilleries, and food-processing plants. Meknès was founded c.1672 by Sultan Ismail, who built many palatial buildings, of which little survives. A European town is laid out beside the old one.

Mekong, one of the great rivers of Southeast Asia, c.2,600 mi (4,180 km) long. It rises as the Za Qu in Tibet and flows generally south through SW China, then circuitously across or along the borders of Myanmar, Laos, Thailand, and Cambodia. It enters the SOUTH CHINA SEA through several mouths across a vast, fertile delta (c.75,000 sq mi/194,250 sq km) near HO CHI MINH CITY (Saigon), in S Vietnam. Its densely populated lower valley, in Cambodia and Vietnam, is one of the world's great rice-growing regions. PHNOM PENH is a major port.

Melanchthon, Philip [məlăngk'thən], 1497–1560, German scholar, humanist, and religious reformer. His name is the Greek rendering of the German Schwarzerd [black earth]. A man of great intellect and wide learning, he was professor of Greek at the Univ. of Wittenberg when he met Martin LUTHER, and they soon became associates. His *Loci communes* (1521) was the first systematic presentation of the principles of the REFORMATION and clarified the new gospel to those outside the movement. A mediator between Luther

and the humanists, he also represented him at many conferences and wrote the Augsburg Confession (1530). Melanchthon was more conciliatory than Luther, as evidenced by his friendship with John CALVIN and his willingness to compromise on doctrinal issues. For his role in creating the German schools, he is known as preceptor of Germany.

Melanesia, one of the three main divisions of OCEANIA, in the SW Pacific Ocean, NE of Australia and S of the equator. It includes the SOLOMON ISLANDS, VANUATU, TUVALU, NEW CALEDONIA, the Bismarck Archipelago, FIJI, and the Admiralty Islands. The Melanesians are largely of Australoid stock and speak languages of Malayo-Polynesian origin.

Melbourne, William Lamb, 2d **Viscount,** 1779–1848, British statesman, prime minister (1834, 1835–39, 1839–41). A Whig with aristocratic views, he conceded reforms such as the Poor Law (1834) and the Municipal Corporations Act (1835), but resisted more radical demands. A favorite of the young Queen VICTORIA, he taught her important lessons in statecraft. His wife, **Lady Caroline Lamb,** 1785–1828, wrote several minor novels, but is best known for her love affair with Lord BYRON.

Melbourne, city (1991 est. pop. 3,153,500), capital of Victoria, SE Australia, on Port Phillip Bay, at the mouth of the Yarra R. Australia's second largest city, it is a commercial and industrial center with such manufactures as ships, automobiles, farm machinery, textiles, and electrical equipment. The city was settled in 1835 and named (1837) for the British prime minister, Lord MELBOURNE. It was the seat of the Australian federal government (1901–27). The population, once primarily British, has changed since World War II with immigration from E and S Europe. Melbourne was the site of the 1956 Olympic games. The Melbourne Cup Race is run annually.

Melchior: see WISE MEN OF THE EAST.

Melchior, Lauritz [mĕl'kēôr], 1890–1973, Danish heroic tenor. A great singer and actor, he was (1926–50) the leading Wagnerian tenor (see WAGNER, RICHARD) at the METROPOLITAN OPERA.

Meleager [mĕlēā'jər], hero of Greek mythology. At his birth a prophecy said that he would die when a certain log in the fire burned. His mother hid the log, and Meleager grew to be a famous warrior. When ARTEMIS sent a huge boar to ravage his land, Meleager led a band of heroes, including CASTOR AND POLLUX, THESEUS, and JASON, in the Calydonian hunt, and killed the boar. Meleager gave its pelt to the huntress ATALANTA, and when his uncles tried to take it he killed them. In revenge his mother burned the hidden log, and Meleager died.

Melilla [mālē'lyä], city (1991 pop. 56,600), Spanish possession, on the Mediterranean coast of Morocco, NW Africa. It is a fishing port and an export point for iron ore. Held by Spain since 1496, it was the site of the revolt that began (1936) the SPANISH CIVIL WAR.

Mellon, Andrew William, 1855–1937, American financier, industrialist, and public official; b. Pittsburgh. With his brother, Richard, he took over (1886) his father's banking firm and later established other banks. He expanded his holdings in key American industries, such as oil, locomotives, coal, hydroelectricity, bridge-building, public utilities, steel, and insurance, and played a key role in founding the huge Aluminum Co. of America. In 1921 he resigned as president of the Mellon National Bank to become U.S. secretary of the Treasury, serving until 1931, under three presidents. He was also (1931–32) ambassador to Great Britain. In 1937 he donated his art collection to the public, with funds for constructing the NATIONAL GALLERY OF ART (Wash., D.C.).

melodrama [Gr., = song-drama], originally a spoken text with musical background, as in Greek drama. Popular in the 18th cent., it was varied to include drama interspersed with music, e.g., *The Beggar's Opera* by John GAY. ROUSSEAU's *Pygmalion* (1762) helped create a vogue for romantic nonmusical plays often ending in the triumph of virtue. The term now applies to all plays with overdrawn characterizations, smashing climaxes, and sentimental appeal, including such "tearjerkers" as Mrs. Henry Wood's *East Lynne.* True musical melodrama has been written in the 20th cent. by such composers as SCHOENBERG and Richard STRAUSS.

melon, fruit of *Cucumis melo,* a plant of the GOURD family, native to Asia but now widely cultivated in warm regions. Many varieties exist, differing in taste, color, and skin texture—e.g., Persian, honeydew, casaba, muskmelon, and cantaloupe. The true cantaloupe (var. *cantalupensis*) is a hard-shelled melon grown in Mediterranean countries; cantaloupes of the U.S. are varieties of the muskmelon.

melting point, temperature at which a substance changes its state from solid to liquid (see STATES OF MATTER). Under standard atmospheric pressure, different pure crystalline solids will each melt at a different specific temperature; thus melting point is a characteristic of a substance and can be used to identify it. The quantity of heat necessary to change 1 gram of any substance from solid to liquid at its melting point is known as its latent heat of fusion.

Melville, Andrew, 1545–1622, Scottish religious reformer and scholar. An academic, he became (1590) rector of St. Andrews and reorganized the Scottish universities. More importantly, as successor to John KNOX, he was largely responsible for the introduction of a presbyterian system into the Scottish church. A foe of prelacy and royal supremacy, he struggled to assert church independence.

Melville, Herman, 1819–91, one of the greatest American writers; b. N.Y.C. His experiences on a whaler (1841–42) and ashore in the Marquesas (where he was captured by cannibals) and other South Sea islands led to the writing of *Typee* (1846), *Omoo* (1847), and other widely popular romances. Melville's masterpiece, *Moby-Dick; or, The Whale* (1851), the tale of a whaling captain's obsessive search for the white whale that had ripped off his leg, is at once an exciting sea story, a heavily symbolic inquiry into good and evil, and one of the greatest novels ever written. Both *Moby-Dick* and the psychological novel *Pierre; or, The Ambiguities* (1852) were misunderstood at the time of their publication and badly received. Although disheartened by his failure to win an audience, by ill health, and by debts, Melville continued to produce such important works as *The Piazza Tales* (1856), a collection including the stories "Benito Cereno" and "Bartleby the Scrivener," *The Confidence Man* (1857), and the novella *Billy Budd, Foretopman* (1924). After holding the position of customs inspector in New York City for 19 years, Melville died in poverty and obscurity. Neglected for many years, his work was rediscovered c.1920.

Memling or **Memlinc, Hans,** c.1430–1494, Flemish religious and portrait painter; b. Germany. His religious works are rather bland, reflecting Roger van der WEYDEN's figure types without their intensity. They include the *Adoration of the Magi Triptych* and the *St. Ursula Shrine* panels (both: Bruges). Memling's portraits are more original, combining accuracy of representation with varied backgrounds of flowers and animals.

Memorial Day, U.S. holiday observed late in May. Formerly known as Decoration Day, it was instituted (1868) to honor the CIVIL WAR dead, but it now commemorates all war dead.

Memphis, ancient city of EGYPT, capital of the Old Kingdom (c.3100–c.2258 B.C.), at the apex of the NILE delta, 12 mi (18 km) from Cairo. The PYRAMIDS and other monuments are nearby. Memphis declined and fell into ruin under the Arabs.

Memphis, city (1990 pop. 610,337), seat of Shelby co., SW Tenn., on a bluff above the Mississippi R., at the mouth of the Wolf R.; est. (by Andrew JACKSON and others) 1819, inc. 1826. The largest city in the state, it is a major river port, rail center, and market for lumber, cotton, and livestock. Textiles, pianos, heating equipment, and motor vehicle parts are among its manufactures. Strategically important in the CIVIL WAR, it fell to Union forces in 1862. The city has numerous medical, educational, and cultural institutions, including the National Civil Rights Museum, located in the motel where Martin Luther KING, Jr., was assassinated. The site of the famous Beale St., Memphis is associated with such musicians as W.C. HANDY and Elvis PRESLEY. The Great American Pyramid, a 32-story glass-encased sports arena and museum complex built in 1991, dominates the city's riverfront.

Menam Chao Phraya: see CHAO PHRAYA.

Menander, 342?–291? B.C., Greek poet, most famous writer of New COMEDY. His ingenious plays, based on love plots, have highly developed characters. Through imitations by PLAUTUS and TERENCE he influenced 17th-cent. COMEDY.

Mencken, H(enry) L(ouis), 1880–1956, American author; b. Baltimore. He was a journalist, notably on Baltimore's *Sun* papers (1906–56). He and George Jean NATHAN edited the *Smart Set* (1914–23) and started (1924) the *American Mercury,* which Mencken

alone edited (1925–33). His ascerbic critical essays, aimed mainly at the complacent bourgeoisie, were collected in *Prejudices* (6 vol., 1919–27). He also wrote many other critical and autobiographical works. In philology, he compiled the monumental *The American Language* (1919; 4th ed., 1936; supplements).

H.L. Mencken

Mendel, Gregor Johann, 1822–84, Austrian monk noted for his experimental work on heredity. At the Augustinian monastery in Brno (1843–68) he conducted experiments, chiefly on garden peas and involving a controlled pollination technique and a careful statistical analysis of his results, that produced the first accurate and scientific explanation for hybridization. His findings, published in 1866, were ignored during his lifetime, but were rediscovered by three separate investigators in 1900. Mendel's conclusions have become the basic tenets of GENETICS and a notable influence in plant and animal breeding. **Mendelism** is a system of heredity based on his conclusions. Briefly summarized, the Mendelian system states that an inherited characteristic is determined by the combination of two hereditary units (now called genes), one from each of the parental reproductive cells, or gametes.

Mendeleev, Dmitri Ivanovich [měndəlā'əf], 1834–1907, Russian chemist. He formulated (1869) the periodic law and invented the PERIODIC TABLE, a system of classifying the elements that allowed him to predict properties of then-unknown elements. He was a professor (1868–90) at the Univ. of St. Petersburg, a government adviser on the development of the petroleum industry, and the director of the bureau of weights and measures.

Mendele mocher sforim [měn'dələ mōkh'ər sfô'rĭm], pseud. of **Sholem Yakob Abramovich,** 1836–1917, Russian Yiddish novelist who also wrote in Hebrew. He is considered the father of modern Hebrew literature, and his Yiddish style was influential. His novels include *The Travels of Benjamin the Third* (1878).

mendelevium (Md), artificial radioactive element, detected in 1955 by A. Ghiorso and colleagues, who produced it one atom at a time by alpha-particle bombardment of einsteinium-253. Little is known about its properties. See ELEMENT (table); PERIODIC TABLE.

Mendelssohn, Felix, 1809–47, German composer, a major figure in 19th-cent. music; grandson of Moses MENDELSSOHN. A prodigy, he composed his first mature work, the Overture to *A Midsummer Night's Dream,* at 17. In 1829 he conducted a performance of the *St. Matthew Passion* that revived interest in J.S. BACH. Mendelssohn's music is characterized by emotional restraint, refinement, and sensitivity, and by adherence to classical forms. Of his five symphonies, the *Scottish* (1830–42), *Italian* (1833), and *Reformation* (1830–32) are best known. His Violin Concerto in E Minor (1844) is popular, as are his ORATORIOS and piano pieces.

Mendelssohn, Moses, 1729–86, German-Jewish philosopher, leader in the movement for cultural assimilation; grandfather of Felix MENDELSSOHN. He was a close friend of the playwright G.E. LESSING. His works on esthetics were highly regarded in his time.

Menelaus [mĕnəlā'əs], in Greek myth, king of SPARTA; husband of HELEN; brother of AGAMEMNON. When PARIS abducted Helen to Troy, Menelaus asked the Greek kings to join him in the TROJAN WAR. At its end he returned to Sparta with Helen.

Menelik II, 1844–1913, emperor of ETHIOPIA (1889–1913). In 1896 he crushed the Italian invasion at Aduwa, thereby establishing Ethiopian independence. His conquests greatly expanded the size of Ethiopia.

Menem, Carlos Saúl, 1930–, president of Argentina (1989–). A follower of PERÓN), he was a provincial governor (1973–76, 1983–89) before and after his imprisonment after the 1976 coup. As president, he addressed Argentina's economic crisis by reducing subsidies for the poor and stimulating the free market.

Mengistu Haile Mariam, 1937–, Ethiopian army officer and dictator (1977–91). He took a leading part in the 1974 coup that deposed Emperor HAILE SELASSIE and by 1977 had ruthlessly consolidated his power as dictator. He established close ties with the USSR and Cuba, which gave him military aid, and his regime undertook a Marxist program, including the nationalization of industry and collectivization of agriculture. His authoritarian, often brutal rule was plagued by uprisings in the northern provinces of ERITREA and Tigre, famine, and war with SOMALIA. Mengistu went into exile in 1991 as the army was overwhelmed by Eritrean and Tigrean rebels.

meningitis or **cerebrospinal meningitis,** acute inflammation of the membranes covering the BRAIN or spinal cord, or both. It can be caused by BACTERIA, a VIRUS, PROTOZOAN, YEAST, or FUNGUS, usually introduced from elsewhere in the body. Symptoms include fever, headache, vomiting, neck and back rigidity, delirium, and convulsions. Examination of the cerebrospinal fluid by means of a spinal tap permits a specific diagnosis. ANTIBIOTICS have reduced mortality and decreased the incidence of such complications as brain damage and paralysis. Infant VACCINATION for haemophilus influenzae type B (HIB), a bacterium that is the major cause of meningitis in children, is recommended.

Menninger, Karl Augustus [měn'ĭnjər], 1893–90, and **William Claire Menninger,** 1899–1966, American psychiatrists, brothers; b. Topeka, Kans. In 1920, Karl and his father, Charles Frederick (1862–1955), founded in Topeka the Menninger Clinic, conceived with the idea of collecting many specialists in one center. They were joined in 1926 by William. The Menninger Foundation, established (1941) for research, training, and public education in psychiatry, became a psychiatric center of the U.S. Karl was instrumental in founding (1946) the Winter Veterans' Administration Hospital, which includes the largest psychiatric training program in the world.

Mennonites, Protestant sect arising among Swiss ANABAPTISTS and for a time called Swiss Brethren. They derive their name from MENNO SIMONS, a Dutch reformer. The group seceded (1523–25) from the state church in Zürich after rejecting its authority and infant baptism. They believed in nonresistance, refused to take oaths, and held the Bible as their sole rule of faith. Their distinctive beliefs were embodied in the Dordrecht Confession of Faith (1632). Mennonites have two sacraments, baptism (for adults only) and the Lord's Supper. The sect spread to Russia, France, and Holland. In America Mennonites first settled (1683) at Germantown, Pa. One of the most conservative divisions of the Mennonite Church is the **Amish** Church, which, under Jacob Ammann broke away (late 17th cent.) from the main body in Europe. The principal U.S. Amish groups are the Old Order Amish, who hold services in German and adhere to traditional customs (e.g., wearing plain clothing and shunning modern education and technology), and the Conservative Amish, who hold services in English as well as German and have adopted some innovations.

Menno Simons, 1496?–1561, Dutch religious reformer. In 1536 he left the Roman Catholic priesthood because of his disbelief in infant baptism and other Catholic teachings. He organized and led the less aggressive division of ANABAPTISTS in Germany and Holland. The name MENNONITES is derived from his name, although he did not actually found the sect.

The key to pronunciation appears on page xiii.

menopause, period in a woman's life when the amount of ESTROGEN produced by the ovaries decreases, resulting in changes in, and ultimately cessation of, MENSTRUATION. It usually occurs between ages 45 and 55 and signals the end of the childbearing years. It may be accompanied by "hot flashes" and vaginal changes (especially decrease in moisture).

Menotti, Gian-Carlo [mānôt'tē], 1911–, Italian operatic composer. His major works include *The Old Maid and the Thief* (1939) and *Amahl and the Night Visitors* (1951), both written for radio broadcast; *The Saint of Bleecker Street* (1950); *Tamu-Tamu* (1973); and other operas with dramatic impact and superb polytonality. In 1958 he instituted the Festival of Two Worlds at Spoleto, Italy. He became artistic director of the Rome Opera in 1993.

Menshevism: see BOLSHEVISM AND MENSHEVISM.

Menshikov, Aleksandr Danilovich, Prince [měn'shĭkəf], 1672?–1729, Russian field marshal and statesman. Friend and chief advisor to PETER I, he held various governorships, becoming notorious for his financial misdeeds. On Peter's death (1725) he helped CATHERINE I (who had been his mistress before marrying Peter) to accede to the throne; he, however, became the real ruler. After the accession of PETER II (1727) he was removed from power and exiled to Siberia.

menstruation, periodic flow of bloody fluid which is part of the human female's reproductive cycle. In this cycle (menstrual cycle), the hormone ESTROGEN, secreted by the ovaries (egg-producing organs), first acts to thicken the lining (endometrium) of the uterus (the muscular organ that carries developing young). After 8 to 10 days the ovary releases an egg and begins to secrete the hormone PROGESTERONE. If the egg is fertilized, it will embed itself in the thick uterine lining. If the egg is not fertilized, the secretion of progesterone declines, and the lowered level of progesterone causes the uterine lining to be sloughed off. The menstrual cycle, which is repeated approximately every 28 days, is the result of complex interactions between ovarian and pituitary hormones and the nervous system. Menstruation commences at puberty (about age 12) and ceases at MENOPAUSE (about age 45 to 55).

mental retardation, subnormal mental development, manifested from birth or early childhood. Although mental retardation has traditionally been diagnosed in the U.S. by significantly lower than normal scores on INTELLIGENCE tests, other characteristics such as social maturity and ability to sustain personal and social independence are now used to evaluate mental competence. Many of the mentally retarded can achieve some language development and can be taught to perform manual tasks of moderate complexity. See also DOWN'S SYNDROME.

Menuhin, Yehudi, 1916–, British violinist; b. N.Y.C. He has been a British subject since 1985. He made his debut in San Francisco at age 7 and has appeared around the world. In 1957 he initiated his own music festival at Gstaad, Switzerland, and in 1963 founded the Yehudi Menuhin School of Music in Suffolk, England. He has toured internationally with the Menuhin Festival Orchestra. Menuhin is an active promoter of Eastern music and little-known works. In 1993 he was created Baron Menuhin of Stoke D'Abernon.

Menzies, Sir Robert Gordon, 1894–1978, Australian statesman. As head of the United Australian party and founder (1944) of the Liberal party, he was prime minister (1939–41, 1949–66). He pursued a firmly anti–Communist policy.

Mephistopheles: see FAUST.

mercantilism, an economic policy of the major trading nations from the 16th to the 18th cent., based on the premise that national wealth and power were best served by increasing exports and collecting precious metals in return. State action, an essential feature of the mercantile system, was used to accomplish its purposes—to sell more than it bought to accumulate bullion and raw materials. Under a mercantilist policy, a government exercised much control over economic life by regulating production, encouraging foreign trade, levying duties on imports to gain revenue, making treaties to obtain exclusive trading privileges, and exploiting the commerce of the colonies. In England, HENRY VIII, ELIZABETH I, and Oliver CROMWELL pursued mercantilist policies; in France, J.B. COLBERT was the chief exponent. Superseding the medieval feudal organization in Western Europe, mercantilism did not decline until the coming of the INDUSTRIAL REVOLUTION and the doctrine of LAISSEZ FAIRE.

Mercator, Gerardus, Latin form of his real name, **Gerhard Kremer,** 1512–94, Flemish geographer, mathematician, and cartographer. He surveyed Flanders and made terrestrial and celestial globes. He was named (1552) to the chair of cosmography of Duisburg, Germany, where he subsequently lived. In 1568 his first map using the projection that bears his name appeared (see MAP PROJECTION). He began (1585) a great atlas, published (1594) by his son.

Mercator map projection, a cylindrical MAP PROJECTION of the features of the earth's surface that can be constructed only mathematically. The parallels of LATITUDE, which on the globe are equal distances apart, are drawn with increasing separation as their distance from the EQUATOR increases in order to preserve shapes. However, areas are exaggerated with increasing distance from the equator. For instance, Greenland is shown with enormously exaggerated size, although its shape is preserved. The poles themselves cannot be shown on a Mercator projection. This type of projection gives an incorrect impression of the relative sizes of the world's countries.

Mercia, kingdom of Anglo-Saxon England, consisting generally of the area of the Midlands. Settled (c.500) by the Angles, it extended its leadership over S England in the reign of Penda (d. 654). This hegemony was strengthened under OFFA (r.757–96), but declined after his death. The eastern part became (886) part of the DANELAW; the western part fell under the control of ALFRED of Wessex.

mercury (Hg) or **quicksilver,** metallic element, known to the ancient Chinese, Hindus, and Egyptians. Silver-white and mirrorlike, it is the only common metal existing as a liquid at ordinary temperatures. Mercury is used in barometers, thermometers, electric switches, mercury-vapor lamps, and certain batteries; a mercury alloy, called an amalgam, is employed in dentistry. Mercury compounds have been used as insecticides, in rat poisons, and as disinfectants. Not easily discharged from the body, the metal is a cumulative poison; its ingestion in more than trace amounts in contaminated food or its absorption by the skin or mucous membranes results in **mercury poisoning,** which can cause skin disorders, hemorrhage, liver and kidney damage, and gastrointestinal disturbances. Workers in many industries have been affected, and mercury POLLUTION of rivers, lakes, and oceans, usually through the discharge of industrial wastes, has become a serious environmental problem. Most mercury pesticides have been withdrawn from the U.S. market, and in 1972 more than 90 nations approved an international ban on the dumping of mercury in the ocean, where the metal has tended to work its way into the food cycle of aquatic life and to reach dangerous levels in certain food fish. See ELEMENT (table); PERIODIC TABLE.

Mercury, in astronomy, nearest PLANET to the sun, at a mean distance of 36.0 million mi (57.9 million km). It has a diameter of 3,031 mi (4,878 km), a cratered, lunarlike surface, and almost no atmosphere. Because its greatest ELONGATION is 28°, it can never be seen more than 2 hours after sunset or 2 hours before sunrise. The observed motion (43′ each century) of Mercury's perihelion (closest point to the sun) is more than can be explained by planetary perturbations (see CELESTIAL MECHANICS) using Newton's theory of gravitation but is in nearly exact agreement with the prediction of the general theory of RELATIVITY. Mercury has no known satellites. The only SPACE PROBE to study Mercury was *Mariner 10,* which made three encounters in 1974–75. In 1991 radar photographs of Mercury from earth strongly suggested that the planet has polar ice.

Mercury, in Roman mythology, god of commerce and messenger of the gods; identified with the Greek HERMES.

Mercury, Project: see SPACE EXPLORATION, table.

mercury poisoning: see under MERCURY.

Meredith, George, 1828–1909, English novelist and poet. His first distinguished novel, *The Ordeal of Richard Feverel* (1859), was followed by *Evan Harrington* (1860), *The Egoist* (1879), *Diana of the Crossways* (1885), and others. *Modern Love* (1862), a series of 50 poems, traces the dissolution of a marriage. His 1877 lecture *On the Idea of Comedy and the Uses of the Comic Spirit* (pub. 1897) is highly regarded. Written in a witty, oblique style, his works contain penetrating analyses of individual character and social institutions.

Meredith, Owen: see under BULWER-LYTTON.

Merezhkovsky, Dmitri Sergeyevich [mârĭshkôf'skē], 1865–1941, Russian writer. Enormously influential in pre-Revolutionary Russia, he is best known for his study of TOLSTOY and DOSTOYEVSKY (1901–2) and for the philosophical novel trilogy *Christ and Antichrist* (1896–1905). With his wife, the poet Zinaida Gippius, he emigrated to Paris in 1918.

Meridian, city (1990 pop. 41,036), seat of Lauderdale co., E Miss.; settled 1831; inc. 1860. It is the trade and transportation center for a farm, livestock, and timber area. Electronic equipment and textiles are produced. Temporary state capital (1863), it was destroyed (1864) by Gen. SHERMAN. The nearby Meridian Naval Air Station is economically important.

meridian circle: see TRANSIT INSTRUMENT.

Mérimée, Prosper [mārēmā'], 1803–70, French romantic author. His concise, understated style was most fully realized in such short novels as *Carmen* (1846, the basis for BIZET's opera) and *Colomba* (1852). His short story "Mateo Falcone" (1829) is a masterpiece of the genre.

Merleau-Ponty, Maurice, 1908–61, French philosopher. Influenced by Edmund HUSSERL, he advocated a form of PHENOMENOLOGY but, unlike most phenomenologists, affirmed the material reality of a world that transcends one's consciousness of it. In the 1940s and 50s he was sympathetic to the historical materialism of Karl MARX, but later he turned his attention to the study of language and meaning. His major works are *The Structure of Behavior* (1942) and *Phenomenology of Perception* (1945).

Merman, Ethel, 1909–84, American musical comedy star, noted for her booming voice; b. Astoria, N.Y., as Ethel Zimmerman. Her greatest successes were *Annie Get Your Gun* (1946), *Call Me Madam* (1950), and *Gypsy* (1958).

Merovingian art and architecture [mĕr'əvĭn'jēən]. Named for Merovech, founder of the first Germanic-Frankish dynasty (5th cent.–751), the Merovingian period was marked by a decline of classical tradition, and the absorption of a radically new element into the artistic mainstream—the abstract and brilliantly ornamental style of the nomadic barbarian tribes. Their art was confined to small, portable objects. The Central European and Eastern settlers introduced CLOISONNÉ and excelled at enamelwork and metalwork. Merovingian architecture, monumental sculpture, and painting were based on classical and Early Christian traditions. Little remains of the structures, but larger churches were said to be based on the basilican plan, with characteristic Merovingian timber roofs. Their most original device was the use of a bell tower. Merovingian stone sculpture simplified antique forms. Animal motifs were common, and manuscript illumination elaborated initial letters based on animal forms. The human figure became an abstract sign.

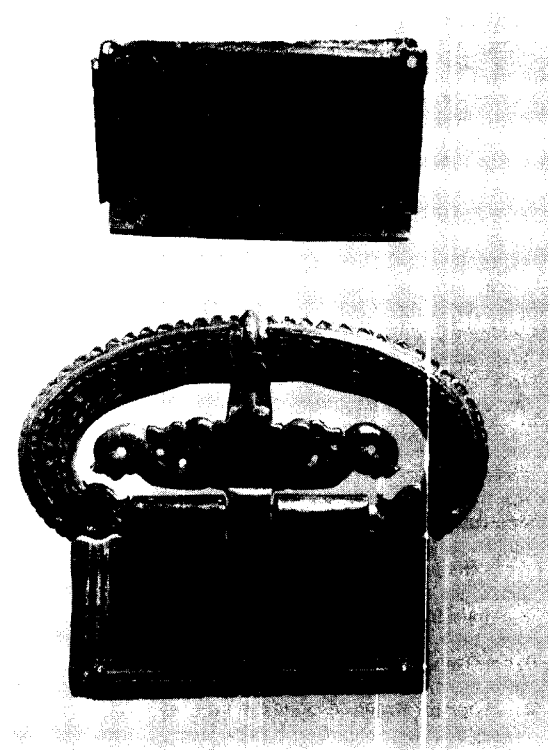
Merovingians, dynasty of Frankish kings that flourished from the 5th cent. to 751. They traced their descent from the semilegendary Merovech, or Meroveus, chief of the Salian Franks. His grandson, CLOVIS I, founded the Frankish monarchy in 481. His descendants divided his domains into Austrasia, Neustria, AQUITAINE, BURGUNDY, Paris, and Orléans. These territories were often combined and sometimes reunited under a single Merovingian ruler. Dagobert I (c.612–c.639) was the last Merovingian to exercise personal power. His successors, the "idle kings," left governing to the mayors of the palace, the CAROLINGIANS. In 751 PEPIN THE SHORT deposed Childeric III, the last Merovingian king.

Merrimack: see MONITOR AND MERRIMACK.

Merton, Robert K(ing), 1910–, American sociologist; b. Philadelphia. His early work includes studies of deviant behavior as social adaptation. After joining (1944) the Columbia Univ. faculty, he teamed with Paul F. LAZARSFELD, as associate director of the Bureau of Applied Social Research. He worked on sociological theory and developed improved methods of conducting social scientific research. His wide-ranging writings include works on mass media and the sociology of science.

Merton, Thomas, 1915–68, American religious writer and poet; b. France. A Roman Catholic convert, he became a Trappist monk in 1941 and was later ordained a priest. He died in an accident in Thailand. Merton is best known for his autobiography, *The Seven Storey Mountain* (1948), and two volumes on Trappist life, *The Waters of Siloe* (1949) and *The Sign of Jonas* (1953).

Merwin, W(illiam) S(tanley), 1927–, American poet; b. N.Y.C. His volumes of poetry include *A Mask for Janus* (1952), *The Carrier of Ladders* (1970; Pulitzer), *Opening the Hand* (1983), and *Selected Poems* (1988). Merwin is also known for his translations, e.g., *The Cid* (1959).



Merovingian belt buckle

Mesa, city (1990 pop. 288,091), S central Ariz., 15 m (24 km) from PHOENIX, in the Salt R. valley; founded by MORMONS 1878, inc. 1883. The city's population multiplied fivefold from 1960 to 1980 and 89% from 1980 to 1990. It has electronics, aircraft, metal, and machine-tool industries. Citrus and farm products are packed and processed. Tourism is also important.

mesa, name given in the SW U.S. to a small, isolated, flat-topped hill with two or more steep, usually perpendicular sides. Mesas are thought to have formed when a relatively hard surface rock layer protected those beneath it from the regional erosion that wore away the surrounding rock. The rock layers composing mesas are more or less horizontal. See also BUTTE.

Mesa Verde National Park: see NATIONAL PARKS (table).

Mesolithic period: see under STONE AGE.

meson: see ELEMENTARY PARTICLES.

Mesopotamia [Gr., = between rivers], ancient region of W Asia around the Tigris and Euphrates rivers, now in Iraq. Called the "cradle of civilization," the heart of the area was a plain rendered fertile in ancient times by canals. Settlements have been found in N Mesopotamia, which probably date from 5000 B.C., and urban civilization later arose in S Mesopotamia in city states such as Erech and Ur (see SUMER). AKKAD emerged (c.2340 B.C.) as the region's first empire and was followed by BABYLONIA and ASSYRIA. Mesopotamia was still important in the Byzantine Empire and in the Abbasid caliphate, but the Mongols devastated the area in A.D. 1258. Today it is largely arid and barren, but its rich oil fields have international importance.

Mesopotamian art: see ASSYRIAN ART; PHOENICIAN ART; SUMERIAN AND BABYLONIAN ART.

mesosphere: see ATMOSPHERE.

Mesozoic era: see GEOLOGIC ERA (table).

Mesquite, city (1990 pop. 101,484), Dallas co., N Texas, a Dallas suburb; inc. 1887. One of the fastest-growing U.S. cities, it had a population increase of over 50% in the 1980s. Mesquite is home to

The key to pronunciation appears on page xiii.

several major corporate headquarters; telephone equipment is a leading manufacture.

mesquite, spiny tree or shrub (genus *Prosopis*) of the PULSE family, native to tropical and subtropical regions. The seedpods of *P. juliflora* contain an edible, sweet pulp that is used as forage and to make bread and a fermented drink; the durable wood is used for fence posts and to lend a smoky flavor to grilled foods. Mesquite roots may penetrate 50 ft (15 m) into the ground for water, enabling the plant to grow in sites unsuited to most crops.

Messalina (Valeria Messalina), d. A.D. 48, corrupt Roman empress, wife of CLAUDIUS I, who had her killed after a scandal in which she publicly married her lover.

Messenia [mĕsē'nēə], ancient region of SW GREECE, in the PELOPONNESUS, corresponding to modern Messinias. From the 8th cent. B.C. Messenia was engaged in a series of revolts against Spartan domination, and it was finally freed when THEBES defeated Sparta at the battle of Leuctra (371 B.C.). Excavation has revealed an important center of MYCENAEAN CIVILIZATION at the Messenian city of PYLOS.

Messiaen, Olivier [mĕsyäN'], 1908–92, French composer and organist. He was a noted teacher and theorist. His works, which reflected his religious mysticism, include *L'Ascension* (1935) and *Des canyons aux étoiles* (1974) for orchestra; *Le Banquet céleste* (1936), for organ; *Oiseaux exotiques* (1956); *Turangalila* (1949), a symphony in 10 movements, and *St. Francis of Assisi,* (1983), an opera.

Messiah or **Messias** [Heb., = anointed], in Judaism, a man who is to be sent by God to restore Israel and reign righteously over all humanity. The idea developed among the Jews especially in adversity; self-proclaimed messiahs, e.g., SABBATAI ZEVI and Jacob FRANK, always attracted some followers. Jewish Messianic expectations generally focused on a kingly figure of the house of DAVID who would be born in Bethlehem. JESUS may have considered himself, and is generally considered by Christians, to be the Messiah promised by the Bible; the name *Christ* is Greek for "Messiah." Expectation of a redeemer is also found in some ancient Middle Eastern texts and among Buddhists, Zoroastrians, Confucians, and Muslims (see MAHDI).

Messier catalog, systematic list of 103 nebulous celestial objects published (1771, 1780, 1781) by the French astronomer Charles Messier. Of these, 33 were identified by later observers as galaxies, 55 as star clusters, and 11 as true nebulae; the 4 others are a double star; an asterism, or small group of stars; a patch of the Milky Way; and a duplicate observation. Objects on the list include the CRAB NEBULA (M1) and the ANDROMEDA GALAXY (M31).

Messys, Quentin: see MASSYS, QUENTIN.

metabolism, sum of all living processes in living systems. Two subcategories of metabolism are anabolism, the building up of organic molecules from simpler ones, and catabolism, the breaking down of complex substances, often accompanied by the release of energy. Thus the energy required for anabolism is obtained from catabolic reactions. Basal metabolism, the heat produced by an organism at rest, represents the minimum amount of energy required to maintain life at normal body temperature.

metal, chemical ELEMENT displaying certain properties, notably metallic luster, the capacity to lose electrons and form a positive ION, and the ability to conduct heat and electricity (see CONDUCTION), by which it is normally distinguished from a nonmetal. The metals comprise about two thirds of the known elements. Some elements, e.g., arsenic and antimony, exhibit both metallic and nonmetallic properties, and are called metalloids. Metals fall into groups in the PERIODIC TABLE determined by similar arrangements of the orbital electrons and a consequent similarity in chemical properties. Such groups include the ALKALI METALS (Group Ia in the periodic table), the ALKALINE-EARTH METALS (Group IIa), and the RARE-EARTH METALS (LANTHANIDE and ACTINIDE series). Most metals other than the alkali metals and the alkaline-earth metals are called transition metals (see TRANSITION ELEMENTS). The oxidation states, or VALENCE, of the metal ions vary from +1 for the alkali metals to +7 for some transition metals. Chemically, the metals differ from the nonmetals in that they form positive ions and basic oxides and hydroxides. Upon exposure to moist air, a great many metals undergo corrosion, i.e., enter into a chemical reaction, the oxygen of the atmosphere uniting with the metal to form the oxide of the metal, e.g., rust on exposed iron. See also ALLOY; METALLURGY.

metalloid: see METAL; PERIODIC TABLE.

metallurgy, science extracting metals from their ores. The processes employed depend upon the chemical nature of the ORE to be treated and upon the properties of the METAL to be extracted. When an ore has a low percentage of the desired metal, a method of physical concentration, e.g., the FLOTATION PROCESS, must be used before the extraction process begins. Because almost all metals are found combined with other elements in nature, chemical reactions are required to set them free. These chemical processes are classified as *pyrometallurgy,* the use of heat for the treatment of an ore, e.g., in SMELTING and roasting; *electrometallurgy,* the preparation of certain active metals by ELECTROLYSIS; and *hydrometallurgy,* or leaching, the selective dissolution of metals from their ores. Modern metallurgical research is concerned with preparing radioactive metals, with obtaining metals economically from low-grade ores, with obtaining and refining rare metals hitherto not used, and with formulating ALLOYS.

metamorphic rock: see METAMORPHISM; ROCK.

metamorphism, in geology, process of change in the structure, texture, or composition of ROCKS caused by heat, deforming pressure, and/or hot, chemically active fluids. In general, metamorphic rock is coarser, denser, and less porous than the rock from which it was formed. The change in texture commonly results in a rearrangement of MINERAL particles into a parallel alignment called foliation, probably the most characteristic property of metamorphic rocks; it is seen in SLATE, SCHIST, and GNEISS. Local metamorphism is usually caused by the intrusion of a mass of igneous rock into older rock. Regional metamorphism accompanies mountain-building activity associated with large-scale crustal movements.

metamorphosis, in zoology, a term used for a series of distinct stages in the development from egg to adult. For example, an insect such as the butterfly is active and wormlike (a caterpillar) in its larval stage. In its next stage (pupal) the insect is surrounded by an outer covering (a cocoon); it is outwardly inactive but undergoes many changes in internal organization. Eventually the insect emerges transformed into its adult stage (a butterfly). Metamorphosis is called complete when there is no suggestion of the adult in the larval stage. In incomplete metamorphosis, the successive larval stages resemble the adult, as in the GRASSHOPPER. Many species change their habitat after undergoing complete metamorphosis (e.g., the toad lives in water in its tadpole stage and on land in its adult stage).

metaphysical poets, name first used by Samuel JOHNSON (1744) for a group of 17th-cent. English lyric poets. Their hallmark is the metaphysical conceit, wit, learned imagery, and subtle argument. Most important were John DONNE, George HERBERT, Henry VAUGHAN, Abraham COWLEY, Richard CRASHAW, and Andrew MARVELL. They considerably influenced 20th-cent. poetry.

metaphysics, branch of philosophy concerned with the ultimate nature of existence. Ontology (the study of the nature of being), cosmology, and philosophical theology are its main branches. The term comes from the metaphysical treatises of ARISTOTLE, who presented the First Philosophy (as he called it) after the *Physics* [Gk. *meta-physic,* = after physics]. Metaphysical systems in the history of philosophy have included Aristotelian SCHOLASTICISM and the rationalistic systems of the 17th cent. (e.g., those of DESCARTES, SPINOZA, and LEIBNIZ). KANT, in the 18th cent., held scientific metaphysical speculation to be an impossibility but considered metaphysical questions a moral necessity. His work influenced that of FICHTE, SCHELLING, and HEGEL. Since the mid-19th cent. philosophy has generally denied validity to metaphysical thought. Modern interest in metaphysics has centered on analyzing the metaphysical systems that inform prevailing modes of thought. See also LOGICAL POSITIVISM.

Metastasio, Pietro, 1698–1782, Italian poet and librettist. He became court poet at Vienna in 1729. With his predecessor, Apostolo Zeno, he created the rigid *opera seria* (see OPERA). His works include the melodrama *Attilio Regolo* (1750) and many librettos, including *La clemenza di Tito* (1734, music by Mozart) and *The Shepherd King* (1751).

Metcalfe, Charles Theophilus Metcalfe, 1st Baron, 1785–1846,

British governor-general of CANADA (1843–45). In his administration the ministry of Robert BALDWIN and L.H. LAFONTAINE resigned (1843), and he formed a Conservative government that won an election. He was forced to retire (1845) because of ill health.

Metellus, ancient Roman family of the plebeian gens Caecilia. It was one of the families that controlled the senate. **Quintus Caecilius Metellus Macedonicus,** d. 115 B.C., conquered (148 B.C.) Macedonia and pacified (146 B.C.) Greece. **Quintus Caecilius Metellus Numidicus,** d. 91? B.C., a leader of the senatorial party and consul (109 B.C.), conducted the Numidian War against Jugurtha. He antagonized Marius and was exiled (100 B.C.). His son, **Quintus Caecilius Metellus Pius,** d. c.63 B.C., continued his father's opposition to Marius. In 89 B.C. he fought in the Social War and in the civil war that followed defended Rome against Marius and Lucius Cornelius CINNA. In 83 B.C. Metellus joined SULLA and defeated the Marians in Umbria and Cisalpine Gaul. He warred unsuccessfully (79–72 B.C.) against Sertorius in Spain.

meteor, small piece of extraterrestrial matter that becomes visible as a "shooting star" or "falling star" when it enters the earth's atmosphere. While still outside the atmosphere, it is called a meteoroid. As a meteor it is heated to incandescence through friction (due to collisions with air molecules) and usually disintegrates completely before reaching the earth; those meteors large enough to reach the ground are called METEORITES. A meteor of considerable duration and brightness is known as a fireball; a fireball that explodes in the air is called a bolide. The frequency of meteors increases when the earth, in its orbit, annually passes through a swarm of particles generated from the breakup of a comet. The meteors of such a **meteor shower** all appear to originate at a single point, or radiant, in the sky. Some of the better-known showers (named for the constellations in which their radiants are located) and their approximate dates are: Lyrids, Apr. 21; Perseids, Aug. 12; Orinoids, Oct. 20; Taurids, Nov. 4; Leonids, Nov. 16; Geminids, Dec. 13.

meteorite, large METEOR that survives the intense heat of atmospheric friction and reaches the earth's surface. Meteorites may have originated as fragments of asteroids. They are classified in three general categories. The siderites, or irons, are composed entirely of metal (chiefly nickel and iron). The aerolites, or stony meteorites, show a diversity of mineral elements including large percentages of silicon and magnesium oxides; the most abundant type of aerolite is the chondrite, so called because the metal embedded in it is in the form of grainlike lumps, or chondrules. The siderolites, or stony irons, which are rarer than the other types, are of both metal and stone in varying proportions. When a meteorite reaches the earth, the tremendous force of impact with the earth's surface causes great compression, heating, and partial vaporization of the outer part of the meteorite and of the materials in the ground; expansion of the gases thus formed and of steam produced from groundwater causes an explosion that shatters the meteorite and carves out a **meteorite crater** in the ground. One of the best-preserved craters is Meteor, or Barringer, Crater, near Winslow, Arizona, c.¾ mi (1½ km) in diameter and 600 ft (180 m) deep. The largest meteorite ever discovered, the 60-ton Hoba West, rests where it was found (in 1920), near Grootfontein, Namibia.

meteorology, branch of science that deals with the ATMOSPHERE of a planet, particularly that of the earth. Meteorology is based on the scientific measurement of various atmospheric conditions with a wide assortment of instruments. Air temperature is measured with the THERMOMETER; air pressure with the BAROMETER; wind direction with the weather vane; wind speed with the anemometer; high-altitude air-pressure and wind information with the WEATHER BALLOON; relative humidity with the HYGROMETER; precipitation with the rain gauge; and cloud formations and weather fronts with both radar and high-altitude WEATHER SATELLITES. The meteorologist uses the data collected from many geographical locations to create a weather map. On a typical map the various weather elements are shown by figures and symbols. Isobars are drawn to show areas of equal pressure, and FRONTS and areas of precipitation are also indicated. Meteorologists also analyze the data collected with computer models in order to predict, or forecast, the WEATHER for the next few hours and the next few days. Long-range weather forecasts, which are more general and less accurate, are also made for future periods of several months.

meter: see METRIC SYSTEM; WEIGHTS AND MEASURES, table.

methadone, synthetic NARCOTIC, similar in effect to MORPHINE, used primarily in the treatment of narcotic drug addiction. Given to addicts, it blocks the euphoric action of HEROIN without itself causing euphoria and causes less severe and hazardous withdrawal symptoms than other narcotic drugs (although critics of methadone therapy point out that methadone patients are still addicts). Methadone is also used as an ANALGESIC, especially in patients who are terminally ill.

methanal: see FORMALDEHYDE.

methane (CH_4), colorless, odorless, gaseous HYDROCARBON formed by the decay of plant and animal matter. It occurs naturally as the chief component of NATURAL GAS, as the firedamp of coal mines, and as the marsh gas released in swamps and marshes. Methane can also be made synthetically by various means. It is combustible and can form explosive mixtures with air. Used for fuel in the form of natural gas, methane is also an important starting material for making solvents and certain FREONS.

Methodism, the doctrines, polity, and worship of those Protestant denominations that have developed from the movement started in England by the teaching of John WESLEY. He, with his brother Charles, George WHITEFIELD, and others, formed (1729) a group at Oxford that met for religious exercises. From their resolution to conduct their lives and study by "rule and method," they were given the name Methodists. Influenced by the Moravians, the Wesleys began (1738) evangelistic preaching, often in barns, houses, and open fields. The moving of preachers from one appointment to another was the beginning of the system of itinerancy. John Wesley was essentially a follower of Jacobus ARMINIUS, but Whitefield was unable to accept Arminian doctrine and broke away (1741) to form the Calvinistic Methodists. The first annual conference (1744) drew up the Articles of Religion, which stressed repentance, faith, sanctification, and full, free salvation for all. The group adopted a constitution in 1784 and withdrew from the Church of England in 1791 to become the Wesleyan Methodist Church. In America Methodism began after 1766 in New York with the preaching of Philip Embury and spread rapidly under Francis ASBURY. The first conference was held in 1773, and the Methodist Episcopal Church in America was formed in 1784. In both England and the U.S., Methodists splintered into many groups, but significant progress toward unity has been made in the 20th cent. Among U.S. Methodist bodies the United Methodist Church is the largest, with nearly 9 million members.

Methodius, Saint: see CYRIL AND METHODIUS, SAINTS.

Methuselah [mēthyōō'zələ], descendant of Seth; son of ENOCH. GENESIS says he lived 969 years.

metric system, system of weights and measures planned in France and adopted there in 1799. Now used by most of the countries of the world, it is based on a unit of length called the meter (m) and a unit of mass called the kilogram (kg). The meter is now defined as the distance light travels through a vacuum in 1/299,792,458 of a second. The kilogram is defined as the mass of the International Prototype Kilogram, a platinum-iridium cylinder kept at Sèvres, France, near Paris. Other metric units can be defined in terms of the meter and the kilogram (see WEIGHTS AND MEASURES, table). Fractions and multiples of the metric units are related to each other by powers of 10, allowing conversion from one unit to a multiple of it simply by shifting a decimal point. This avoids the lengthy arithmetical operations required by the ENGLISH UNITS OF MEASUREMENT. The prefixes in the accompanying table have been accepted for designating multiples and fractions of the meter, the gram (= 1/1000 kilogram), and other units. Several other systems of units based on the metric system have been in wide use. The cgs system uses the centimeter (= 1/100 meter) of length, the gram of mass, and the SECOND of time as its fundamental units; other cgs units are the dyne of FORCE and the erg of WORK or energy. The mks system uses the meter of length, the kilogram of mass, and the second of time as its fundamental units; other mks units include the newton of force, the joule of work or energy, and the watt of POWER. The units of the mks system are generally much larger and of a more practical size than the comparable units of the cgs system. ELECTRIC

The key to pronunciation appears on page xiii.

AND MAGNETIC UNITS have been defined for both these systems. The International System of Units (officially called the Système International d'Unités, or SI) is a system of units adopted by the 11th General Conference on Weights and Measures (1960). Its basic units of length, mass, and time are those of the mks system; other basic units are the AMPERE of electric current, the kelvin of temperature (a degree of temperature measured on the Kelvin TEMPERATURE scale), the candela (see PHOTOMETRY) of luminous intensity, and the MOLE, used to measure the amount of a substance present. All other units are derived from these basic units.

PREFIXES FOR BASIC METRIC UNITS

Metropolitan Museum of Art, New York City, the foremost art museum in the U.S.; founded 1870, opened 1880. Owned by the city, it is largely supported by private endowment. The museum's most outstanding collections include European paintings and sculpture of the Renaissance, baroque, and modern periods. It has extensive Egyptian holdings, e.g., the Temple of Dendur, and a vast collection of Asian works. Much of its collection of medieval art is housed at the CLOISTERS. Its American Wing contains a comprehensive array of U.S. arts and crafts of all periods, its Costume Institute includes thousands of authentic costumes and accessories, and its Michael C. Rockefeller Wing houses a large collection of primitive art. The museum is also known for its collections of Greek pottery, Greek and Roman sculpture, and graphic arts.

Metropolitan Opera Company, term used in referring collectively to the organizations that have produced OPERA at the Metropolitan Opera House, New York City. The original opera house was on West 39th Street. The company's first presentation, on Oct. 22, 1883, was a performance of Charles GOUNOD's *Faust.* In 1966 the Met moved to LINCOLN CENTER FOR THE PERFORMING ARTS, opening with a performance of Samuel BARBER's *Antony and Cleopatra.* A galaxy of great stars have sung at the Met, e.g., Enrico CARUSO, Kirsten FLAGSTAD, Feodor CHALIAPIN, Maria CALLAS, Joan SUTHERLAND, and Luciano PAVAROTTI. Conductors of the opera orchestra have included Gustav MAHLER and Arturo TOSCANINI. Managers have included Giulio Gatti-Casazza (1898–1908) and Rudolf Bing (1940–72).

Metsu or **Metzu, Gabriel** [mĕt'sü], 1630?–1667, Dutch genre painter. He is best known for his quiet, charming interiors. His fine draftsmanship and exquisite handling of light and texture can be seen in *Music Lesson* (The Hague) and *Duet* (National Gall., London).

Metsys, Quentin: see MASSYS, QUENTIN.

Metternich, Clemens Wenzel Nepomuk Lothar, Fürst von [mĕt'ərnĭkh], 1773–1859, Austrian statesman. He became foreign minister in 1809 and secured (1812) a temporary alliance with France. Later he developed a policy of substituting Austrian for French supremacy, and Austria joined the QUADRUPLE ALLIANCE (1814). Metternich, a conservative, was the guiding spirit at the Congress of VIENNA (1814–15) and succeeding European congresses. The period 1815–48 has been called the Age of Metternich. He sought to maintain a balance of power in Europe, and to make Austria supreme in Italy and in the newly formed GERMAN CONFEDERATION. His system depended on censorship, espionage, and the suppression of revolutionary and nationalist movements.

Metzinger, Jean, 1883–1956, French painter and writer. With GLEIZES he wrote *Du cubisme* (1912) (see CUBISM). His paintings employ cubist faceting that is never wholly abstract, e.g., *The Dancer* (Albright-Knox Art Gall., Buffalo).

Metzu, Gabriel: see METSU, GABRIEL.

Meunier, Constantin [mönyā'], 1831–1905, Belgian sculptor and painter. His paintings express the dignity of labor. He is best known for his bronze reliefs and monuments, e.g., the unfinished *Monument to Labor* (Brussels), which includes reliefs, statues, and a group, *Maternity.*

Meuse or **Maas,** river, one of the chief waterways of N Europe, c.560 mi (900 km) long. It rises in NE France, flows through an important mining and industrial region of Belgium, and into the S Netherlands, where it branches out to form a common delta with the RHINE R.

Mexicali, city (1990 pop. 602,390), NW Mexico, capital of Baja California state. Located across the U.S. border from Calexico, Calif., in agricultural area, its economy is dominated by assembly plants producing goods for export to the U.S.

Mexican art and architecture were highly developed before the Spanish conquest (see PRE-COLUMBIAN ART AND ARCHITECTURE). With the arrival of the Spanish, native peoples were introduced to European art and building techniques. During the 17th cent., native artists became adept at religious oil paintings, wax figures, and polychrome wood sculpture, and, mingling European and indigenous traditions, Mexican paintings achieved the unique mellowness and richness of color of the Mexican baroque. The first great native Mexican artist was Baltasar de Echave, the Elder (c.1548–1620), who founded the first indigenous school (1609). During the mid-17th cent., sculpture and architecture gained ascendancy and the Churrigueresque (named for José CHURRIGUERA) became the dominant style. The 18th cent. produced such important painters as José Ibarra and Miguel Cabrera. In the 19th cent., the landscapes of José María VELASCO and the satirical prints of José Guadalupe POSADA reaffirmed a national style. During the regime of Emperor MAXIMILIAN (1864–67), the heavy splendor of French Second Empire architecture was introduced. French influence continued under the administration of Porfirio DÍAZ (1876–1911), when ART NOUVEAU was also introduced. Since the 1910 revolution, Mexican art has manifested a strongly revolutionary tone, as in the murals of the modern Mexican masters Diego RIVERA, José Clemente OROZCO, and David Alfaro SIQUEIROS. In abstract painting, Rufino TAMAYO is outstanding. Contemporary Mexican artists continue to produce a variety of works in many styles and techniques. Modern architecture in Mexico combines contemporary schools with native elements in such notable achievements as the Ciudad Universitaria, outside Mexico City. Folk arts, including textiles, pottery, and silverwork, have flourished throughout Mexican history. See also NATIONAL MUSEUM OF ANTHROPOLOGY; SPANISH COLONIAL ART AND ARCHITECTURE.

Mexican War, 1846–48, armed conflict between the U.S. and Mexico. The immediate cause of the war was the U.S. annexation of TEXAS (Dec. 1845); other factors included the existence of long-standing claims by U.S. citizens against MEXICO and the American ambition to acquire CALIFORNIA. In 1845 Pres. Polk sent John SLIDELL to Mexico to purchase California and New Mexico. When the mission failed, Polk prepared for war, and in Mar. 1846 Gen. Zachary TAYLOR occupied Point Isabel, on the Rio Grande. This was viewed as an act of aggression by the Mexicans, who claimed the Nueces R. as the boundary, and Mexican troops crossed the Rio Grande

and shelled (May 3) Fort Brown. Polk pronounced these actions an invasion of American soil, and the U.S. declared war on May 13, 1846. Meanwhile, Taylor had won victories at Palo Alto and Resaca de la Palma (May 8 and 9); he took Matamoros (May 18), Monterrey (Sept. 20–24), and Buena Vista (Feb. 1847). Gen. S.W. KEARNEY occupied Santa Fe (Aug. 1846) and advanced to find that California was already under American rule. In the final campaign of the war, Gen. Winfield SCOTT captured Veracruz (Mar. 1847), defeated Gen. SANTA ANNA at Cerro Gordo (April), and stormed CHAPULTEPEC. On Sept. 14, 1847, American troops entered Mexico City, where they remained until peace was restored. The Treaty of GUADALUPE HIDALGO (Feb. 2, 1848) ended the war. Mexico ceded two fifths of its territory to the U.S. and received an indemnity of $15 million.

Mexico, officially United Mexican States, republic (1990 pop. 81,140,922), 761,600 sq mi (1,972,544 sq km), S North America; bordered by the U.S. (N), the Gulf of Mexico and the Caribbean Sea (E), Belize and Guatemala (SE), and the Pacific Ocean (W). Principal cities include MEXICO CITY (the capital), GUADALAJARA, and MONTERREY. The country is predominantly mountainous, and no more than 15% of the land is considered arable. There is lowland in the southeast and along the coasts, but the heart of the country is the extensive Mexican plateau, with elevations generally above 4,000 ft (1,220 m). Fringed by the ranges of the SIERRA MADRE, the plateau (except for the arid north) is a region of broad, shallow lakes where more than half of the country's population is concentrated. To the south is a chain of extinct volcanoes, including POPOCATÉPETL, Ixtacihuatl, and ORIZABA, which at 18,406 ft (5,610 m) is Mexico's highest point. Since World War II Mexico has had considerable economic growth, but in the mid-1980s it suffered a severe depression due in part to a drop in world oil prices. By the early 1990s, however, debt relief, diversification, foreign investment, and PRIVATIZATION of many industries long owned by the Mexican government had begun to produce an economic upturn. Agriculture engages about a quarter of Mexico's active work force and is slowly being modernized. Major irrigation projects have increased yields. Cotton, coffee, sugar, and tomatoes are the major export crops, and much corn, wheat, sugarcane, beans, and citrus fruits are grown. Livestock raising and fishing are also significant. Mexico has considerable mineral resources, including vast petroleum reserves and zinc, sulfur, silver, antimony, copper, and manganese. Industries, usually in or near the larger cities, produce iron and steel, motor vehicles, engines, processed foods, refined petroleum and petrochemicals, chemical fertilizers, and other products. Assembly factories (MAQUILADORAS) along the U.S. border are a major source of foreign income. Tourism is also economically important. The population has grown rapidly in the 20th cent., more than quadrupling from 1940 to 1990. The great majority of the people are of mixed Spanish and indigenous descent, but a sizable minority are of purely indigenous descent. The official language is Spanish, but many Mexicans still speak only indigenous tongues. Over 95% of the people are Roman Catholic.

History. Before the arrival of the Spanish in the early 16th cent., great indigenous civilizations (the AZTEC, MAYA, TOLTEC, MIXTEC, ZAPOTEC, and OLMEC) flourished in Mexico. Arriving in 1519, Hernán CORTÉS overthrew the Aztec empire (1521) and captured its ruler, MONTEZUMA. The territory became the viceroyalty of New Spain in 1535. Spanish conquerors exploited the mineral wealth of the land, using as laborers the native population and a growing mestizo class; at the same time they extended Spanish rule to the remainder of Mexico and to what is now the southwestern U.S. A rebellion led (1810–15) by Miguel HIDALGO Y COSTILLA failed, but in 1821 Spain accepted Mexican independence, and an "empire," headed by Augustín de ITURBIDE, was established in 1822. In 1823 army officers overthrew the empire and established a federal republic. The early years were marked by turmoil and corruption. Texas broke free of Mexican rule in 1836, and in the ensuing MEXICAN WAR (1846–48) with the U.S., Mexico lost much territory. Internally, the republic was torn by strife among contending political leaders, and

The key to pronunciation appears on page xiii.

in 1855 a democratic reform movement, led by Benito JUÁREZ, overthrew the dictatorship of Antonio López de SANTA ANNA and drafted a liberal constitution. Civil war followed, and in 1864 NAPOLEON III of France, who had colonial ambitions, established another ill-starred Mexican empire, under the Hapsburg prince MAXIMILIAN; it collapsed in 1867, and Maximilian was killed. Then followed the long reformist dictatorship of Porfirio DÍAZ, who ruled Mexico with a firm hand for most of the 35 years after 1876. Díaz promoted economic growth and provided a degree of stability, but his encouragement of the concentration of wealth in the hands of a few spawned a new generation of revolutionaries. Among these were Emiliano ZAPATA, Francisco "Pancho" VILLA (whose raid into the U.S. in 1916 resulted in a brief retaliatory U.S. invasion of Mexico), and Francisco I. MADERO, who toppled Díaz in 1911 but was himself overthrown and murdered in 1913. A foundation for reform was laid by Venustiano CARRANZA's constitution of 1917. In 1929 Plutarco Elías CALLES founded the National Revolutionary party (renamed the Institutional Revolutionary party, or PRI, in 1946), which has governed Mexico ever since (although it suffered heavy setbacks in the 1988 elections). During the presidency of Lázaro CÁRDENAS (1934–40), land was redistributed, illiteracy reduced, power projects initiated, and some industries nationalized. Cárdenas's successors have tended to stress industrial development, which has benefited the middle and upper classes. In 1982 the faltering economy caused the government to devalue the peso and nationalize the banks; the country's enormous foreign debt hampered economic growth. In 1988 Carlos SALINAS GORTARI was elected president amid charges of widespread fraud. Salinas opened Mexico to foreign investment, signed the NORTH AMERICAN FREE TRADE AGREEMENT with the U.S. and Canada, and oversaw a general improvement in the economy. A Mayan-based uprising (1994) in the southern state of Chiapas, however, provided a reminder of the poverty in which many Mexicans still live.

PRESIDENTS OF MEXICO SINCE THE CONSTITUTION OF 1917

PRESIDENT	DATES IN OFFICE
Venustiano Carranza	1917-20
Adolfo de la Huerta	1920
Álvaro Obregón	1920-24
Plutarco Elías Calles	1924-28
Emilio Portes Gil	1928-30
Pascual Ortiz Rubio	1930-32
Abelardo L. Rodríguez	1932-34
Lázaro Cárdenas	1934-40
Manuel Ávila Camacho	1940-46
Miguel Alemán	1946-52
Adolfo Ruiz Cortines	1952-58
Adolfo López Mateos	1958-64
Gustavo Díaz Ordaz	1964-70
Luis Echevarría Álvarez	1970-76
José López Portillo	1976-82
Miguel de la Madrid Hurtado	1982-88
Carlos Salinas de Gortari	1988-

Mexico, Gulf of, arm of the Atlantic Ocean, c.700,000 sq mi (1,813,000 sq km), off SE North America. Oil and natural gas occur along the coast and offshore on the continental shelf. TAMPA, PENSACOLA, MOBILE, NEW ORLEANS, GALVESTON, and CORPUS CHRISTI are major U.S. ports; TAMPICO and VERACRUZ are important Mexican ports.

Mexico, National Autonomous University of, at Mexico City. Founded 1551 by Charles I of Spain (Holy Roman Emperor CHARLES V), it is one of the two oldest universities in the New World. In the 19th cent. the government suppressed it several times for being a center of reactionary politics; the last time it was closed from 1865 to 1910. After its reopening, it was reorganized as a legally autonomous institution. The university offers a variety of programs in the arts and sciences and professional fields. The ultramodern, colorfully decorated structures of the main campus are renowned architecturally.

Mexico City, city (1990 pop. 8,236,960; 1991 met. area est. 20,899,000), central Mexico, capital and largest city of Mexico; it has the largest population of the world's cities. Mexico City is on the Mexican plateau, in the Valley of Mexico, at an elevation of c.7,800 ft (2,380 m), and is ringed by mountains. It is the nation's political, cultural, and commercial hub and its main center of both light and heavy industry. Entrapment of industrial, automobile, and other emissions by the surrounding mountains has made the air among the world's most polluted; in 1991 the government banned vehicles from part of the city and closed a refinery as part of a program to improve air quality. The oldest part of the city surrounds a large central plaza from which wide avenues radiate to the environs. Structures such as a 16th-cent. cathedral and the colonial-baroque National Palace (both on the plaza), 19th cent. public buildings, skyscrapers, and the boldly modern University City reflect a rich, 400-year architectural heritage. Mexico City was founded soon after the conquest of Mexico (1521) at the site of the AZTEC capital, Tenochtitlán, and was the capital of New Spain before Mexico's independence (1821). The city was captured (1847) by U.S. troops during the MEXICAN WAR, was conquered (1863) by the French army, and was occupied (1914–15) by rebel forces during the Mexican Revolution. In 1957 and 1985 earthquakes caused extensive damage to the capital. Mexico City was host to the 1968 OLYMPIC GAMES.

Meyerbeer, Giacomo, 1791–1864, German operatic composer, noted for his spectacular French grand operas *Robert le Diable* (1831) and *Les Huguenots* (1836). Two opéras comiques, *North Star* (1854) and *Dinorah* (1859), are noteworthy.

Mezzogiorno, region, S Italy, comprising six modern regions and the islands of SICILY and SARDINIA. The APPENINES render much of the land untillable, but agriculture is the mainstay of the generally underdeveloped economy. The chief crops are grains, fruits, olives, grapes, and vegetables. The port cities of Bari and NAPLES are important industrial centers. The region's income, educational level, and standard of living is considerably lower than that of N Italy.

mezzo-soprano: see VOICE.

mezzotint, method of copper or steel ENGRAVING in tone. The mezzotint plate is given an overall, even grain by burring the surface with a curved, saw-toothed tool. The picture is then developed in light and shade with a scraper and a burnisher. The resulting print is softly tonal, with no sharp lines. Said to have been invented by Ludwig von Siegen c.1640, the process became prominent in 18th-cent. England, where it was often used to reproduce paintings.

Mg, chemical symbol of the element MAGNESIUM.

Miami, Native American group with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). Although of Eastern Woodlands culture (see NORTH AMERICA, INDIGENOUS PEOPLES OF), they shared the Plains trait of buffalo hunting. In the 18th cent. enemies drove them to NW Ohio, from which they retired to Indiana, numbering c.1,700. Chief LITTLE TURTLE led them in the INDIAN WARS of the Old Northwest. Most Miami moved (1867) to a reservation in Oklahoma; the land has since been divided among them. In 1990 there were 4,477 Miamis in the U.S.

Miami, city (1990 pop. 358,548; met. area 1,937,094), seat of Dade co., SE Fla., on Biscayne Bay; inc. 1896. Tourism is its main industry, and there are extensive recreational and convention facilities. A famous resort and cruise-ship port, it is also the processing and shipping center for an agricultural region. Aircraft rebuilding and repair and aluminum products are among its industries. First settled in the 1870s, it was developed into a recreational center after 1896. Miami's first boom occurred during the Florida land speculation in the 1920s. In the 1960s the city became a focus for Caribbean immigration, and from the late 1970s into the 1990s many Cuban and Haitian refugees arrived, taxing the city's facilities. Today over half of the population is Hispanic, and the Cuban influence has put a distinctive stamp on the city. Miami has also become a major center of trade and finance with Latin America. The city is the site of the Orange Bowl and has a major international airport.

Miami Beach, city (1990 pop. 92,639), SE Fla., on an island between Biscayne Bay and the Atlantic Ocean; inc. 1915. It is connected with MIAMI by causeways. A world-famous resort with over 350 hotels and motels along its "gold coast," including many notable ART

DECO buildings. it relies on tourism and convention business. The city was built (beginning largely in the 1920s) in an area that was mangrove swamp.

mica, general term for a large group of hydrous aluminum and potassium silicate minerals, usually occurring in scales and sheets. The most important commercial micas are muscovite and phlogopite. Muscovite, the commoner variety, is usually colorless but may be red, yellow, green, brown, or gray; it is found most often in pegmatite dikes. Phlogopite ranges in color from yellow to brown and occurs in crystalline limestones, dolomites, and serpentines. Sheet mica is used as an insulating material and in certain acoustic devices. Scrap and ground mica is used in wallpaper, fancy paint, ornamental tile, roofing, and lubricating oil.

Micah or **Micheas,** book of the OLD TESTAMENT, 33d in the Authorized Version, sixth of the Minor Prophets; it contains the prophecy of Micah, a contemporary of ISAIAH (fl. 730 B.C.), on the doom and redemption of JUDAH and ISRAEL.

Michael, archangel prominent in Jewish, Christian, and Muslim traditions. In the BIBLE he is mentioned as the guardian angel of Israel. In Christian tradition he is the conqueror of SATAN. His feast (jointly with the other archangels) is Michaelmas, Sept. 29.

Michael, Byzantine emperors. **Michael I** (Rhangabe), d. c.845 (r.811–13), was the son-in-law of NICEPHORUS I. Orthodox in religion, he restored the monastic reformer St. Theodore of Studium. He was deposed after a defeat by the BULGARS. **Michael II** (the Stammerer), d. 829 (r.820–29), helped LEO V to succeed Michael I, and himself succeeded after Leo's murder. Tolerant in religion, he himself favored ICONOCLASM. He lost (825) Crete to the Arabs. **Michael III** (the Drunkard), 836–67 (r.842–67), was the grandson of Michael II. Early in his reign iconoclasm was punished and the heretic Paulicians persecuted. The administration of government by the debauched Michael's uncle, Bardas, was marked by the missions of Saints CYRIL AND METHODIUS. Michael's favorite, Basil, ordered the murders of Bardas (866) and Michael (867), and succeeded as BASIL I. **Michael VIII,** c.1225–82 (r.1261–82), was the first of the Palaeologus dynasty. He became emperor of Nicaea (1259) by usurping the throne of JOHN IV after blinding him. In 1261 he recovered Constantinople from the Latin emperor Baldwin II and was crowned Byzantine emperor by the patriarch. For the rest of his reign he struggled with CHARLES I of Naples and with the despotate of Epirus, which Charles invaded. Michael negotiated with Pope Gregory X for a union of Eastern and Western churches (see COUNCIL, ECUMENICAL), but failed. To defeat Charles he financed the SICILIAN VESPERS (1282).

Michael, 1921–, last king of ROMANIA (1927–30, 1940–47). He became king under a regency after his father, CAROL II, was forced to renounce the throne. In 1930, however, Carol dethroned Michael. Carol was forced to abdicate by ANTONESCU in 1940, and Michael again became king. In 1947 the Communist-dominated government forced him to abdicate, and he went into exile.

Michael the Brave, d. 1601, Romanian national hero, prince of Walachia (1593–1601), of Transylvania (1599–1600), and of Moldavia (1600). Through his military victories and massacre of Turkish officials he was able to force the Turks to grant him virtual independence (1596) and his Romanian principalities. His dealings with Holy Roman Emperor RUDOLF II, however, resulted in his assassination. After his death WALACHIA and Moldavia reverted to Turkey, and TRANSYLVANIA came under Austrian domination.

Michel, Robert H(enry), 1923–, U.S. politician; b. Peoria, Ill. A Republican, Michel was first elected to the U.S. House of Representatives from Illinois in 1956. He was House minority whip (1975–81) before he became minority leader in 1981.

Michelangelo Buonarroti, 1475–1564, Italian sculptor, painter, poet. He was a towering figure of RENAISSANCE, mannerist, and baroque art. From 1490 to 1492 he lived in Lorenzo de' MEDICI's house, where he was influenced by Neoplatonic thought. His early drawings show the influence of GIOTTO and MASACCIO, whereas the marble reliefs of the *Madonna of the Stairs* and *Battle of the Centaurs* (both: Casa Buonarroti, Florence) show the influence of DONATELLO and Roman sarcophagi. In 1494 he executed statuettes for San Petronio (Bologna), and here the monk SAVONAROLA impressed him with his apocalyptic vision, which would later fuse with the artist's own tragic sense of human destiny. Between 1496 and 1501, Michelangelo worked in Rome, doing the marble *Bacchus* (Bargello, Florence) and the exquisitely balanced *Pietà* (St. Peter's, Rome). He returned to Florence in 1501, where he was commissioned to do the magnificent *David* (Academy, Florence). From these years date the *Bruges Madonna* (Notre Dame, Bruges) and the painted tondo of the *Holy Family* (Uffizi). In 1505 he was ordered back to Rome by Pope JULIUS II to do his sepulchral monument. This was the most frustrating project of his life. Michelangelo spent a year on the gigantic bronze, which was melted for cannon shortly after its completion. Shortly after awarding the contract for the tomb, Julius commissioned the decoration of the ceiling of the SISTINE CHAPEL, which Michelangelo worked on from 1508 to 1512. The ceiling is divided into three zones, the highest showing scenes from Genesis. Below are prophets and sibyls. In the lunettes and spandrels are figures identified as ancestors of Jesus or the Virgin, which seem to suggest a vision of primordial humanity. After the death of Julius II, his heirs again contracted for the execution of his monument and 30 years of litigation ensued. Michelangelo had to abandon his plan for a vast mausoleum for Julius II in St. Peter's. His colossal *Moses* (San Pietro in Vincoli, Rome) and the statues known as *Slaves* (Academy, Florence; Louvre) were to have been included. From 1520 to 1534 he worked on the Medici Chapel (San Lorenzo, Florence) and designed the elegant, mannerist Laurentian Library of this church. A forceful contrast between contemplation and action is seen in his statues of Giuliano and Lorenzo de' Medici, and his allegorical figures of *Dawn, Evening, Night,* and *Day.* In 1529 he assisted as engineer in the defense of Florence. After working on the *Last Judgment* of the Sistine Chapel and the *Conversion of Paul* and *Martyrdom of Peter* in the Pauline Chapel (Vatican), he devoted himself to architecture as chief architect of ST. PETER'S CHURCH. In his last years Michelangelo's work shows a more spiritualized and abstract form, e.g., two unfinished *Pietà* groups and the Rondanini *Pietà* (Castello Sforzesco, Milan). He thought of himself primarily as a sculptor, and a feeling for the expressive potentialities of sculptural form manifests itself in all his work. Many of his designs have survived only through his drawings, which used vigorous cross-hatching. Great collections of his drawings are in the Louvre and Uffizi.

Michelet, Jules [mēshəlā'], 1798–1874, French writer, the greatest historian of the romantic school. His *History of France* (1833–67) is a masterpiece of French literature, in terms of its style, its emotional strength, and its powerful evocation. His writing, however, is marred by emotional bias against the clergy, the nobility, and the monarchy.

Michelozzo Michelozzi, 1396–1472, Italian sculptor and architect. He shared leadership with BRUNELLESCHI and ALBERTI in establishing the Renaissance style. His best work includes the Medici-Riccardi palace at Florence, one of the finest city houses ever built, and the Medici villa at Fiesole (1458–61), noted for its terraced gardens.

Michelson, Albert Abraham, 1852–1931, American physicist; b. Prussia. He was head (1892–1931) of the physics department at the Univ. of Chicago. He designed the modern interferometer, with which he measured the speed of light to an unequaled degree of accuracy. His measurement of the length of the standard meter in Paris in terms of the wavelength of the red line of the cadmium spectrum, using the interferometer method, provided an absolute and exactly reproducible standard of length. With Edward Morley he conducted the Michelson-Morley experiment, which led to the refutation of the ETHER hypothesis and was eventually explained by Einstein's theory of RELATIVITY. Michelson became (1907) the first American to win the Nobel Prize in physics.

Michigan, upper midwestern state of the U.S., consisting of two peninsulas thrusting into the GREAT LAKES and having borders with Ohio and Indiana (S), Wisconsin (NW), and the Canadian province of Ontario (E).

Area, 58,216 sq mi (150,779 sq km). *Pop.* (1990) 9,295,297, a 0.4% increase over 1980 pop. *Capital,* Lansing. *Statehood,* Jan. 26, 1837 (26th state). *Highest pt.,* Mt. Curwood, 1,980 ft (604 m); *lowest pt.,* Lake Erie, 572 ft (174 m). *Nickname,* Wolverine State. *Motto, Si Quaeris Peninsulam Amoenam Circumspice* [If You Seek a Pleasant Peninsula, Look about You]. *State bird,* robin. *State flower,* apple blossom. *State tree,* white pine. *Abbr.,* Mich.; MI.

Land and People. The mitten-shaped Lower Peninsula is bor-

dered by Lake MICHIGAN on the west and Lakes HURON and ERIE on the east. The sparsely populated Upper Peninsula is bounded on the south by Lake Michigan and on the north by Lake SUPERIOR, where Isle Royale National Park (see NATIONAL PARKS, table) is located. 70% of the population lives in urban areas. DETROIT, the country's seventh largest city, is by far Michigan's largest and most important city. GRAND RAPIDS, FLINT, LANSING, and ANN ARBOR are other major cities. In 1990 the population was 83% white and 14% African American.

Economy. Michigan is a heavily industrialized state. Detroit and the surrounding cities are the center of the U.S. automobile industry. Nonelectrical machinery and fabricated metals follow transportation equipment in terms of revenue. Dairy products and cattle are the leading sources of agricultural income; corn, winter wheat, soybeans, dry beans, oats, and hay are the most important crops. Michigan is a leading producer of calcium chloride, gypsum, magnesium, peat, and iron ore. With an abundance of natural beauty, Michigan is also a popular tourist destination. Lumbering and fishing supplement the economy.

Government. The constitution (adopted 1963) provides for a governor elected to a four-year term. The legislature consists of a senate whose 38 members serve four-year terms and a house with 110 members elected to two-year terms. Michigan sends 2 senators and 16 representatives to the U.S. Congress and has 18 electoral votes.

History. The region was inhabited principally by the OJIBWA, OTTAWA, and Potawatomi when the French explorer Étienne Brulé landed (1618) at Sault Sainte Marie. After the British assumed control (1763), war with Native Americans—PONTIAC'S REBELLION—erupted (1763). Michigan passed to the U.S. in 1796, although the British held it during the WAR OF 1812. Settlement was encouraged by the opening (1825) of the ERIE CANAL. During the second half of the 19th cent. a lumber boom decimated the state's huge forests. Henry FORD founded the Ford Motor Co. in 1903 and introduced the automated assembly line, thus establishing the state's modern industrial base. Lack of diversity has made Michigan particularly subject to economic problems. The auto industry suffered a serious decline during the late 1970s and early 80s and, after a brief recovery, was hit by national recession and continuing foreign competition in the late 1980s and early 90s.

Michigan, Lake, third largest (22,178 sq mi/57,441 sq km) of the GREAT LAKES, fifth largest lake in the world, and largest freshwater lake entirely within the U.S. It is 307 mi (494 km) long and 30–120 mi (48–193 km) wide, with a surface elevation of 581 ft (177 m) and a maximum depth of 923 ft (281 m), and it is joined to Lake Huron by the Straits of Mackinac. Chicago and Milwaukee are major lakeshore cities, and Indiana Dunes National Lakeshore (est. 1966) borders the southern shore. Discovered in 1634 by the French explorer Jean Nicolet, the lake passed to England in 1763 and to the U.S. as part of the NORTHWEST TERRITORY in 1796.

Mickiewicz, Adam [mētskyĕ'vĭch], 1798–1855, Polish poet. In 1823 he was arrested for nationalist activities and deported to Russia. After 1829 he lived in W Europe but devoted himself to the cause of Polish independence. His masterpiece is the epic poem *Pan Tadeusz* (1834), depicting the life of the Polish gentry.

Micmac, indigenous people largely of Canada's Maritime Provinces, with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). Of Eastern Woodlands culture (see NORTH AMERICA, INDIGENOUS PEOPLES OF), they are expert canoeists, and although once hunters and fishermen, they now derive income from agriculture. In 1990 there were 2,765 Micmacs in the U.S.

microcomputer: see COMPUTER.

microeconomics: see under ECONOMICS.

microelectronics, branch of ELECTRONICS devoted to the design and development of extremely small electronic devices that consume very little electric power. The simplest, but least effective, approach used is to make circuit elements, such as RESISTORS, CAPACITORS, and SEMICONDUCTOR devices, extremely small but discrete. In another approach, circuit elements fabricated as thin films of conductive, semiconductive, and insulating materials are deposited in sandwich form on an insulating substrate. The most advanced method is to form circuits, called INTEGRATED CIRCUITS, within and upon single semiconductor crystals. See also TRANSISTOR.

microfiber: see SYNTHETIC TEXTILE FIBERS.

microfiche, sheet of film containing numerous pages of printed or graphic material that have been greatly reduced by microphotography. Unlike microfilm, in which individual frames are reproduced consecutively on a roll of film, a single 4 × 6-in. (10 × 15-cm) microfiche card may contain hundreds of pages, providing faster access to a desired item. The image is magnified to approximately full size by a viewing machine or reader. Microfiche is increasingly used by libraries and businesses.

micromechanics, the combination of minuscule electrical and mechanical components in a single tiny device less than 1 mm across, such as a valve or a motor. Although micromechanical production processes and applications are still in the developmental stage, efforts have begun to develop machines 1000 times smaller. **Nanotechnology** is concerned with atomic- and molecular-scale devices. Such devices can be constructed using a SCANNING TUNNELING MICROSCOPE. A single atom has been used as an electric switch, and an individual molecule used to convert alternating current into direct current. Cluster chemistry has produced small balls and tubes (see FULLERENE) containing between 10 and 1000 atoms that may be useful in forming nano-thin wires and TRANSISTORS that operate on just a few electrons. A third nanotechnological approach is to grow such devices from proteins, DNA, or synthesized organic molecules. Nanotechnologies are still in the laboratory stage, and practical applications are only envisioned.

micrometer, instrument used for measuring extremely small distances. In the micrometer caliper, the object to be measured is held between the two jaws of the instrument; the distance between the jaws is measured on a scale calibrated to the rotation of the finely threaded screw that moves one of the jaws. In astronomical and microscopic micrometers, the distance that a filament moves from one end to the other of the image of an object is read on a calibrated scale.

Micronesia, one of the three main divisions of OCEANIA, in the W Pacific Ocean, N of the equator. The principal island groups include the Caroline Islands (see PALAU and MICRONESIA, FEDERATED STATES OF), NAURU, the Gilbert Islands (see KIRIBATI), the NORTHERN MARIANA ISLANDS, and the MARSHALL ISLANDS. The inhabitants are of Australoid and Polynesian stock and speak Malayo-Polynesian languages.

Micronesia, Federated States of, independent island group (1992 est. pop. 115,000), c.271 sq mi (702 sq km), in the W Pacific Ocean; formerly part of the U.S. Trust Territory of the PACIFIC ISLANDS. The U.S. is responsible for its defense. It comprises four states—Kosrae, Pohnpei (formerly Ponape), Chuuk (formerly Truk), and Yap—and the capital, Kolonia, is on the island of Pohnpei. U.S. aid ($1 billion pledged for the 1990s) is the primary source of income. Other economic mainstays are subsistence farming, fishing, and tourism. The population is predominantly Micronesian and Christian. English is the official language, but the indigenous languages are Austronesian and Polynesian tongues. Germany purchased the islands from Spain in 1898. They were occupied (1914) by Japan, which received them (1920) as a League of Nations mandate. During WORLD WAR II U.S. forces captured the islands and in 1947 they became part of the U.S. trust territory. In 1979 they became self-governing as the Federated States of Micronesia. In 1986, they assumed free-association status with the U.S. See PACIFIC OCEAN map.

microphone, device (invented c.1877) used in broadcasting, recording, and sound-amplifying systems to convert sound into electrical energy. Its basic component is a flexible diaphragm that responds to the pressure or particle velocity of sound waves. In an electrostatic, or condenser, microphone, two parallel metal plates (electrodes) are given opposite electrical charges. One of the plates is attached to the diaphragm and moves in response to its vibrations, generating a varying voltage. An electret microphone, the most widely used type, has a permanently charged dielectic (electret) between the two electrodes. See also TELEPHONE.

microprocessor, INTEGRATED CIRCUIT containing the arithmetic, logic, and control circuitry required to interpret and execute in-

structions from a COMPUTER PROGRAM. When combined with other integrated circuits that provide storage for data and programs, often on a single SEMICONDUCTOR base to form a chip, the microprocessor becomes the heart of a small COMPUTER, or microcomputer. Developed during the 1970s, the microprocessor has made possible the inexpensive hand-held electronic CALCULATOR, the digital wristwatch, and the ELECTRONIC GAME. Microprocessors are also used to control consumer appliances, to regulate gasoline consumption in automobiles, and to monitor alarm systems.

microscope, optical instrument used to increase the apparent size of an object. A magnifying glass, an ordinary double convex LENS having a short focal length, is a simple microscope. When an object is placed nearer such a lens than its principal focus, i.e., within its focal length, an image is produced that is erect and larger than the object. The compound microscope, invented in the early 17th cent., consists of two or more such lenses fixed in the two extremities of a hollow metal cylinder. This cylinder is mounted upright on a screw device, which permits it to be raised or lowered above the object until a clear image is formed. The lower lens (nearer to the object) is called the objective; the upper lens (nearer to the eye of the observer), the eyepiece. When an object is in focus, a real, inverted image is formed by the lower lens at a point inside the principal focus of the upper lens. This image serves as an "object" for the upper lens, which produces another image larger still (but virtual) and visible to the eye of the observer. The compound microscope is widely used in bacteriology, biology, and medicine in the examination of such extremely minute objects as bacteria, other unicellular organisms, and plant and animal cells and tissue. Technical advances making use of different forms of light and other forms of radiation (see, e.g., ELECTRON MICROSCOPE) have increased enormously the magnification and resolution of microscopes.

Microspora, phylum of intracellular parasitic PROTOZOANS that live in almost all groups of animals. Phylum members are of economic concern because they are parasites of bees and silkworms.

microwave, ELECTROMAGNETIC RADIATION having a frequency range from 1,000 to 300,000 megahertz, corresponding to a wavelength range from 300 to 1 mm (about 12 to about 0.04 in.). Microwaves are used in MICROWAVE OVENS, RADAR, and communications links spanning moderate distances, such as CELLULAR TELEPHONE systems.

microwave oven, cooking device that uses MICROWAVES to penetrate foods and rapidly cook them. The microwaves cause water molecules in the food to vibrate, thus producing heat. Once used almost exclusively in fast-food restaurants, microwave ovens have become increasingly popular in home kitchens. Significant microwave radiation leakage occurred with some early ovens, but safeguards have eliminated the problem.

Midas, in Greek mythology, king of Phrygia. Because he befriended SILENUS, DIONYSUS granted him the power to turn everything he touched into gold. When even his food became gold, he washed away his power in the Pactolus River.

Middle Ages, period in W European history roughly from the fall of the West Roman Empire in the 5th cent. to the 15th cent., once called the Dark Ages. Christianity became the unifying force of culture. FEUDALISM and the MANORIAL SYSTEM, the HOLY ROMAN EMPIRE, the CRUSADES, and CHIVALRY fused Christian ideals with economic, political, and military institutions. Guilds in rising towns maintained the Christian spirit in economic life. Universities developed under the auspices of the church. The philosophy of SCHOLASTICISM, expounded by St. THOMAS AQUINAS, combined new learning with Christian faith. GOTHIC ARCHITECTURE and the writings of DANTE and CHAUCER show the vitality and spirit of the age. Transition to the modern age came with a money economy, political centralization, exploration, secularization, and the humanism of the RENAISSANCE. Finally, the Protestant REFORMATION shattered the medieval unity of Christianity.

Middle America, indigenous peoples of, aboriginal peoples of the area between the present-day U.S. and South America. The MAYA of the YUCATÁN, with their advanced culture, had links with the Chorotega of Nicaragua and Honduras, and these in turn had contacts with the Chibcha of Colombia. High civilizations flourished in Mexico after the domestication of corn, e.g., beside the Maya, the OLMEC, TOLTEC, MIXTEC, ZAPOTEC, and AZTEC. They developed architecture, agriculture, and stonework and metalwork to a remarkable degree. Following the Spanish conquest (16th cent.), Mexico's indigenous population was used as laborers, first under the EN COMIENDA system of tributory labor, then under peonage. Native artisans, however, continued to make contributions to painting and architecture. Not until the Mexican revolution of 1910 and the *indianismo* movement of ZAPATA were efforts made to advance Mexico's indigenous peoples socially and economically. Today descendants of the Mexican civilizations, along with Huastecs, TARASCANS, Yaquis, Tarahumaras, and other groups, constitute a major element of the population of Middle America. Both people of indigenous and mixed descent (mestizos) are found in all levels of society, and millions still speak NATIVE AMERICAN LANGUAGES.

Middle East, term applied to a region that includes SW Asia and part of NE Africa, lying W of Afghanistan, Pakistan, and India. It includes the Asian part of TURKEY; SYRIA; ISRAEL; JORDAN; IRAQ; IRAN; LEBANON; the countries of the Arabian peninsula, that is, SAUDI ARABIA, YEMEN, OMAN, UNITED ARAB EMIRATES, QATAR, BAHRAIN, KUWAIT; EGYPT; and LIBYA. The region was the site of great ancient civilizations, e.g., MESOPOTAMIA and Egypt, and it was the birthplace of JUDAISM, CHRISTIANITY, and ISLAM. It contains much of the world's oil reserves and has many strategic trade routes, e.g., the SUEZ CANAL. In the 20th cent. the area has been the scene of political turmoil and major warfare, e.g., in WORLD WAR I, WORLD WAR II, the ARAB-ISRAELI WARS, the IRAN-IRAQ WAR, and the PERSIAN GULF WAR. The term *Middle East* is also sometimes used in a cultural sense for that part of the world predominantly Islamic in culture, in which case Afghanistan, Pakistan, and the remaining countries of North Africa are included.

Middleton, Thomas, 1580–1627, English dramatist. He collaborated with DEKKER, DRAYTON, and others, and wrote (1604–11) realistic, satiric comedies, including *Michaelmas Term, A Trick to Catch the Old One,* and *A Mad World, My Masters.* Later (1621–27) he wrote two powerful tragedies, *The Changeling* (with William Rowley) and *Women Beware Women.*

Middle West or **Midwest,** U.S. region usually defined as including the N central states of OHIO, INDIANA, ILLINOIS, MICHIGAN, WISCONSIN, MINNESOTA, IOWA, MISSOURI, KANSAS, and NEBRASKA. It is a rich farm area, noted for its corn and hogs, as well as an important industrial region, home of the nation's automobile and rubber industries.

midget: see DWARFISM.

MIDI [*M*usical *I*nstrument *D*igital *I*nterface], a protocol for sending digital information between electronic music instruments and equipment, including COMPUTERS and signal processors (devices that modify sounds by adding reverberation, modifying pitch, and other means). The basic protocol addresses common functions, such as notes, timing, pitch, and pedal information. MIDI keyboards, guitars, violins, and drums have become as common as the synthesizer in ELECTRONIC MUSIC.

Midian [mĭd'ēən] or **Midianites** [-īts], in the BIBLE, a nomadic Bedouin people of N Arabia and of the lands E of Palestine. They were closely associated with the Israelites and were among the first to use the camel. MOSES married the daughter of their priest Jethro.

midnight sun, phenomenon in which the sun remains visible in the sky continuously for 24 hr or longer. It occurs in the polar regions because of the tilt of the equatorial plane to the plane of the ecliptic (the sun's apparent path through the sky). It occurs at the polar circles only at the SOLSTICE (summer for Arctic, winter for Antarctic), but as one approaches the pole it increases in occurrence up to a continuous six months (from vernal to autumnal equinox for the North Pole; the reverse for the South Pole).

mid-ocean ridge: see OCEAN; PLATE TECTONICS.

Midrash, verse-by-verse interpretation of Hebrew Scriptures, consisting of homily and exegesis, by Jewish teachers since c.400 B.C. The *Midrash Rabbah* is the most authoritative of the collections of commentaries on the TORAH and the Five Scrolls (the books Song of Solomon, Ruth, Lamentations, Ecclesiastes, and Esther in the Hebrew Bible).

midsummer day and midsummer night, feast of the nativity of St. JOHN THE BAPTIST (June 24) and the preceding night (June 23). Close to the summer SOLSTICE, midsummer has been associated

with solar ceremonies since before Christianity. Supernatural beings were thought to roam on midsummer night.

Midway, island group (2 sq mi/5.2 sq km), central Pacific, c.1,150 mi (1,850 km) NW of Honolulu. Annexed by the U.S. in 1867, it is a naval base with no indigenous population. On June 3–6, 1942, the Japanese navy was crippled in the battle of Midway, fought nearby with carrier-based aircraft.

midwifery, art of assisting at childbirth. The term *midwife* for centuries referred to a woman who was an overseer during the process of delivery. Professional schools of midwifery were established in Europe in the 16th cent. Midwives are still used widely in Europe and have experienced an upsurge of popularity in the U.S. Most modern American midwives are registered nurses who have completed additional specialized training.

Mielziner, Jo [mēlzē'nər], 1900–1976, American theatrical designer; b. France. He designed sets for more than 200 productions, including *Strange Interlude* (1928), *A Streetcar Named Desire* (1947), and *Death of a Salesman* (1949).

Miës van der Rohe, Ludwig [mē'ĕs vän dĕr rō'ə], 1886–1969, German-American architect, a founder of MODERN ARCHITECTURE. In Germany, he was appointed (1930) director of the BAUHAUS. But in 1937 he left Germany to teach at the Armour Inst., Chicago (now Illinois Inst. of Technology), where he also planned a new campus. His combination of the glass skyscraper concept with surface expression of structural members is seen in the Seagram Building, New York City (1956–58; with Philip JOHNSON).

Mifflin, Thomas, 1744–1800, American Revolutionary quartermaster general (1775–78) and statesman; b. Philadelphia. He was president of the CONTINENTAL CONGRESS (1783–84), a delegate to the FEDERAL CONSTITUTIONAL CONVENTION (1787), and governor of Pennsylvania (1790–99).

Mifune Toshiro [mĭfōō'nē], 1920–, Japanese actor; b. China. A versatile actor, he appeared in many films directed by KUROSAWA AKIRA, e.g., *Rashomon* (1950), *Throne of Blood* (1957), *Yojimbo* (1960). Mifune has also performed in some U.S. films.

migraine, headache characterized by recurrent attacks of severe pain, usually on one side of the head. The pain is believed to be associated with intense vasoconstriction, followed by prolonged dilation of blood vessels leading to and within the brain. Attacks vary in duration and frequency. In classic migraines the pain is preceded by visual disturbances, sensitivity to light, nausea, and dizziness. ERGOT derivatives and sumatriptan, a serotonin agonist, can alleviate the headache; the BETA BLOCKER propranolol may prevent the condition.

Milan, Ital. *Milano,* city (1990 pop. 1,449,403), capital of LOMBARDY, N Italy, in the Po basin. It is the economic and financial heart of modern Italy, with such manufactures as textiles, machinery, chemicals, and motor vehicles. Capital of Rome's Western Empire and a Christian center, it was damaged by barbarian invasions. It became a free commune (12th cent.) and rose to leadership in Lombardy. Losing its republican liberties, it was ruled by the VISCONTIS (1277–1447) and the SFORZAS (1447–1535). Later it passed to Spain, Austria, and Napoleon I before union (1861) with Italy. Milan was severely damaged in World War II. Dominated by its white marble cathedral (1386–1813), it is also known for the renowned opera house Teatro alla Scala, the Church of Santa Maria delle Grazie (housing LEONARDO's *Last Supper*), the Brera Palace, and the Ambrosian Library.

mildew, name for certain organisms and the plant diseases they cause, and for the discoloration and disintegration of materials (e.g., leather, fabrics, and paper) caused by related fungi. The powdery mildews (Fungi division Ascomycota; see FUNGUS) form a gray-white coating on plant tissues. The downy mildews (PROTIST division Oomycota) form white, purplish, or gray patches; a downy mildew caused the potato BLIGHT and famine in Ireland (1845–49) and more recently threatened the French wine industry.

Miletus [mīlē'təs], ancient seaport of W ASIA MINOR, in Caria, near Sámos. Occupied by the Greeks (c.1000 B.C.), it became a leading IONIAN city. It led the revolt (499 B.C.) against the Persians, who sacked the city (494).

Milhaud, Darius [mēyō'], 1892–1974, French composer. His music incorporates polytonality, JAZZ, and Brazilian elements. One of the Parisian group "les SIX," he is noted for his operas *Le Pauvre Matelot* (1927; libretto by COCTEAU) and *Christophe Colombe* (1930; libretto by CLAUDEL) and for his ballets, e.g., *The Creation of the World.* (1923).

military-industrial complex, in the U.S., the link between the Defense Dept. and a permanent peacetime arms industry that enables those groups to wield extraordinary political and economic power. The term was coined by Pres. EISENHOWER in his farewell address (1961), when he warned of the threat it posed to democracy. The end of the COLD WAR has largely ended the peacetime arms buildup in the U.S. and has caused the contraction of the nation's arms industry, diminishing the power of the military-industrial complex.

military science, study and application of the rules and principles of warfare, designed to achieve success in military operations. It comprises military strategy and tactics, as adapted to utilize the latest developments in weapons and communications technology. Strategy and tactics are relative terms referring, respectively, to large-scale and small-scale military operations. Strategy may be defined as the general scheme of the conduct of a war, often referred to as "grand strategy." On the highest level it has come to mean national strategy, involving complex assessments of technological resources, national priorities, and geopolitical factors. Tactics, on the other hand, refers to the planning and execution of means to achieve strategic objectives.

militia, military organization composed of citizens enrolled by enlistment or CONSCRIPTION and trained for service in times of national emergency. When the emergency is over, militia members traditionally resume civilian status. An early prototype of the militia was developed by PHILIP II of Macedon, and the concept persisted in Europe until the rise of standing national armies in the 17th and 18th cent. The Military Company of Massachusetts, the first American militia, was followed by similar groups in other colonies; during the 19th cent. various U.S. states had their own militia, which served in all the nation's wars. After World War I these military units were established as the NATIONAL GUARD.

Milk, Harvey, 1931–78, U.S. politician and gay rights activist. In 1977 he was elected to the San Francisco Board of Supervisors, becoming first acknowledged homosexual in the U.S. to win high local office. Former city supervisor Dan White assassinated Milk and Mayor George Moscone in 1978.

milk, liquid secreted by the mammary glands of female mammals to feed their young. Cow's milk is most widely used by humans, but milk of such animals as the mare, goat, ewe, buffalo, camel, and yak is also consumed. An almost complete food, milk contains fats; proteins (mainly casein); salts; sugar (lactose); vitamins A, C, and D; some B vitamins; and minerals, chiefly calcium and phosphorus. The composition of milk varies with the species, breed, feed, and condition of the animal. Commercially produced milk commonly undergoes PASTEURIZATION to check bacterial growth and homogenization for uniformity. Dried (powdered) milk and concentrated milk have been in use since the mid-19th cent. Concentrated milk may be condensed (sweetened) or evaporated (unsweetened). Skim milk, valuable in fat-free diets, is low in vitamin A. See BUTTER; CHEESE; DAIRYING; FERMENTED MILK.

Milken, Michael R., 1946–, American financial executive; b. Calif. An executive at Drexel Burnham Lambert Inc., he transformed corporate takeovers by the use of high-yield JUNK BONDS, becoming enormously wealthy in the process. In 1989, a federal grand jury handed down a 98-count indictment against Milken for violations of federal securities and racketeering laws. He pled guilty to securities fraud and related charges in 1990, and the government dropped the more serious charges of INSIDER TRADING and racketeering.

milk of magnesia, common name for the chemical compound magnesium hydroxide $Mg(OH)_2$. The viscous, white, mildly alkaline mixture used as a medicinal antacid and laxative is a suspension of about 8% magnesium hydroxide in water.

Milky Way, large spiral GALAXY containing about 100 billion stars, including the sun. It is characterized by a central nucleus of closely packed stars, lying in the direction of the constellation Sagittarius, and a flat disk marked by spiral arms. Seen edgewise as a broad band of light arching across the night sky from horizon to horizon, the Milky Way passes through the constellations Sagittarius, Aquila, Cygnus, Perseus, Auriga, Orion, and Crux. The disk is

c.100,000 LIGHT-YEARS in diameter and on the average 10,000 light-years thick (increasing up to 30,000 light-years at the nucleus). A thin halo of STAR CLUSTERS surround the galaxy, extending to about 130,000 light-years. The sun is c.28,000 light-years from the nucleus and takes 200 million years to revolve once around the galaxy.

Mill, John Stuart, 1806–73, British philosopher and economist. He received a rigorous education under his father, James Mill (1773–1836), and Jeremy BENTHAM (1748–1832), who were close friends and together had founded UTILITARIANISM. John Stuart Mill's own philosophy, influenced by his wife, Harriet Taylor, developed into a more humanitarian doctrine than that of utilitarianism's founders: he was sympathetic to socialism, and was a strong advocate of women's rights and such political and social reforms as proportional representation, labor unions, and farm cooperatives. In logic he formulated rules for the process of induction, and he stressed the method of EMPIRICISM as the source of all knowledge. *On Liberty* (1859) is probably his most famous work. Among his other books are *Principles of Political Economy* (1848), *Utilitarianism* (1863), and his celebrated *Autobiography* (1873). One of the most important liberal thinkers of the 19th cent., Mill strongly influenced modern economics, politics, and philosophy.

Millais, Sir John Everett [mĭlā'], 1829–96, English painter. He was a founder of the PRE-RAPHAELITE movement. His early work shows a painstaking rendering of detail, e.g., *Christ in the Carpenter's Shop* (1850; Tate Gall., London). A friend of RUSKIN, he was (1896) president of the Royal Academy.

Millay, Edna St. Vincent, 1892–1950, American poet; b. Rockland, Me. Known as much for her bohemian life-style as for her verse, she won fame with the lyric *Renascence* (1917) and *The Harp Weaver* (1923; Pulitzer). Later volumes include the sonnet cycle *Fatal Interview* (1931). She also wrote several verse dramas, e.g., *Aria da Capo* (1920).

Miller, Arthur, 1915–, American dramatist; b. N.Y.C. His masterpiece, *Death of a Salesman* (1949), is the story of an ordinary American destroyed by hollow values. Miller's other works, all dealing with political or moral issues, include *All My Sons* (1947), *The Crucible* (1953), *A View from the Bridge* (1955), *After the Fall* (1964), *The Price* (1968), *Playing for Time* (1980, a television adaptation), and *The Ride down Mount Morgan* (1991). His autobiography was published in 1987.

Miller, Cincinnatus Heine or **Cincinnatus Hiner:** see MILLER, JOAQUIN.

Miller, Henry, 1891–1980, American author; b. N.Y.C. He lived in Paris in the 1930s and later settled in Big Sur, Calif. His controversial novels, mixing frank sexual description, autobiographical incident, and speculation on philosophy, literature, and society, include *Tropic of Cancer* (1934) and *Tropic of Capricorn* (1939), both banned in the U.S. until 1961, and the trilogy *The Rosy Crucifixion* (1949–60). He also wrote a fine travel book, *The Colossus of Maroussi* (1941); essays; and the autobiography *My Life and Times* (1972).

Miller, Jonathan (Wolfe), 1934–, English director, actor, and writer. He was coauthor of and actor in the zany satirical revue *Beyond the Fringe* (London, 1961; N.Y.C., 1962). A physician, Miller has also directed plays for the National Theatre and television, e.g., *The Shakespeare Plays,* and operas, and has written the television series, *The Body in Question* (1978) and *Madness* (1991).

Millerand, Alexandre [mēlrăN'], 1859–1943, president of France (1920–24). Expelled from the Socialist party, he moved to the right politically and was minister of war (1912–13, 1914–15). In 1920 he was premier before becoming president.

Millet, Jean François [mēlā'], 1814–75, French painter. He studied with Hippolyte Delaroche and was associated with the BARBIZON SCHOOL. Considered a social realist, he produced works noted for their power and simplicity, e.g., *The Gleaners* (1857; Louvre) and *The Angelus* (1859; Louvre).

millet, common name for several plants of the GRASS family cultivated mainly for cereals in the Old World and forage and hay in North America. The main varieties are foxtail, pearl, barnyard, and proso millets. Proso millet is the chief cereal in parts of Africa and Asia; the chief millet in the U.S. is foxtail millet.

Millikan, Robert Andrews, 1868–1953, American physicist and educator; b. Morrison, Ill. He taught (1896–1921) physics at the Univ. of Chicago and later (1921–45) was chairman of the executive council of the California Institute of Technology and director of the Norman Bridge Laboratory there. He received the 1923 Nobel Prize in physics for his measurement of the ELECTRON's charge and his work on the PHOTOELECTRIC EFFECT. He also studied COSMIC RAYS (which he named), X rays, and physical and electric constants.

millipede, wormlike segmented ARTHROPOD with two pairs of legs on each body segment except the first few and last. Most temperate species are small and dull in appearance, but tropical millipedes are often brightly colored. In contrast to the carnivorous CENTIPEDES, which they resemble, millipedes feed mostly on decaying vegetation.

Mills, C. Wright, 1916–62, American sociologist; b. Waco, Tex. A controversial figure, he advocated a comparative world sociology and criticized intellectuals for not using their freedom responsibly by working for social change. In *The Power Elite* (1956), he explained the power structure of postwar American society in terms of an oligarchy.

Mills, Robert, 1781–1855, American architect of the CLASSIC REVIVAL; b. Charleston, S.C. In 1836 Pres. JACKSON appointed him architect of public buildings in Washington, D.C. His major works there include the Treasury Building (1836), the Patent Office and Old Post Office (both begun 1839), and the WASHINGTON MONUMENT (designed 1833, built 1848–84, without the base he intended for it). He also designed the Bunker Hill monument and other public projects in various cities.

Milne, A(lan) A(lexander), 1882–1956, English author. He is known for his verse collections for children, *When We Were Very Young* (1924) and *Now We Are Six* (1927), and for the classic children's stories *Winnie-the-Pooh* (1926) and *The House at Pooh Corner* (1928).

Milo: see MÍLOS.

Miloš or **Milosh** (Milos Obrenović), 1780–1860, prince of Serbia (1817–39, 1858–60), founder of the OBRENOVIĆ dynasty and of modern SERBIA. In 1815 he led a rebellion against the Turks and, after presumably killing his rival, KARAGEORGE, was named (1817) prince of Serbia under the suzerainty of the sultan. He abdicated in favor of his sons, Milan and Peter, but was recalled in 1858.

Milošević, Slobodan, 1941–, Yugoslav-Serbian political leader. He held posts in the Communist party and state enterprises from the early 1960s, becoming party leader in Belgrade in 1984 and Serbia by 1987. Initially opposed to liberalization, he was elected (1989) president of Serbia and transformed the Serbian party into the nationalistic Socialist party. He called for the inclusion of Serbian areas of other republics in a "greater Serbia" as the price for YUGOSLAVIA's dissolution and supported Serbian militias in CROATIA and BOSNIA AND HERCEGOVINA. In 1992 he was reelected amid accusations of fraud.

Miłosz, Czesław [mē'wäsh], 1911–, Polish poet, novelist, and essayist; b. Lithuania. He has lived in the U.S. since 1960. The main source of his early poetry was the Lithuanian countryside of his youth, which also figures prominently in his autobiographical novel, *The Issa Valley* (tr. 1981). His classically styled verse appears in English translation in *Selected Poems* (tr. 1973), *Provinces* (1991), and other volumes. He is also well known for the sociopolitical essays in *The Captive Mind* (1953) and for the novel *The Seizure of Power* (1955). He was awarded the 1980 Nobel Prize in literature.

Miltiades [mĭltī'ədēz], d. 489 B.C., Athenian general in the PERSIAN WARS. In 490 B.C. he defeated the Persians at MARATHON and then marched his exhausted army 20 mi (32 km) to Athens, which he defended from the Persian fleet.

Milton, John, 1608–74, English poet. As a Cambridge undergraduate he wrote poems in Latin and English, including 'Ode on the Morning of Christ's Nativity" (1629). "L'Allegro" and "I Penseroso" were probably written soon after. Continuing his studies at home, he produced the MASQUE *Comus* (1634) and the great ELEGY "Lycidas" (1638). After a year in Italy, Milton supported the Presbyterian struggle to reform the Church of England with pamphlets attacking the episcopal form of church government. *Areopagitica* (1644), an argument for freedom of the press, grew out of dissatisfaction with

Parliament's strict censorship. Milton gradually broke with the Presbyterians and in 1649 wrote *The Tenure of Kings and Magistrates*, supporting the Independents, who had imprisoned Charles I, and arguing that subjects may depose and put to death an unworthy king. The pamphlet earned him a Latin secretaryship in CROMWELL's Commonwealth government. During this period Milton went blind and had to work through secretaries, one of them MARVELL. He had long planned to write an epic, and in retirement after the RESTORATION (1660), he worked on *Paradise Lost*. It appeared in 1667 and again, reorganized, in 1674. The story of Satan's rebellion against God and of the expulsion of Adam and Eve from the Garden of Eden, it is generally considered the greatest epic in the English language. *Paradise Regained* (1671) tells how Jesus overcame Satan's temptations. *Samson Agonistes* (also 1671) is a poetic drama modeled on Greek tragedy but with biblical subject matter. During his life Milton also wrote 18 English and five Italian SONNETS, accepted as among the best ever written.

Milwaukee, city (1990 pop. 628,088; met. area 1,432,149), seat of Milwaukee co., SE Wis., on Lake Michigan; inc. as a city 1848. The largest city in the state, it is a major GREAT LAKES port, shipping cargo from the Midwest to world ports via the SAINT LAWRENCE SEAWAY. Heavy machinery and electrical equipment, diesel and gasoline engines, and tractors are produced; the city's beer industry is famous. MARQUETTE visited the site, then a Native American trading center, in 1673. Throughout the early 19th cent. it grew as a fur-trading and shipping site. Heavy 19th-cent. immigration, especially from Germany, made it a great industrial city. The Socialist leader Victor BERGER dominated its strong labor movement. Points of interest include Marquette Univ., the Milwaukee Art Center, and a church designed by Frank Lloyd WRIGHT.

Mimas, in astronomy, natural satellite of SATURN.

mime: see PANTOMIME.

mimicry, in biology, the advantageous resemblance of one species to another, often unrelated species or to a feature of its own habitat (see PROTECTIVE COLORATION). Mimicry serves to protect the mimic from predators or to deceive its prey (e.g., ant-eating spiders that themselves resemble ants). Although most common among insects, mimicry occurs in both plants and animals.

mimic thrush, name for exclusively American BIRDS of the family Mimidae, allied to the WRENS and THRUSHES and including the mockingbird, catbird, and thrashers. Mimic thrushes are most numerous in Mexico. They are slim, robin-sized birds with slender, downcurved bills, long tails, and strong legs suited to scratching through dead leaves for insects; they also eat berries and fruit. All are famous for their imitative vocal powers; the mockingbird, the preeminent North American songbird, may mimic some 30 calls in succession.

mimosa, tree, shrub, or herb (genus *Mimosa*) of the PULSE family, found mainly in the tropics. Mimosas usually have feathery foliage and rounded clusters of fragrant pink flowers atop the branches; they are grown as ornamentals. Best known is the sensitive plant (*M. pudica*), whose leaves fold up and collapse under stimuli such as touch, darkness, or drought. The similar and related yellow-flowered ACACIA is often sold as mimosa.

minaret, in Islamic architecture, tower, from which the faithful are called to prayer by a muezzin. Most MOSQUES have one or more minarets, usually at the corners. The earliest minarets were at the Mosque of Amr (A.D. 673) in Egypt. At first, minarets were generally square; free-standing conical minarets, probably derived from Babylonian ZIGGURATS, appeared in the 9th cent. The mosque of El-Azhar (15th cent.) in Cairo is an example of the octagonal Egyptian style.

Mindanao, island (1987 est. pop. 13,093,000), Philippines, southernmost and second largest (c.36,540 sq mi/94,640 sq km) of the main Philippine islands. Davao and Zamboanga are the principal cities. The terrain is generally mountainous and heavily forested, with a high point of 9,690 ft (2,954 m) at Mt. Apo. Pineapples, mangoes, bananas, and rice are grown. Heavy industry includes steel, chemical, and fertilizer plants powered by hydroelectricity from the Maria Christina Falls, on the Agus R. The population is largely Roman Catholic but about one third is Muslim, mostly concentrated in the west; small minorities that adhere to traditional beliefs survive in isolated areas. Muslim demands for autonomy have led to guerrilla warfare.

Mindszenty, Jozsef [mĭnd'sĕntē], 1892–1975, Hungarian primate, Roman Catholic cardinal. An opponent of Communism, Mindszenty was arrested (1948) by the Hungarian government and at his trial pleaded guilty to most of the charges. It was widely believed that he had been drugged to obtain a confession. Sentenced to life imprisonment, he found refuge in the U.S. legation during the Hungarian uprising of 1956. In 1971 the Vatican arranged his departure from Hungary, and in 1974 he was removed as primate.

mine, in warfare, a bomb placed in a fixed position, to be detonated by contact, magnetic proximity, or electrical impulse. Land mines, both antitank and antipersonnel, came into wide use in World War II; they were normally equipped with pressure sensors placed slightly above or below ground. Naval mines, known since the 16th cent., were first widely employed in World War I. The modern naval mine is often equipped with sonar or magnetic sensors and is laid on or anchored just below the surface of the sea.

mineral, natural inorganic substance having a characteristic and homogeneous chemical composition, definite physical properties, and, usually, a definite crystalline form. A few (e.g., carbon, gold, iron, and silver) are elements, but most are chemical compounds. ROCKS are combinations of minerals. Important physical properties of minerals include hardness, specific gravity, cleavage, fracture, luster, color, transparency, heat conductivity, feel, magnetism, and electrical properties. Minerals originate by precipitation from solution, by the cooling and hardening of magmas, by the condensation of gases or gaseous action on rock, and by METAMORPHISM. They are of great economic importance in manufacturing; many are valued as gems.

mineral, dietary, inorganic element found in the earth's crust that is an essential nutrient, vital to normal body function. Minerals are those elements for which the body's requirement is at least 100 mg per day. Trace minerals are those that are needed in smaller amounts. Major dietary minerals include calcium and phosphorus (for bones and teeth), magnesium (for cellular metabolism), sodium (for fluid balance and muscle function), potassium (for fluid-electrolyte and acid-base balance), chloride (for water balance and digestion), and sulfur (for protein structure and enzyme activity). Other essential nutrients include dietary FATS, PROTEINS, CARBOHYDRATES, and VITAMINS.

Minerva, in Roman mythology, goddess of handicrafts and the arts; identified with the Olympian ATHENA.

Ming, dynasty: see CHINA.

Mingus, Charles, 1922–79, American jazz musician; b. Nogales, Ariz. One of the most important 20th-cent. jazz composers, he was also a bassist, pianist, bandleader, and vocalist. In the 1950s and 60s he led groups noted for their energetic improvisations and loose rhythms.

miniature schnauzer: see SCHNAUZER.

minicomputer: see COMPUTER.

minimalism, movement in American painting and sculpture that originated in New York City in the early 1960s. A reaction against the subjectivity and romanticism of ABSTRACT EXPRESSIONISM, minimalism stressed impersonality and anonymity in precise, often monumental, geometric forms and pure colors intended to have no references beyond the works themselves. Minimalist art is typified by the primary structures of such sculptors as Carl ANDRE, Donald JUDD, and Tony SMITH, and by the hard-edge paintings of such artists as Ellsworth KELLY, Kenneth Noland, and Frank STELLA.

minimalist music, style of music that developed in the 1960s in the U.S. As MINIMALISM reacted against the excesses of ABSTRACT EXPRESSIONISM, minimalist music rejected many of modern music's complexities. Generally, minimalist compositions emphasize simplicity in melodic line and harmonic progression, stress repetition and rhythm, and reduce historical or expressive reference. The use of electronic instruments is common, as are influences from Asia and Africa. Minimalist composers include Philip GLASS, Steven Reich, Terry Riley, and John Adams.

minimum wage, lowest wage legally permitted in an industry, organization, or the like. Minimum wages are aimed at assuring workers a standard of living above the lowest permitted by health and decency. The minimum has been set by labor unions (through

COLLECTIVE BARGAINING), through arbitration, and by legislation. Introduced (1894) in New Zealand, it rapidly was adopted by nearly all countries. In the U.S. a campaign by organized labor culminated in the passage (1938) of the Fair Labor Standards Act (see WAGES AND HOURS ACT), which set minimum wages for nonfarm workers in interstate commerce. The U.S. minimum wage has risen steadily over the years, reaching $4.25 per hour in 1991, and coverage has been extended to more types of workers, among them state and local government employees. A family of four with a single breadwinner working at the minimum wage, however, will have an income significantly below the official U.S. poverty level.

mining, extraction of solid MINERAL resources from the earth, including ORES (which contain commercially valuable amounts of METALS), precious stones, building stones, and solid fuels. Surface mining, open-pit, or open-cut, mining, STRIP MINING, and QUARRYING are the most common mining methods that start from the earth's surface and maintain exposure to it. Under certain circumstances surface mining can become prohibitive, and underground mining is then considered. The objective of underground mining is to extract the ore below the surface of the earth safely and economically. Entry is through a tunnel or shaft, and the ore is mined in stopes, or rooms. Material left in place to support the ceiling is called a pillar and can sometimes be recovered afterward. A modern underground mine is a highly mechanized operation, using vehicles, rail haulage, and multiple drill units. To protect miners and their equipment, much attention is paid to mine safety, including proper ventilation and roof support. There are a number of other mining methods, including *solution mining,* in which the ore is brought into a liquid solution by a chemical or bacteria and pumped to the surface; *gopher mining,* an old-fashioned method in which small, narrow holes are driven to extract the ore; and *placer mining,* in which gravel, sand, or talus is removed from deposits by hand, hydraulic nozzles, or dredging.

mink, semiaquatic carnivorous MAMMAL (genus *Mustela*), related to the WEASEL and highly prized for its thick, lustrous, rich brown fur. Found in Europe and North America, it has a slender, arched body about 20 in. (51 cm) long and a bushy tail. Minks live near water, where they feed on MUSKRATS, fishes, frogs, and birds. The mink is widely bred on farms for the fur trade.

Minkowski, Hermann [mĭnkôf'skē], 1864–1909, Russian mathematician. He evolved a four-dimensional geometry of space and time that influenced the formulation of the general theory of relativity.

Minneapolis, city (1990 pop. 368,383), seat of Hennepin co., E Minn., at the head of navigation on the Mississippi R., at St. Anthony Falls; inc. 1856. Minneapolis and adjacent SAINT PAUL are called the Twin Cities and form the heart of a major metropolitan area (1990 pop. 2,464,124). The largest city in the state and a major port, it is a financial, industrial, and rail center. Flour milling and computer and electronic industries are particularly important. In the 19th cent. it was the nation's leading lumber center. Minneapolis is noted for such cultural institutions as the Univ. of Minn., Walker Art Center, and Guthrie Theater. It has wide streets, and many lakes and parks. Extensive redevelopment was begun in the central city during the 1960s and continued into the 1980s.

Minnesota, upper midwestern state of the U.S.; bordered by Lake Superior and Wisconsin (E), Iowa (S), South Dakota and North Dakota (W), and the Canadian provinces of Manitoba and Ontario (N).

Area, 84,068 sq mi (217,736 sq km). *Pop.* (1990) 4,375,099, a 7.3% increase over 1980 pop. *Capital,* St. Paul. *Statehood,* May 11, 1858 (32d state). *Highest pt.,* Eagle Mt., 2,310 ft (702 m); *lowest pt.,* Lake Superior, 602 ft (184 m). *Nickname,* North Star State. *Motto, L'Etoile du Nord* [The Star of the North]. *State bird,* common loon. *State flower,* showy lady's slipper or pink and white lady's slipper. *State tree,* red pine. *Abbr.,* Minn.; MN.

Land and People. Iron-rich mountains, including the Vermilion and Mesabi ranges, are located in the east. In the north glaciers have left many lakes, including those in Voyageurs National Park (see NATIONAL PARKS, table), and boulder-strewn hills that give way to broad prairies in the south. The MISSISSIPPI R. originates in N Minnesota and flows northeast through the state. Winter locks the land in snow, and spring is brief; summer is hot. Nearly 70% of the population lives in urban areas. MINNEAPOLIS is the largest city, followed by its twin city, ST. PAUL, and DULUTH, the country's leading GREAT LAKES port. In 1990 over 94% of the population was white.

Economy. Agribusiness, particularly dairying, along with manufacturing, dominated by the production of processed foods and nonelectrical machinery, are leading sources of income. Other key industries produce chemicals, paper, and electronic equipment. In agricultural output beef cattle are important, as are corn, soybeans, wheat, and sugar beets. Forest products also constitute an important sector of the economy. Minnesota leads the country in iron mining.

Government. The 1858 constitution provides for a governor serving a four-year term. The legislature consists of a senate whose 67 members serve four-year terms and a house whose 134 members are elected at two-year intervals. Minnesota is represented in the U.S. Congress by two senators and eight representatives and has 10 electoral votes.

History. The region was inhabited mostly by OJIBWAS, in the east, and SIOUX, in the west, when French explorers and fur traders arrived in the mid-17th cent. By the LOUISIANA PURCHASE (1803) the U.S. acquired all of present-day Minnesota. Settlement began during the 1820s; the many Scandinavians who shaped much of the life of the state arrived later in the century. With a large rural population, Minnesota was fertile ground for the reform movements of the late 19th cent.: the National Grange (see GRANGER MOVEMENT) was founded (1867) by a Minnesotan, and later the POPULIST PARTY and the FARMER-LABOR PARTY received wide support in Minnesota. The Farmer-Labor party merged (1944) with the Democratic party, producing such national leaders as Hubert HUMPHREY and Walter MONDALE. While falling farm prices adversely affected the state in the early 1980s, Minnesota was scarcely impacted by the national recession of the late 1980s and early 90s.

minnow, any of a large family (Cyprinidae) of freshwater FISH that includes CARP, bream, chub, dace, shiners, and GOLDFISH. Most minnows are small and drab, but a few species are brightly colored. Minnows are important in freshwater aquatic life, feeding on insects, larvae, and CRUSTACEANS and in turn serving as food for larger fishes. Superior hearing has given minnows the nickname "hearing aid" fish and accounts for their characteristic wariness.

Minoan civilization [mĭnō'ən], a Bronze Age AEGEAN CIVILIZATION that flourished in CRETE. It is divided into three periods. The early Minoan period (c.3000–2200 B.C.) saw the rise of the culture from a neolithic state, with the tentative use of bronze and the appearance of hieroglyphic writing. The Middle Minoan period (c.2200–1500 B.C.) was the high point: the great palaces appeared at KNOSSOS and Phaestus, culture thrived, and linear writing was used. The Late Minoan period (c.1500–1000 B.C.) faded out in poverty, and the cultural center passed to the Greek mainland.

Minorca: see BALEARIC ISLANDS.

minor planet: see ASTEROID.

Minos [mī'nŏs, -nəs], in Greek mythology, king of CRETE, son of ZEUS and Europa. The wealthiest ruler in the Mediterranean area, he was presumably an actual ancient Cretan king for whom the MINOAN CIVILIZATION is named. In legend, he was the husband of Pasiphaë and the father of Androgeus, Glaucus, ARIADNE, and PHAEDRA.

Minotaur, in Greek mythology, monster with a bull's head and man's body. When King MINOS of CRETE failed to sacrifice a bull to POSEIDON, the god caused Queen Pasiphaë to lust after the animal. By it, she conceived the Minotaur, which was confined in the labyrinth built by DAEDALUS. There it devoured human beings until it was killed by THESEUS.

minstrel show, stage entertainment by white performers made up in blackface, popular in the 19th cent. Jokes between an "interlocutor" and gaudily dressed members of the company caricatured African Americans, creating stereotypes that lasted for decades. VAUDEVILLE or olio (medley) acts and burlesques on plays or operas were also featured.

mint, place where legal coinage is manufactured. The name is derived from the temple of Juno Moneta [Latin, = *min-*] in Rome, where silver coins were made as early as 269 B.C. Mints existed earlier elsewhere, as in Lydia and Greece. The first U.S. mint was established in Philadelphia in 1792. The U.S. Bureau of the Mint

now maintains mints in that city, and in Denver and San Francisco. See also COIN.

mint, in botany, common name for the Labiatae, or the Lamiaceae, a large family of chiefly annual or perennial herbs, distributed worldwide but most common in the Mediterranean region. The family is typified by square stems, paired opposite leaves, and white, red, blue, or purple flowers. The aromatic ESSENTIAL OILS in the plants' foliage are used in perfumes, flavorings, and medicines. The true mints (genus *Mentha*), SAGE, lavender, and ROSEMARY are important sources of essential oils; these and BASIL, THYME, MARJORAM, and OREGANO are common kitchen herbs. Other well-known members of the family are CATNIP and HOREHOUND. The most commercially important true mints are peppermint (*M. piperita*), a source of menthol, and the milder spearmint (*M. spicata*).

Mint: Spearmint, Mentha spicata, a plant of the mint family

Minton, English family of potters. **Thomas Minton,** 1765–1836, founded a pottery firm at Stoke-on-Trent and created the famous willow-pattern ware. His son **Herbert Minton,** 1793–1858, developed the firm and made it famous.

minuet, French dance from Poitou, introduced at Louis XIV's court in 1650. In 3/4 meter and moderate tempo, it was danced by open couples with graceful, gliding steps. Many composers, e.g., HAYDN and W.A. MOZART, used its musical form in sonatas and symphonies.

Minuit, Peter [mĭn'yo͞oĭt], c.1580–1638, first director general of New Netherland. Sent to America by the Dutch West India Company, he purchased (1626) Manhattan from Native Americans for trinkets valued at $24. He later headed the group that established (1638) NEW SWEDEN.

Miocene epoch: see GEOLOGIC ERA (table).

mir, Russian peasant community. Among free peasants the mir owned the land; among SERFS it allocated land reserved for serf use. When serfdom ended (1861; see EMANCIPATION, EDICT OF) land was allotted to the mir rather than to individuals, but this proved impractical. The 1908 reforms of STOLYPIN broke many mirs into individual holdings. After the RUSSIAN REVOLUTION of 1917 the COLLECTIVE FARM replaced the mir.

Mirabeau, Honoré Gabriel Riquetti or **Riqueti, comte de** [mĕrăbō'], 1749–91, politician of the FRENCH REVOLUTION. After a life of wild excess and repeated imprisonment, he was elected (1789) to the STATES-GENERAL. With his fiery eloquence, he became the spokesman of the third estate and tried to create a constitutional monarchy that would permit him to become prime minister. As a member of the Constituent Assembly, however, he was thwarted when the Assembly barred its members from the cabinet. Mirabeau then began secret dealings with the king and queen, but the couple did not heed his advice. He died just before his dealings with the court were discovered.

miracle play or **mystery play,** form of medieval drama, developed (10th–16th cent.) by the addition of dialogue and dramatic action to the Roman Catholic liturgy. Originally performed in Latin, miracle plays were later given in the vernacular. Based on the Scriptures and on the lives of the saints, they were given in churchyards and marketplaces on church festival days and lasted from sunrise to sunset. Principal English examples are the York Plays (1430–40), the Towneley or Wakefield Plays (c.1450), the Coventry Plays (1468), and the Chester Plays (1475–1500).

mirage, atmospheric optical illusion in which an observer sees a nonexistent body of water or an image of some object. Examples of mirages are pools of water seen over hot desert sands or hot pavement and, at sea, an inverted image of a ship seen in the sky. These phenomena can be explained by the facts (1) that light rays undergo refraction, i.e., are bent, in passing between media of differing densities, and (2) that the boundary between two such media acts as a mirror for rays of light coming in at certain angles. Mirages can be photographed.

Miranda, Francisco de [mĕrän'dä], 1750–1816, Venezuelan revolutionary. A Spanish army officer, he fought in both the American Revolution and the French Revolutionary Wars, was in the service of Catherine the Great, then joined (1810) the revolution against Spanish rule in VENEZUELA. He commanded rebel forces and served briefly as dictator, but military reverses forced his surrender (1812) and imprisonment. He is known as the Precursor, to distinguish him from Simon BOLÍVAR, who completed the task of liberation.

Miranda, in astronomy, natural satellite of URANUS.

Miranda v. Arizona, case decided in 1966 by the U.S. SUPREME COURT, reversing an Arizona conviction. Miranda had been questioned and had confessed without being told of his right to a lawyer. Chief Justice WARREN ruled that EVIDENCE such as Miranda's confession could not be introduced unless the defendant had, before questioning, been told of his rights through what came to be called "Miranda warnings."

Miró, Joan [mĕrō'], 1893–1983, Spanish surrealist painter. His work is characterized as psychic automatism, an expression of the subconscious in free form. By 1930 he had developed a lyrical style distinguished by the use of brilliant color and the playful juxtaposition of delicate lines with abstract, often amoebic shapes, e.g., *Dog Barking at the Moon* (1926; Philadelphia Mus. of Art). In some of Miró's work there is an undertone of nightmare and horror (see SURREALISM).

mirror, in OPTICS, a reflecting surface that forms an image of an object when light rays coming from that object fall upon it (see REFLECTION). A plane mirror, which has a flat reflecting surface, reflects a beam of light without changing its character. In a convex spherical mirror, the vertex, or midpoint, of the mirror is nearer to the object than the edges, and parallel rays from a light source diverge after reflection. In a concave mirror, the vertex is farther away from the object than the edges, and rays parallel to the principal axis are reflected to a single point, or principal focus. A concave parabolic mirror is the principal element of a reflecting TELESCOPE.

MIRV: see MISSILE, GUIDED.

miscarriage: see ABORTION; PREGNANCY.

misdemeanor, in law, a criminal offense, less grave than a FELONY. By federal and state laws it is usually punishable by fine or by imprisonment for less than one year.

Mishima Yukio, 1925–70, Japanese author; b. Kimitake Hiraoka. His novels are noted for their use of paradox and their exquisitely detailed characterization. They include the tetralogy *The Sea of Fertility* (tr. 1972–74), *The Sound of Waves* (1954), and *The Temple of the Golden Pavilion* (1956). Mishima committed ritual suicide after haranguing Japan's army for its powerlessness under the constitution.

Mishna, collection of interpretations of the legal portions of the TORAH and a codification of traditional Jewish practice. The Mishna and the Gemara, a commentary on the Mishna, constitute the TALMUD. Next to the Scriptures, the Mishna is the basic textbook of Jewish life and thought, covering, e.g., agriculture, Sabbath and

festivals, marriage and divorce, and civil and criminal matters. The final compilation of the Mishna was made under the direction of JUDAH HA-NASI from the work of the Tannaim, a group of sages of the 1st and 2d cent. A.D., including AKIBA BEN JOSEPH. The Mishna has been widely translated and has had a considerable influence beyond the confines of Judaism.

Miskolc [mĭsh'kôlts], city (1990 pop. 196,449), NE Hungary, on the Sajó R. Hungary's second largest city, it is an industrial center producing iron and steel, cement, processed food, and other manufactures. Frequent invasions, e.g., by the Mongols (13th cent.), have marked its history. Landmarks include the Avas Reformed Church (15th cent.).

missile, guided, self-propelled, unmanned space or air vehicle carrying a high-explosive warhead (short-range missiles) or a nuclear warhead (long-range missiles). Its path can be adjusted during flight, either by automatic self-contained controls or by distant human control. Guided missiles are powered either by ROCKET engines or by JET PROPULSION. They were first developed in modern form by the Germans, who in WORLD WAR II employed V-1 and V-2 guided missiles against Great Britain and the Low Countries. Missiles may be aerodynamic, i.e., controlled by aerodynamic surfaces and following a straight-line trajectory to the target, or ballistic, i.e., powered during flight and following a parabolic trajectory. Aerodynamic missiles are of four types. Air-to-air missiles are fired by aircraft at enemy aircraft and are often guided by self-contained controls that detect and target the missile toward heat sources. Air-to-surface missiles, launched by aircraft against ground positions, are generally radio-controlled. Surface-to-air missiles, such as the U.S. Patriot missile, operate against aircraft or other missiles. Surface-to-surface missiles include antitank and naval missiles. Longer-range surface-to-surface missiles, such as the Iraqi Scud, are in fact short-range ballistic missiles. The intermediate-range ballistic missile (IRBM) can reach targets up to 1,500 nautical miles (2,400 km) away. The intercontinental ballistic missile (ICBM), first deployed by the USSR in 1958, and the submarine-launched ballistic missile (SLBM) have ranges of many thousands of miles. A multiple independently targeted reentry vehicle (MIRV) permits one booster to carry several warheads, each guided to a separate target. An antiballistic missile (ABM) is designed to detect and intercept enemy missiles. Space-, air-, sea-, and mobile land-based ABMs are barred by the 1972 ABM treaty. A cruise missile is launched like a missile but uses flipout wings and a turbofan engine to fly like an airplane to its target at altitudes of about 50 ft (15 m). A land-attack cruise missile employs internally stored computerized maps of its route to follow the contour of the terrain, making it very accurate and relatively impervious to defense systems. Cruise missiles can be launched from aircraft, surface ships, submarines, or (banned by a U.S.-Russia treaty) the ground. Guided missiles with nuclear warheads have become the key strategic weapon of modern warfare.

Missionary Ridge: see CHATTANOOGA CAMPAIGN.

missions, name of organizations that extend religious teaching and of efforts to disseminate the Christian religion. CHRISTIANITY was spread through the Roman Empire by missions, and in later centuries it was extended by missionary labors in Ireland, Germany, and Scandinavia. In the 16th cent. missions were formed in the New World, especially by the FRANCISCANS and the Jesuits (see JESUS, SOCIETY OF). In Colonial America, Roger WILLIAMS and John ELIOT did notable work among Native Americans, as did the Moravian Church. Mission activity became intense in Africa and Asia in the 19th and 20th cent. and was greatly furthered by the work of David LIVINGSTONE and Albert SCHWEITZER.

Mississippi, U.S. state in the Deep South; bordered by Alabama (E), the Gulf of Mexico (S), Arkansas and Louisiana, with most of the border formed by the Mississippi R. (W), and Tennessee (N).

Area, 47,716 sq mi (123,584 sq km). *Pop.* (1990) 2,573,216, a 2.1% increase over 1980 pop. *Capital,* Jackson. *Statehood,* Dec. 10, 1817 (20th state). *Highest pt.,* Woodall Mt., 806 ft (246 m); *lowest pt.,* sea level. *Nickname,* Magnolia State. *Motto, Virtute et Armis* [By Valor and Arms]. *State bird,* mockingbird. *State flower,* magnolia. *State tree,* magnolia. *Abbr.,* Miss.; MS.

Land and People. W Mississippi is covered by the Delta, a flat alluvial plain that gives way to hilly land in the northeast, and the Piney Woods, which extend south almost all the way to the Gulf coastal plain. The climate is subtropical in the south and temperate in the north. Mississippi is a heavily rural state, with about 47% of its residents living in urban areas. JACKSON is the largest city, followed by BILOXI and MERIDIAN. In 1990 the African-American population accounted for 35.6% of the total—the highest percentage of any state.

Economy. Only since 1965 has manufacturing surpassed agriculture in terms of revenue. The leading industries produce apparel, processed foods, furniture, transportation equipment, electrical machinery, and lumber products. Cotton, soybeans, catfish, cattle, broiler chickens, rice, and hay are important agricultural products. Oil and natural gas deposits are located under one third of the land, and their extraction is a major industry. Other industries include fishing off the coast and forestry. Despite substantial modernization efforts, Mississippi has the lowest per capita income in the U.S.

Government. The constitution of 1890 provides for a governor serving a four-year term. The legislature consists of a 52-seat senate and 122-seat house, with members of both bodies elected to four-year terms. Mississippi is represented in the U.S. Congress by two senators and five representatives and has seven electoral votes.

History. Hernando DE SOTO's expedition passed (1540–42) through the region, then inhabited by the CHOCTAW, CHICKASAW, and Natchez, but the first permanent European settlement was made (1699) by the French on Biloxi Bay. The area was taken (1779) by the Spanish, and the newly independent U.S. acquired it only after a boundary dispute with West Florida was settled (1795). New settlers arrived via the NATCHEZ TRACE, lured in part by the cotton boom. Mississippi seceded (1861) from the Union, and Jefferson DAVIS, a Mississippian, was president of the CONFEDERACY during the CIVIL WAR. The state was readmitted to the Union in 1870, but it effectively disenfranchised African Americans and instituted (1904) segregationist "Jim Crow" laws. After the disastrous Mississippi R. flood of 1927, the federal government began a huge flood-control program. During the 1960s Mississippi was a center of the CIVIL-RIGHTS movement and attracted national attention when Gov. Ross Barnett tried unsuccessfully (1962) to block the admission of an African-American student to the Univ. of Mississippi. After passage of the Federal Voting Rights Act of 1965, significant numbers of African Americans voted and many African-American state officials have been elected. Largely unable to shift from manufacturing to a service-centered economy in the face of industrial decline, Mississippi has struggled with a troubled economy into the 1990s.

Mississippi, principal river of the U.S. and of North America, flowing generally south c.2,350 mi (3,780 km) from Lake Itasca (alt. 1,463 ft/446 m) in N Minnesota to enter the Gulf of Mexico through a vast, birdsfoot-type delta in Louisiana. It forms, with the MISSOURI R., its chief tributary, the world's third longest (c.3,740 mi/6,020 km) river system. The Mississippi is navigable by ocean-going vessels to Baton Rouge, La., and by barges and towboats through a 9-ft (2.7-m) channel as far as Minneapolis, Minn., with canals circumventing rapids near Rock Island, Ill., and Keokuk, Iowa. There are over 40 dams above St. Louis, Mo., and c.1,600 mi (2,580 km) of levees below Cape Girardeau, Mo., to regulate and restrain the river's flow. Normally, the Mississippi is c.3,500 ft (1,070 m) wide near St. Louis and c.4,500 ft (1,370 m) wide at Cairo, Ill., but it reached a width of 80 mi (129 km) in places during a disastrous flood in 1927 and inundated large areas during the rainy spring of 1973 and rainy summer of 1993. In 1988 drought sent water levels to the lowest ever recorded and halted most river traffic. Seen by DE SOTO in 1541, the river was claimed by France after LA SALLE descended it to reach the Gulf of Mexico in 1682. It was ceded to Spain in 1763 and was regained by France in 1800, before it passed to the U.S. in 1803 as part of the LOUISIANA PURCHASE. Mark TWAIN's *Life on the Mississippi* (1883) describes vividly the end of the river's steamboat era, which began in 1811.

Missouri, one of the midwestern states of the central U.S.; bordered by Illinois, Kentucky, and Tennessee (E), Arkansas (S), Oklahoma, Kansas, and Nebraska (W), and Iowa (N).

Area, 69,686 sq mi (180,487 sq km). *Pop.* (1990) 5,117,073, a 4.1% increase over 1980 pop. *Capital,* Jefferson City. *Statehood,*

Aug. 10, 1821 (24th state). *Highest pt.,* Taum Sauk Mt., 1,772 ft (540 m); *lowest pt.,* St. Francis R., 230 ft (70 m). *Nickname,* Show Me State. *Motto, Salus Populi Suprema Lex Esto* [The Welfare of the People Shall Be the Supreme Law]. *State bird,* bluebird. *State flower,* hawthorn. *State tree,* dogwood. *Abbr.,* Mo.; MO.

Land and People. Two great rivers have shaped the state: the MISSISSIPPI, which forms its eastern border, and the MISSOURI, which flows west to east across the state to join the Mississippi just above St. Louis. Most of the land north of the Missouri consists of plains, while south of the river the elevations increase, especially in the Ozark Plateau. More than 68% of the population lives in urban areas. The largest city is KANSAS CITY, followed by SAINT LOUIS, a great inland port, and SPRINGFIELD. The state's population was 88% white and 11% African American in 1990.

Economy. Missouri is a heavily industrialized state, with transportation (particularly aerospace) equipment, processed foods (especially beer, flour, and beef), electrical and electronic equipment, and chemicals the leading products. The most valuable farm products in the thriving agricultural sector are cattle, hogs, soybeans, dairy foods, corn, wheat, and hay. Missouri has long led the country in the production of lead, and it also extracts barite, lime, zinc, coal, and iron. Tourism is especially important in the OZARKS.

Government. The constitution of 1945 provides for a governor elected to a four-year term. The general assembly consists of a senate whose 34 members serve four-year terms and a house whose 163 members are elected to two-year terms. Missouri is represented in the U.S. Congress by two senators and nine representatives and has 11 electoral votes.

History. When Robert Cavalier, sieur de LA SALLE, claimed the area for France in 1682, it was inhabited by Native American peoples, including the OSAGE and Missouri. In 1803 the land passed to the U.S. as part of the LOUISIANA PURCHASE, and soon St. Louis became the gateway to the West, especially after the advent of steamboat traffic on the Missouri and Mississippi rivers in the 1820s. The question of admitting the Missouri Territory into the Union became a burning national issue because it involved the question of extending slavery; the dispute was ended by the MISSOURI COMPROMISE (1821), which admitted Missouri as a slave state. INDEPENDENCE, St. Joseph, and other cities became the starting points for wagon trains traveling west, and the state's own population grew, especially with the arrival of railroads and, subsequently, of thousands of German immigrants during the 1840s and 50s. Missouri remained loyal to the Union in the CIVIL WAR and was the scene of guerrilla activities, which gave rise to postwar lawlessness on the part of Jesse JAMES and other outlaws. Industry gradually surpassed agriculture in importance, especially after World War II, when Missouri became the country's second largest manufacturer of automobiles (after Michigan). Although faced with high unemployment, the state continued to attract varied industrial and commercial enterprises in the 1980s. In 1993 record rains led to widespread flooding in the state, particularly along the Missouri and Mississippi rivers.

Missouri, longest river of the U.S., flowing c.2,565 mi (4,130 km) from its source in the Rocky Mts. to join the MISSISSIPPI R. 17 mi (27 km) N of St. Louis, Mo., forming the world's third longest (c.3,740 mi/6,020 km) river system. Its principal headwaters are the Jefferson, Madison, and Gallatin rivers, which unite to form the main stream at Three Forks, Mont. The river is navigable for 760 mi (1,223 km) to Sioux City, Iowa, by barges and towboats. Above Sioux City, its fluctuating flow is regulated by seven major dams—Gavins Point, Fort Randall, Big Bend, Oahe, Garrison, Fort Peck, and Canyon Ferry—that are part of the coordinated Missouri River Basin Project authorized by the U.S. Congress in 1944. During the rainy summer of 1993 the lower Missouri reached record levels, flooding many areas. MARQUETTE and JOLLIET passed the mouth of the river in 1673, and VÉRENDRYE explored its upper reaches in 1738. Other early explorers were David Thompson (1797), and Meriwether Lewis and William Clark (see LEWIS AND CLARK EXPEDITION) on their journey (1803–6) to the Pacific Ocean. River traffic, begun when the first steamboat reached Fort Benton in 1819, declined with the loss of freight to the railroads after the Civil War but was revitalized in the early 20th cent. through navigational improvements below Sioux City.

Missouri Compromise, 1820–21, measures passed by the U.S. Congress to end the first crisis concerning the extension of SLAVERY. Maine was admitted as a free state and Missouri as a slave state, and slavery was prohibited from the Louisiana Purchase north of 36°30′. This proviso held until 1854, when the KANSAS-NEBRASKA ACT repealed the Missouri Compromise.

mistletoe, common name for the Loranthaceae, a family of chiefly tropical parasitic herbs and shrubs with leathery leaves and waxy white berries. Mistletoes, aerial hemiparasites with green leaves that carry out PHOTOSYNTHESIS, attach themselves to their hosts by modified roots called haustoria. They are widely associated with folklore and are used as Christmas decorations. The mistletoe commonly sold in the U.S. is *Phoradendron flavescens;* most popular in Europe is the "true" mistletoe (*Viscum album*).

Mistral, Frédéric [mēsträl′], 1830–1914, French Provençal poet. He led the Félibrige movement to promote Provençal as a literary language and was its greatest poet. His best-known work is the verse romance *Mirèio* (1859). He shared the 1904 Nobel Prize in literature with José ECHEGARAY.

Mistral, Gabriela, pseud. of **Lucila Godoy Alcayaga,** 1889–1957, Chilean poet. An educator and diplomat, she was the first Latin American to receive the Nobel Prize in literature (1945). Her lyric works include *Sonnets of Death* (1914), *Desolación* (1922), *Tala* (1938), and *Lagar* (1954).

Mitchell, George J(ohn), 1933–, American politician; b. Waterville, Me. An attorney in government and private practice for most of the 1960s and 1970s, he was serving (1979–80) as a U.S. district judge when he was appointed (1980) U.S. Senator from Maine. In 1988 he succeeded Robert BYRD as Democratic (majority) leader in the Senate.

Mitchell, John Newton, 1913–88, U.S. attorney general (1969–72); b. Detroit. A law partner of Richard M. NIXON, he managed Nixon's 1968 presidential campaign. In March 1972 he became head of the president's reelection committee, but he resigned in June, at the beginning of the WATERGATE AFFAIR. Subsequent investigations led to Mitchell's indictment, trial, and conviction (Jan. 1, 1975) on charges of conspiracy, obstruction of justice, and perjury. He served 19 months in prison and was released in 1979.

Mitchell, Margaret, 1900–49, American novelist; b. Atlanta, Ga. Her one novel, *Gone with the Wind* (1936; Pulitzer), is set in Georgia during the CIVIL WAR and RECONSTRUCTION. It and the film adaptation (1939) were enormously successful.

Mitchell, Maria, 1818–89, American astronomer; b. Nantucket, Mass. The first woman to be elected to the American Academy of Arts and Sciences, she studied sunspots, nebulae, and satellites, and discovered (1847) a comet. After 1865 she was professor of astronomy at Vassar College.

Mitchell, Silas Weir, 1829–1914, American physician and author; b. Philadelphia. A pioneer in applying psychology to medicine, he was noted for his treatment of nervous disorders and for his study of the nervous system. His medical works include *Injuries of Nerves and Their Consequences* (1872) and *Fat and Blood* (1877), which summarized his well-known rest cure. His novels include historical romances and psychological studies.

Mitchell, Wesley Clair, 1874–1948, American economist; b. Rushville, Ill. He held teaching posts at several institutions, including the Univ. of California and Columbia, and helped found the National Bureau of Economic Research. One of the most eminent U.S. economists, he focused much of his research on statistical investigation of the business cycle. His major work is *Business Cycles* (1913; 2d ed. 1927).

Mitchell, William ("Billy"), 1879–1936, American general, commander of the American expeditionary air force in World War I; b. France. He advocated a large, independent air force, but his public criticism of the military for neglecting air power led to his court martial (1925) and resignation in 1926.

mite, small, often microscopic ARACHNID. Mites are often parasites of animals and plants and infest stored foodstuffs. Some burrow into the skin of mammals, causing MANGE and scabies. Chiggers, which are the larvae of harvest mites, transmit the organism that causes scrub typhus. The larger **tick,** which is related to the mite, is usually a parasite of birds and mammals, embedding its entire head under the skin and sucking the host's blood. Ticks transmit many

diseases, including LYME DISEASE and ROCKY MOUNTAIN SPOTTED FEVER.

Mitford, Nancy, 1904–73, English writer. She satirized the aristocracy she was born into in novels like *The Pursuit of Love* (1945) and *Love in a Cold Climate* (1949). Her sister **Jessica Mitford,** 1917–, is a writer best known for her exposé of the funeral business, *The American Way of Death* (1963), and an autobiography, *Daughters and Rebels* (1960).

Mithra, god of ancient Persia and India. In the 5th cent. B.C. he appears as the principal Persian deity, god of light and wisdom. His cult expanded to become a worldwide religion, called **Mithraism.** In the 2d cent. A.D. it was more general in the Roman Empire than Christianity, to which it bore many similarities. Mithraism taught the dualistic struggle between the forces of good and evil and offered hope of immortality through the practice of rites and a system of rigorous ethics. It declined rapidly in the late 3d cent. A.D.

Mithridates VI, c.131–63 B.C., king of ancient PONTUS, called Mithridates the Great. The extension of his empire brought him into war with Rome. In the First Mithridatic War (88–84 B.C.) he conquered (88 B.C.) most of Asia Minor, but in 85 B.C. he was defeated there and in Greece. The Second Mithridatic War (83–81 B.C.) ended in a Roman defeat. In the Third Mithridatic War (76–63 B.C.) LUCULLUS defeated Mithridates, and POMPEY drove the king into the Crimea, where he had himself killed by a slave.

mitosis, process of nuclear division in a living cell by which the hereditary material, or CHROMOSOMES, is exactly replicated, the two parts being distributed to identical daughter nuclei. In mitosis each cell formed receives chromosomes that are alike in composition and equal in number to the chromosomes of the parent cell. Mitotic division occurs in somatic (body) cells; in germ cells (OVUM and SPERM) MEIOSIS (halving of the number of chromosomes) also takes place.

Mitterrand, François Maurice [mētəräN'], 1916–, French political leader, president of France (1981–). He fought in the Resistance during World War II and later served in the national assembly (1946–58) and senate (1959–62). In the 1950s he held several cabinet posts. He first ran for the presidency in 1965, losing to Charles DE GAULLE. In 1971 he joined and became first secretary of the Socialist party and led it to increasing success at the polls. Mitterrand lost the presidential race to Valéry GISCARD D'ESTAING in 1974 but defeated him in 1981, becoming the first Socialist president of the Fifth Republic. In his first term the Socialists nationalized banks and introduced other traditional socialist policies but later reversed those policies and instituted austerity measures when the economy faltered. He won reelection in 1988 and is the longest-serving president in the history of France. Internationally, Mitterrand has sought to strengthen the European Community and pursue an independent foreign policy in the Middle East and Africa.

Mixtec, indigenous people of SW Mexico (see MIDDLE AMERICA, INDIGENOUS PEOPLES OF) who speak a language of the Otomian stock (see NATIVE AMERICAN LANGUAGES). Important from ancient times, the Mixtec seem to have had an advanced culture before the coming of the TOLTEC. They began spreading southward about 900 and by the 14th cent. overshadowed their rivals the ZAPOTEC. Excelling in stonework and metalwork, wood carving, and pottery decoration, the Mixtec strongly influenced other Mexican cultures. They resisted the Spanish in the 16th cent., but were subjugated with the aid of the Zapotec. There are about 300,000 Mixtec-speaking people in Mexico today.

mixture: see COMPOUND.

Miyazawa Kiichi, 1919–, prime minister of Japan (1991–93). Miyazawa served (1942–52) in the finance ministry before his election to parliament in 1953. He held ministerial posts in several Liberal Democratic party (LDP) governments, including minister of foreign affairs (1974–76) and of finance (1986–88). Implicated in a bribery and corruption scandal in 1988, he resigned as finance minister. In 1991 he became prime minister. His failure (1993) to win passage of political reforms led to a split in the LDP and the loss of its parliamentary majority, and he resigned.

mks system: see METRIC SYSTEM.

Mn, chemical symbol of the element MANGANESE.

Mnemosyne: see MUSES.

Mnesicles [nēs'ĭklēz], Greek architect, 5th cent. B.C. He designed the Propylaea, and the ERECHTHEUM is sometimes ascribed to him. Both are on the Acropolis, Athens.

Mo, chemical symbol of the element MOLYBDENUM.

Moab, ancient nation in the uplands E of the Dead Sea, now part of Jordan. The Moabites were close kin to the Hebrews, and the language of the Moabite stone (dating to 850 B.C.) is practically the same as biblical Hebrew. Moab is continually mentioned in the Bible. Its people were later absorbed by the Nabataeans.

Mobile, city (1990 pop. 196,278), seat of Mobile co., SW Ala., at the head of Mobile Bay and the mouth of the Mobile R.; inc. 1814. It is a major port and historically important shipbuilding center, with oil refineries and paper, textile, aluminum, and chemical industries. It was founded in 1710 and was the capital of French Louisiana from 1710 to 1719. Held by Britain and then Spain, it was taken by the U.S. in 1813. The city is noted for its beautiful antebellum houses, and for its annual Mardi Gras (est. early 18th cent.) and Azalea Trail Festival (est. 1929).

mobile, type of moving sculpture developed by Alexander CALDER in 1932 and named by Marcel DUCHAMP. Often constructed of colored metal pieces connected by wires, mobiles have moving parts that are sensitive to a breeze or light touch.

mobile telephone: see CELLULAR TELEPHONE.

Mobutu Sese Seko, 1930–, president of ZAÏRE (1967–); b. Joseph Désiré Mobutu. He became prime minister of the former Belgian Congo in 1966 after staging a coup that toppled the government of Joseph KASAVUBU. In 1967 he established a presidential form of government headed by himself, and in 1971 he changed the Congo's name to Zaïre. As head of a one-party state, he suppressed tribal conflicts and encouraged a sense of nationhood. At the same time he amassed a huge personal fortune, and corruption became widespread in the country. In 1991 continuing economic deterioration and unrest led him to agree to share power with opposition leaders, but he subsequently used the army to thwart change.

mockingbird: see MIMIC THRUSH.

mock orange: see SAXIFRAGE.

Model Parliament: see PARLIAMENT.

modem [*mo*dulator/*dem*odulator], device used to transmit and receive digital data over normally analog communications lines, usually as an audio signal on telephone circuits. A modem attached to a computer performs a DIGITAL-TO-ANALOG CONVERSION of data and transmits them to another modem which performs a analog-to-digital conversion that permits its attached computer to use the data. The rate of data transfer can be increased using data compression. Wireless modems send or receive data as a radio signal. A **fax modem** enables a computer to send and receive transmissions to and from a FACSIMILE MACHINE.

modern architecture, essentially homogeneous architectural style appearing in most Western countries after World War I and continuing to develop through the mid-20th cent. It possesses no appellation more precise than modern, although other labels, e.g., INTERNATIONAL STYLE and functionalism, have also been applied. A conscious attempt to assimilate modern technology is one characteristic. Technical progress in the development of materials was evident in the construction of the CRYSTAL PALACE in 1851. In the ensuing years iron, steel, and glass determined the form of many buildings, but irrelevant ornament persisted. As late as 1889 the EIFFEL TOWER found a public not yet ready to accept pure structure as beautiful. The use of a steel skeleton for a tall building began with the first SKYSCRAPER, by William Jenney, in Chicago (1883). Industrial architecture in Europe was pioneered by Peter BEHRENS, Auguste PERRET, and others. At the end of the 19th cent. a revolution occurred in the buildings and writings of Louis H. SULLIVAN and Frank Lloyd WRIGHT. Wright in the U.S. and the exponents of ART NOUVEAU in Europe introduced the concept of rhythmic flow of interior space, eliminating rigid room divisions. Conversely, the architects of de STIJL returned to more disciplined structural form. By 1920 the interrelation of building type with materials and function was widely accepted. The concept of buildings as volumes enclosed by massive materials had given way to a concentration on space supported or enclosed by light, thin materials. The idea of enclosure was de-emphasized, so that structural elements them-

selves came into focus. Major exponents of this view were LE CORBUSIER and Walter GROPIUS. Abstract painting and sculpture were looked to for new ideas and did much to condition the public to recognize abstract structural beauty, free from past associations. By mid-century, modern architecture and city planning, influenced by new technology and mass production, were dealing with increasingly complex social needs. Important characteristics of modern architectural works are expanses of glass and the use of reinforced concrete. Advances in elevator technology, air conditioning, and electric illumination have all had important effects. The use of an unvarying module, or basic dimensional unit, characteristic of the works of Buckminster FULLER and Moshe Safdie, among others, echoes machine-tool precision. Pioneers of the 1920s were MIES VAN DER ROHE and Gropius. Important contributors to modern design include Marcel BREUER, Richard NEUTRA, and I.M. PEI. Criticism in the 1950s attacking modern architecture's "sterility" and "institutional" anonymity produced a tendency toward individual expression typified by Louis KAHN, E.D. STONE, Philip JOHNSON, and the architects of the "new brutalism" movement in England and the U.S. A dynamic sculptural unity characterizes the work of Le Corbusier and Eero SAARINEN. Other major modern architects include Alvar AALTO, P.L. NERVI, Paolo SOLERI, and Oscar NIEMEYER. In the 1960s, a more critical reaction to modern architecture, first enunciated in the writings of Robert VENTURI, culminated in many forms of architectural POSTMODERNISM, a movement that remained prominent into the early 1990s.

modern art: see ABSTRACT EXPRESSIONISM; BLAUE REITER, DER; BRÜCKE, DIE; CONSTRUCTIVISM; CUBISM; DADA; EIGHT, THE; EXPRESSIONISM; FAUVISM; FUTURISM; IMPRESSIONISM; MINIMALISM; NABIS; NAZARENES; PHOTOREALISM; POSTIMPRESSIONISM; POSTMODERNISM; STIJL, DE; SUPREMATISM; SURREALISM.

modern dance, theatrical dance forms that are distinct from BALLET and from show dancing of the musical comedy or variety stage. Developed in the 20th cent., primarily in the U.S., it resembles modern art and music in being experimental and iconoclastic. It began with the work of Isadora DUNCAN, Loie Fuller, and Ruth ST. DENIS in the early 20th cent. Duncan idealized emotion and emphasized freedom of movement. Fuller sought to imitate and illustrate natural phenomena, creating illusionistic effects with lighting, as did Alwin NIKOLAIS later. St. Denis, improvising on Asian sources, with elaborate costumes, evoked a sense of mystery. With her husband, Ted Shawn, she increased the popularity of modern dance in the U.S. through their influential Denishawn company and schools. The second generation of modern-dance innovators, led by Martha GRAHAM, Doris HUMPHREY, and Charles WEIDMAN, rebelled against the ART NOUVEAU exoticism and commercialism of Denishawn. They launched their own companies, Graham and Humphrey stressing stark, intellectual, dramatic movement, Weidman concentrating on comic satire. These companies dominated modern dance until the late 1940s, when more surreal, abstract forms were developed by a new group of choreographers led by Merce CUNNINGHAM. Paul TAYLOR created works to the sound of heartbeats and telephone signals, and Twyla THARP eliminated sound accompaniment entirely. Yvonne Rainier pioneered the use of nondance movement (acrobatics, marching), a development carried even further by Steve Paxton. Other influential contemporary dancer-choreographers include Meredith Monk, Bill T. Jones, and Trisha Brown. Many choreographers, e.g., Agnes DE MILLE and Alvin AILEY, have also broken down the distinctions between modern dance, ballet, and show dancing.

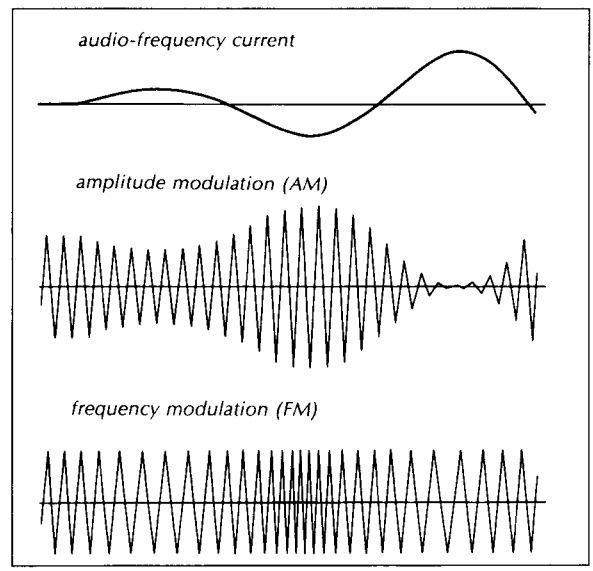
modernism, in religion, movement to reconcile developments of 19th- and 20th-cent. science and philosophy with historical Christianity. It arose from the application of modern critical methods to the study of the Bible and the history of dogma and stressed the humanistic aspects of religion. Its ideas permeated many Protestant churches and called forth a reaction in FUNDAMENTALISM. A similar movement in Roman Catholicism was condemned (1907) as heretical.

modernismo, movement in Spanish literature, c.1890–1920. It arose in Latin America, derived in part from the French SYMBOLISTS and PARNASSIANS. *Azul* blue (1888), by the Nicaraguan poet Rubén DARÍO, typified the new aesthetic, with its elegant form, exotic images, and subtle word music. Other major Latin American *modernistas* were José Santos Chocano, Herrera y Reissig, LUGONES, Amado Nervo, José Enrique Rodó, and SILVA. *Modernismo* spread to Spain, influencing JIMÉNEZ, UNAMUNO, and VALLE INCLÁN. After World War I, a new generation of writers rejected the mannerism and hollow elegance of *modernismo*.

Modesto, city (1990 pop. 164,730), seat of Stanislaus co., central Calif., near the northern end of the SAN JOAQUIN valley; inc. 1884. One of the nation's leading agricultural cities, it has huge facilities for food processing and winemaking.

Modigliani, Amedeo [mōdēlyä'nē], 1884–1920, Italian painter. He lived in Paris after 1906. His first work was influenced by CUBISM and AFRICAN ART, but he soon developed a unique style characterized by an elongation of form, a purity of line, and a languorous atmosphere reminiscent of Florentine MANNERISM. His short life was one of poverty and disease. Only after his death was his work prized.

Modoc, indigenous people of Northwest Coast culture (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with a Sahaptin-Chinook language of the Penutian stock (see NATIVE AMERICAN LANGUAGES). They lived in SW Oregon and N California, clashing violently with the early white settlers. They were moved to a reservation in 1864, but their chief, Captain Jack, led a rebel group back to California, precipitating the Modoc War (1872–73), which ultimately divided the tribe. The Modoc now live mostly in Oregon with other groups.



Modulation

modulation, in communications, process in which some characteristic of a WAVE (the carrier wave) is made to vary in accordance with an information-bearing signal wave (the modulating wave); demodulation is the process by which the original signal is recovered from the wave produced by modulation. In modulation the carrier wave is generated or processed so that its amplitude, frequency, or some other property varies. Amplitude modulation (AM), widely used in radio, is constant in frequency and varies the intensity, or amplitude, of the carrier wave in accordance with the modulating signal. Frequency modulation (FM) is constant in amplitude and varies the frequency of the carrier wave in such a way that the change in frequency at any instant is proportional to another time-varying signal. The principal application of FM is also in radio, where it offers increased noise immunity and greater sound fidelity at the expense of greatly increased bandwidth. In pulse modulation the carrier wave is a series of pulses that are all of the same amplitude and width and are all equally spaced. By controlling one of these three variables, a modulating wave may impress its information on the pulses. In pulse code modulation (PCM) it is the presence or absence of particular pulses in the carrier stream that constitutes the modulation.

modulation, in music, shift in the KEY center of a composition, a

means of achieving variety in use since the late 15th cent. In modulating from one key to another, a chord common to both keys is used as a pivot chord. If no chord is common to the two keys, the passage may move through several keys before the desired modulation is effected.

Moerae: see FATES.

Mofaddaliyat: see MUFADDALIYAT.

Mogul or **Mughal,** Muslim empire of India (1526–1857). It was founded by BABUR and flourished until the 18th cent., when the SIKHS and MAHRATTAS triumphed over it. The British kept a puppet Mogul emperor on the throne until 1857. The flowering of Muslim art and architecture was the most lasting achievement of the Moguls.

Mogul art and architecture. A characteristic Indo-Islamic art style, evolved from PERSIAN ART AND ARCHITECTURE, evolved in India under the Mogul emperors. The school of Mogul painting began in 1549 when Emperor Humayun invited two Persian painters to direct the illustration of the *Amir Hamza,* a fantastic narrative of which some 1,400 large paintings were executed on cloth. The first Mogul monument was the mausoleum to Humayun erected by AKBAR (1556–1605), who went on to build an entire city, FATEHPUR SIKRI, making use of the low arches and bulbous DOMES that characterize the Mogul style. Modeling and perspective were also adapted from Western painting. Emperor Jahangir (1605–27) encouraged portraiture and scientific studies of birds, flowers, and animals, which were collected in albums. SHAH JAHAN (1628–58) perfected Mogul architecture and erected at Agra the tomb of his favorite wife, the TAJ MAHAL, with its symmetrical Persian plan. This period saw the amalgamation of influences into a true Mogul style. Portraiture was most highly developed and ink drawings were of high quality at the court of Shah Jahan. Under the puritanical Emperor AURANGZEB (1658–1710) the decline of the arts began, although the ornate Pearl Mosque (1662) at Delhi is worth mention. During his reign the Mogul academy was dispersed, and the artists joined Rajput courts.

mohair: see FIBER.

Mohawk: see IROQUOIS CONFEDERACY.

Mohegans, indigenous people of the Eastern Woodlands (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). Sometimes called Mohicans, they were a branch of the MAHICANS, occupying SW Connecticut. United with the PEQUOT in the early 1630s, they became a distinct tribe under UNCAS, who later reunited both groups into a powerful force that had British support. Sale of their land to the whites led to decline. They are known through J.F. COOPER's *The Last of the Mohicans.* In 1993 there were several hundred Mohegans in SE Connecticut.

Mohicans: see MAHICANS; MOHEGANS.

Moholy-Nagy, László [mô'hôlē-nŏ'dyə], 1895–1946, Hungarian painter, designer, and experimental photographer. A founder of CONSTRUCTIVISM, and a professor at the BAUHAUS (1923–28), he directed the Bauhaus School of Design, Chicago, until 1938, and then opened and headed the Chicago Institute of Design. His teaching influenced American commercial and industrial design, and he wrote *The New Vision* (tr. 1928) and *Vision in Motion* (1947).

Mohorovičić discontinuity or **Moho,** boundary layer between the crust and the mantle of the EARTH. It is marked by a sharp alteration in the velocity of earthquakes passing through that region.

Moi, Daniel arap, 1924–, president of Kenya (1978–). He was vice president (1967–78) under Jomo KENYATTA and succeeded to the presidency in 1978. In 1982 he made Kenya a one-party state, and his government subsequently became increasingly dictatorial and corrupt. Internal opposition and pressure from Kenya's foreign-aid donors led Moi to end one-party rule in 1991. He was reelected in 1992 in a multiparty election widely regarded as flawed.

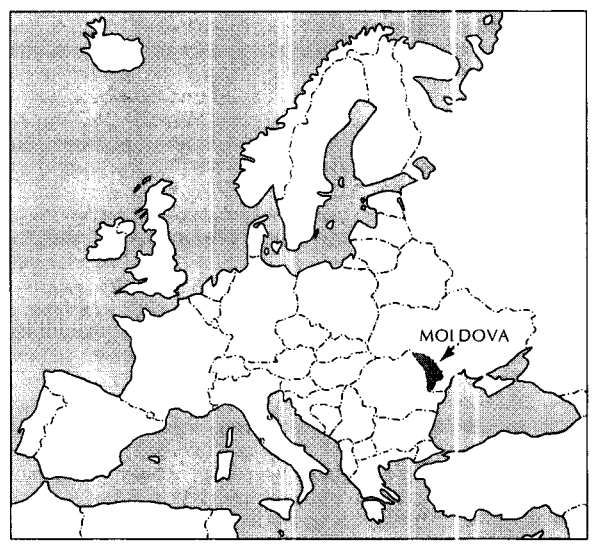
Moirai: see FATES.

Mojave Desert or **Mohave Desert,** arid area, SE California, part of the Sonoran section of the Basin and Range physiographic division of the western U.S. It is warm throughout the year, but with marked diurnal temperature changes, and receives an average annual rainfall of 5 in. (12.7 cm), mostly in winter. **Joshua Tree National Monument** preserves the region's unique ecosystem.

molasses: see SUCROSE.

mold, multicellular FUNGUS typified by a body composed of a network of cottony filaments. The colors of molds are due to spores borne on the filaments. Most molds are SAPROPHYTES. Some species (e.g., *Penicillium*) are used in making cheese and ANTIBIOTICS. Some organisms traditionally thought to be mold (e.g., SLIME MOLD) are now considered protists.

Moldavia, historic province (c.14,700 sq mi/38,100 sq km), E Romania, separated in the east from MOLDOVA by the Prut R. and in the west from Transylvania by the Carpathian Mts. Suceava and IAŞI, its historic capitals, and Galaţi, its port on the Danube R., are its chief cities. Moldavia is a fertile plain on which grains, fruits, and other crops are grown. Lumbering and oil-drilling are the major industries. Part of the Roman province of Dacia, the area became (14th cent.) a principality under native rulers, notably Stephen the Great (r.1457–1504). It came under Turkish suzerainty in the 16th cent. and later lost Bukovina (1775) to Austria and Bessarabia (1812) to Russia. In 1856 Moldavia and WALACHIA became independent under nominal Turkish suzerainty. The accession (1859) of Alexander John CUZA as prince of both areas began the history of modern ROMANIA.



Moldova or **Moldavia,** officially Republic of Moldova, republic (1992 est. pop. 4,458,000), c.13,000 sq mi (33,670 sq km), E central Europe, formerly a constituent republic of the USSR. It borders on Romania (W) and Ukraine (E, N, and S). The capital is CHIŞINĂU. A hilly plain, Moldova produces beef and dairy cattle, honey, and such crops as grains and fruits. Major industries are food and tobacco processing, winemaking, metallurgy, and the manufacture of textiles and chemicals. About 65% of the population are Romanian-speaking Moldovans; Ukrainians and Russians make up more than a quarter of the people, and there are several smaller minorities, including the Turkish-speaking Gagauz in the south. Orthodox Christianity is the predominant religion. The official language is Moldovan (Romanian).

History. An independent principality in the 14th cent., the region fell to the Ottoman Turks in the 16th cent. Some portions passed to Russia between 1791 and 1812. Moldova was first established (1924) as the Moldavian Autonomous Soviet Socialist Republic within Ukraine. In 1940 the USSR forcibly annexed Bessarabia from Romania (which had seized the region from Russia in 1918), and it and ethnically non-Ukrainian parts of the Moldavian ASSR became the Moldavian SSR, a constituent republic of the Soviet Union. In 1991, following the failed coup against Gorbachev, the republic declared itself independent as Moldova. It joined the COMMONWEALTH OF INDEPENDENT STATES (CIS), but in 1993 the parliament failed to ratify the CIS treaty. The largely Ukrainian and Russian slice of E Moldova between the Dniester and Ukraine sought

autonomy as the "Trans-Dniester Republic," and fighting erupted between Moldovan and separatist forces in 1992. A truce left the separatists in control of the area. The Gagauz have also sought autonomy.

mole, any of the small, burrowing, insectivorous MAMMALS of the family Talpidae of the Northern Hemisphere. About 6 in. (15.2 cm) long, moles have pointed muzzles and powerful, clawed front feet for tunneling. Their eyes are covered with skin or buried in fur and they have no external ears, but their senses of hearing, smell, and touch are acute. They eat half their weight daily in worms, insects, and small animals. Moles are trapped as pests and for their fur.

mole, in chemistry, a quantity of particles of any type equal to Avogadro's number (6.02252×10^{23}). One gram-atomic weight (or one gram-molecular weight)—the amount of an atomic (or molecular) substance whose weight in grams is numerically equal to the ATOMIC WEIGHT (or MOLECULAR WEIGHT) of that substance—contains exactly one mole of atoms (or molecules). For example, one mole, or 12.011 grams, of carbon contains 6.02252×10^{23} carbon atoms, and one mole, or 180.16 grams, of glucose ($C_6H_{12}O_6$) contains the same number of glucose molecules.

Molech [mō'lĕk] or **Moloch** [mō'lŏk], Canaanite god of fire to whom children were offered in sacrifice. He is also known as an Assyrian god. His worship was contrary to Hebrew law, and the prophets strongly condemned it.

molecular biology, scientific study of the molecular basis of life processes, including cellular respiration, excretion, and reproduction. One focus of molecular biology is the study of genetic material (DNA, RNA, and the nucleotides of which they are made). GENETIC ENGINEERING has used the insights of molecular biology to manipulate plant and animal genes.

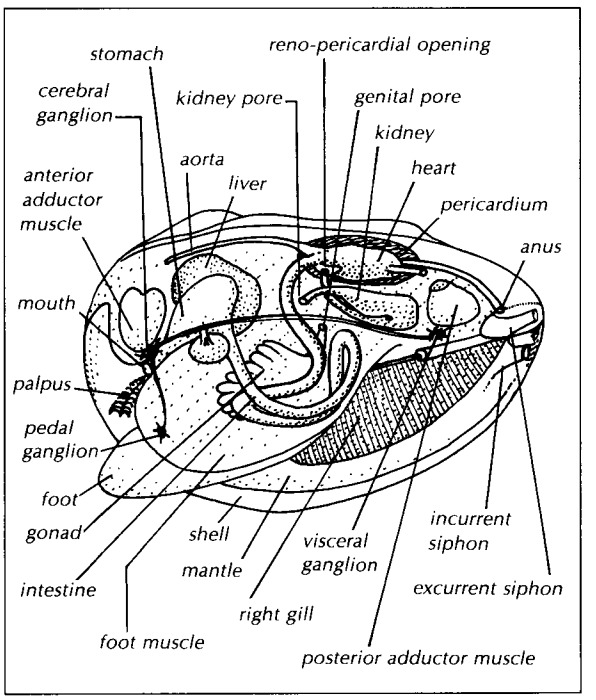
molecular modeling, the computer simulation, by various means, of chemical structures or processes. Special computer-graphics programs can display three-dimensional images of molecular structures and chemical processes, showing the distances and angles of chemical bonds and the modifications that result when atoms or groups of atoms are introduced or substituted. In computer-assisted organic synthesis, the molecular structure of a compound is analyzed to discover how it might be synthesized; special databases can be searched for all occurrences of a particular molecular substructure and for ways to achieve a particular molecular transformation. Calculation-based modeling uses theoretical chemistry and complex mathematical equations to optimize chemical reactions by predicting such things as the energy required or released by reaction between two molecules. Molecular modeling has altered the way research is conducted. When results can be predicted before experiments are performed, experiments that have the highest probability of success can be chosen, potentially reducing the cost of research.

molecular weight, weight of a MOLECULE of a substance expressed in atomic mass units (see ATOMIC WEIGHT). The molecular weight is the sum of the atomic weights of the atoms making up the molecule.

molecule, smallest particle of a COMPOUND that has all the chemical properties of that compound. Molecules are made up of two or more ATOMS, either of the same ELEMENT or of two or more different elements. Ionic compounds, such as common salt, are made up not of molecules but of ions arranged in a crystalline structure (see CRYSTAL). Unlike ions, molecules carry no electrical charge. Molecules differ in size and MOLECULAR WEIGHT as well as in structure (see ISOMER).

Molière, Jean Baptiste Poquelin [môlyĕr'], 1622–73, French playwright and actor, the creator of high French COMEDY; b. Jean Baptiste Poquelin. The son of a merchant, Molière early joined the Béjart troupe of actors. After touring the provinces for 13 years, the company, now headed by Molière, returned to Paris under the patronage of Louis XIV. It performed with continuous success at the Palais Royal and was the forerunner of the Comédie Française. At once actor, director, stage manager, and writer, Molière produced farces, comedies, masques, and ballets for the entertainment of the court. Best known are the comedies of character that ridicule a vice or a type of excess by caricaturing a person who incarnates it. Among these satires are *Tartuffe* (1664)—the religious hypocrite; *Le Misanthrope* (1666)—the antisocial man; *The Miser* (1668); *The Would-be Gentleman* (1670)—the parvenu; *The Learned Women* (1672)—affected intellectuals; *The Imaginary Invalid* (1673)—the hypochondriac. Molière's genius is equally apparent in his broad farces: *The Doctor in Spite of Himself* (1666), *George Dandin* (1668), and *Scapin, the Trickster* (1671). Other works include the poetic *Amphitryon* (1668), after PLAUTUS, and *The Forced Marriage* (1664).

mollusk, animal in the phylum Mollusca, the second largest invertebrate phylum. Mostly aquatic, mollusks have usually soft, unsegmented bodies enclosed in a shell; in some forms the shell is internal, and in a few it is absent. An organ called the mantle secretes the substance that forms the shell. A muscular foot under the body is used for locomotion. Certain mollusks, such as CLAMS, OYSTERS, and SCALLOPS, are important food sources, and mollusk shells are highly valued by collectors. Mollusks include GASTROPODS, or univalves, BIVALVES, CEPHALOPODS (OCTOPUSES and SQUIDS), and CHITONS.



Mollusk: Internal anatomy of a clam, a mollusk of the class Pelecypoda

Molly Maguires, secret organization of Irish-Americans in the coal districts of Scranton, Pa. (c.1865–1875). Organized to combat oppressive mining conditions, the Mollies often resorted to murdering or intimidating the owner-controlled police. They called a strike in 1875, but the organization was finally broken by Pinkerton detectives hired by management. Twenty Molly Maguires were hanged.

Molnár, Ferenc [môl'när], 1878–1952, Hungarian dramatist and novelist. His best-known plays are *Liliom* (1909), made into the musical *Carousel; The Guardsman* (1910); and *The Swan* (1920). His novels include *The Paul Street Boys* (1907).

Moloch: see MOLECH.

Molokai [mō'lōkī'], island (1985 est. pop. 7,000), 261 sq mi (676 sq km), Hawaii. Molokai is generally mountainous; Mt. Kamakou (4,970 ft/1,515 m) is the highest peak. There are many cattle ranches and pineapple plantations. A leper colony (est. 1860) is on the N coast.

Molotov, Vyacheslav Mikhailovich [mô'lətəf], 1890–1986, Soviet leader. Rising rapidly through the Communist party, he became premier of the USSR in 1930. In 1941 STALIN assumed the post and Molotov became vice premier. As commissar of foreign affairs (a title later changed to foreign minister) he negotiated the 1939

Russo-German nonaggression pact. After the 1941 German invasion he worked to strengthen ties with the West, later sharing in the founding of the UN. In 1949 Vishinsky became foreign minister; Molotov remained vice premier. After Stalin's death he was again foreign minister (1953–56). Expelled from the central committee of the party for opposing KHRUSHCHEV in 1957, he was expelled from the party in 1964 and later reinstated into it in 1984.

Moltke, Helmuth Karl Bernard, Graf von, 1800–91, Prussian field marshal. Moltke was made chief of the general staff in 1858 and molded the Prussian army into a formidable war machine. His strategy was responsible for the Prussian triumphs in the Danish War (1864), the AUSTRO-PRUSSIAN WAR (1866), and the FRANCO-PRUSSIAN WAR (1870–71). He was named count (Graf) after the Prussian victory at Metz (1870).

Moluccas or **Spice Islands,** island group and province (1990 pop. 1,856,075), c.32,300 sq mi (83,660 sq km), E Indonesia, between Celebes and New Guinea. The capital is Ambon. Of volcanic origin, the Moluccas are mountainous, fertile, and humid. They are the original home of nutmeg and cloves; other spices and copra are produced. Explored by MAGELLAN (1511–12), the islands were taken by the Dutch, who secured a monopoly in the clove trade, in the 17th cent.

molybdenum (Mo), metallic element, recognized as a distinct element by Karl SCHEELE in 1778. Hard, malleable, ductile, silver-white, and high-melting, it is used in X-ray and electronic tubes, electric furnaces, and certain rocket and missile parts. It is a hardening agent in STEEL alloys. Molybdenum disulfide is used as a lubricant in spacecraft and automobiles. See ELEMENT (table); PERIODIC TABLE.

Mombasa, city (1990 est. pop. 537,000), SE Kenya, on the Indian Ocean. It is Kenya's chief port and a major commercial and industrial center. Manufactures include processed food, refined oil, cement, and glass. Most of the city is on an island connected with the mainland by a causeway. From the 8th to 16th cent. Mombasa was a center of Arab trade in ivory and slaves. Later held by the Portuguese, the Arabs, and Zanzibar, the city passed (1887) to the British, who made it the capital of their East Africa protectorate. It is the ocean terminus of the railway to Uganda.

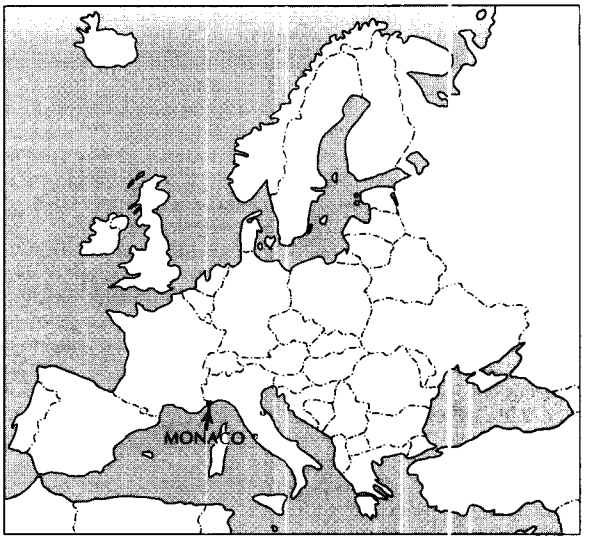
momentum, in mechanics, the quantity of MOTION of a body. The linear momentum of a body is the product of its mass and velocity. The angular momentum of a body rotating about a point is equal to the product of its mass, its angular velocity, and the square of the distance from the axis of rotation. Both linear and angular momentum of a body or system of bodies are conserved (see CONSERVATION LAWS, in physics) if no external force acts on it or them.

Mommsen, Theodor [môm'sən], 1817–1903, German historian. His *History of Rome* (1854–56, 1885) is an unmatched recreation of Roman society and culture based on his study of ancient coins, inscriptions, and literature. It is his greatest work, although his liberal politics prejudiced his view of the ancient world. He won the 1902 Nobel Prize in literature.

Monaco, Lorenzo: see LORENZO MONACO.

Monaco, officially Principality of Monaco, independent principality (1990 pop. 29,876), c.370 acres (150 hectares), on the Mediterranean Sea, an enclave in SE France, near the Italian border. Monaco-Ville is the capital. Its beautiful location, natural harbor, mild climate, and world-famous gambling casino at Monte Carlo make Monaco a leading tourist resort. Shipping; pharmaceutical, precision instrument, and perfume manufacturing; and food processing also contribute to the economy. Monaco has no income or corporation taxes; disagreement with the French government in the 1960s led to the severe curtailment of the use of Monaco as a tax haven by French citizens. About 50% of the population is French; 16% are Monegasque, and a similar number are Italian. French is the official language, but English, Italian, and Monegasque are also spoken. The vast majority of the people are Roman Catholic. Under the 1962 constitution Monaco is governed by the ruling prince (currently RAINIER III), assisted by a minister of state, a cabinet, and an elected national council.

History. Monaco was ruled by the Genovese Grimaldi family from the 13th cent. In 1731 the French Goyon-Matignon family succeeded to the principality by marriage and assumed the name Grimaldi. Monaco passed under the protection of Spain (1542),



France (1641), and Sardinia (1815), returning to French protection in 1861. Until Monaco's first constitution in 1911, the prince was an absolute ruler. A treaty of 1918 provides that succession to the throne must be approved by the French government.

monarchy, form of government in which sovereignty is vested in a single person whose right to rule is generally hereditary and lifelong. In ancient societies divine descent of the monarch was often claimed. Medieval Christian monarchs were considered the appointed agents of divine will and as such were crowned by the church; their power, however, was often dependent on the nobles. Later monarchs, e.g., HENRY VIII of England and LOUIS XIV of France, became increasingly absolute and developed (16th–17th cent.) the theory of **divine right,** which claimed that the monarch was responsible not to the governed but to God alone. The GLORIOUS REVOLUTION (1688) in England and the FRENCH REVOLUTION weakened the European monarchies, and while monarchs remained symbols of national unity, real power gradually passed to constitutional assemblies, as in Great Britain and Sweden. Saudi Arabia is among the few remaining functional monarchies.

monasticism, organized life in common in a retreat from worldly life, for religious purposes. Men who belong to such communities are monks and their houses are monasteries; communities of women are commonly called convents, and their inhabitants are nuns. Vows of poverty, chastity, and obedience are typical of monastic life, which is known to most great religions—Buddhism, Jainism, Islam, and Christianity. In Christianity monasticism arose from the movement toward the extreme asceticism of a hermit's life. In the Orthodox Eastern Church monks still lead a hermitlike life, but live in common, usually following the rules prescribed by St. Basil the Great. Western monasticism was shaped by St. BENEDICT. The Benedictine abbeys under his rule preserved Roman civilization and became centers of learning in the Middle Ages. There are many Roman Catholic monastic orders, including the FRANCISCANS, the DOMINICANS, and the CARMELITES. Some orders are entirely secluded (enclosed), but most are devoted to teaching, charity, or missionary work. Generally Protestantism has not adopted monasticism.

monazite, phosphate mineral [$(Ce,La,Y,Th)PO_4$], found in the form of sand in the U.S., Madagascar, Brazil, India, Sri Lanka, and Australia. Monazite is an important source of CERIUM, THORIUM, and other RARE-EARTH METALS.

Monck, Charles Stanley, 4th **Viscount,** 1819–94, 1st governor-general of the Dominion of CANADA (1867–68). As governor-general of British North America (1861–67) he worked for confederation and formation (1867) of the dominion.

Monck or **Monk, George,** 1st **duke of Albemarle,** 1608–70, English soldier and politician. Under Oliver CROMWELL, he served in Scotland and in the first DUTCH WAR. In 1659, when the Protectorate of Richard Cromwell fell, Monck marched on London, called for a

new Parliament, and declared openly for the RESTORATION of CHARLES II. Charles later heaped honors upon him. Monck also served in the Second Dutch war.

Moncton, city (1991 pop. 57,010), SE New Brunswick, E Canada, on a great bend of the Petitcodiac R. It is a major rail center for the east, with manufactures of textiles and wood and metal products. The city is named for the British general Robert Monckton (the *k* was dropped), whose capture of nearby Fort Beauséjour in 1755 ended French rule of ACADIA. Unusual features of the city are the twice-daily tidal bore that rushes up the Petitcodiac from the Bay of FUNDY and Magnetic Hill, an optical illusion.

Mondale, Walter F(rederick) "Fritz," 1928–, vice president of the U.S. (1977–81); b. Ceylon, Minn. A liberal Democrat, he was a protégé of Hubert HUMPHREY, succeeding him as U.S. senator from Minnesota (1964–77). In 1976 he was chosen by Jimmy CARTER as his running mate and was elected vice president. Carter and Mondale ran for reelection in 1980 but lost to Republicans Ronald REAGAN and George BUSH. Mondale won the 1984 Democratic presidential nomination and became the first major-party candidate to choose a woman, Geraldine FERRARO, as a running mate, but Reagan defeated him in the general election. In 1993 he was appointed U.S. ambassador to Japan.

Monday: see WEEK.

Mondrian, Piet [môn'drēän], 1872–1944, Dutch painter. Influenced by CUBISM, he developed a geometric, nonobjective style that he called neoplasticism. Cofounder of the STIJL group and the magazine *De Stijl,* he published (1920) a book on his theories called *Le Neo-Plasticisme* (French) or *Neue Gestaltung* (German). His theories influenced the BAUHAUS and MODERN ARCHITECTURE. Typical of his work are compositions using only vertical and horizontal lines at 90° angles in primary colors and sometimes black or grays against a white background.

moneran, member of the taxonomic kingdom Monera, which consists of organisms that lack cell nuclei, such as BACTERIA and BLUE-GREEN ALGAE.

Monet, Claude [mônā'], 1840–1926, French landscape painter. A founder of IMPRESSIONISM, he is considered one of the foremost figures in the history of landscape painting. He always worked outside, learning from the landscape itself. Typical of his early period is *Terrace at Le Havre* (1866; Metropolitan Mus.). He later devoted himself to painting the changes in light and atmosphere caused by changes in the hour and season, using his own observation and the laws of optics. He eliminated black and gray from his palette, breaking down light into its color components as a prism does, and repeatedly painted such subjects as haystacks, Rouen Cathedral, and the great lyrical series of water lilies (1899, 1904–25) in his own garden at Giverny (one version, c.1920, Mus. Mod. Art, N.Y.C.).

monetarism, economic theory that monetary policy, or control of the money supply, is the primary if not sole determinant of a nation's economy. Monetarists believe that management of the money supply to produce credit ease or restraint is the chief factor influencing inflation or deflation, recession or growth; they dismiss fiscal policy (government spending and taxation) as ineffective in regulating economic performance. Milton FRIEDMAN has been the leading modern spokesman for monetarism.

monetary system, international: see INTERNATIONAL MONETARY SYSTEM.

money, abstract unit of account in terms of which the value of goods, services, and obligations can be measured. By extension, the term may designate anything that is generally accepted as a means of payment. Almost all economic activity is concerned with the making and spending of money incomes. Historically, a great variety of objects have served as money, among them stones, shells, ivory, wampum beads, tobacco, furs, and dried fish, but from the earliest times precious metals have been favored because of ease of handling, durability, divisibility, and high intrinsic value. Money does not, however, depend on its value as a commodity. Paper currency, first issued about 300 years ago, was usually backed by some standard commodity of intrinsic value into which it could be freely converted on demand. By contrast, fiat money is inconvertible money made legal tender by the decree of the government. The world's first durable plastic currency was introduced by Australia in a special issue in 1988 and in a regular issue in 1992. Plastic bills are more resistant to counterfeiting than paper. The U.S. monetary system was based on BIMETALLISM during most of the 19th cent., but a full gold standard was in effect in the early 20th cent. It provided for free coinage of gold and full convertibility of currency into gold coin. The Gold Reserve Act of 1934 and later measures reduced the U.S. dollar's dependence on gold, and in 1971 the U.S. abandoned gold convertibility altogether. For years international payments were settled by CENTRAL BANK gold movements, but a new system was adopted in the 1970s (see INTERNATIONAL MONETARY SYSTEM). Most U.S. currency in circulation today consists of Federal Reserve notes, but currency and coin are less widely used as a means of payment than checks and electronic transfers, and since the mid-1980s DEBIT CARDS have become increasingly common. In the U.S. the money supply, or total amount of money in the economy, is measured in different ways: M1 includes cash plus checking-account deposits; the broader measures, M2 and M3, add MONEY-MARKET FUNDS, savings, time deposits, and other items. The money supply, a key economic barometer, is influenced by the actions of the FEDERAL RESERVE SYSTEM.

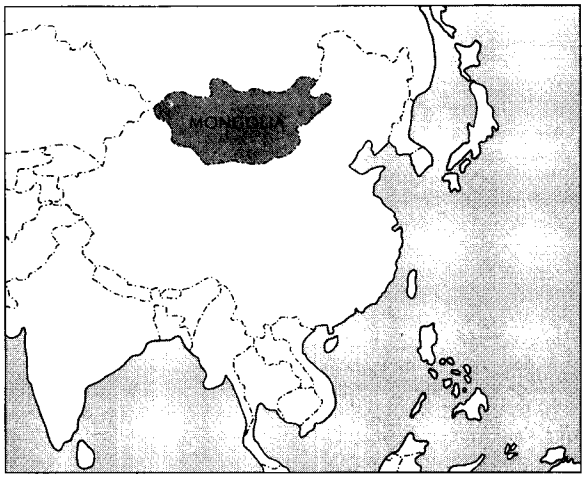
money-market fund, type of MUTUAL FUND that invests in high-yielding, short-term money-market instruments, such as U.S. government securities, COMMERCIAL PAPER, and certificates of deposit. Returns of money-market funds usually parallel the movement of short-term interest rates. Some funds buy only U.S. government securities, such as Treasury bills, while general-purpose funds invest in various types of short-term paper. They became enormously popular with investors in the early 1980s because of their high yields, relative safety, and high liquidity. Much of the money-market growth came at the expense of banks and thrift institutions. With the drop in interest rates in the late 1980s, many investors moved from money-market funds to stock mutual funds and other investments.

money supply: see MONEY.

Monge, Gaspard, comte de Péluse [môNzh], 1746–1818, French mathematician, physicist, and public official; a founder of the École polytechnique. He laid the foundations of descriptive geometry, a field essential to mechanical drawing and architectural drawing, and made important contributions to differential geometry.

Mongolia, Asian region (c.906,000 sq mi/2,346,540 sq km), bordered by Chinese territory on three sides and by Siberian Russia (N). It comprises the Republic of MONGOLIA (Outer Mongolia) and the INNER MONGOLIAN AUTONOMOUS REGION of China. A region of desert and of steppe plateau from 3,000 to 5,000 ft (910–1,510 m) high, it has a cold, dry climate and is sparsely populated. The GOBI desert is in the central section. Mongolia has traditionally been a land of pastoral nomadism; livestock raising and the processing of animal products are the main industries. Irrigation has made some cultivation possible, and there is some mining and oil drilling. In history, great hordes of horsemen repeatedly swept down from Mongolia into N China. JENGHIZ KHAN united (c.1205) Mongolia and led the MONGOLS in creating one of the greatest empires of all time. China extended its rule over the entire region by the late 17th cent., but later vied with Russia for control. Outer Mongolia broke away from China in 1911 but was later reoccupied; with the help of the Red Army, the Chinese were ousted in 1921 and the Mongolian People's Republic (renamed the Republic of Mongolia in 1991) was founded. Inner Mongolia remained under Chinese control.

Mongolia, officially State of Mongolia, republic (1992 est. pop. 2,306,000), 604,247 sq mi (1,565,000 sq km), N central Asia; also called Outer Mongolia. Bordered by Russia (N) and China (S), it occupies more than half of the region historically known as MONGOLIA. The capital is ULAN BATOR. The average elevation exceeds 5,100 ft (1,554 m); mountain ranges and high plateaus cover most of the northwest and the central south, and the GOBI desert lies in the south and east. Wide seasonal variations in temperature, rugged terrain, and an arid climate limit agriculture; nomadic year-round grazing of sheep, goats, cattle, horses, yaks, and camels has been the major occupation for centuries. A small industrial sector is based primarily on livestock processing and the manufacture of textiles and consumer goods. Some timber is cut in the north, and



coal, copper, molybdenum, tin, tungsten, and gold are mined and processed. The population is composed primarily of Khalkha Mongols, who speak Khalkha Mongolian; there are also minorities of Oirat Mongols, Kazakhs, Chinese, and Russians. Lamaist Buddhism, discouraged by the former Communist government, has undergone a revival.

History. Mongolia's early history is that of the MONGOLS. It was under Chinese suzerainty from 1691 until the collapse of the Ch'ing dynasty in 1911, when a group of Mongol princes proclaimed an autonomous republic under Jebtsun Damba Khutukhtu (the Living Buddha of Urga). The new state was reoccupied by the Chinese in 1919, taken by the White Russians in 1921, and occupied the same year by Mongolian Communists and the Red Army. Mongolia was proclaimed an independent state, and remained a monarchy until 1924, when the Soviet-dominated Mongolian People's Republic was established. Rural collectivization and the persecution of Lama priests led to a mass exodus (1932) of people with their livestock into China's Inner Mongolia. For many years, Mongolia sided with the USSR in its dispute with China, but it later signed boundary (1983) and consular (1986) agreements with China. In 1990 a reformist Communist government, headed by Punsalmaagiyn Ochirbat, came to power. Increased political, economic, and religious freedom resulted, and many abandoned monasteries were reoccupied by Lamaist monks. The country was renamed the Republic of Mongolia in 1991. In 1992 Mongolia opened its first stock exchange and adopted a new democratic constitution. Ochirbat, running as a noncommunist, won Mongolia's first free presidential election in 1993.

Mongolian languages, group of languages forming a subdivision of the Altaic subfamily of the URALIC AND ALTAIC family of languages. See LANGUAGE (table).

Mongoloid: see RACE.

Mongols, Asian people, numbering nearly 3 million, who live in the Republic of Mongolia (formerly Outer Mongolia), Inner Mongolia (part of China), and Russia. A nomadic pastoral people, they merged their traditional shamanism with Buddhism in the 16th cent., creating Lamaism (see TIBETAN BUDDHISM). Early in the 13th cent. JENGHIZ KHAN united the feuding Mongol tribes into a powerful nation. From their capital at KARAKORUM the Mongols swept into Europe and China, by 1260 ruling a huge empire: the Great Khanate (see KUBLAI KHAN), comprising all of China; the Jagatai khanate, in Turkistan; the Kipchak khanate, in Russia (see GOLDEN HORDE, EMPIRE OF THE); and a khanate in Persia. The Mongol hordes with prominent Turkic elements came to be called TATARS. TIMUR, who founded a new empire in the 14th cent., claimed descent from Jenghiz Khan, as did BABUR, founder of the MOGUL empire. After their expulsion from China in 1382, the Mongols declined.

mongoose, small, carnivorous MAMMAL of the civet family, found in S Asia and Africa, with one species extending into S Spain. Typical mongooses (genus *Herpestes*) are weasellike in appearance, with long, slender bodies and pointed faces. They range in length from 1½ to 3½ ft (45 to 106 cm). The Indian gray mongoose (*H. edwardsi*) is known for its ability to kill snakes, including COBRAS. Mongooses are fierce hunters, and because of their destructiveness it is illegal to import them into the U.S., even for zoos.

monism, in METAPHYSICS, term applied from the 18th cent. to any theory that explains phenomena by one unifying principle or as the manifestation of a single substance, variously identified as spirit or mind (e.g., HEGEL), energy, or an all-pervasive deity (e.g., SPINOZA). The opposites of monism are pluralism, the explanation of the universe in terms of many principles or substances, and DUALISM.

monitor, any of various dragonlike, mostly tropical LIZARDS (genus *Varanus*), found in the Eastern Hemisphere. The carnivorous monitor lizard has a long head and neck, long tail, and strong legs with sharp claws. Monitors range in size from the 8-in. (20-cm) species of W Australia to the 10-ft, 300-lb (3-m, 136-kg) Komodo dragon, the giant of living lizards, which lives only on Komodo, a small Indonesian island.

Monitor and Merrimack, American ships that fought the first battle between ironclads, in the CIVIL WAR. On Mar. 9, 1862, the Confederate frigate *Merrimack,* converted into an ironclad and renamed the *Virginia,* engaged in battle at HAMPTON ROADS with the Union ironclad *Monitor.* The combat, which ended in a draw, revolutionized naval warfare.

Monk, George: see MONCK, GEORGE, 1ST DUKE OF ALBEMARLE.

Monk, Thelonious (Sphere), 1917–82, African-American pianist and composer; b. Rocky Mount, N.C. Considered one of the most important, and eccentric, modern JAZZ figures, Monk played in a dissonant, often humorous style characterized by subtle rhythmic irregularities. His many compositions include "'Round Midnight" and "Straight No Chaser."

Thelonious Monk

monkey, PRIMATE, belonging to either of the two superfamilies Cercopithecoidea (Old World) and Ceboidea (New World). Monkeys are excellent climbers, and most are primarily arboreal. Unlike APES, they cannot swing arm-over-arm but run on branches on all fours. Nearly all live in tropical or subtropical climates. Monkeys have flat, rather human faces and highly developed hands and feet,

with opposable big toes and, where present, thumbs. Old World monkeys, more closely related to apes and humans than New World monkeys, include the macaque, the BABOON, and the MANDRILL; New World monkeys include the marmoset, tamarin, and capuchin.

monkey-puzzle tree, evergreen tree (*Araucaria araucana*) native to Chile, widely cultivated as an ornamental. The symmetrical branches have an unusual angularity and are completely covered by stiff, overlapping leaves. The monkey-puzzle tree and the related Norfolk Island pine (*A. excelsa*) and bunya-bunya (*A. bidwillii*) are good timber trees. Species of *Araucaria* form the dominant vegetation of the coniferous forests of Chile and S Brazil.

Mon-Khmer languages [mōn-kəmâr'], group of languages frequently considered as a subfamily of the Southeast Asian family of languages. Included in the subfamily are Cambodian (or Khmer); Mon (or Talaing), spoken in Myanmar; and a number of other languages, such as Cham of Cambodia and southern Vietnam, and Khasi of Assam, in India. See LANGUAGE (table).

Monmouth, James Scott, duke of, 1649–85, pretender to the English throne, illegitimate son of CHARLES II. Supporters of a Protestant succession championed Monmouth as heir to Charles II. After the accession (1685) of the Roman Catholic JAMES II, Monmouth landed in Dorset and was proclaimed king, but forces loyal to James soon routed his army. Monmouth was captured and beheaded.

Monmouth, battle of, in the AMERICAN REVOLUTION, fought June 28, 1778, near Monmouth Courthouse, N.J. During an attack on the British, Gen. Charles LEE suddenly ordered a retreat. Only the arrival of Gen. WASHINGTON and Baron von STEUBEN prevented an American rout, and the British escaped.

Monnet, Jean [mônā'], 1888–1979, French economist and public official, leading proponent of European unity after World War II. He served (1919–23) as deputy general of the LEAGUE OF NATIONS. In 1947 he authored the Monnet Plan for French economic revival, which led to French participation in the MARSHALL PLAN. Following a proposal by Robert SCHUMAN, he drafted the Schuman Plan, which established (1952) the European Coal and Steel Community (ECSC). Monnet, its first president (1952–55), conceived the ECSC as the initial step toward European economic and political integration. His ideas also contributed to the development of the Common Market. See EUROPEAN UNION.

monoclonal antibody, an antibody mass-produced in the laboratory from a single clone. Monoclonal antibodies are typically made by fusing a normally short-lived, antibody-producing B cell (see IMMUNITY) to a fast-growing cell, such as a cancer cell. The resulting hybrid cell, or hybridoma, multiplies rapidly, producing large quantities of the antibody. Monoclonal antibodies are used in laboratory research and in medical tests, but their effectiveness in disease treatment has been limited. Experimental cancer therapies have used drugs or radioactive materials attached to monoclonal antibodies that, when injected into patients, home in on antigens that grow only on the surface of cancer cells.

monocotyledon: see ANGIOSPERM.

Monod, Jacques [mônō'], 1910–76, French biologist and author. He and François JACOB proposed (1961) the concepts of messenger RNA (see NUCLEIC ACID) and the operon. For their work they shared with André LWOFF the 1965 Nobel Prize in physiology or medicine. In *Chance and Necessity* (1970) Monod argued that humans are products of chance genetic mutations.

mononucleosis, infectious, acute infectious disease of older children and young adults, occurring sporadically or in epidemic form. An airborne herpes virus, known as Epstein-Barr virus, is believed to be the cause. Symptoms include fever, enlarged spleen (in about half the cases), sore throat, and extreme fatigue. HEPATITIS is common. Therapy includes bed rest and the treatment of symptoms.

Monophysitism [Gr., = belief in one nature], a heresy of the 5th and 6th cent., a reaction against NESTORIANISM. It challenged the orthodox creed of the Council of Chalcedon (451) by saying Jesus had only a divine nature. For invalidating Chalcedon, the East was put under excommunication by the pope until 519. In Syria, Egypt, and Armenia, monophysitism dominated, and a permanent schism set in by 600, resulting in the creation of the Jacobite, Coptic, and Armenian churches.

monopoly, market condition in which there is only one seller of a commodity. By virtue of control over supply, the seller exerts nearly total control over prices. By adopting laws excluding competition from an industry, governments have created public service monopolies. These may be public monopolies (e.g., the U.S. Postal Service) or publicly regulated private monopolies (e.g., power and light companies). Control of a supply by a few producers, who often act to restrain price competition, is known as an oligopoly. In the U.S., most forms of monopoly and, to a lesser extent, oligopoly are illegal under ANTITRUST LAWS. The government grants monopolies in the form of patents and copyrights to encourage the arts and sciences.

monorail, railway system whose cars run on a single rail, either above it or suspended beneath it. Driving power is transmitted from the cars to the track by means of wheels that rotate horizontally, making contact with the rail between its upper and lower flanges. Short-run monorails have been built in Houston and Seattle and at Disneyland, in Anaheim, Calif., and Walt Disney World, near Orlando, Fla. Maglev trains use a monorail-like guideway (see MAGNETIC LEVITATION).

monosodium glutamate (MSG), sodium salt of the amino acid glutamic acid, commonly used as a flavor enhancer in foods. Often found in Chinese food, it sometimes causes sensitive individuals to experience adverse physical reactions such as dizziness and flushing, known as the "Chinese Restaurant Syndrome."

monotheism, in religion, belief in one GOD. The term is applied particularly to JUDAISM, CHRISTIANITY, and ISLAM, but early ZOROASTRIANISM and Greek religion in its later stages were monotheistic as well. See also POLYTHEISM.

Monotheletism or **Monothelitism** [Gr., = one will], 7th-cent. heresy condemned by the Third Council of Constantinople (680). First proposed in 622, it said that Jesus had two natures, but operated with one will. It was adopted by Emperor HERACLIUS I as a compromise between MONOPHYSITISM and orthodoxy and was vehemently opposed by Rome.

monotreme, member of the primitive mammalian order Monotremata (sometimes considered a subclass, Prototheria), found in Australia, Tasmania, and New Guinea. The only members are the PLATYPUS and several species of ECHIDNA. They are unique among MAMMALS in laying eggs instead of bearing live young. Certain skeletal features resemble those of REPTILES, from which the monotremes evolved. Adults are toothless; males have spurs connected to poison glands on their hind feet.

Monotype: see PRINTING.

Monroe, James, 1758–1831, 5th president of the U.S. (1817–25); b. Westmoreland co., Va. He fought in several campaigns in the AMERICAN REVOLUTION and was wounded at Trenton. He studied law with Thomas JEFFERSON (1780–83) and served in the Virginia legislature (1782) and the Continental Congress (1783–86), where he opposed the Constitution for creating an overly centralized government. In the U.S. Senate (1790–94), he was a staunch Jeffersonian and a violent opponent of the FEDERALIST PARTY. Governor of VIRGINIA from 1799 to 1802, and again in 1811, he undertook diplomatic missions to England, Spain, and France, and helped negotiate (1803) the LOUISIANA PURCHASE. He served as James MADISON's secretary of state (1811–17), doubling briefly as secretary of war (1814–15). Monroe was easily elected president in 1816 and again in 1820. His administration was characterized as an "era of good feeling." He signed the MISSOURI COMPROMISE, settled boundaries with Canada, and acquired Florida (1819). In 1923 he issued the MONROE DOCTRINE, one of the most important principles of U.S. foreign policy. At the end of his term he retired to his estate, Oak Hill, near Leesburg, Va.

Monroe, Marilyn, 1926–62, American film actress; b. Los Angeles as Norma Jean Baker. A famed sex symbol, she showed real acting talent in such films as *Bus Stop* (1956), *Some Like It Hot* (1959), and *The Misfits* (1960).

Monroe Doctrine, dual principle of U.S. foreign policy enunciated Dec. 2, 1823, in Pres. MONROE's message to Congress. Formulated with the help of Madison's secretary of state, John Quincy ADAMS, it stated that the American continents were no longer open for

colonization by European powers and that the U.S. would view with displeasure any European intervention in the Americas. Although never formally recognized in international law, the doctrine was invoked successfully several times and became important in U.S. foreign policy. As imperialistic tendencies grew, the Monroe Doctrine was viewed with suspicion by Latin American countries, who associated it with the possible extension of U.S. hegemony. Pres. Theodore ROOSEVELT's corollary stated (1904) that a disturbance in Latin America might force the U.S. to intervene to prevent European intervention. This interpretation was invoked extensively by presidents Taft and Wilson to justify U.S. intervention in the Caribbean. By the end of the 1920s the doctrine had become less important, and under Pres. F.D. ROOSEVELT the emphasis was on Pan-Americanism. Despite the reemergence of the specter of unilateral intervention in Latin America in the 1950s and 60s, for the most part the U.S. has continued to support hemispheric cooperation within the framework of the ORGANIZATION OF AMERICAN STATES.

Monrovia, city (1991 est. pop. 500,000), capital of Liberia, on the Atlantic Ocean at the mouth of the St. Paul R. Monrovia is Liberia's largest city and its administrative and commercial center. The city's economy revolves around its harbor, which was improved by U.S. forces under LEND-LEASE during World War II. It is a free port, and some 150 shipping companies are registered there under the Liberian flag. Manufactures include cement and refined petroleum. Monrovia was founded in 1822 as a haven for freed American slaves and was named for U.S. Pres. James MONROE. Monrovia was severely damaged during the 1990 Liberian civil war and has yet to recover.

monsoon, wind that changes direction with the seasons. Monsoons are the result of differing air pressures caused by the varied heating and cooling rates of continental landmasses and oceans. Winter monsoons associated with India and Southeast Asia are generally dry; summer monsoons in those regions are extremely wet.

montage, the art and technique of motion-picture editing in which contrasting shots or sequences are used impressionistically to affect emotional or intellectual responses. It was developed creatively after 1925 by Sergei EISENSTEIN.

Montagnais and Naskapi, Labrador peoples with almost identical languages and customs, and a Northern caribou culture (see NORTH AMERICA, INDIGENOUS PEOPLES OF). The Montagnais subsisted on moose, fish, and seals; the Naskapi on caribou, fish, and small game. Both declined rapidly after contact with whites. Some 7,000 now live as hunters and trappers in Quebec and Labrador.

Montagnards: see MOUNTAIN, THE.

Montagu, John: see SANDWICH, JOHN MONTAGU, 4TH EARL OF.

Montagu, Lady Mary Wortley, 1689–1762, English author, noted primarily for her highly descriptive letters, published in 1763. *Town Eclogues* (1747) gives an entertaining picture of contemporary manners. Her quarrel with POPE and his attack on her in his poetry are well known.

Montaigne, Michel Eyquem, seigneur de [môNtĕn'yə], 1533–92, French essayist. Initiator and greatest master of the ESSAY as a modern literary form, he was a magistrate (1557–70) and mayor of Bordeaux (1581–85). He produced his first two books of *Essays* while living in retirement between 1571 and 1580, and the third after 1586. The essays show the development of Montaigne's thinking, from a study of himself into a more general study of humanity and nature. The early works reflect his concern with pain and death. A middle period is characterized by his skepticism regarding all knowledge. Montaigne's last essays reflect his acceptance of life as good and his conviction that people must discover their own nature in order to live in peace and dignity. The *Essays,* models of the familiar, digressive style, treat a wide variety of subjects of universal concern and have greatly influenced both later French writing and English literature.

Montale, Eugenio, 1896–1981, Italian poet and critic. His poetry, complex and often pessimistic, has appeared in such volumes as *Cuttlefish Bones* (1925) and *The Four-year Notebook* (1977). Prose collections include *The Butterfly of Dinard* (1956) and *On Poetry* (1976). Montale was awarded the 1975 Nobel Prize in literature.

Montana, Joe (Joseph Clifford Montana), 1956–, American football player, b. New Eagle, Pa. One of the finest quarterbacks in the game's history, he played (1979–93) for the San Francisco 49ers, leading them to four Super Bowl championships. He was twice the NFL's player of the year (1989, 1990). His records include the highest percentage of completed passes (63.7%), most consecutive games with 300 or more yards passing (5), and most consecutive passes completed (22). He joined the Kansas City Chiefs in 1993.

Montana, Rocky Mt. state in NW U.S.; bounded by North Dakota and South Dakota (E), Wyoming (S), Idaho (W), and the Canadian provinces of British Columbia, Alberta, and Saskatchewan (N).

Area, 147,138 sq mi (381,087 sq km). *Pop.* (1990), 799,065, a 1.6% increase over 1980 pop. *Capital,* Helena. *Statehood,* Nov. 8, 1889 (41st state). *Highest pt.,* Granite Peak, 12,799 ft (3,904 m); *lowest pt.,* Kootenai R., 1,800 ft (549 m). *Nickname,* Treasure State. *Motto, Oro y Plata* [Gold and Silver]. *State bird,* Western meadowlark. *State flower,* bitterroot. *State tree,* Ponderosa pine. *Abbr.,* Mont.; MT.

Land and People. E Montana is part of the GREAT PLAINS region; W Montana is marked by the lofty peaks of the Bitterroot Range—part of the Rockies—the site of Glacier National Park. A section of Yellowstone National Park is also in the state. (See NATIONAL PARKS, table). The generally cold continental climate features heavy winter snows in the west and hot, dry summers in the east. About 52% of the population of this sparsely populated state lives in urban areas. BILLINGS is the largest city, followed by GREAT FALLS. In 1990 the population was about 93% white and 6% Native American.

Economy. Montana's economy is dominated by mineral, timber, and agricultural production. Oil, coal, copper, antimony, vermiculite, and many other minerals are extracted. The state has been the site of many large water projects, and varied crops are grown on its irrigated farmland. The fertile grazing lands of the east support cattle, the most profitable agricultural product, followed by wheat, dairy products, barley, and sugar beets. Most industries are based on Montana's raw materials; among them are lumber milling and the manufacture of paper goods, processed food, and refined oil. Tourism is of growing importance.

Government. The 1973 constitution provides for a governor elected to a four-year term. The legislature consists of a senate with 50 members elected to four-year terms and a house with 100 members elected for two years. Montana sends two senators and one representative to the U.S. Congress and has three electoral votes.

History. Montana's plains were the home of the buffalo and the Native Americans they supported, including the BLACKFOOT, SIOUX, Shoshone, ARAPAHO, CHEYENNE, and SALISH, many of whose descendants continue to live in Montana on reservations. The U.S. gained possession of the region through the LOUISIANA PURCHASE (1803), and it attracted mainly trappers, the so-called MOUNTAIN MEN, until the fur supply diminished during the 1840s. The first large-scale influx of settlers came after gold was discovered (1858) and after ranching began (1860s). The indigenous tribes resisted encroachment on their lands, notably at LITTLE BIG HORN, where Gen. George CUSTER's forces were annihilated (1876), but they were soon subdued by government troops. Fierce competition erupted between cattle- and sheep-ranchers over grazing rights, and the discovery of copper (c.1880) at Butte ushered in a period of struggle among copper companies for control of the mines. From 1909 to 1918 the open range was fenced in, as homesteaders began to farm. Both farmers and miners were affected by the GREAT DEPRESSION, but the economy showed great gains during and after World War II. The national energy crisis of the 1970s resulted in a boom in Montana's energy industries, especially coal mining. Despite substantial exploitation of its natural resources, by the last years of the 20th cent. Montana was still largely made up of vast undeveloped and unpopulated places, many of great scenic beauty.

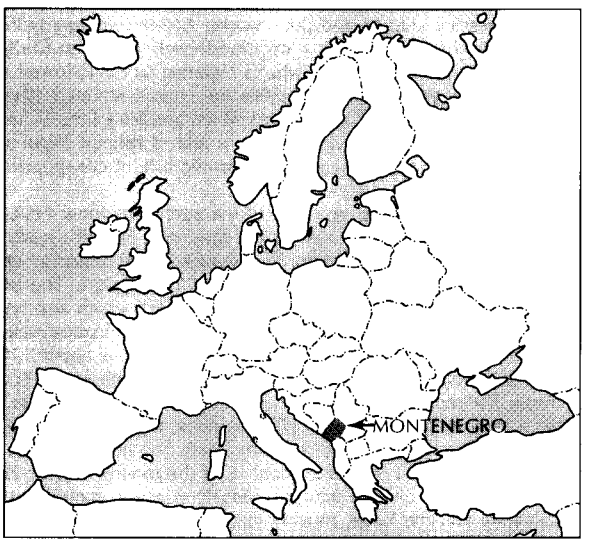
Mont Blanc, highest peak (15,771 ft/4,807 m) in Europe outside the CAUCASUS, located in the Alps near Chamonix, SE France. It was first climbed in 1786.

Montcalm, Louis Joseph de [môntkäm', Fr. môNkälm], 1712–59, French general. During the FRENCH AND INDIAN WARS he captured (1756–57) Fort Ontario and Fort Henry, and beat off (1758) a British attack on Fort TICONDEROGA. He defended Quebec against Gen. WOLFE's army until he lost (1759) the open battle on the Plains of Abraham, in which both Montcalm and Wolfe were killed; as a result, Quebec fell to the British.

Monte Carlo: see MONACO.

Montego Bay, city (1991 pop. 83,446), NW Jamaica. A port, railroad terminus, and commercial center, it is one of the most popular resorts in the Caribbean. There is an active trade in sugar, bananas, coffee, and rum and some light industries.

Montenegro, Serbo-Croatian *Crna Gora,* constituent republic of Yugoslavia (1991 pop. 615,000), 5,332 sq mi (13,810 sq km), SW Yugoslavia. Podgorica (renamed Titograd, 1946–92) is the capital. Only 6% of the largely mountainous region is cultivated. Tourism, shipping, aluminum production, stock raising, and mining have been economically important, but the economy has been hurt by the UN embargo against Yugoslavia. Montenegrins, the vast majority of the population, are closely related to the Serbs but form a distinct ethnic group. Most adhere to the Orthodox faith. There are Muslim, Albanian, and Serb minorities. Montenegro, a principality in the Serbian empire, continued to resist the Turks after SERBIA's defeat (1389) at Kosovo Field (see under KOSOVO). By 1499, however, most of the present-day republic was held by the Turks; Venice held the port city of Kotor. Montenegro's independence was granted in 1799. Its last monarch, NICHOLAS I, was deposed in 1918, and Montenegro was united with Serbia. In 1946 it became a Yugoslav republic; it sided with Serbia during the Yugoslav breakup and subsequent fighting.



Monterey, city (1990 pop. 31,954), W Calif, on the northern side of the Monterey Peninsula, on Monterey Bay; inc. 1850. A famous resort, it is one of the oldest cities in the state and is rich in history. A presidio was built in 1770, and Monterey was capital of the Spanish territory of Alta California for much of the period 1775–1846. The U.S. Navy took the city in 1846; California's constitution was written there (1849). It became a fishing and whaling center. Numerous historical buildings stand, including a customs house (1827), California's first theater (1844), and a jail (1854).

Monterrey, city (1990 pop. 1,064,197), NE Mexico, capital of Nuevo León state, c.150 mi (240 km) S of Laredo, Texas. Mexico's second-ranking industrial center, Monterrey has the country's largest iron and steel foundries; chemicals, cement, glass, and beer are also produced. It is in a mountain valley where a moderate, dry climate and hot springs have made it a popular resort. Founded in 1579, it was captured (1846) by U.S. forces during the MEXICAN WAR.

Montespan, Françoise Athénaïs, marquise de [môNtəspäN], 1641–1707, mistress of LOUIS XIV of France. She replaced (c.1667) Mlle de La Vallière as the king's mistress and bore him several children. She was supplanted by Mme de MAINTENON.

Montesquieu, Charles Louis de Secondat, baron de la Brède et de, 1689–1755, French jurist and political philosopher. His satire on French institutions, *Persian Letters* (1721), brought him fame. *The Spirit of Laws* (1748), his greatest work, compares the republican, despotic, and monarchical forms of government, revealing the influence of John LOCKE. Montesquieu advocated the separation and balance of powers within government as a means of guaranteeing the freedom of the individual; this doctrine helped form the philosophical basis for the U.S. CONSTITUTION.

Montessori, Maria, 1870–1952, Italian educator and physician. She was the originator of the **Montessori method** of educating small children and the first woman to receive (1894) a medical degree in Italy. At the Orthophrenic School in Rome she worked as a psychiatrist with retarded children, using an environment rich in manipulative materials. In 1907 she started her first DAY-CARE CENTER, utilizing the same methods with normal preschoolers on the theory that a child will learn naturally if placed in an environment consisting of "learning games" suited to the child's abilities and interests. Relying on self-motivation and auto-education, the teacher intervenes only when a child needs help. Montessori also developed child-sized furniture. Her writings include *The Montessori Method* (1912) and *The Secret of Childhood* (1936).

Monteverdi, Claudio, 1567–1643, Italian composer, the first great figure in the history of OPERA. His first opera, *Orfeo* (1607), was revolutionary in its combination of dramatic power and orchestral expressiveness. After settling in Venice (1613) he wrote mostly church music, but continued to produce operas and MADRIGALS. He set the style for Venetian opera. His late works include *The Coronation of Poppaea* (1642).

Montevideo, city (1985 pop. 1,247,920), S Uruguay, capital of Uruguay, on the Río de la Plata. One of the continent's major ports, it is Uruguay's only large city, with nearly half its population; handles virtually all its foreign trade; has diverse manufactures; and is the base for much of the South Atlantic fishing fleet. It is a spacious, attractive city with outstanding architecture and popular beaches. Settled by the Spanish after 1724, it became Uruguay's capital in 1828.

Montez, Lola, 1818?–1861, Irish dancer who became the mistress of King Louis I of Bavaria. He made her a countess, and her influence over Bavarian political affairs was considerable. For that reason she was one of the causes of the Revolution of 1848. She was banished and eventually settled in the U.S., where she died in poverty.

Montezuma or **Moctezuma,** 1480?–1520, AZTEC emperor (c.1502–20), sometimes called Montezuma II. Warlike and despotic, he caused grave unrest among subject peoples. Believing the Spanish conquerors to be descendants of the god QUETZALCOATL, he gave them gifts to persuade them to leave, but Hernán CORTÉS captured him and attempted to govern through him. Montezuma was killed either by the Spanish or by his own rebelling people. His name is linked with fabulous treasures that the Spanish took and presumably lost at sea.

Montfort, Simon de, earl of Leicester, 1208?–1265, leader of the baronial revolt against HENRY III of England. Simon was active in forcing Henry to accept (1258) the PROVISIONS OF OXFORD. After the king's annulment (1261) of the provisions, Simon became a leader in the BARONS' WAR, and won a great victory over the king at Lewes (1264). He was then master of England. His famous Parliament of 1265, to which he summoned not only knights from each shire but also, for the first time, representatives from the boroughs, was an attempt to gain national support. Opposition to Montfort grew and was rallied in the Welsh Marches by the king's son Edward (later EDWARD I). The war was resumed, and Montfort was defeated and killed at Evesham.

Montgolfier, Joseph Michel [môNgôlfyā'], 1740–1810, and **Jacques Étienne Montgolfier,** 1745–99, French brothers, inventors of the first practical BALLOON. On June 5, 1783, they sent up near Lyons a large linen bag inflated with hot air; later that year a Montgolfier balloon sailed over Paris in the first manned free balloon flight.

Montgomery, Bernard Law, 1st **Viscount Montgomery of Alamein,** 1887–1976, British field marshal. In WORLD WAR II, he became the idol of the British public after his victory (1942) at El ALAMEIN (see NORTH AFRICA, CAMPAIGNS IN), and served in Sicily and Italy until Dec. 1943. In Normandy he was field commander of all ground forces until Aug. 1944, then led the 21st Army Group across N Germany to the Baltic. He headed (1945–46) British occupation

forces in Germany and served (1951–58) as deputy commander of the Allied powers in Europe.

Montgomery, city (1990 pop. 187,106), state capital and seat of Montgomery co., E central Ala., on the Alabama R.; inc. 1819. A major agricultural market center, it is in the cotton-rich Black Belt. Fertilizer and furniture are among its important manufactures. Named state capital in 1847, it boomed as a port and cotton market. The Confederate States of America were formed (Feb. 1861) in the old capitol (built 1857), where Jefferson DAVIS was inaugurated, and Montgomery served as Confederate capital through 1861. The city is often called the "Cradle of the CONFEDERACY."

month, time required for the MOON to orbit once around the earth. The *sidereal month,* or time needed for the moon to return to the same position relative to a fixed star, averages 27 days 7 hr 43 min 12 sec; the *synodic month,* or time needed for the moon to go through its complete cycle of PHASES, averages 29 days 12 hr 44 min 3 sec. For the month's harmony with the solar calendar, see CALENDAR. Since ancient times certain lucky stones or birthstones have been connected with the months; they are often given as follows: *January* [from the god JANUS]: GARNET; *February* [from Lat., = expiatory, because of ancient rites]: AMETHYST; *March* [from the god MARS]: BLOODSTONE or AQUAMARINE; *April:* DIAMOND or SAPPHIRE; *May:* AGATE or EMERALD; *June* [from the gens *Junius*]: PEARL; *July* [from Julius CAESAR]: RUBY or ONYX; *August* [from AUGUSTUS]: carnelian or peridot; *September* [from Lat., = seven; formerly the 7th month]: chrysolite or sapphire; *October* [eight]: BERYL, TOURMALINE, or OPAL; *November* [nine]: TOPAZ; *December* [ten]: ruby, TURQUOISE, or zircon. See also WEEK; YEAR.

Montherlant, Henri de [môNtĕrläN′], 1896–1972, French author. Such novels as *The Bullfighters* (1926) and *The Bachelors* (1934), decadent and egotistical, glorify force and masculinity. His plays, all very successful, include *The Master of Santiago* (1947), *Port-Royal* (1954), and *Don Juan* (1958).

Monticello, estate near Charlottesville, Va., home and burial place of Thomas JEFFERSON, who designed it. Begun in 1770, the mansion is one of the earliest examples of the American CLASSIC REVIVAL. Today it is a national shrine.

Montpelier, city (1990 pop. 8,247), state capital (since 1805) and seat of Washington co., central Vt., on the Winooski and North Branch rivers; inc. 1855. State government and insurance offices are the chief employers; lumber and granite are produced in the area. A tourist center, the city is surrounded by the Green Mountains.

Montpensier, Anne Marie Louise d'Orléans, duchesse de [môNpäsyā′], 1627–93, French princess, called La Grande Mademoiselle, daughter of Gaston d'Orléans. A rebel leader in the FRONDE, she relieved (1652) Orléans with her troops and opened the gates of Paris to the prince of CONDÉ's army.

Montreal, officially **Montréal,** city (1991 pop. 1,017,666), S Quebec, E Canada, part of Montreal metropolitan area (1991 pop. 1,775,871), on Montréal Island, in the St. Lawrence R. at the entrance to the SAINT LAWRENCE SEAWAY. One of Canada's largest cities, it is second only to Paris as the largest primarily French-speaking city in the world (although it has a large English-speaking minority). It is also the nation's chief east-coast seaport and rivals TORONTO as the principal industrial, financial, and commercial center. Landmarks include 764-ft (233-m) Mt. Royal, the hill for which the city is named; historic Old Montreal (*Vieux Montréal*), along the waterfront; Place Ville Marie (built 1960s), first of several underground urban complexes that have transformed life downtown; a modern subway (opened 1966); and *Man and His World,* a permanent mini-version of the international exposition EXPO '67, on an island in the St. Lawrence. Montreal was founded in 1642 by French settlers as Ville Marie de Montréal, on the site of the Native American village of Hochelaga. Vaudreuil de Cavagnal surrendered the city to the British in 1760, and Americans under Richard Montgomery briefly held it (1775–76) during the AMERICAN REVOLUTION. Montreal's importance as a transshipment port for Great Lakes-Atlantic commerce increased rapidly after construction of the Lachine Canal (1825), which allowed ships to bypass the Lachine Rapids, and its volume of trade took another leap forward after the opening (1957) of the St. Lawrence Seaway.

Monts, Pierre du Gua, sieur de [mōn], c.1560–c.1630, French colonizer in Canada. After he and Samuel de CHAMPLAIN explored (1604–5) the coasts of New Brunswick and New England, he founded (1605) the first French colony in Canada at Port Royal (see ANNAPOLIS ROYAL).

Mont-Saint-Michel, rocky isle (1982 est. pop. 75), in the Gulf of St.-Malo, NW France. Access to this major tourist attraction is by causeway or by land at low tide. The Benedictine abbey was founded (708) by Saint Aubert. Three-story buildings and the rock summit provide a base for the abbey church, a superb achievement of Gothic architecture.

Montserrat, island (1992 est. pop. 12,600), 39.5 sq mi (102 sq km), British dependency, West Indies, one of the Leeward Islands. Plymouth is the capital. It was discovered (1493) by Columbus and colonized (1632) by the English. After years of Anglo-French rivalry it became a British possession in 1783. It has had internal self-government since 1960.

Moody, Dwight Lyman, 1837–99, American evangelist; b. Northfield, Mass. In 1870 he met Ira Sankey, who became associated with him in evangelistic campaigns in the U.S. and in Britain. In Massachusetts, Moody founded Northfield Seminary (1879) and Mt. Hermon School (1881), which were merged (1971) as the Northfield Mt. Hermon School. He also opened (1889) a Bible institute (now the Moody Bible Inst.) in Chicago.

Moody, Helen Wills: see WILLS, HELEN NEWINGTON.

Moon, Sun Myung, 1920–, South Korean religious leader. He was an engineering student and dock worker before founding (1954) the Unification Church with a doctrine loosely based on Christianity as interpreted by Moon, who is regarded by his followers as God's messenger. In the early 1990s the church reported 40,000 U.S. followers (3 million worldwide). Moon and his followers have been accused of brainwashing converts and of various illegal activities, and he was convicted (1982) in the U.S. of conspiracy to evade taxes.

moon, the single natural SATELLITE of the earth. The lunar orbit is elliptical, and the average distance of the moon from the earth is about 240,000 mi (385,000 km). The moon's orbital period around the earth, and also its rotation period, is 27.322 days. The true angular size of the moon's diameter is about ½°, which also happens to be the sun's apparent diameter. This coincidence makes possible total solar ECLIPSES. The moon's diameter is about 2,160 mi (3,476 km); it has about 1/81 the mass of the earth and is ⅗ as dense. The moon completely lacks both water and atmosphere. It has a rigid crust about 45 mi (70 km) thick, making the moon a rigid solid to a greater depth than the earth. The inner core has a radius of 600 mi (1,000 km), about ⅔ of the moon's radius. The lunar surface is divided into the densely cratered mountainous highlands and the large, roughly circular, smooth-floored plains called maria. See also SPACE EXPLORATION; SPACE PROBE.

moonstone, type of FELDSPAR, found in Sri Lanka, Myanmar, and Madagascar, used as a gem. The refraction of light by its thin, paired internal layers causes its milky, bluish sheen.

Moor, Antonis: see MORO, ANTONIO.

Moore, Clement Clarke, 1779–1863, American poet; b. N.Y.C. A biblical scholar and educator, he is chiefly remembered for his poem "A Visit from St. Nicholas" (1823).

Moore, Douglas Stuart, 1893–1969, American composer and teacher; b. Cutchogue, N.Y. His major works, noted for their theatricality and use of the American vernacular, include *Moby Dick* (1928) for orchestra; the children's opera *The Headless Horseman* (1937); and the opera *Giants in the Earth* (1951).

Moore, George, 1852–1933, English author; b. Ireland. He introduced NATURALISM into the Victorian novel with *A Mummer's Wife* (1885). *Esther Waters* (1894) is his best-known novel. His association with the Irish literary renaissance is described in *Hail and Farewell* (3 vol., 1911–14), an autobiography.

Moore, G(eorge) E(dward), 1873–1958, English philosopher. He taught (1898–1939) at Cambridge Univ. and edited (1921–47) the journal *Mind.* First influenced by F.H. BRADLEY and KANT, Moore became more interested in critical EPISTEMOLOGY, and particularly in distinguishing between acts of consciousness and their possible objects. He also became concerned (along with Bertrand RUSSELL and WITTGENSTEIN) with the philosophical implications of linguistic analysis and questioned the definition of "reality." Although Moore

The key to pronunciation appears on page xiii.

provided no systematic set of philosophical doctrines, he influenced contemporary British and American philosophy, especially through his work on commonsense beliefs; his interest in the use of signs (see SEMIOTICS); his representation of REALISM; and his works on ETHICS, *Principia Ethica* (1903) and *Ethics* (1912).

Moore, Henry, 1898–1986, English sculptor. His early sculpture was rough and angular, influenced by PRE-COLUMBIAN ART. Around 1928 he developed a more personal style that gained him international repute. His works in wood, stone, and cement (done without clay models) are characterized by smooth organic shapes that include empty hollows. His favorite subjects were mother and child and the reclining figure. His works include a monument for the Univ. of Chicago.

Henry Moore sculpture Recumbent Figures

Moore, Marianne, 1887–1972, American poet; b. St. Louis. Her poetry is witty, crisp, intellectual, and often satirical. Volumes of her verse include *Poems* (1921), *Collected Poems* (1951; Pulitzer), and *Complete Poems* (1967). Among her other works are translations and essays.

Moore, Thomas, 1779–1852, Irish poet. His *Irish Melodies* (1808–34) include "Believe Me If All Those Endearing Young Charms" and "The Harp that Once through Tara's Halls." *Lalla Rookh* (1817), a long poem on Asian themes, was very popular. Moore was a friend and biographer of BYRON.

Moors, nomadic people of N Africa, originally inhabitants of Mauretania. They became Muslims in the 8th cent. and went to Spain (711), where they overran the Visigoths. They spread northward across the Pyrenees into France but were turned back by CHARLES MARTEL in 732. In S Spain, however, they established the Umayyad emirate (later caliphate) at Córdoba. The court grew in wealth, splendor, and culture. Other centers of Moorish culture were Toledo, Granada, and Seville. The Moors never established a stable central government. In the 11th cent. the caliphate fell, and Moorish Spain was captured by the ALMORAVIDS, who were supplanted in 1174 by the ALMOHADS. During this period, Christian rulers continued efforts in N Spain to recapture the south. In 1085 ALFONSO VI of León and Castile recovered Toledo. Córdoba fell in 1236, and one by one the Moorish strongholds surrendered. The last Moorish city, Granada, fell to FERDINAND V and ISABELLA I in 1492. Most of the Moors were driven from Spain, but two groups, the Mudejares and MORISCOS, remained.

moose, largest member (genus *Alces*) of the DEER family, found in N Eurasia and N North America. The Eurasian species (*A. alces*) is known in Europe as the ELK. The larger American moose is sometimes classed as a separate species (*A. americana*); it has a heavy, brown body with humped shoulders, long, lighter-colored legs, a thick, almost trunklike muzzle, and broad, flattened antlers in the male. Moose hunting is strictly regulated.

Mor, Antonis: see MORO, ANTONIO.

moraine, rock and soil debris carried and finally deposited by a GLACIER. A lateral moraine is the material that falls onto a glacier's edges from valley cliffs. A ground moraine is the debris deposited by a melting glacier. A terminal moraine is the debris left at the edge of a glacier's extreme forward movement. The great ice sheets of the Pleistocene epoch left terminal moraines stretching across North America and Europe. See also DRIFT.

Moral Majority, U.S. political action group composed of conservative, fundamentalist Christians. Founded (1979) and led (1979–87) by evangelist Rev. Jerry Falwell, the group played a significant role in the 1980 elections by its strong support of conservative candidates. It lobbied for prayer and the teaching of CREATIONISM in public schools, while opposing the Equal Rights Amendment (see FEMINISM), homosexual rights, abortion, and the U.S.-Soviet SALT treaties. It dissolved in 1989.

Moral Re-Armament: see BUCHMAN, FRANK NATHAN DANIEL.

Moravia, Alberto, 1907–90, Italian novelist; b. Alberto Pincherle. His first novel, *Time of Indifference* (1929), is a powerful study of spiritual ennui. Other novels include *The Woman of Rome* (1947), *Two Women* (1957), *The Empty Canvas* (1960), and *Time of Desecration* (tr. 1980). He also wrote short stories and essays.

Moravia, historic region, E Czech Republic, bordered by BOHEMIA (W), Slovakia (E), Czech SILESIA (N), and Austria (S). BRNO is the chief city and the former Moravian capital. Moravia consists of a fertile agricultural central valley with mountains in the east, north, and west. It is also highly industrialized, with such manufactures as steel, textiles, and shoes, and has lignite, coal, and other resources. In the 9th cent. Moravia became a great empire, ruling Bohemia, Silesia, Slovakia, and S Poland. From the early 11th cent. it was in effect a crown land of BOHEMIA, with which it passed (1526) to the HAPSBURGS of Austria. Moravia, however, retained its own diet and suffered less than Bohemia in the civil and religious strife of the 16th cent. It became an Austrian crown land in 1849. After WORLD WAR I Moravia was incorporated into the new nation of CZECHOSLOVAKIA. The MUNICH PACT (1938) transferred NW and S Moravia to Germany, which occupied (1939–45) all of Moravia during WORLD WAR II. Since 1960 the region has comprised two administrative regions, North and South Moravia. With the dissolution of Czechoslovakia (1993), Moravia became part of the Czech Republic.

Moravian Church, Renewed Church of the Brethren, or **Unitas Fratrum,** an evangelical Christian communion. It originated in Bohemia among some of John HUSS's followers, who broke with Rome in 1467. Persecution reduced their numbers, but a renewal took place after 1722 at Herrnhut, on the Saxon estate of Graf von ZINZENDORF. In America the sect founded (c.1740) Bethlehem, Pa., which has remained the center of the Moravians in the U.S. They take Scripture as the rule of faith and morals and have a simple liturgy and a modified episcopacy. Moravians number about 55,000 in the U.S.

Moray. For Scottish names spelled thus, see MURRAY.

Mordecai: see ESTHER.

More, Sir Anthony: see MORO, ANTONIO.

More, Sir Thomas (Saint Thomas More) 1478–1535, English statesman, author of *Utopia,* and martyr of the Roman Catholic Church. He received a Latin education and became a humanist through contact with John Colet, John LYLY, and ERASMUS. As a lawyer he attracted the attention of HENRY VIII, whom he served as a diplomat; More was lord chancellor (1529–32). His refused to subscribe to the Act of Supremacy, was imprisoned, and executed. He wrote works in Latin (*Utopia,* 1516) and in English, including devotions, tracts, poems, prayers, and meditations. His English works were published in 1557.

Moreau, Jeanne, 1928–, French film actress. In *Jules and Jim* (1961) she etched an ambiguous portrait of a delightful heroine capable of destroying the men who love her. Her other films include *The Lovers* (1959), *Les Liaisons dangereuses* (1960), *The Bride Wore Black* (1967), *Going Places* (1974), and *The Summer House* (1993). She has also directed films.

Morelos y Pavón, José María [mōrā'lōs ē pävōn'], 1765–1815, Mexican revolutionary leader. A liberal priest, he led (1810–13) rebel forces to initial victories over the Spanish army, becoming generalissimo. But he was defeated (1813) by Gen. ITURBIDE at Valladolid and later captured, defrocked, and executed.

Moreno Valley, city (1990 pop. 118,779), Riverside co., S Calif.; inc. 1984. It is California's fastest-growing city, having increased its population by over 300% in the 1980s. Among its industries are electronics, steel, home construction and improvement enterprises, and engineering. March Air Force Base employs many city residents.

Moreto y Cabaña, Augustin [mōrā'tō ē käbä'nyä], 1618–69, Spanish dramatist of the GOLDEN AGE. His greatest play, of more than 100, is *Disdain for Disdain.*

Morgan, American family of financiers and philanthropists. **Junius Spencer Morgan,** 1813–90, b. West Springfield, Mass., prospered at investment banking. In 1864 he assumed control of a London firm that became J.S. Morgan & Co., which handled most British investments in the U.S. His son, **John Pierpont Morgan,** 1837–1913, b. Hartford, Conn., built the family fortunes into a colossal financial and industrial empire. In 1871 he helped form Drexel, Morgan & Co. (later J.P. Morgan & Co.). His ascent to power was accompanied by dramatic financial battles, notably over railroads, against Jay GOULD, James FISK, E.H. HARRIMAN, and others. Morgan formed (1901) the U.S. Steel Corp., the first billion-dollar corporation in the world. He financed manufacturing and mining, and controlled banks, insurance companies, shipping lines, and communications systems. A popular symbol of the "money trust," he came under public criticism for many of his dealings. His numerous philanthropies included donation of part of his renowned art collection to the METROPOLITAN MUSEUM OF ART. His son, **John Pierpont Morgan,** 1867–1943, b. Irvington, N.Y., headed the house of Morgan after his father died and helped finance the Allied effort during World War I. He endowed the Pierpont Morgan Library, N.Y.C. (see under LIBRARY, table).

Morgan, John Hunt, 1825–64, Confederate general in the U.S. CIVIL WAR, famed for his daring cavalry raids behind Union lines; b. Huntsville, Ala. A raid through Kentucky, Indiana, and Ohio in 1863 was his most outstanding feat.

Morgan, Lewis Henry, 1818–81, American anthropologist; b. Aurora, N.Y. Derived from his unexcelled studies of the SENECA, *Systems of Consanguinity and Affinity of the Human Family* (1870) describes his theory correlating KINSHIP terminology with forms of marriage and rules of descent. *Ancient Society* (1877), which classifies world cultures by progressive stages of savagery, barbarism, or civilization, influenced MARX and ENGELS, who interpreted its evolutionary doctrine as support for their theory of history.

Morgan, Thomas Hunt, 1866–1945, American zoologist and pioneering geneticist, b. Lexington, Ky. Professor of experimental zoology at Columbia Univ. (1904–28) and director of the biological sciences laboratory at the California Institute of Technology (1928–45), Morgan demonstrated the physical basis of heredity and the importance of the GENE, using the fruit fly *Drosophila.* He also described the phenomena of linkage and crossing over and used them to map the arrangement of genes along the CHROMOSOME. His influential books include *The Theory of the Gene* (rev. ed., 1928). Morgan received the 1933 Nobel Prize in physiology or medicine for his work on genetics.

Morgenthau, Hans Joachim, 1904–80, German-American political scientist; b. Germany. He came to the U.S. in 1937 and taught chiefly at the Univ. of Chicago. He emphasized the role of "realism" and "national interest" in international affairs. Among his works are *Politics Among Nations* (1948, rev. ed. 1973) and *Politics in the 20th Century* (1962).

Morgenthau, Henry, Jr., 1891–1967, U.S. secretary of the treasury (1934–45); b. N.Y.C. During World War II he supervised huge sales of government bonds and advocated international monetary stabilization. He helped establish (1945) the International Monetary Fund and the World Bank.

Mörike, Eduard [mö'rikə], 1804–75, German poet and clergyman. Many of his rich lyrics were set to music by Hugo WOLF. He also wrote a novel, *Maler Nolten* (1832), and a novella, *Mozart's Journey from Vienna to Prague* (1856).

Moriscos [môris'kōz], MOORS converted to Christianity after the Christian reconquest (11th–15th cent.) of Spain. The religion and customs of Muslims in the Christian parts of Spain were generally respected until the fall of Granada (1492), after which Moors who refused conversion were coerced. They rebelled (1500–1502) unsuccessfully. Although most Moors accepted conversion, others were persecuted by the INQUISITION. The Moriscos rose in a bloody rebellion (1568–71), which was put down by PHILIP II. They prospered in spite of persecution, but Philip decreed (1609) their expulsion for both religious and political reasons.

Morison, Samuel Eliot, 1887–1976, American historian; b. Boston. He taught at Harvard (1915–55). In 1926 he was appointed the official historian of Harvard and wrote the *Tercentenarial History of Harvard College and University* (3 vol., 1936). Commissioned by Pres F.D. ROOSEVELT, he wrote a *History of Naval Operations in World War II* (15 vol., 1947–62). His other works include *Admiral of the Ocean Sea* (1942; Pulitzer), a biography of COLUMBUS; *John Paul Jones* (1959; Pulitzer); and *The European Discovery of America* (2 vol., 1971–74).

Morisot, Berthe [môrēzō'], 1841–95, French impressionist painter. She was a close friend and sister-in-law of MANET. Her work inclined toward pure IMPRESSIONISM, e.g., *La Toilette* (Art Inst., Chicago).

Morita Akio, 1921–, Japanese business executive. He joined with another engineer to found (1946) the Tokyo Telecommunications Co. Renamed (1958) Sony, the company developed the transitor radio and other innovative electronic products and flourished. By the early 1990s Sony had purchased CBS records and Columbia Pictures and was one of the world's largest corporations, and Morita had become one of the world's richest persons.

Morley, Sylvanus Griswold, 1883–1948, American archaeologist; b. Chester, Pa. He directed (1924–40) the Carnegie Institution expeditions at CHICHÉN ITZÁ and published an introduction to Mayan hieroglyphs (1915) and studies of the inscriptions at Copán (1920) and Petén (5 vol., 1938).

Morley, Thomas, c.1577–1603, English composer, pupil of William BYRD. His works include MOTETS, music for Anglican services, and charming MADRIGALS, as well as a guide to 16th-cent. English music practice.

Mormons, name commonly used for the members of the Church of Jesus Christ of Latter-Day Saints. The religion was founded by Joseph SMITH after he claimed that golden tablets containing the Book of Mormon were revealed to him at Palmyra, N.Y. He and his followers established (1831) a headquarters at Kirtland, Ohio. The group grew rapidly, and Smith planned to make W Missouri its permanent home until conflict with neighbors caused their expulsion (1838–39). They then moved to Nauvoo, Ill., but again hostility arose with neighbors and culminated in the mob murder of Smith and his brother Hyrum in 1844. The Mormons moved west and founded (1847) SALT LAKE CITY in Utah, where, under Brigham YOUNG, they weathered hardships and built a communal economy. Plural marriages within the group prevented Utah's admission to the Union until 1896, but in 1890 the church withdrew its sanction of polygamy. The church is led by a 3-member First Presidency and by the Council of Twelve (the Apostles). In 1990 it reported a U.S. membership of 4,267,000. Mormonism is marked by the importance of revelation, by stress on the interdependence of spiritual and temporal life, and by vigorous proselytizing. Mormon beliefs are based on the Bible, the Book of Mormon, revelations to Smith (*Doctrine and Covenants*), and *The Pearl of Great Price* (sayings attributed to Moses and Abraham). A separatist group, the Reorganized Church of Jesus Christ of Latter-Day Saints, was organized in 1852. Its headquarters are in Independence, Mo.

morning glory, common name for the family Convolvulaceae, herbs, shrubs, and small trees (many of them climbing forms) of warm regions. The tropical morning glory genus (*Ipomoea*), which includes the SWEET POTATO, and the temperate bindweed genus (*Convolvulus*) are chiefly herbaceous vines of prolific growth with colorful funnel-shaped blossoms that often open only in the morning.

Moro, Aldo, 1916–78, Italian politician. A Christian Democrat, he was minister of justice (1955–57), prime minister (1963–68, 1974–76), and foreign minister (1970–72). In 1978 he was kidnapped and murdered by the terrorist Red Brigades.

Moro, Antonio, c.1519–c.1575, Flemish portrait painter, known as Antonis Mor or Moor and Sir Anthony More. Court painter to the house of Hapsburg, he was influenced by TITIAN. His portraits, e.g.,

The key to pronunciation appears on page xiii.

Mary Tudor (1554; Prado) and Alessandro Farnese (1557; Parma), influenced international court portraiture.

Morocco, officially Kingdom of Morocco, kingdom (1992 est. pop. 26,709,000), 171,834 sq mi (445,050 sq km), NW Africa, bordered by the Mediterranean Sea (N), the Atlantic Ocean (W), Mauritania (which lies beyond the disputed territory of Western Sahara, S), and Algeria (E). Principal cities include RABAT (the capital), CASABLANCA, MARRAKESH, and FEZ. The ATLAS Mts., rising to 13,671 ft (4,167 m) in Jebel Toubkal in the southwest, dominate most of the country. In the south lie the sandy wastes of the SAHARA desert, but in the north is a fertile coastal plain, home of most of the population. Agriculture and mining are the mainstays of the economy. Morocco is the world's leading producer and exporter of phosphates; other important minerals include iron ore, copper, lead, zinc, cobalt, molybdenum, and coal. Food processing and the manufacture of leather goods are also important. Half the labor force is employed in agriculture, growing cereals, citrus fruits, and vegetables. Tourism and fishing also contribute to the economy. Most Moroccans are of mixed Arab-Berber descent and are Muslim; Islam is the state religion. There are small Christian and Jewish minorities. Arabic is the official language; Berber dialects, French (a main language of commerce), and Spanish are also spoken.

History. Originally inhabited by Berbers, Morocco became a province of the Roman Empire in the 1st cent. A.D. After successive invasions by barbarian tribes, Islam was brought by the Arabs in c.685. An independent Moroccan kingdom was established in 788; its dissolution in the 10th cent. began a period of political anarchy. The country was finally united in the 11th cent. by the ALMORAVIDS, a Berber-Muslim dynasty, who established a kingdom reaching from Spain to Senegal. Unity was never complete, however, and conflict between Arabs and Berbers was incessant. European encroachment began in 1415, when Portugal captured Ceuta, and ended with the Portuguese defeat at the battle of Alcazarquivir in 1578. In the 19th and early 20th cent. the strategic importance and economic potential of Morocco once again excited the European powers, sparking an intense, often violent, rivalry among France, Spain, and Germany. Finally, in 1912, most of Morocco became a French protectorate; a small area became a Spanish protectorate. Nationalist feelings began to surface in the 1930s, becoming more militant after World War II, and in 1956 Morocco gained its independence. In 1957 the sultan became King Muhammad V. He was succeeded in 1961 by his son, HASSAN II, whose early reign, plagued by internal unrest, coups, and assassination attempts, was repressive. Hassan's position was strengthened in 1976, when Spain relinquished the Spanish Sahara to joint Moroccan-Mauritanian control. Challenged by the Polisario Front, a guerrilla movement backed by Algeria and seeking independence for the area (which they named WESTERN SAHARA), Mauritania withdrew in 1979, but Morocco continued battling there and claimed the entire territory.

Moroni, city (1990 est. pop. 23,000), capital of COMOROS.

Moronobu (Hishikawa Moronobu), c.1618–c.1694, Japanese painter and color-print designer of the *ukiyo-e* school (see JAPANESE ART). One of his few surviving works is a screen painting in the Museum of Fine Arts, Boston.

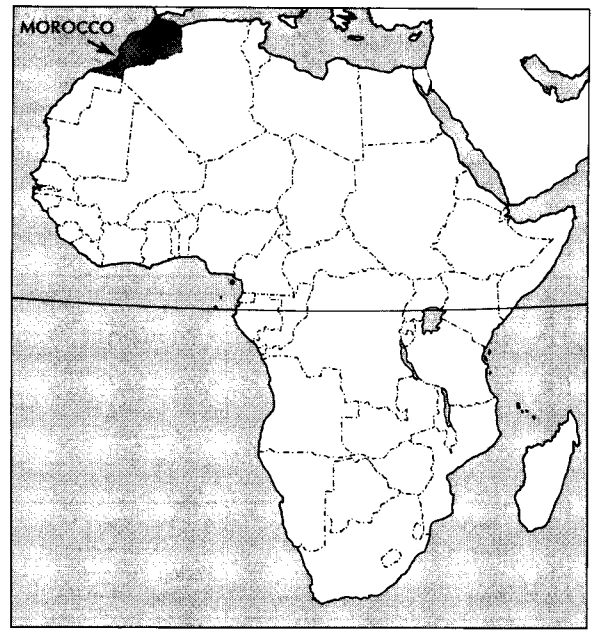
morphine, highly addictive NARCOTIC derivative of OPIUM used for the relief of pain. Morphine suppresses anxiety and alters the perception of pain, thereby producing euphoria. It also impairs mental and physical performance, reduces sex and hunger drives, and induces apathy. Its use is strictly regulated (see DRUG ADDICTION AND DRUG ABUSE).

Morrice, James Wilson, 1865–1924, Canadian painter; b. Montreal. Traveling widely, he painted subtly colored, delicately rendered landscapes, e.g. *Venice: Night* (National Gall., Ottawa).

Morris, Gouverneur, 1752–1816, American statesman; b. Morrisania, N.Y. An early supporter of the AMERICAN REVOLUTION, he helped handle the finances of the new government (1781–85) and was active in the writing of the Constitution.

Morris, Mark 1956–, American dancer and choreographer; b. Seattle. He danced for Eliot Feld and Twyla THARP before establishing his own company (1980). His dances are noted for their ingenuity and amalgamation of high and low culture.

Morris, Richard Brandon, 1904–89, American historian; b. N.Y.C.



An authority on early American legal and diplomatic history, he was Gouverneur Morris Professor of History at Columbia (1959–73). His works include *Government and Labor in Early America* (1946) and *The Peacemakers* (1967). He was also editor of the papers of John Jay and was president of the American Historical Association.

Morris, Robert, 1734–1806, American merchant, signer of the DECLARATION OF INDEPENDENCE; b. England. His role in raising money for George WASHINGTON's army earned him the title "financier of the Revolution."

Morris, William, 1834–96, English poet, artist, craftsman, designer, social reformer, and printer, considered one of the great Victorians. Influenced by RUSKIN and BURNE-JONES, he became interested in the MIDDLE AGES. He then was attached to the PRE-RAPHAELITES, and, encouraged by D.G. ROSSETTI, began to paint and write poetry, e.g., *The Earthly Paradise* (3 vol., 1868–70). In reaction to industrialism, he started (1861) the decorating firm of Morris and Co. to revitalize the splendor of medieval decorative arts (see ARTS AND CRAFTS). He made carvings, STAINED GLASS, TAPESTRIES, chintzes, and furniture. He became interested in politics and reform, forming (1884) the Socialist League, and writing *News from Nowhere* (1891), in which he states that art is the expression of joy in labor rather than a luxury. His most important venture was the Kelmscott Press (1890, Hammersmith), where he designed type, page borders, and bindings of fine books.

Morris, Wright, 1910–, American writer; b. Central City, Nev. His novels, which treat various aspects of the American experience, include *Love among the Cannibals* (1957), *Fire Sermon* (1971), and *Plains Song* (1980).

Morrison, Toni, 1931–, African-American novelist; b. Lorain, Ohio, as Chloe Anthony Wofford. She is noted for her spare but poetic language, emotional intensity, and sensitive observation of African-American life. Her novels include *The Bluest Eye* (1970), *Song of Solomon* (1977), *Tar Baby* (1981), *Beloved* (1987; Pulitzer), and *Jazz* (1992). She was awarded the Nobel Prize for literature in 1993.

Morse, Samuel Finley Breese, 1791–1872, American inventor and noted portraitist; b. Charlestown, Mass. After spending 12 years perfecting his own version of André AMPÈRE's idea for an electric TELEGRAPH, Morse demonstrated (1844) the practicability of his device to Congress and subsequently won world fame. Because many phases of the invention had been anticipated by others, his originality as the inventor of telegraphy has been questioned. Morse later experimented with submarine cable telegraphy.

Morse code [for Samuel MORSE], set of signals used on the TELE-

GRAPH and in some radio transmissions, or with a flash lamp for visible signaling. The unit of the code is the *dot*, representing a very brief depression of the telegraph key. The *dash* represents a depression three times as long as the dot. Different combinations of dots and dashes are used to code the alphabet, the numerals 1 to 9 and zero, the period, and the comma. American Morse differs considerably from International Morse. Morse code is now mainly used by amateur (ham) radio operators.

mortar, in warfare, a short-range weapon that fires a shell on a high trajectory. The name once applied to a heavy ARTILLERY piece but lately has designated a much lighter, muzzle-loaded, smooth-bore infantry weapon—consisting principally of a tube and a supporting bipod—that fires a fairly heavy projectile in a high arc.

mortgage, in law, a pledge of property as security for payment of a debt. If the borrower (the mortgagor) fails to pay the debt, the lender (the mortgagee) has the right to seek foreclosure, a procedure through which the property is sold to satisfy the lender's claims. Almost any kind of property may be mortgaged; the most familiar mortgage is that on a home.

Mortimer, Roger de, 1st **earl of March,** 1287?–1330, English nobleman. He opposed EDWARD II in the wars of 1321–22 and escaped to France, where Edward's queen, ISABELLA, became his lover. They invaded (1326) England, deposed and murdered Edward, and had young EDWARD III crowned. Mortimer, with Isabella, then virtually ruled England until 1330, when Edward III had him tried and executed.

mosaic, art of producing surface design by closely inlaying colored pieces of marble, glass, tile, or semiprecious stone. In the Roman Empire, floors were decorated with mosaics made up of large marble slabs in contrasting colors or of small marble cubes (tesserae). Tessera floors varied from black-and-white geometrical patterns to large pictorial scenes. Glass mosaics were used in early Christian basilicas. The craft reached its height in the 6th cent. at Byzantium (later Constantinople), where the HAGIA SOPHIA was decorated with gold mosaics. The use of gold and of colors produced by metallic oxides later reached the West. In the 5th and 6th cent. RAVENNA became the center of Western mosaic art. A revival in Italy (11th–13th cent.) produced such mosaics as those in St. Mark's Church, Venice. Mosaic was also used in Russia, particularly in Kiev. The advent of FRESCO decoration in 14th-cent. Italy caused mosaic art to decline. In the 19th cent., the Gothic revival produced modern attempts at mosaics, e.g., those in WESTMINSTER ABBEY. Mosaics are important in 20th-cent. Mexico, where they continue a pre-Columbian tradition. Contemporary examples are also found in Europe, South America, and Israel.

Moscow, Rus. *Moskva,* city (1991 est. pop. 8,802,000), capital of RUSSIA and former capital of the UNION OF SOVIET SOCIALIST REPUBLICS, W central European Russia, on the Moskva R. The largest city in Russia, Moscow is the hub of its rail network, an inland port, and the site of civil and military airports. Its many manufactures include machinery and machine tools, automobiles, chemicals, and textiles. First mentioned by chroniclers in 1147, it became (c.1271) the seat of the grand dukes of Vladimir-Suzdal and (by the 15th cent.) capital of the Russian state. From the 14th cent. it was the seat of the metropolitan (later patriarch) of the Russian Orthodox Church. The capital was transferred (1712) to the new city of SAINT PETERSBURG. Built largely of wood until the 19th cent., Moscow burned many times, notably after NAPOLEON's invasion (1812). In the 19th and early 20th cent. it was the focus in Russia of social democracy and other political movements. After the RUSSIAN REVOLUTION, it was (1918–91) the capital of the USSR. Economic growth doubled the population between 1926 and 1939. In WORLD WAR II the German offensive against Moscow (1941) was stopped about 20 mi (32 km) from the city's center, but damage was minimal. Its major sections form concentric circles around the KREMLIN. Red Square, the Lenin Mausoleum, and St. Basil's Cathedral are major landmarks. Among Moscow's cultural institutions are the Univ. of Moscow (est. 1755), Russian State Library (formerly Lenin Library), Tretyakov Gallery, and Bolshoi Theater.

Moseley, Henry Gwyn Jeffreys, 1887–1915, English physicist. Studying the relations among bright-line spectra of different elements, he derived the ATOMIC NUMBERS from the frequencies of vibration of X rays emitted by each element. Moseley concluded that the atomic number is equal to the charge on the nucleus. This work explained discrepancies in the Mendeleev system (see PERIODIC TABLE).

Moses, Hebrew lawgiver; b. probably Egypt. The prototype of the prophets, in the 13th cent. B.C. he led his people out of bondage in Egypt to the edge of Canaan. According to the Bible (EXODUS; LEVITICUS; NUMBERS; DEUTERONOMY), he lived in constant touch with God, who promulgated the Law (often called Mosaic law) through Moses' mouth. Moses never entered the Promised Land but only saw it from Mt. Pisgah before he died. Authorship of the first five books of the Bible—the Pentateuch or TORAH—has traditionally been ascribed to him; hence they are called the Books of Moses.

Moses, Grandma (Anna Mary Robertson Moses), 1860–1961, American painter; b. Washington co., N.Y. A farm wife, untrained in art, she began painting in her 70s. Her popular American primitive paintings are colorful, simple, and carefree scenes of rural life.

Moslem, form of Muslim: see ISLAM.

mosque, Muslim worship building. ISLAM is little dependent on ritual, and the house and courtyard of MUHAMMAD at Medina were the first worship site. As Islam spread, almost any edifice was used, including Christian and Zoroastrian temples. The mosque's basic elements are space to assemble and some orientation so that the faithful may pray toward MECCA. This direction is marked by a *mihrab,* usually a decorated niche. The elaborate mihrabs of later mosques are covered with intricate woodwork, carved marble, or tiles. A mosque may also contain a pulpit; a *maqsura* or enclosed space around the *mihrab,* often with lacy screen work; MINARETS; a courtyard surrounded by colonnaded or arcaded porticos with wells or fountains for ablutions; and space for a school. Early Egyptian and Syrian mosques adhered to the primitive pattern. The mosque of Omar (A.D. 691) at Jerusalem, called the Dome of the Rock, follows an octagonal Byzantine plan and has a wooden dome, but domed mosques were not common for another six centuries. In the 14th cent. a cruciform mosque with pointed vaults around a central court appeared; the arm toward Mecca was wider and deeper. The finest example of the cruciform mosque is the great mosque of Sultan Hasan (1356) at Cairo. Mosques of N Africa and Spain tended to be simple, but that at Córdoba (begun A.D. 780) was larger than any Christian church. It became the Cathedral of Córdoba in 1238. In the 15th and 16th cent., colonnaded halls were replaced by large, square, domed interiors, as in the Blue Mosque of Tabriz (1437–68) and the imperial mosque at Isfahan (1585–1612). After 1453, the converted HAGIA SOPHIA became a model for Islamic religious structures. The pointed, bulbous domes and polychrome tile decoration of Persian mosques are distinctive. Indian mosques, following the Persian style, employed stone and marble exteriors that gave them a more solid monumentality.

mosquito, small, long-legged, winged INSECT (order Diptera), related to the FLY. Most females have piercing, sucking mouthparts and feed on the blood of mammals; males feed on plant juices. Eggs are usually laid in stagnant water and the larvae are aquatic.

The key to pronunciation appears on page xiii.

Many diseases, including MALARIA, YELLOW FEVER, and human ENCEPHALITIS, are transmitted by certain species of mosquitoes.

moss, small primitive plant typified by tufted growth that is usually vertical; alternately considered a member of the class Bryopsida or division Bryophyta (see BRYOPHYTE). Although limited to moist habitats because they require water for FERTILIZATION and lack a vascular system for absorbing water, mosses are extremely hardy and grow nearly everywhere. The green moss plant visible to the naked eye, seldom over 6 in. (15.2 cm) in height, is the GAMETOPHYTE generation, which gives rise to the sporophyte generation. Mosses have some importance in soil formation and provide food for certain animals. SPHAGNUM, or peat moss, is commercially valuable as the main constituent of PEAT. CLUB MOSS and SPANISH MOSS are unrelated to true moss.

most-favored-nation clause, provision in trade agreements between nations that extends to the signatories the automatic right to any tariff reduction or other trade advantage negotiated with a third country. Nations belonging to the General Agreement on Tariffs and Trade (see UNITED NATIONS) accept this principle, which is intended to promote free trade. Today there are efforts to relax this principle to accommodate developing countries seeking preferential treatment for their exports. Regional trading groups such as the European Community (see EUROPEAN UNION), which abolish tariffs within the group while maintaining them for trade with nonmembers, pose another challenge to the principle.

Mosul, city (1985 est. pop. 571,000), N Iraq, on the Tigris R. Trade in agricultural goods and exploitation of oil are the two main occupations of the inhabitants, who are mostly Arabs. The surrounding area, however, is peopled by Kurds. Mosul was devastated (13th cent.) by the MONGOLS and was part (1534–1918) of the OTTOMAN EMPIRE. Its possession by Iraq was disputed (1923–25) by Turkey but was confirmed (1926) by the League of Nations.

motet, a type of musical composition outstanding in the 13th cent., and a different type in the Renaissance. The 13th-cent. motet, originating in Paris, was a polyphonic piece for three voices: a tenor (a fragment of PLAINSONG or other melody arranged in a pattern) and two accompanying voices, sometimes based on secular French songs. The Renaissance motet, originating in Flanders, was polyphonic and unaccompanied, with a single Latin text for four to six voices. JOSQUIN DESPREZ, LASSO, PALESTRINA, TALLIS, and BYRD were important motet composers. Since BACH's time the term has referred to various kinds of sacred choral POLYPHONY.

moth, any of a large group of INSECTS that, with the BUTTERFLIES, constitutes the order Lepidoptera. Moths have two pairs of wings that function as a single pair and are covered with dustlike scales. Wingspreads range from ⅛ in. (2 mm) to 10 in. (25 cm). Many moths have PROTECTIVE COLORATION matching their background. They are distinguished from butterflies by their stouter, usually hairy bodies and feathery antennae. Most moths are nocturnal and rest with wings outspread; butterflies usually fly by day and rest with wings upraised. Moths undergo a complete METAMORPHOSIS, feeding on leaves or other plant material.

Mother Lode, belt of gold-bearing quartz veins in central California, along the western foothills of the Sierra Nevada. The discovery (1848) of alluvial gold on the South Fork of the American R. led to the California gold rush. Mark TWAIN and Bret HARTE helped make the Mother Lode famous.

mother-of-pearl or **nacre,** iridescent substance that lines the shells of some mollusks, notably the pearl OYSTER, pearl MUSSEL, and ABALONE. Valued for its delicate beauty, it is used for buttons, knife handles, and inlay work.

Motherwell, Robert, 1915–91, American painter and writer; b. Aberdeen, Wash. A painter, teacher, and theoretician of ABSTRACT EXPRESSIONISM, he painted canvases characterized by large, amorphous shapes of strong, austere colors, e.g., his best-known series, *Elegies to the Spanish Republic* (1975).

motion, in MECHANICS, the change in position of one body with respect to another. The study of the motion of bodies is called DYNAMICS. The time rate of linear motion in a given direction by a body is its *velocity;* this rate is called the *speed* if the direction is unspecified. If during a time t a body travels over a distance s, then the *average speed* of that body is s/t. The change in velocity (in magnitude and/or direction) of a body with respect to time is its acceleration. The relationship between FORCE and motion was expressed by Isaac NEWTON in his three laws of motion: (1) a body at rest tends to remain at rest, or a body in motion tends to remain in motion at a constant speed in a straight line, unless acted on by an outside force; (2) the acceleration a of a mass m by a force F is directly proportional to the force and inversely proportional to the mass, or $a = F/m$; (3) for every action there is an equal and opposite reaction. The third law implies that the total MOMENTUM of a system of bodies not acted on by an external force remains constant (see CONSERVATION LAWS, in physics). Motion at speeds approaching that of light must be described by the theory of RELATIVITY, and the motions of extremely small objects (atoms and elementary particles) are described by QUANTUM MECHANICS.

motion pictures, movie-making as an art and an industry, including its production techniques, its creative artists, and the distribution and displaying of its products (see MOTION-PICTURE PHOTOGRAPHY and CAMERA). Experiments in photographing movement were made in the U.S. and Europe well before 1900. The first motion pictures made with a single camera were by E.J. Marey, a French physician, in the 1880s. In 1889 Thomas EDISON developed the kinetograph, using rolls of coated celluloid film, and the Kinetoscope, for peepshow viewing. The LUMIÈRE brothers, in France, created the Cinématographe (1895). Projection machines were developed in the U.S. and first used in New York City in 1896. The first movie theater, a "nickelodeon," was built in Pittsburgh in 1905. Movies developed simultaneously as an art form and an industry. They had enormous immediate appeal, and were established as a medium for chronicling contemporary attitudes, fashions, and events. The camera was first used in a stationary position, then panned from side to side and moved close to or away from the subject. With the evolution of sound films in the late 1920s, language barriers forced national film industries to develop independently. In the U.S. a separation of motion-picture crafts had developed by 1908, and actors, producers, cinematographers, writers, editors, designers, and technicians worked interdependently, overseen and coordinated by a director. Hollywood, Calif., became the American movie capital after 1913. Films were at first sold outright to exhibitors and later distributed on a rental basis. By 1910 the "star system" had come into being. Directors became known for the individual character of their films and were as famous as their stars. During World War I the U.S. became dominant in the industry. In 1927 dialogue was successfully introduced in *The Jazz Singer.* Early color experiments were achieved by hand-tinting each frame. In 1932 Technicolor, a three-color process, was developed. The film industry in its heyday (1930–49) was managed by a number of omnipotent studios producing endless cycles of films in imitation of a few successful original types. In those great years Hollywood gave employment to a host of talented actors, e.g., Ingrid BERGMAN, Humphrey BOGART, Joan CRAWFORD, Bette DAVIS, Cary GRANT, Katharine HEPBURN, Spencer TRACY, and John WAYNE. In the 1950s the overwhelming popularity of TELEVISION began to erode studio profits, necessitating technological innovations such as wide-screen processes, stereophonic sound systems, and three-dimensional cinematography (3-D). By 1956 studios were compelled to produce movies made expressly for television reruns. In the 1960s many filmmakers began to work independently of the studio system, producing low-budget films that departed from the glamorous, celebrity-packed works of earlier years. Costly and elaborate science fiction productions and horror films attained unprecedented popularity in the late 1970s and 80s. During the same period movies on videotape, either purchased or rented for home viewing on a VIDEOCASSETTE RECORDER, also became important. By the early 1990s computer technology permitted "interactive" films, in which the audience controls some aspects of the plot. Among the great motion-picture directors are D.W. GRIFFITH, Mack SENNETT, John FORD, and Alfred HITCHCOCK in the U.S.; Jean RENOIR, Jean-Luc GODARD, and François TRUFFAUT in France; Ingmar BERGMAN in Sweden; F.W. MURNAU and Rainer Werner FASSBINDER in Germany; Lucino VISCONTI, Michelangelo ANTONIONI, and Federico FELLINI in Italy; Sergei EISENSTEIN and Aleksandr DOVZHENKO in the USSR; Satyajit RAY in India; and KUROSAWA AKIRA in Japan.

motor, electric, machine that converts electrical energy into mechanical energy. One type of electric motor consists of a conduct-

ing loop mounted on a nonconducting shaft. Current fed to carbon brushes enters the loop through two slip rings. A magnetic field around the loop, supplied by an iron-core field magnet, causes the loop to turn when current flows through it. In an alternating-current (AC) motor, the current flowing in the loop is synchronized to reverse direction at the moment when the plane of the loop is perpendicular to the magnetic field and there is no magnetic force exerted on the loop. Because the momentum of the loop carries it around until the current is again supplied, continuous motion results. In AC induction motors, the current passing through the loop does not come from external sources but is induced as the loop passes through a magnetic field. In direct-current (DC) motors, a split-ring commutator switches the direction of the current each half rotation to maintain the shaft's direction of motion. In a brushless DC motor, the rotating portion contains a permanent magnet and the conducting coil of wire is stationary. In any motor, the stationary parts constitute the stator, and the assembly that turns is called the rotor, or armature.

Mott, Lucretia Coffin, 1793–1880, American feminist and reformer; b. Nantucket, Mass. A Quaker lecturer for temperance, peace, labor rights, and abolition, she aided fugitive slaves and helped form the Philadelphia Female Anti-Slavery Society. When the World Anti-Slavery Convention in London (1840) refused to recognize women delegates, she joined Elizabeth Cady STANTON in organizing (1848) the first women's rights convention, in Seneca Falls, N.Y.

mound builders, in archaeology, peoples who built mounds in E central North America, concentrating in the Mississippi and Ohio river valleys, from the early 6th cent. to historic times. Probably ancestors of Native Americans found in that region by Europeans, they were politically diverse and developed distinct cultures. Artifacts indicate fine stone carving, pottery making, and weaving, as well as widespread trade in copper, mica, and obsidian. The mounds vary in size (1–100 acres/0.4–40 hectares), shape (geometric or animal effigy, e.g., Serpent Mound in Ohio), and purpose (burial, fortress, or TOTEM).

Mount, William Sidney, 1807–68, American painter; b. Setauket, N.Y. At first a portraitist, in 1836 he turned to the lively genre subjects for which he is noted, such as horse trading, country dances, and farm scenes. Mount was the first important painter to portray African Americans, and his portrayals, while stereotypical, are sympathetic.

Mountain, the, in the FRENCH REVOLUTION, nickname for the deputies of the extreme left who occupied the raised seats in the National Convention. The Montagnards [men of the Mountain] included the JACOBINS and the CORDELIERS; they ruled France in the REIGN OF TERROR (1793–94). See also PLAIN, THE.

mountain, high land mass projecting above its surroundings, usually of limited width at its summit. Some are isolated, but they usually occur in ranges. A group of ranges closely related in form, origin, and alignment is a mountain system; an elongated group of systems is a chain; and a complex of ranges, systems, and chains continental in extent is a cordillera, zone, or belt. Some mountains are remains of PLATEAUS dissected by erosion (see BUTTE; MESA). Others are cones of VOLCANOES or intrusions of igneous rock that form domes. Fault-block mountains occur where huge blocks of the earth's surface are raised relative to neighboring blocks. All the great mountain chains are either FOLD mountains or complex structures in which folding, faulting, and igneous activity have taken part. The ultimate cause of mountain building has been a source of controversy. The concept of PLATE TECTONICS, however, is the first reasonable unifying theory, hypothesizing that the earth's crust is broken into several plates that sideswipe each other or collide. Where they collide (see CONTINENTAL DRIFT), compressional stresses are generated along the margin of the plate containing a continent, causing deformation and uplift of the continental shelf and continental rise, where accumulated sediments become complex folded and faulted mountain chains. Mountains have important effects on the climate, population, economics, and civilization of the regions where they occur. Major mountain ranges include the ALPS, the ANDES, the CAUCASUS, the HIMALAYAS, the PYRENEES, and the ROCKY MOUNTAINS. The highest elevation on earth above sea level is the peak of Mt. EVEREST.

mountain climbing, the practice of climbing to elevated points for sport, pleasure, or research. It is also called mountaineering. The three principal types are (1) trail climbing, or hiking through forest trails to the top of small mountains; (2) rock climbing, the ascent of steeper mountains requiring the use of rope and steel spikes (pitons) that are driven into the rock; and (3) ice climbing, on very high mountains with peaks above the timber line. The "golden age" of mountain climbing began in the 1850s and ended with the conquest (1865) of the last of the great Alpine peaks, the Matterhorn. Mt. Everest, the world's tallest mountain, was first climbed (1953) by Edmund HILLARY and Tenzing Norkay.

mountain laurel, evergreen shrub (*Kalmia latifolia*) of the HEATH family, native to E North America. Poisonous to livestock, mountain laurel has leathery leaves and large clusters of spring-blooming pink or white flowers borne at the ends of the branches. It is the state flower of Connecticut and Pennsylvania. True LAUREL is in a separate family.

mountain lion: see PUMA.

mountain men, trappers and traders in the 1820s and 30s who opened the Rocky Mountain region. They lived in the wilderness, gathering furs, and guided the first wagon trains to OREGON. The arrival of settlers and the waning popularity of the beaver hat ended their activities by the early 1840s.

Mountbatten, Louis Francis Albert Victor Nicholas, 1st **Earl Mountbatten of Burma,** 1900–1979, British admiral; great-grandson of Queen VICTORIA. In WORLD WAR II he directed commando raids in Europe and commanded Allied operations in Burma (now Myanmar) from 1943. As viceroy of India (1947) Mountbatten concluded the negotiations for the independence of India and Pakistan. He was (1959–65) chief of the British defense staff. In 1979 he was killed when a bomb planted by Irish Republican Army members exploded aboard his fishing boat off the Irish coast.

Mountbatten, Philip: see EDINBURGH, PHILIP MOUNTBATTEN, DUKE OF.

Mount Holyoke College, at South Hadley, Mass.; founded 1837. The oldest institution of higher education for women in the U.S., it was established (as Mt. Holyoke Female Seminary) through the efforts of Mary Lyon, its first principal. It offers a broad liberal arts curriculum and grants graduate degrees through a consortium of schools.

Mounties: see ROYAL CANADIAN MOUNTED POLICE.

Mount of Olives: see OLIVES, MOUNT OF.

Mount Rainier National Park: see NATIONAL PARKS (table).

Mount Rushmore National Memorial, near Keystone, S.D., with the monumental heads of four U.S. presidents—Washington, Jefferson, Lincoln, and Theodore Roosevelt—carved on the face of a mountain. Visible for 60 mi (97 km), the heads were sculpted (1927–41) by Gutzon BORGLUM with the help of his son.

Mount Stephen, George Stephen, 1st **Baron,** 1829–1921, Canadian financier. After serving as president (1876–81) of the Bank of Montreal, he helped to finance construction (1880–85) of the Canadian Pacific Railway and was its president (1881–88).

Mount Vernon, NE Virginia, overlooking the Potomac R. near Alexandria, S of Washington, D.C.; home of George WASHINGTON from 1747 until his death in 1799. The land was patented in 1674, and the house was built (1743) by his half brother Lawrence Washington. George Washington inherited it in 1754. A wooden structure of Georgian design, the mansion has wide lawns, fine gardens, and subsidiary structures, all restored with attention to Washington's detailed notes.

mouse, any of numerous species of small RODENTS. The house mouse (*Mus musculus*), found worldwide, usually measures about 6 in. (15 cm) and weighs under 1 oz (28 grams). It has gray to brown fur, large, rounded ears, and a naked, scaly tail. It causes great destruction and contamination of food supplies, and may carry human diseases, e.g., typhoid. House mice are used in scientific experiments and sometimes kept as pets. The Old World field mouse (genus *Apodemus*) is closely related to the house mouse. In North America the name *field mouse* is applied to the VOLE.

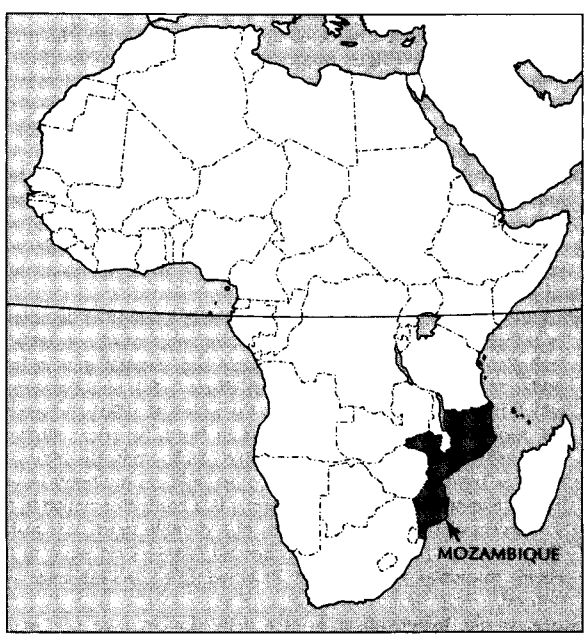
Moussorgsky or **Mussorgsky, Modest Petrovich** [mōōsôrg' skē], 1839–91, Russian composer. A member of the FIVE, he was one of the first to promote a national Russian style. His finest work is the opera *Boris Godunov* (produced 1874). Other major pieces include

the piano SUITE *Pictures at an Exhibition* (1874), later orchestrated by RAVEL; and *A Night on Bald Mountain* (1860–66), for orchestra. Moussorgsky made much use of folk songs. His rejection of European traditions influenced other Russian composers and also Debussy.

Moynihan, Daniel Patrick, 1927–, American sociologist and public official; b. Tulsa, Okla. He was a professor at Harvard Univ. and became an advisor to presidents KENNEDY, JOHNSON, and NIXON. Moynihan later served as ambassador to India (1973–75) and U.S. representative to the UN (1975–76). A Democratic U.S. senator from New York state since 1977, he became chairman of the Senate finance committee in 1993. He has written many books, including *Beyond the Melting Pot* (1963), with Nathan Glazer.

Mozambique, officially Republic of Mozambique, republic (1992 est. pop. 15,469,000), 302,328 sq mi (783,030 sq km), SE Africa, bordered by the Indian Ocean (E), South Africa and Swaziland (S), Zimbabwe, Zambia, and Malawi (W), and Tanzania (N). Major cities include MAPUTO (the capital) and Beira. The Mozambique Channel, an arm of the Indian Ocean, separates the country from Madagascar. The c.1,600-mi (2,575-km) coastline is indented by numerous rivers, notably the ZAMBEZI, which is navigable for c.290 mi (465 km) within the country. Africa's largest hydroelectric dam is at Cabora Bassa on the Zambezi. The northern and central interior is mountainous, rising to a high point at Monte Binga (7,992 ft/2,436 m). About one third of Lake MALAWI (Nyasa) falls within Mozambique's borders. Much of the country is covered with savanna, and there are extensive hardwood forests. Mozambique's economy is heavily based on agriculture, but fishing and some industry are being developed. The main export is shrimp. The main cash crops are cotton, cashew nuts, sugarcane, tea, and sisal. Coal, diamonds, and bauxite are mined on a small scale, but extensive mineral reserves remain unexploited. Industry is limited to the processing of raw materials (notably food and cotton) and the manufacture of fertilizers and cement. More than 95% of the people are Bantu-speaking Africans, most of whom follow traditional beliefs. There are large Christian and Muslim minorities. Most Mozambicans speak various Bantu languages, but Portuguese is the official language.

History. From the first visit of the Portuguese explorer Vasco da GAMA in 1498 until independence in 1975, the history of the region has been one of suppression and exploitation of African peoples by a European colonial power. The first traders were intent on gold and ivory shipped from the coast, but attempts to penetrate the interior met strong resistance. By the late 16th cent. Africans were forced to work on large feudal estates operated by private Portuguese adventurers with little government control, and an extensive slave trade developed in the mid-18th cent. In the 1890s Portugal launched a military campaign to crush African resistance, and after 1926 it assumed direct control of the economic exploitation of the country. The Mozambique Liberation Front (Frelimo) opened guerrilla warfare against white rule in 1964 and, after heavy fighting against a Portuguese army of about 60,000, controlled much of the country by the early 1970s. Following the 1974 military coup in Portugal a cease-fire was arranged, and Mozambique gained independence in 1975. Samora MACHEL, leader of Frelimo, became president of a Marxist regime that nationalized the land. Most of the country's 220,000 whites fled, and its relations with Portugal and the U.S. became strained. Since 1976 Mozambique has been devastated by war between the government and the Mozambique National Resistance (Renamo). Supported by right-wing elements in South Africa and the U.S., Renamo waged a brutal war, killing thousands, uprooting more, and bringing economic life to a halt. Machel was killed in a plane crash in 1986 and was succeeded as president by Joaquim Alberto Chissano. In the late 1980s Frelimo moved to end one-party rule and relax state control of the economy. Frelimo and Renamo signed an accord ending the civil war in 1992; free elections are scheduled for 1994.



Mozart, Wolfgang Amadeus [mōt'särt], 1756–91, Austrian composer whose oeuvre represents one of the great peaks of musical history. His works, written in every genre, combine beauty of sound with classical grace and technical perfection. He learned to play harpsichord, violin, and organ from his father, **Leopold Mozart,** 1719–87, a composer and violinist. A remarkable prodigy, the young Mozart was composing by age five, presenting concerts throughout Europe as a child, and by age 13 had written concertos, sonatas, symphonies, and operettas. In Italy (1768–71) he absorbed Italian style, and in 1771 he was appointed concertmaster to the archbishop of Salzburg, a position in which he was restless. *Idomeneo* (1781), one of the best examples of 18th-cent. OPERA *seria*, was the first opera of his maturity. He moved to Vienna (1781), married, and met HAYDN, to whom he dedicated six string quartets (1782–85), testimony to the two composers' influence on each other. *The Abduction from the Seraglio* (1782), a *singspiel* combining songs and German dialogue, brought some success. He turned to the Italian *opera buffa,* creating the comic masterpiece *The Marriage of Figaro* (1786). *Don Giovanni,* considered "difficult" in its day but now recognized as one of the most brilliant operas ever written, followed in 1787. In the same year Mozart succeeded GLUCK as court composer to Joseph II; *Eine kleine Nachtmusik* (1787) is an example of the elegant occasional music he wrote in this role. In 1788 he wrote his last three symphonies, Nos. 39–41, which display his complete mastery of classical symphonic form and intense personal emotion. In Vienna he produced his last *opera buffa, Cosi fan tutte* (1790). In *The Magic Flute* (1791) he returned to the *singspiel,* bringing the form to a lyrical height. He then worked feverishly on a requiem commissioned by a nobleman; it proved to be Mozart's own, and the work was completed by his pupil Franz Süssmayr. The composer died at 35 in poverty and was buried in a pauper's grave. A catalogue of Mozart's works was made in 1862 by Ludwig von Köchel; they are usually identified accordingly, e.g., the Piano Concerto in B Flat, K. 595.

MRI: see magnetic resonance imaging under MAGNETIC RESONANCE.

MSG: see MONOSODIUM GLUTAMATE.

Mt, chemical symbol of the element MEITNERIUM.

Muallaqat [mo͞oäl'äkät'], Arabic anthology consisting of 7 (in some versions, 9 or 10) odes by 6th- or early-7th-cent. poets. Esteemed as the finest Arabic odes, they present an unsurpassed picture of pre-Islamic Bedouin life.

Mubarak, Muhammad Hosni, 1928–, president of Egypt (1981–). Air force commander (1972–75) and vice president (1975–81), he was chosen to succeed Pres. SADAT after the latter was assassinated. Mubarak continued many of Sadat's policies, particularly the CAMP DAVID ACCORDS with Israel. He also moved to mend Egypt's strained relations with other Arab states and to control the growing influence of Islamic fundamentalists in Egypt. He was reelected in 1987 and 1993.

Mucha, Alphonse [mo͞okh'ä], 1860–1939, Czech artist. His ART NOUVEAU style, characterized by twisting, swirling, flower and hair mo-

tifs, is best seen in his posters for Sarah BERNHARDT. His paintings glorify the Slavic peoples.

muckrakers, name applied to American journalists, novelists, and critics in the first decade of the 20th cent. who tried to expose the abuses of business and corruption in politics. They included Lincoln STEFFENS, Ida TARBELL, and Upton SINCLAIR. The word derives from the term *muckrake* (derived from John BUNYAN's *Pilgrim's Progress*), used by Pres. Theodore ROOSEVELT in a 1906 speech in which he agreed with some of the muckrakers' aims but said that their methods were sensational and irresponsible.

Mufaddaliyat [mo͞ofä"dälēät'] or **Mofaddaliyat** [mō–], great anthology of Arabic poetry by authors from the Golden Age of Arabic poetry (500–650), compiled by the philologist Al Mufaddal ad-Dabbi. It is also a valuable source of information on pre-Islamic Arab life.

Mugabe, Robert Gabriel [mo͞ogä'bā], 1924–, president of ZIMBABWE (1987–). He was a founder of the Zimbabwe African National Union (ZANU) in 1963 and, after imprisonment (1964–74) by the white Rhodesian government, became (1976) co-leader, with Joshua Nkomo, of the Patriotic Front. A Marxist, Mugabe led ZANU guerrilla forces until independence, and following elections in 1980 became Zimbabwe's prime minister. In 1987 he was elected president under a revised constitution.

mugwumps, in U.S. history, slang term for the Republicans who, in 1884, deserted their party nominee, James G. BLAINE, to vote for the Democratic candidate, Grover CLEVELAND.

Muhammad [Arab., = praised], 570?–632, the Prophet of ISLAM, one of the great figures of history; b. Mecca, of the tribe of Kuraish, which ruled Mecca. His daughter Fatima (see FATIMID) was his only child to have issue. When he was 40 Muhammad felt himself selected by God to be the Arab prophet of true religion. His revelations and teachings, forming the basis of Islam, are recorded in the KORAN. In his first years Muhammad made few converts and many enemies. In 622 a plan was made at Mecca to murder him, but he escaped to Yathrib. From this event, the flight, or HEGIRA, of the Prophet (622), Islam counts its dates. Muhammad spent the rest of his life at Yathrib, henceforth called Medina, the City of the Prophet, where he built his model theocratic state and from which he ruled his rapidly growing empire. By 630 he had won all Arabia. Muhammad seemed at first to have expected that the Jews and Christians would welcome him, but he was disappointed. Islam has enshrouded Muhammad's life in a mass of legends and traditions (contained in the *Hadith*). His name appears in various forms, among them Mohammed and Mahomet.

Muhammad, sultans of the OTTOMAN EMPIRE (Turkey). **Muhammad I,** 1389?–1421 (r.1413–21), was the son of BEYAZID I. He renewed Ottoman power by defeating his brothers and reuniting most of his father's empire. **Muhammad II** (the Conqueror), 1429–81 (r.1451–81), is considered the true founder of the Ottoman Empire. He destroyed the remains of the Byzantine Empire by capturing (1453) Constantinople, which he made his capital. He conquered the Balkan Peninsula, including Greece, Bosnia, and several Aegean islands, and annexed the Crimea, Trebizond, and Karamania. The reign of **Muhammad IV,** 1641–92 (r.1648–87), was marked by disorder and corruption, although Grand Vizier KÖPRÜLÜ restored (1656) some order. Muhammad suffered military defeats and was deposed. **Muhammad V,** 1844–1918, sultan (1909–18), succeeded to the throne after the Young Turks had toppled his brother, ABD AL-HAMID II. He exercised no power, the government being dominated by Enver Pasha, and during his reign Turkey lost most of its remaining European possessions in the BALKAN WARS (1912–13); it also lost Tripoli to Italy (1911–12). Germany was the dominant influence in his reign, and he sided with the Central Powers in World War I. He was succeeded by his brother, **Muhammad VI,** 1861–1926, the last sultan (r.1918–22). He was under the control of the victorious Allies and was forced to submit to a harsh peace treaty. Meanwhile, Kemal ATATÜRK established a rival government, declared the sultanate abolished (1922), and proclaimed Turkey a republic. Muhammad VI fled and died in exile.

Muhammad V, 1910–61, king of Morocco (1957–61). He became sultan in 1927. An ardent nationalist, he was deposed and exiled (1953–55) by the French, but they were forced to recall him. He obtained (1956) full sovereignty from France and Spain, and took (1957) the title of king of Morocco.

Muhammad, Elijah, 1897–1975, African-American religious and political leader; b. Elijah Poole, near Sandersville, Ga. On the disappearance of Wali Farad in 1934, he assumed leadership of the Temple of Islam in Detroit, the sect that became the BLACK MUSLIMS. Preaching black separatism, Muhammad called himself "the messenger of Allah" and exercised autocratic control over his followers through a moralistic doctrine of social reform. On his death his son **Wallace D. Muhammad,** 1933–, b. Detroit, became the movement's leader. He has moved the sect closer to orthodox Islam and lifted restrictions on political activity and military service.

Muhammad Ali, 1769?–1849, pasha of Egypt (after 1805). He was a common soldier who rose through the ranks. As pasha he was virtually independent of his nominal overlord, the Ottoman sultan. In 1811 he exterminated the MAMLUKS, who had ruled Egypt for c.700 years. He won great victories for the Turks in Arabia and the Sudan. He fought the rebels in Greece, but his fleet was destroyed (1827) at Navarino by the British, French, and Russians. In the 1830s he turned against the sultan and made inroads in Syria and Asia Minor but was forced to give up his gains by the European powers.

Muhammad Reza Shah Pahlevi, 1919–80, shah of IRAN (1941–79). He ascended the throne after the British and Russians deposed his father, REZA SHAH PAHLEVI, suspecting him of German sympathies. He fled the country briefly in 1953 during an uprising led by Muhammad MUSSADEGH but was reinstated, due in part to the support of the U.S. Iran's great petroleum wealth allowed the shah to institute far-reaching economic and social reforms. He was bitterly opposed, however, by orthodox Muslims, who resented his modernizing policies, and by liberals and leftists, who accused him of maintaining a brutal police state. Revolution broke out in the fall of 1978, and on Jan. 5, 1979, the shah fled the country. He died in exile in Egypt.

Mühlenberg, Heinrich Melchior, 1711–87, American Lutheran clergyman, patriarch of Lutheranism in America; b. Germany. He came (1742) to Pennsylvania and soon became the leader of all the Lutheran groups in the colonies. He organized (1748) the first Lutheran synod in America. His son **John Peter Gabriel Muhlenberg,** 1746–1807, b. Trappe, Pa., became an Episcopal clergyman in Woodstock, Va. He led a regiment in the American Revolution and was later a congressman from Pennsylvania. Another son of Heinrich, **Frederick Augustus Conrad Muhlenberg,** 1750–1801, b. Trappe, Pa., served as a pastor in Pennsylvania and was pastor (1773–76) at Christ (Lutheran) Church in New York City. During the Revolution he returned to Pennsylvania and was a delegate (1779–80) to the Continental Congress. He was later a congressman (1789–97) and served twice as Speaker of the House. Heinrich's great-grandson, **William Augustus Muhlenberg,** 1796–1877, b. Philadelphia, joined the Episcopal church and held pastorates in Pennsylvania. In New York City, he became (1846) rector of the Church of the Holy Communion and helped to found (1858) St. Luke's Hospital.

Muir, John, 1838–1914, American naturalist; b. Scotland. He emigrated to the U.S. in 1849 and settled in California in 1868. Muir was a conservationist and a crusader for national parks and reservations. Muir Woods National Monument in California was named for him, as was Alaska's Muir Glacier, which he discovered.

Mukden: see SHENYANG.

mulberry, common name for the Moraceae, a family of deciduous or evergreen trees and shrubs, often climbing, mostly of pantropical distribution and typified by milky sap. Several genera bear edible fruit, e.g., *Morus* (mulberries), *Ficus* (FIGS), and *Artocarpus,* which includes the breadfruit. Both the white (*M. alba*) and the red (*M. rubra*) mulberries are cultivated in North America. Mulberry fruits are tender and juicy and resemble blackberries; the fruit of *M. rubra* is used to make wine. SILKWORMS feed on mulberry leaves. The Osage orange (*Maclura pomifera*) is a hardy tree native to the south central U.S. and is a source of a durable wood and a dye. The breadfruit (*A. ultilis*) is a cultivated, staple food plant in the Pacific tropics and West Indies; its wood, fiber, and latex are also utilized.

mule, sterile, hybrid offspring of a male donkey (see ASS) and a

female HORSE, bred as a work animal. It has long ears, slender legs, small hooves, and a loud bray. Cautious and temperamental, mules are slower but more surefooted than horses and have great powers of endurance. They have been used as pack and draft animals since prehistoric times.

mule, in manufacturing: see SPINNING.

Müller, Friedrich Maximilian: see MÜLLER, MAX.

Muller, Hermann Joseph, 1890–1967, American geneticist and educator; b. N.Y.C. He was awarded the 1946 Nobel Prize in physiology or medicine for discovering a technique of artificially inducing MUTATIONS by means of X rays. He also proposed and developed the theory that genes, because of their unique ability to self-replicate themselves and any alterations arising in them, are the basis of life.

Müller, Max (Friedrich Maximilian Müller), 1823–1900, German philologist and Orientalist. An authority on Sanskrit and Eastern religions, he taught at Oxford. He did more than any other scholar to popularize philology and mythology, e.g., his lectures *Science of Language* (1861, 1863).

Mulroney, Brian, 1939–, Canadian politician, prime minister of Canada (1984–93). Raised in Quebec, he was the first Canadian prime minister from the working class. After an unsuccessful bid (1976) to lead the Progressive Conservatives, he became party leader in 1983 and led the party to a landslide victory in 1984. A second electoral win (1988) assured passage of the U.S.–Canada Free Trade Agreement, and he later (1992) signed the NORTH AMERICAN FREE TRADE AGREEMENT with Mexico and the U.S. Mulroney twice failed (1990, 1992) to win approval of constitutional changes that would have given French QUEBEC special status within Canada, and he lost popularity when he proved unable to alleviate the effects of a prolonged recession in the early 1990s. He resigned as prime minister in 1993.

Multan, city (1981 pop. 696,316), E central Pakistan, in the Punjab. It is the commercial center of a farming region and has such industries as metalworking, food processing, and textile and chemical manfacturing. One of the Indian subcontinent's oldest cities, it fell to such conquerors as Alexander the Great (326 B.C.), the Arabs (8th cent.), Timur (1398), and the Sikhs (1818). The British ruled it from 1848 to 1947.

Multilateral Investment Guarantee Agency: see UNITED NATIONS (table 3).

multimedia, in personal computing, software and applications that combine text, high quality sound, graphics, and animation or video. In order to work with multimedia, a personal computer typically requires a more powerful microprocessor, increased memory and storage capabilities, a high quality monitor and a video accelerator, external loudspeakers or headphones and a sound card (or sound board) for improved sound generation, and a CD-ROM drive (see COMPACT DISC), as well as special software to utilize many of these devices. A multimedia computer may also use other devices, such as a microphone or keyboard for audio input and a videocassette recorder or camcorder for video input or output. Multimedia software is used for electronic publishing and electronic games and in employee training programs. The term *multimedia* is also used to describe home entertainment systems and other electronic products and services, particularly interactive ones, that combine text, sound, video, and the like.

multiple sclerosis, chronic degenerative disease of the central NERVOUS SYSTEM in which patches of the myelin sheath around nerve fibers are lost. The cause is unknown. Symptoms include disturbances in vision, speech, balance, and coordination, as well as numbness and tremors. The onset of the disease generally occurs between ages 20 and 40. Although it may result in severe disability, its course varies widely, with symptoms appearing at irregular intervals for years. There is no curative treatment, although drugs can sometimes reduce the severity of the symptoms.

Mumford, Lewis, 1895–90, American social philosopher and educator; b. Flushing, N.Y. A critic of architecture and city planning, Mumford argued that people must turn from dehumanizing technology back to human feelings and moral values. His books include *The Culture of Cities* (1938), *The Condition of Man* (1944), and *The City in History* (1961).

mummy, human or animal body preserved by embalming or by natural conditions. The word refers primarily to ancient burials found in Egypt. Mummies, embalmed and tightly wrapped, were preserved for over 5,000 years in the dry air of Upper Egypt, making it possible to determine fairly accurately how the great pharaohs appeared in life. Mummification seems to have been performed to prepare the body for reunification with the soul in an afterlife; royal figures, their retinue, and even food were preserved. Similar practices occurred in other parts of the world, e.g., among the INCAS. Natural mummification, caused by certain soil and climatic conditions, is seen in bodies found in Danish peat bogs dating from 300 B.C. to A.D. 300.

mumps or **epidemic parotitis,** acute contagious viral disease whose symptoms include pain and swelling of the salivary glands, pain on swallowing, and fever. Mumps usually affects children between ages five and fifteen and rarely lasts more than three days. In adults it is often more severe and may cause swelling of the meninges covering the brain and, in males, pain and swelling of the testes and, infrequently, sterility. VACCINATION can prevent the disease in individuals over 15 months old.

Munch, Edvard [mo͞ongk], 1863–1944, Norwegian painter and graphic artist. His exciting, violent, and emotionally charged style expressed his sense of isolation in themes of fear, death, and anxiety. Among his strongest and best-known works are *The Shriek* (1893), *Vampire* (1894), and *The Kiss* (1895). Munch's work was of primary importance in the birth of German EXPRESSIONISM. He also made powerful and shocking WOODCUTS.

Munda languages [mo͞on'də], group of languages spoken in parts of N and central India, and generally regarded as a subfamily of the Southeast Asian family of languages. See LANGUAGE (table).

Munich, Ger. *München,* city (1989 est. pop. 1,212,000), capital of Bavaria, S Germany, on the Isar R. It is an industrial center with such manufactures as processed food and beer and precision instruments. Founded in 1158 by HENRY THE LION, it became (1255) the residence of the WITTELSBACH family. It was the capital of the kingdom of BAVARIA after 1806 and became a cultural center in the 19th cent. NATIONAL SOCIALISM (Nazism) was founded in Munich and had its party headquarters there. The MUNICH PACT (1938) was signed in the city. Badly damaged during WORLD WAR II, it was rebuilt after 1945. Its many points of interest include the 15th-cent. Frauenkirche and the Old Pinakothek museum.

Munich Pact, 1938, agreement signed at Munich, Germany, by Germany, Great Britain, France, and Italy, which surrendered the Sudetenland, Czechoslovakia, to Germany. CZECHOSLOVAKIA, not invited to the talks, was forced to give in to the pact's terms, and President BENEŠ, realizing that he had been abandoned by his allies, resigned. British Prime Min. Neville CHAMBERLAIN, upon his return to London, announced that he had achieved "peace in our time," but the pact was widely regarded as an abject surrender to HITLER. The Munich Pact became a symbol of appeasement, and WORLD WAR II began about one year after its signing.

Muñoz Rivera, Luis [mo͞onyōs' rēvā'rä], 1859–1916, Puerto Rican journalist and nationalist. A leader of PUERTO RICO's independence movement, he headed (1901) the first cabinet under U.S. occupation. He published the *Puerto Rico Herald* in New York City, and he obtained American citizenship for Puerto Ricans.

Munro, Alice, 1931–, Canadian writer. She is known for short stories dealing with growing up in rural Ontario. Her collections include *Something I've Been Meaning to Tell You* (1974), *The Progress of Love* (1986), and *Friend of My Youth* (1990).

Munro, Hector Hugh, pseud. **Saki,** 1870–1916, English author; b. Myanmar. He is known for his witty, often bizarre stories, collected in *Reginald* (1904), *The Chronicles of Clovis* (1911), and other volumes. He also wrote novels.

Münzer, Thomas [mün'tsər], c.1489–1525, German Protestant reformer, generally linked with the ANABAPTISTS, although he rejected baptism altogether. He was an associate of LUTHER in 1519, but his position soon diverged from Luther's as he became increasingly iconoclastic in theology and radical in political and social beliefs. During the Peasants' War (1524–26) he set up a communistic theocracy at Mühlhausen. He was later overthrown and beheaded.

muon: see ELEMENTARY PARTICLES.

Murad, sultans of the OTTOMAN EMPIRE (Turkey). **Murad I,** 1326?–89 (r.1362?–89), widened Ottoman holdings by conquering Mace-

donia and Serbia, forced the Byzantine emperor to pay him tribute, and founded the JANISSARIES. He was assassinated. **Murad II,** 1403–51 (r.1421–51), put down Mustafa, a pretender, and established Ottoman naval power by seizing (1430) Salonica from the Venetians. In 1444 he won a great victory over the crusading LADISLAUS IV of Poland and Hungary. **Murad IV,** 1612?–1640 (r.1623–40), the last of the warrior-sultans recovered Baghdad. **Murad V,** 1840–1904 (r.1876), was declared insane and was succeeded by his brother ABD AL-HAMID II.

Murasaki Shikibu, pseud., c.978–1031, Japanese writer and court figure. She wrote the celebrated romantic *Tale of Genji*. One of the first great Japanese works of fiction, it traces the lives of Prince Genji, his wives, and their children, and subtly delineates a complex society.

Murat, Joachim [mürä'], 1767–1815, marshal of France, king of Naples (1808–15). A brilliant cavalry leader, he served in many of NAPOLEON I's campaigns, helped him to overthrow (1799) the DIRECTORY, married (1800) Napoleon's sister Caroline Bonaparte, and succeeded (1808) Joseph Bonaparte (see BONAPARTE, family) as king of Naples. He reached an agreement (1814) with Austria to keep his throne, but turned against Austria during the HUNDRED DAYS and met defeat. He was executed after trying to regain Naples.

murder: see HOMICIDE.

Murdoch, (Jean) Iris, 1919–, English novelist and philosopher. Her novels, subtle, witty, and convoluted, have elicited varying critical reaction. They include *The Flight from the Enchanter* (1956), *A Severed Head* (1961), *An Accidental Man* (1972), *Nuns and Soldiers* (1980), *The Good Apprentice* (1985), and *The Message to the Planet* (1990).

Murdoch, (Keith) Rupert, 1931–, Australian-American publishing magnate. Combining sensationalist journalism with aggressive promotion, he established a worldwide communications empire with powerful holdings in Australia; several of Britain's largest newspapers, including the prestigious *Times*, and book publisher HarperCollins; and, in the U.S., the New York *Post*, Boston *Herald*, *Village Voice*, *New York* magazine, and *TV Guide*. He also acquired 20th Century Fox film studios and established television networks in the U.S., Britain, and Asia.

Murfreesboro, city (1990 pop. 44,922), seat of Rutherford co., central Tenn., on the Stones R.; inc. 1817. The processing center of a dairy, livestock, and farm area, it produces textiles, lumber, and other products. It was the state capital (1819–26) and, in the CIVIL WAR, it was the scene of a bloody Union victory at the Battle of Murfreesboro (or Stones River), Dec. 31, 1862–Jan. 2, 1863. The city has a national battlefield and cemetery.

Murillo, Bartolomé Estéban [mo͝orē'lyō], 1617?–1682, Spanish religious and portrait painter. His early works, e.g., *Birth of the Virgin* (Louvre), show the influence of ZURBARÁN in the dramatic use of light and shadow. He was instrumental in founding (1660) the Seville Academy. From 1670 to 1682 he painted many of his major religious works, such as those for the Charity Hospital and Capuchin convent (Seville Mus.). While working on the *Marriage of St. Catherine* (1682) for the Capuchin church, Cádiz, Murillo fell from the scaffold and died. His greatest works are considered his portraits, e.g., *Knight of the Collar* (Prado) and his naturalistic genre works, e.g., *Girl and Her Duenna* (National Gall., Wash., D.C.).

Murmansk, city (1989 pop. 468,000), NW European Russia, on the Kola Gulf of the Barents Sea. The terminus of the NORTHEAST PASSAGE, it is a major ice-free port, a base for naval and fishing vessels, and the world's largest city N of the Arctic Circle. Industries include fish canneries, shipyards, and sawmills. It was a village before World War I. The port and the rail line from Saint Petersburg were built in 1915–16. Allied forces occupied Murmansk in 1918–20. In World War II it was a major supply base and port for Anglo-American convoys.

Murnau, F(riedrich) W(ilhelm) [mo͝or'nou], 1889–1931, German film director. His films, including *Nosferatu* (1922), *The Last Laugh* (1924), and *Sunrise* (1927), are noted for the use of a constantly moving camera to depict states of mind.

Murray, James, 1721?–94, British general, first civil governor of CANADA (1764–68). After his distinguished service in the FRENCH AND INDIAN WAR, he was named governor. His protection of French Canadians led to charges that he had betrayed England, but he was exonerated (1766).

Murray, Sir James Augustus Henry, 1837–1915, English lexicographer. From 1879 he was editor of the *New English Dictionary* (the *Oxford English Dictionary*), the major work of his career; it was published in 1928.

Murray, Philip, 1886–1952, American labor leader; b. Scotland. Coming to the U.S. in 1902 and working in the Pennsylvania coal mines, he rose to the vice presidency of the United Mine Workers of America (UMW) in 1920. After the formation (1935) of the CIO (see AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS), he headed its successful steelworkers' organizing campaign. When John L. LEWIS resigned as CIO president in 1940 after opposing the reelection of Pres. F.D. Roosevelt, Murray, who had split with Lewis on this issue, succeeded him. From 1942 until his death, Murray headed both the CIO and the United Steelworkers of America.

Murray, chief river of Australia, 1,609 mi (2,589 km) long. It rises in SE New South Wales, flows westward to form the NEW SOUTH WALES–VICTORIA boundary, and empties into the INDIAN OCEAN in SOUTH AUSTRALIA. Its waters, combined with those of the DARLING and MURRUMBIDGEE rivers, are used for irrigation and hydroelectricity.

Murrow, Edward R(oscoe), 1908–65, American newscaster; b. Greensboro, N.C. He was noted for his dramatic and accurate broadcasts from London during World War II. He later produced the popular television programs *See It Now* and *Person to Person*.

Murrumbidgee, river, SE Australia, flowing generally westward c.1,050 mi (1,690 km) through New South Wales to join the MURRAY R. on the Victoria border. Its irrigated valley is Australia's most productive farming area.

Muscat or **Maskat,** city (1993 pop. 329,842), capital of Oman, SE Arabia, on the Gulf of Oman. It has a fine harbor, dominated by two 15th–16th-cent. Portuguese forts, and exports dates, fish, and mother-of-pearl. Portugal held it from 1508 to 1648, and Persian princes until 1741, when it became Oman's capital.

muscle, contractile TISSUE that effects the movement of the body. Muscle tissue is classified according to its structure and function. Striated, or skeletal, muscle is under conscious control, effecting purposeful movements of limbs and other body parts. It is called striated because microscopic examination reveals alternating bands of light and dark. Smooth muscle, which lines most hollow organs, is involuntary, i.e., regulated by the autonomic nervous system. It produces movement within internal organs such as those of the DIGESTIVE SYSTEM. Cardiac muscle is striated like skeletal muscle but, like smooth muscle, is controlled involuntarily. It is found only in the HEART, where it forms that organ's thick walls. Contraction, thought to be a similar process in all types of muscle, involves the proteins actin and myosin and their arrangement within the muscle tissue.

muscovite: see MICA.

Muscovy Company or **Russia Company,** first major English joint-stock trading company; chartered in 1555. It financed trading expeditions to Russia and Asia. In 1698 its monopoly was lost, but the company continued to exist until 1917.

muscular dystrophy, any of several inherited diseases characterized by progressive wasting of the skeletal muscles. The most common form, Duchenne, is caused by an abnormal sex-linked gene located on the X chromosome and affects only boys. It begins with leg weakness before age 3 and progresses rapidly, with death often occurring before age 30. Treatment by inserting healthy cells into the muscle to produce the protein (dystrophin) that the abnormal gene should have made, has shown some success. Another form involves primarily facial and shoulder muscles and affects both sexes, usually from adolescence, and progresses more slowly.

Muses, in Greek mythology, the nine patron goddesses of the arts; daughters of ZEUS and Mnemosyne, a TITAN who personified memory. They were: Calliope (epic poetry and eloquence), Euterpe (music and lyric poetry), Erato (love poetry), Polyhymnia (oratory or sacred poetry), Clio (history), Melpomene (tragedy), Thalia (comedy), Terpsichore (choral song and dance), and Urania (astronomy).

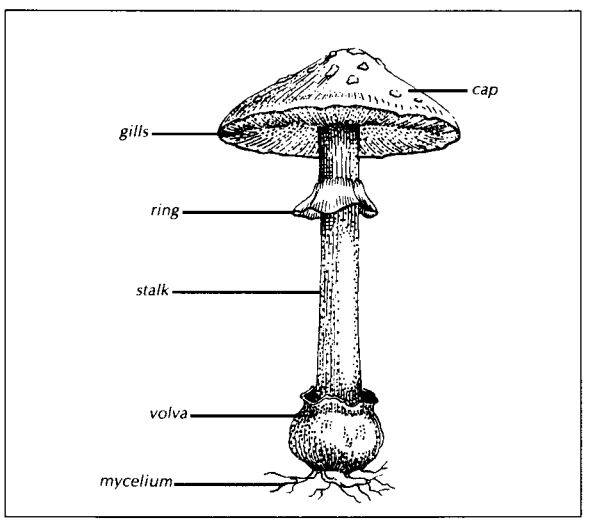
Museum of Fine Arts, Boston; inc. 1870; opened 1876. Originally

a pooling of the collections of the Boston Atheneum, Harvard Univ., and the Massachusetts Institute of Technology, the museum is privately endowed. Its collections of Eastern art, particularly from India, China, and Japan, are outstanding, as is its collection of ancient Egyptian art. It is extremely rich in 18th-cent. American paintings, especially those by J.S. COPLEY and Gilbert STUART, and has a fine collection of the works of John Singer SARGENT and the silver of Paul REVERE. The museum's West Wing, designed by I.M. PEI, opened in 1981.

Museum of Modern Art, New York City; incorporated in 1929 and privately supported. In addition to one of the world's finest collections of modern art, the museum has outstanding photography and film departments. Its first building was opened in 1939; a new wing designed by Philip JOHNSON followed (1964) and the structure was renovated and expanded in 1984.

Museum of the American Indian, Heye Foundation: see SMITHSONIAN INSTITUTION.

mushroom, fungus characterized by spore-bearing gills on the underside of an umbrella- or cone-shaped cap. The term *mushroom* is properly restricted to the plant's above-ground portion, which is the reproductive organ. Once a delicacy for the elite, edible mushrooms are now grown commercially, especially strains of the meadow mushroom (*Agaricus campestris*). Although mushrooms contain some protein and minerals, they are largely water and hence of limited nutritive value. Inedible, or poisonous, species are often popularly referred to as toadstools; one of the best-known poisonous mushrooms is the death angel (genus *Amanita*).



The poisonous mushroom Amanita

Musial, Stan(ley Frank), 1920–, American baseball player; b. Donora, Pa. An outfielder and first baseman for the St. Louis Cardinals (1941–63), "Stan the Man" ranks as one of the great hitters in baseball history. He won the National League batting title seven times and the most valuable player award three times. Musial compiled a lifetime batting average of .331 and hit 475 home runs. His league record of 3,630 career hits was broken by Pete ROSE in 1981.

musical comedy: see MUSICALS.

musical notation, symbols used to make a written record of musical sounds. BOETHIUS applied the first 15 letters of the alphabet to notes in use at the end of the Roman period. By the 6th cent. notation of Gregorian chant was by means of neumes, thought to derive from Greek symbols for pitch (see PLAINSONG); they indicated groupings of sounds to remind a singer of a melody already learned by ear. By the end of the 12th cent. the Benedictine monk Guido d'Arezzo had perfected the staff, placing letters on certain lines to indicate their pitch. These letters evolved into the clef signs used today. In the 15th cent. the shape of notes became round, and time signatures replaced coloration to indicate note value. The key signature developed early, although sharps were not used until the 17th cent. The five-line staff (with ledger lines used to extend the range) became standard in the 16th cent. Expression signs and Italian phrases to indicate tempo and dynamics came into use in the 17th cent. Notation for ELECTRONIC MUSIC is still not standardized but generally combines traditional symbols with specially adapted rhythm and pitch notation.

musicals, form of stage entertainment originating in late-19th-cent. England as musical comedy. Incorporating music, chorus dancing, and topical numbers, it has flourished primarily in the U.S. Important early stars were George M. COHAN and Lillian RUSSELL. The best-known composers of musicals include Irving BERLIN, Jerome KERN, Cole PORTER, Noel COWARD, George GERSHWIN, Richard RODGERS, Lorenz HART, Oscar HAMMERSTEIN 2D, Stephen SONDHEIM, and Andrew LLOYD WEBBER. Innovations came with Rodgers and Hammerstein's *Oklahoma!* (1943), which integrated music, song, and dance with a detailed plot, and *West Side Story* (1957), which introduced serious themes, causing the genre to be called simply "musicals." In the 1960s the "rock musical" (see ROCK MUSIC) came into prominence with the production of *Hair* (1967). Film musicals attained their greatest popularity in the 1930s, 40s, and 50s.

music-hall, in England, a form of entertainment featuring song, dance, acrobatics, PANTOMIME, and comic sketches, catering to the lower and middle classes. Originally offered in inns and taverns, the music-hall as a separate establishment first appeared in the mid-1800s. Following a rapid rise, the music-hall went into a decline with the coming of radio and motion pictures.

music video, performance on videotape of a recorded song, often accompanied by dance, and using quick cuts, stylization, fanciful imagery, and sometimes computer graphics. Originally promotional vehicles, most videos are in the rock idiom and are directed at a teenage audience. Although some are notable for artistic innovation, many feature the macho stars and scantily clad dancers that have become cultural clichés. Music videos were popularized by the MTV cable network (est. 1981) and have influenced advertising, television, and film.

Musil, Robert [mōō'zĭl], 1880–1942, Austrian novelist. Subtle psychological analysis marks his novels *Young Törless* (1906) and *The Man without Qualities* (3 vol., 1930–42). His style has been compared to that of PROUST.

musk, odorous substance secreted by an abdominal gland in the male musk DEER, used in PERFUME as a scent and fixative. Its odor comes from an organic compound called muscone. Musklike substances are also obtained from the MUSKRAT and the civet; some plants yield oils that resemble musk.

muskellunge: see PIKE.

musket: see SMALL ARMS.

Muskie, Edmund Sixtus, 1914–, U.S. senator from Maine (1959–80); b. Rumford, Me. He was governor of Maine (1955–57), the 1968 Democratic vice-presidential nominee, and a contender for the presidential nomination in 1972. He was Pres. CARTER's secretary of state (1980–81).

muskmelon: see MELON.

Muskogean [məskō'gēən], branch of NATIVE AMERICAN LANGUAGES belonging to the Hokan-Siouan family of North America. See NATIVE AMERICAN LANGUAGES (table).

musk ox, hoofed animal (*Ovibus moschatus*) of the CATTLE family, found in arctic North America and Greenland. The musk ox is covered with shaggy fur and has a musky odor. It has splayed hooves and broad, flat horns that downcurve along the sides of the head. Hunted to near extinction in the 19th cent., it is now restored.

muskrat, aquatic RODENT. The common muskrats (genus *Ondatra*) are found in marshes, quiet streams, and ponds in most of North America north of Mexico. They have partially webbed feet, a long tail, and shiny brown outer fur (much used commercially) with a dense undercoat. Muskrats are 10 to 14 in. (25 to 36 cm) and weigh 2 to 3 lb (0.9 to 1.4 kg). Muskrats are closely related to VOLES.

Muslim: see ISLAM.

Muslim art and architecture: see ISLAMIC ART AND ARCHITECTURE; MOGUL ART AND ARCHITECTURE.

Muslim Brotherhood, Islamic organization founded (1928) in Egypt by Hasan al-Banna and long opposed to the increasing secularization of many Islamic nations. Egypt banned the organization

in 1954 when its growing influence threatened the government. Now clandestine, the group has adherents in Egypt, Syria, Sudan, and other Arab countries and has resorted to acts of political violence.

Muslim League, political organization of the Muslims of the Indian subcontinent. Founded (1906) by AGA KHAN III, it grew into an independent party under Muhammad IQBAL and, later, Muhammad Ali JINNAH. In 1947 it became the ruling party of newly formed Pakistan. It split into several factions by 1953 and declined thereafter.

Mussadegh, Muhammad [mo͞o'sädāg], 1880–1967, Iranian political leader, prime minister (1951–53). He led the militant nationalists who succeeded in nationalizing (1951) the British-owned oil industry. The shah openly opposed him and, after trying (1952) to oust Mussadegh, was forced into temporary exile. Upon the shah's return to power (1953), Mussadegh was imprisoned until 1956; after that he lived under house arrest.

mussel, edible BIVALVE mollusk, abundant in cooler seas. Mussels form extensive, crowded beds, anchoring themselves to pilings or rocks by a secretion of strong threads known as the byssus. The dark-shelled burrowing freshwater mussel is a source of PEARLS and MOTHER-OF-PEARL.

Musset, (Louis Charles) Alfred de [müsā'], 1810–57, French romantic poet. In his exquisite love lyrics, e.g., *Les Nuits* (1835–37), and his narrative poems, e.g., *Rolla* (1833), he combined classic clarity with the passionate subjectivity of ROMANTICISM. He also wrote short novels and plays, including *Lorenzaccio* (1834). An autobiographical novel, *Confession of a Child of the Century* (1836), gives an account of his unhappy love affair with George SAND.

Mussolini, Benito, 1883–1945, Italian Fascist leader and dictator. He edited Socialist newspapers but broke with the Socialists to support Italy's entry into World War I. In 1919 he organized his staunchly nationalistic followers, who wore black shirts as uniforms and practiced terrorism in armed groups. In 1921 he was elected to Parliament and founded the National Fascist party (see FASCISM). His Fascists marched (Oct. 1922) on Rome, and King VICTOR EMMANUEL III called on Mussolini to form a government. Called *Duce* leader, he gradually created a dictatorship and ended parliamentary government (1928). In 1929 he concluded the LATERAN TREATY with the Vatican. His imperialistic designs led to the conquest of Ethiopia (1935–36) and the occupation of Albania (1939). He signed (1939) an alliance with Nazi Germany, but Italy's involvement in WORLD WAR II was a military failure in Greece and N Africa. The imminent Allied invasion of the Italian mainland led to a rebellion within the Fascist party. The king dismissed Mussolini and had him imprisoned, but the Germans made him a puppet ruler in N Italy. On the German collapse (1945) Mussolini was captured by Italian partisans, summarily tried, and executed.

Mussorgsky, Modest Petrovich: see MOUSSORGSKY.

mustard, common name for the Cruciferae, a large family chiefly of herbs of north temperate regions, typified by flowers with four petals arranged diagonally ("cruciform") and alternating with the four sepals. The Cruciferae, often rich in SULFUR compounds and VITAMIN C, include many important food and condiment plants, e.g., rape, rutabaga, TURNIP, mustard, numerous CABBAGE varieties, WATERCRESS, HORSERADISH, and RADISH. The herbs called mustard are species of *Brassica* native to Europe and W Asia. Black (*B. nigra*) and white (*B. alba*) mustard are cultivated for their seeds, which are ground and used as a condiment, usually mixed to a paste with vinegar or oil. Mustards are also grown as salad plants and for greens.

mustard gas: see POISON GAS.

Mutanabbi, al-, 915–65, Arab poet, considered the greatest classical Arabic poet; b. Iraq. His early involvement with a religious cult earned him the sobriquet "the would-be prophet." He was part of the brilliant court of the Hamdanid ruler Sayf al-Dawlah in Aleppo, where he wrote many of his elaborate panegyrics.

mutation, in biology, a sudden change in a GENE, or unit of hereditary material, that results in a new inheritable characteristic. In higher animals and many higher plants a mutation may be transmitted to future generations only if it occurs in germ, or sex cell, tissue; body cell mutations cannot be inherited. Changes within the chemical structure of single genes (see NUCLEIC ACID) may be induced by exposure to radiation, temperature extremes, and certain chemicals. The term *mutation* may also be used to include losses or rearrangements of segments of CHROMOSOMES, the long strands of genes. Drugs such as colchicine double the normal number of chromosomes in a cell by interfering with cell division (see MITOSIS). Most mutations are not beneficial, however, as the environment changes, mutations may prove advantageous and contribute to evolutionary changes in a species.

Muti, Riccardo, 1941–, Italian conductor. Principal conductor (1969–81) of the Orchestra Maggio Musicale, in Florence, and (1973–82) the Philharmonia Orchestra, in London, he succeeded Eugene ORMANDY as musical director (1980–92) of the Philadelphia Orchestra (see ORCHESTRA, table). In 1986 he became musical director of Milan's La Scala opera house.

Mutsuhito: see MEIJI.

mutual assured destruction (MAD), theory of nuclear deterrence in which each side has an assured means of retaliation (second-strike capability) in the event of an enemy attack. Also known as the "balance of terror," it depends on both sides having a balance of defensive and offensive forces. Defined by Defense Secy. Robert MCNAMARA in the mid-1960s, MAD resulted in an emphasis on the production of offensive weapons and provided the theoretical foundation for arms control between the U.S. and USSR, because limits could be established on how much offensive power was necessary to assure deterrence. Each actual or potential technological advance by either side, however, destabilized the balance, and the doctrine became obsolete by the 1980s.

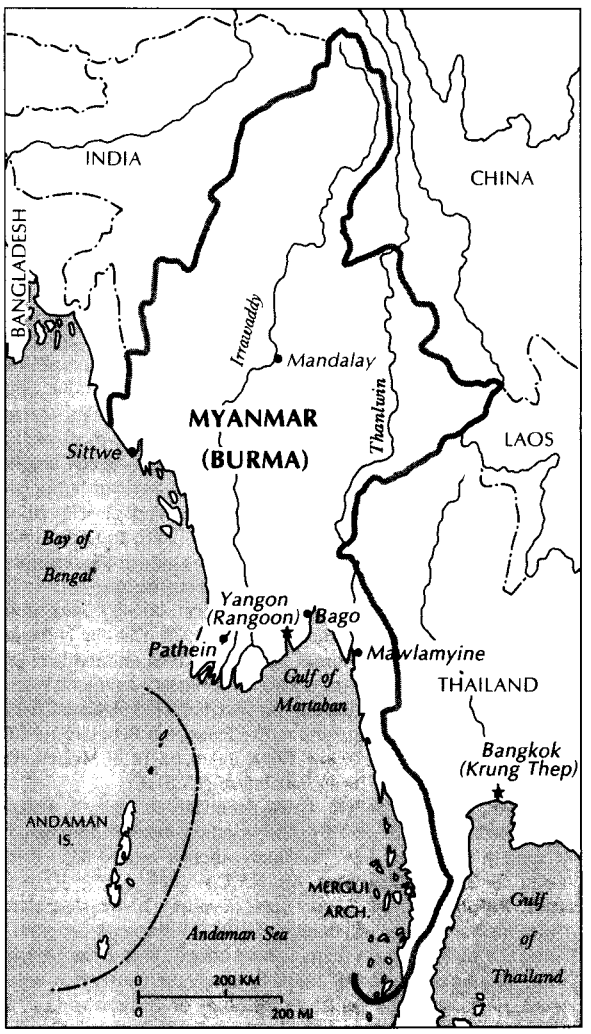
mutual fund, in finance, investment company or trust that has a very fluid capital stock. It is unique in that at any time it can sell, or redeem, any of its outstanding shares at net asset value (i.e., total assets minus liabilities, divided by the total number of shares). A mutual fund, also called an open-end investment company, may own the shares or bonds of several corporations (sometimes of a specified nation or industry), government securities, precious metals, or other assets. A closed-end investment company differs from an open-end company in that the number of shares sold to investors is limited and the price of the shares may fluctuate above and below the net asset value. Mutual funds are designed to provide skilled management and diversification, thereby lessening risk. Earnings are distributed to shareholders in the form of income and capital-gains dividends. See also MONEY-MARKET FUND.

Muybridge, Eadweard [mī'brĭj], 1830–1904, English photographer. A specialist in animal locomotion, he recorded motion with sequential still cameras. He invented (1881) the zoöpraxiscope to project animated images. Much of his work appeared in *Animals in Motion* (1899).

Myanmar, Myanma, or **Burma,** officially Union of Myanmar, republic (1992 est. pop. 42,642,000), 261,789 sq mi (678,033 sq km), SE Asia, bordered by India, Bangladesh, and the Bay of Bengal (W), China (N and NE), Laos and Thailand (E), and the Andaman Sea (S). Principal cities include YANGON (Rangoon), the capital, and MANDALAY. Except for the centrally located IRRAWADDY valley and delta, where most of the people live, the terrain is mountainous. The climate is mostly tropical monsoonal. About 65% of the labor force is employed in agriculture (mostly rice cultivation) and forestry (especially teak and rubber production). Rich mineral resources, not fully exploited, include petroleum, tin, copper, zinc, and coal. The nationalized industrial sector is small but expanding. Myanmar's developing economy, depressed by past political turmoil, began to recover in the 1980s. Burmans constitute about 70% of the predominantly rural population; minorities include the Shans, Karens, Kachins, Chins, Indians, and Chinese. The predominant religion is Theravada Buddhism. The official language is Burmese, but more than 100 distinct languages are spoken.

History. The Burmans established a kingdom in upper Myanmar in the 9th cent. Under King Anawrahta, who introduced Hinayana Buddhism, they gained (11th cent.) supremacy over the rival Mon kingdom and the Irrawaddy delta. The Burmese capital, Pagan, fell (1287) to the Mongols, and the area was then divided among local rulers. The Burmese Toungoo dynasty united the area in the 16th cent. A resurgence (18th cent.) of Mon rule was checked (1758) by

Alaungapaya, who extended Burmese influence. During three Anglo-Burmese Wars (1824–26, 1852, 1885) the region was annexed piecemeal to British India and did not receive limited self-government until 1937. Occupied by Japan in World War II, Myanmar, then known as Burma, achieved complete independence in 1948, with U NU as prime minister. Economic chaos and persistent opposition by insurgent minorities plagued the new government, and in 1958 leadership passed to Gen. NE WIN who restored order. U Nu was returned to power in 1960, but conditions continued to deteriorate, and in 1962 Ne Win staged a successful military coup. A new constitution, making the nation a one-party socialist republic, was adopted in 1974. Under Ne Win, Myanmar was reduced from one of the most prosperous to one of the poorest countries in SE Asia. Ne Win resigned as president in 1981 and party leader in 1988. In Sept. 1988 the military brutally crushed prodemocracy demonstrations and took direct control of the government, but later promised national elections. The antigovernment National League for Democracy, whose leader, AUNG SAN SUU KYI, was under house arrest, won the 1990 parliamentary elections, but the military refused to surrender power and continued to suppress opposition. Gen. Than Shwe became head of the junta in 1992. State control of the economy has eased in recent years, and the junta has signed cease-fires with most of the insurgent ethnic minorities.



myasthenia gravis, chronic disorder of the muscles, characterized by weakness and a tendency to tire easily. Most commonly found in young adults, the disease occurs when the nerve impulses are prevented from reaching the muscles, blocking muscle contraction. It is an AUTOIMMUNE DISEASE caused by a faulty antibody that destroys ACETYLCHOLINE receptors on the muscle cells. The muscles of the head and neck are most frequently involved, those of the trunk and extremities less frequently. Symptoms typically advance irregularly, with varying intensity and severity, but there is a gradual worsening over a period of years, with the major danger resulting from respiratory paralysis or infection. Treatment can include IMMUNOSUPPRESSIVE DRUGS, drugs that increase the amount of acetylcholine available to the muscle, and PLASMAPHERESIS.

Mycenaean civilization [mīsēnē'ən], an ancient AEGEAN CIVILIZATION known from excavations at Mycenae. Undertaken by Heinrich SCHLIEMANN and others after 1876, they helped revise early Greek history. The Mycenaeans were Indo-European, Greek-speaking people who entered GREECE from the north c.2000 B.C., bringing with them advanced techniques in art and architecture. Mercantile contact with the Minoans on Crete advanced their culture, and by 1600 B.C. Mycenae had become a major center of the ancient world, competing with CRETE for maritime control of the Mediterranean. After the destruction of KNOSSOS (c.1400 B.C.) Mycenae achieved supremacy, and much of the Minoan cultural tradition was transferred to the mainland. The invasion by the Dorians (c.1100 B.C.) ushered in a period of decline, and by 900 B.C. the centers of culture and wealth had shifted elsewhere.

My Lai incident [mē lī], massacre of civilians in the VIETNAM WAR. On Mar. 16, 1968, U.S. soldiers, led by Lt. William L. Calley, invaded the South Vietnamese hamlet of My Lai, an alleged Viet Cong stronghold, and shot to death 347 unarmed civilians, including women and children. The incident was not made public until 1969. Special army and congressional investigations followed. Five soldiers were court-martialed, and one, Lt. Calley, was convicted (Mar. 29, 1971) and sentenced to life imprisonment. In Sept. 1974 a federal court overturned the conviction, and Calley was released.

myna or **mynah,** Asian STARLING, a bird found chiefly in India and Sri Lanka and known for its power of mimicry. The hill myna (*Gracula religiosa*), 12–15 in. (30–38 cm), is the best known. Glossy black with yellow head wattles, it is a forest dweller and lives mostly on fruit. When trained, it is a better mimic than the PARROT.

myopia: see NEARSIGHTEDNESS.

Myrdal, Gunnar [mēr'däl], 1898–1987, Swedish economist, sociologist, and public official. Winner, with F.A. von Hayek, of the 1974 Nobel Prize in economics, Myrdal taught at the Univ. of Stockholm (1933–50, 1960–67), held several government posts, and was executive secretary (1947–57) of the UN Economic Commission for Europe. As head of a Carnegie Corp. study (1938–42) of African Americans, he collaborated on *An American Dilemma* (1944; new ed. 1962), maintaining that the U.S. racial problem was inextricably entwined with the democratic functioning of American society. Other works include *Crisis in the Population Question* (1934), written with his wife, and *Challenge of World Poverty* (1970). His wife, **Alva Myrdal,** 1902–86, Swedish sociologist and diplomat, was Sweden's ambassador to India (1956–61) and minister for disarmament (1966–72). For her work in the area of nuclear disarmament she was awarded (1982) the Nobel Peace Price.

myrrh: see INCENSE-TREE.

myrtle, common name for the family Myrtaceae, trees and shrubs mostly native to tropical regions, especially in America and Australia. The family is characterized by usually evergreen leaves containing aromatic volatile oils; many have showy blossoms. Myrtles are of economic importance for their timber, gums and resins, oils, spices, and edible fruits. The true myrtle genus (*Myrtus*) is chiefly of the American tropics, but the classical myrtle (*M. communis*) is native to the Mediterranean area. Its glossy leaves were made into wreaths for victors in the ancient OLYMPIC GAMES. Other trees in the myrtle family include the CLOVE, EUCALYPTUS, GUAVA, and PIMENTO, or allspice.

mysteries, important secret cults in Greek and Roman religion. Possibly based on primitive fertility rites, their elaborate, mystic ritual appealed to individuals who had tired of the formalistic, state-centered rites of traditional Greek and Roman religion, and who sought a promise of personal salvation and immortality. Some mysteries were survivals of indigenous rites, while others (e.g., the cult

of CYBELE) were of foreign origin. Especially important in Greece were the Eleusinian and ORPHIC MYSTERIES.

mystery story: see DETECTIVE STORY.

mysticism [Gr., = the practice of those who are initiated into the mysteries], the practice of putting oneself into direct relation with GOD, the Absolute, or any unifying principle of life. There are two general tendencies in the speculation of mystics—to regard God as outside the soul, which rises to God by successive stages, or to regard God as dwelling within the soul, to be found by delving deeper into one's own reality. The contemplative path to union conventionally requires a series of steps involving purgation, illumination, and increase of spiritual love. Various rituals may assist the process. The language of mysticism is difficult and usually symbolic; biographies and autobiographies of mystics are the major sources for direct study (for example, those of such mystics as St. THERESA of Ávila; St. JOHN OF THE CROSS; Jakob BOEHME; and Aurobindo GHOSE). Although mysticism is inseparably linked with religion, the term itself is used very broadly in English, being extended to magic, occultism, or the esoteric. Mysticism is encountered in Greek NEOPLATONISM, CHRISTIANITY, JUDAISM, BUDDHISM, HINDUISM, ISLAM, and TAOISM.

mythology, collective myths of a people and scientific study of such myths. Myths are traditional stories occurring in a timeless past and involving supernatural elements. Products of prerational cultures, myths express and explain such serious concerns as the creation of the universe and of humanity, the evolution of society, and the cycle of agricultural fertility. Myths are differentiated from folktales (e.g., Cinderella and tales from *The Arabian Nights*) by being more serious, less entertaining, more supernatural, and less rational and logical. Legends and sagas, by contrast with myths, are historical or quasi-historical in nature. Many theories have been advanced to explain myths. The Greeks' explanation of their own mythology was most fully developed in STOICISM, which reduced the gods to moral principles and natural elements. Such allegorical interpretations continued into the 18th cent. Theologians have tended to view myths (e.g., the blood myth or the myth of a golden age) as foreshadowings or corruptions of Scripture. Modern investigations of mythology began with the 19th-cent. philologist Max MÜLLER, who saw myths as having evolved from linguistic corruptions. Anthropological explanations have also abounded. Sir James FRAZER in his *Golden Bough* (1890) proposed that all myths were originally connected with the idea of fertility in nature, with the birth, death, and resurrection of vegetation as a constantly recurring motif. Bronislaw MALINOWSKI considered myths to be validations of established social patterns. Among influential psychologists, Sigmund FREUD related the unconscious myth and dream, while Carl JUNG believed that all peoples unconsciously formed the same mythic symbols. In the 20th cent. Mircea Eliade believes that myths serve to return their adherents to the time of the original creative act, and Claude LÉVI-STRAUSS contends that myths should be interpreted structurally. Important mythologies include the Greek, largely codified and preserved in the works of HOMER and HESIOD; the Roman, primarily derived from the Greek, and, with it, the best-known; the Norse, which is less anthropomorphic; the Indian (Vedic), which tends to be abstract and otherworldly; the Egyptian, which is closely related to religious ritual; and the Mesopotamian, which exhibits a strong concern with the relationship between life and death. Mythology has enriched literature since the time of AESCHYLUS and has been used by some of the major English poets, e.g., MILTON, SHELLEY, KEATS. Some great literary figures, e.g., William BLAKE, James JOYCE, Franz KAFKA, W.B. YEATS, T.S. ELIOT, and Wallace STEVENS, have constructed symbolic personal myths by reshaping old mythological materials.

N

N, chemical symbol of the element NITROGEN.

Na, chemical symbol of the element SODIUM.

NAACP: see NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE.

Nabis [näbē'] [from Heb., = prophets], a group of artists in France active in the 1890s. The principal theorists were Paul Sérusier and Maurice DENIS, and the members included VUILLARD, BONNARD, MAILLOL, and Félix Valloton. Influenced by GAUGUIN, they developed a style characterized by flat areas of bold color and heavily outlined surface patterns. They were unified by their dislike of IMPRESSIONISM.

Nablus, city (1989 est. pop. 98,000), in the Israeli-occupied WEST BANK. It is the market center for a region where wheat and olives are grown and sheep and goats are grazed. Nablus has remains dating from c.2000 B.C. The Samaritans (see SAMARIA) made it their capital, and under Rome it was named Neapolis, from which the present name derives. The city came under Israeli occupation after the 1967 ARAB-ISRAELI WAR.

Nabokov, Vladimir [näbô'kŏf], 1899–1977, Russian-American novelist; b. St. Petersburg; one of the most original masters of 20th-cent. fiction. After the Russian Revolution of 1917 he lived in England and Germany, came to the U.S. (1940), taught at Cornell (1948–59), and settled in Switzerland (1959). Nabokov's novels are frequently experimental and obscure but are always erudite, witty, and intriguing. His early fiction, in Russian, includes *Despair* (1936) and *Invitation to a Beheading* (1938). His most famous work in English, *Lolita* (1958), the story of a middle-aged European intellectual's infatuation with a 12-year-old American "nymphet," brought him overnight fame and became a modern classic. Among his other novels are *Pnin* (1957), *Pale Fire* (1962), and *Ada* (1969). Nabokov also wrote poetry, criticism, stories, and autobiographies, and was an internationally recognized lepidopterist.

Nacogdoches [năk"ədō'chĭs], city (1990 pop. 30,872), seat of Nacogdoches co., E Tex.; settled 1779, inc. 1929. The city is located in a pine and hardwood forest. Lumbering, feed and fertilizer production, and tourism are important. Historically prominent, Nacogdoches was a Spanish bastion against French Louisiana. Settlement (1820) by Americans led to the Fredonian Rebellion (1826), a premature attempt to make Texas independent of Mexico. The city was active in the Texas Revolution (1835–36).

Nadelman, Elie, 1882–1946, Polish-American sculptor; b. Poland. He settled in the U.S. in 1914. His wood or metal sculptures have a smooth simplicity, e.g., his jaunty, urbane bronze *Man in the Open Air* (c.1915; Mus. Mod. Art, N.Y.C.).

Nader, Ralph, 1934–, U.S. consumer advocate; b. Winsted, Conn. Since his book *Unsafe at Any Speed* (1965) influenced Congress to bring automobile design under federal control, Nader has been the most prominent leader of the U.S. CONSUMER PROTECTION movement. He founded the Center for the Study of Responsive Law, the Center for Auto Safety, and the Public Interest Research Group.

Nadir Shah or **Nader Shah,** 1688–1747, shah of IRAN (1736–47), founder of the Afshar dynasty. After victories over the Afghans and the Turks, he became shah by deposing (1736) the last of the Safavid dynasty. He successfully invaded India in 1739; the great

treasures he carried off included the Peacock Throne and the Koh-i-noor diamond. He greatly extended Iran's territory.

NAFTA: see NORTH AMERICAN FREE TRADE AGREEMENT.

Nagano, city (1990 pop. 347,036), central Honshu, Japan, on the Tenryu R. It produces processed food, automobile parts, and textiles. Nagano is also a religious center; Zenkoji, a 7th-cent. Buddhist temple, is there. It will be the site of the 1998 winter Olympic games.

Nagasaki, city (1990 pop. 444,616), capital of Nagasaki prefecture, W Kyushu, Japan. Nagasaki's port was the first to receive (16th cent.) Western trade, and remains one of Japan's leading ports. Shipbuilding is the chief industry. During World War II, Nagasaki was the target of the second ATOMIC BOMB ever detonated (Aug. 9, 1945) on a populated area. About 75,000 people were killed or wounded, and more than one third of the city was devastated.

Nag Hammadi, town in Egypt where 53 gnostic texts in the Coptic language and dating from the 4th cent. A.D. were discovered in 1945. The texts, which shed new light on Christian gnosticism, include gospels, apocalypses, sayings of the resurrected Jesus, and theological treatises.

Nagorno-Karabakh [nəgôr'nə-kərəbäkh], autonomous region (1990 est. pop. 192,000), 1,699 sq mi (4,400 sq km), SE Azerbaijan. Stepanakert is the capital. The mountainous region's residents are mainly Armenian. Farming and grazing are important. There are some light industries, and marble and limestone are quarried. Won by Armenia in the 1st cent. A.D., the area passed through Arab and Persian hands before being ceded to Russia (1805). In the late 1980s Armenian residents began demanding the region's inclusion in Armenia, leading to an Armenian-Azerbaijani war for control of Nagorno-Karabakh. By the end of 1993, Armenians had won control of most of the region.

Nagoya, city (1990 pop. 2,154,664), capital of Aichi prefecture, central Honshu, Japan. It is a major port, transportation hub, and industrial center producing steel, textiles, aircraft, and automobiles. The city has many universities, of which Nagoya Imperial Univ. is the best known, and two famous shrines, the Atsuta (founded 2d cent.), where the sacred imperial sword is housed, and the Higashi Honganji, which was built in 1692.

Nagy, Imre [nôj, nŏd'yə], 1895?–1958, Hungarian Communist leader. As premier (1953–55), he loosened government controls and was critical of Soviet influence. Denounced and removed from office, he was recalled as premier shortly before the 1956 uprising (see HUNGARY). After the revolt was crushed, he was tried and executed by KÁDÁR's regime.

Nahuatlan [nä'wŏt''lən], group of languages of the Uto-Aztecan branch of the Aztec-Tanoan linguistic stock of North America and Mexico. See NATIVE AMERICAN LANGUAGES (table).

Nahum, book of the OLD TESTAMENT, 34th in the Authorized Version, seventh of the Minor PROPHETS, a prophecy of doom against NINEVEH, the Assyrian capital, by Nahum the Elkoshite, who is otherwise unknown.

naiads, in Greek mythology: see NYMPH.

Naipaul, V(idiadhar) S(urajprasad) [nī'pôl], 1932–, English author; b. Trinidad. He has lived in England since 1950. Of Indian parentage, he is known for his elegant prose style, penetrating analyses of alienation, and ironic, increasingly pessimistic vision of the THIRD WORLD. He has written serious travel literature, *The Middle Passage* (1962) and *India: A Million Mutinies Now* (1990); novels, *A House for Mr. Biswas* (1961) and *Guerrillas* (1975); political essays; and an analysis of modern ISLAM, *Among the Believers* (1981).

Nairobi, city (1990 est. pop. 1,505,000), capital of Kenya, in the E African highlands. A modern metropolis with broad boulevards, it is Kenya's largest city; its administrative, communications, and economic center; and the distribution center for such agricultural products as coffee and cattle. Manufactures include automobiles, food products, chemicals, and textiles. Nairobi is linked by rail with the port of MOMBASA. Nairobi National Park, a large wildlife park nearby, attracts many tourists. Founded in 1899, Nairobi became (1905) the capital of a British protectorate (later Kenya Colony).

Naismith, James: see BASKETBALL.

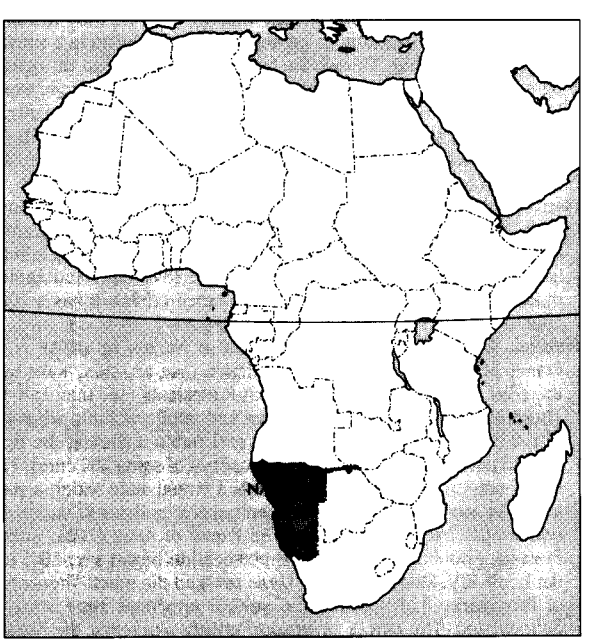
Nakasone Yasuhiro, 1918–, Japanese political leader and prime minister (1982–89). He served in the Diet after 1946. A political ally of TANAKA KAKUEI, Nakasone succeeded SUZUKI ZENKO as prime minister. He increased Japan's military strength and established closer ties with the U.S. and with China. He resigned in 1989.

naked mole rat, name applied to a species (*Heterocephalus glaber*) of small RODENTS found in E Africa, whose members—the only hairless rodents—live entirely in underground colonies with a structure resembling that of insect colonies. Each colony has a queen, a breeding male, soldiers, and workers. Colony members are closely related and seem to work for the success of the whole community rather than individual survival.

Nakhichevan, autonomous republic (1990 est. pop. 310,000), 2,124 sq mi (5,501 sq km), an exclave of Azerbaijan bordered by Iran and Turkey (S) and separated from Azerbaijan by Armenia (N). Nakhichevan is the capital. Agricultural products include cotton, tobacco, rice, wine, and silk. There are salt, molybdenum, lead, and zinc deposits and various light industries. The population is mainly Azeri.

Namath, Joe (Joseph William Namath), 1943–, American football player; b. Beaver Falls, Pa. A star quarterback at the Univ. of Alabama, he received a lucrative contract from the New York Jets, sparking a bidding war for players between the National and American leagues that ultimately produced a merger. "Broadway Joe," who led the Jets to an upset victory in the 1969 Super Bowl, was known for his free life-style.

Namibia [nämĭb'ēə], officially Republic of Namibia, formerly South West Africa, republic (1992 est. pop. 1,575,000), c.318,000 sq mi (823,620 sq km), SW Africa, bordered by Angola (N), Zambia (NE), Botswana (E), South Africa (SE), and the Atlantic Ocean (W). Namibia also includes the CAPRIVI STRIP in the northeast and the former South African enclave of WALVIS BAY, which was relinquished to Namibia in 1994. WINDHOEK is the capital. The country consists of four main geographical regions: the barren Namib Desert, along the entire Atlantic coast; a large central plateau that rises to 8,402 ft (2,561 m) at Brandberg Mt.; the western edge of the KALAHARI desert; and an alluvial plain in the north. The agricultural sector of the economy is based on stock raising (cattle, goats, and sheep), with income derived mainly from Karakul pelts, meat and livestock, and dairy goods. Namibia has rich deposits of diamonds, copper, lead, uranium, manganese, zinc, tin, silver, vanadium, and tungsten; its extensive mining industry is run chiefly by foreign companies. Fishing fleets operate in the Atlantic. Meat and fish processing are important, and manufacturing is pursued on a small scale. The population includes Bantu-speaking ethnic groups and whites of South African, German, and British descent. English is



the official languages; Afrikaans is widely spoken. About half the people are Christian; the rest follow traditional beliefs.

History. The coastal regions of Namibia were explored by the Portuguese and Dutch in the early 15th cent., by English missionaries in the 18th cent., and by German missionaries in the 1840s. The German government proclaimed (1884) a protectorate over what is now Lüderitz and soon extended it to all of South West Africa. German forces crushed (1908) a revolt of the Nama and the Herero, resulting in the deaths of some 84,000 Africans. In World War I the country was occupied by SOUTH AFRICA, which afterward administered it under a League of Nations mandate. In 1945 South Africa refused to surrender its mandate and place South West Africa under the UN trusteeship system, and rejected demands by the UN General Assembly, backed (1971) by the International Court of Justice, that it withdraw. The UN adopted the name Namibia. In the 1970s South Africa proceeded with plans for independence on its own terms, holding elections and forming (1979) a national assembly, while a nationalist group, the South West Africa People's Organization (SWAPO), based largely in Angola, waged guerrilla warfare. In 1988 South Africa agreed to a UN-supervised transition to independence, and in 1990 Namibia became independent under Pres. Sam Nujoma, leader of SWAPO's guerrilla army, after SWAPO won 57% of the vote. Namibia remains dependent on South Africa as a source for needed imports and for shipment of its exports and as a market for them.

Nanchang, city (1990 est. pop. 1,350,000), capital of Jiangxi prov., China, on the Gan R. Noted for the porcelain produced in the nearby town of Jingdezhen, it is an important industrial city with products that include electronic equipment, machinery, textiles, and tractors. An old walled city, it dates from the Sung dynasty (12th cent.). Important in the Chinese revolution, it was the site of the Nanchang Uprising (1927), led by ZHOU ENLAI and ZHU DE.

Nanjing or **Nanking** [Chin. = southern capital], city (1990 est. pop. 2,500,000), capital of Jiangsu prov., E central China, on the CHANG (Yangtze) R. One of China's largest cities, it is dominated by the Chang River bridge, a crucial link in China's transport network. Nanjing's products include iron and steel, refined oil, processed food, chemicals, textiles, machinery, and motor vehicles. It served (3d–6th cent.; 14th–15th cent.; 1928–37) as capital of China and insurgents held the city (1853–64) during the TAIPING REBELLION (1850–64), the second SINO-JAPANESE WAR (1937–45), and the Chinese revolution. A celebrated literary center, it is known for its educational institutions, its large library, and its astronomical observatory.

nanotechnology: see MICROMECHANICS.

Nansen, Fridtjof, 1861–1930, Norwegian arctic explorer, statesman, scientist, and humanitarian. From 1893 to 1896 he tried to reach the NORTH POLE by drifting in ice across the polar basin in a special crush-resistant ship. Though he failed, his information on oceanography, meteorology, and diet laid the basis for future arctic work. He was professor of zoology and oceanography at the University of Christiana (now Oslo); Norway's first minister to England (1906–8); and the LEAGUE OF NATIONS high commissioner for refugees, for which he received the 1922 Nobel Peace Prize.

Nantes [näNt], city (1990 pop. 244,995), capital of Loire-Atlantique dept., W France. It is a major ocean port with such manufactures as food products and naval and farm equipment. A Roman administrative center, it was held by Norsemen (843–936) and Breton dukes (10th cent.) before union with France (1524). It has a 10th-cent. castle and a 15th-cent. cathedral.

Nantes, Edict of, 1598, decree issued at Nantes by HENRY IV of France at the end of the Wars of Religion (see RELIGION, WARS OF); the edict defined the rights of French Protestants (see HUGUENOTS). These included liberty of conscience and public worship wherever it had been previously granted, full civil rights including the right to hold public office, and Protestant control of some 200 cities. The last condition gave French Protestants a virtual state within a state and was incompatible with the centralizing policies of RICHELIEU and MAZARIN, and of LOUIS XIV. The Peace of Alais (1629) ended Protestant political privileges and persecution began after 1665 under Louis XIV. Finally, in 1685, Louis revoked the edict. Thousands of Protestants fled abroad, and several provinces were virtually depopulated. The edict's revocation greatly weakened the French economy by driving out a skilled and industrious segment of the nation.

Nantucket, island (1990 pop. 6,012), SE Massachusetts, 25 mi (40 km) S of CAPE COD. First settled in 1659, it was a major whaling center until the mid-19th cent. and is now one of the most popular summer resorts in the U.S. It is c.14 mi (23 km) long.

Naomi: see RUTH.

napalm, incendiary material used in bombs and flame throwers. Developed during World War II, napalm is a mixture of gasoline (sometimes mixed with other petroleum fuels) and a thickening agent. The thickener turns the mixture into a dense jelly that flows under pressure, as when shot from a flame thrower and sticks to a target as it burns. Earlier SOAP thickeners have been replaced by polystyrene and similar polymers.

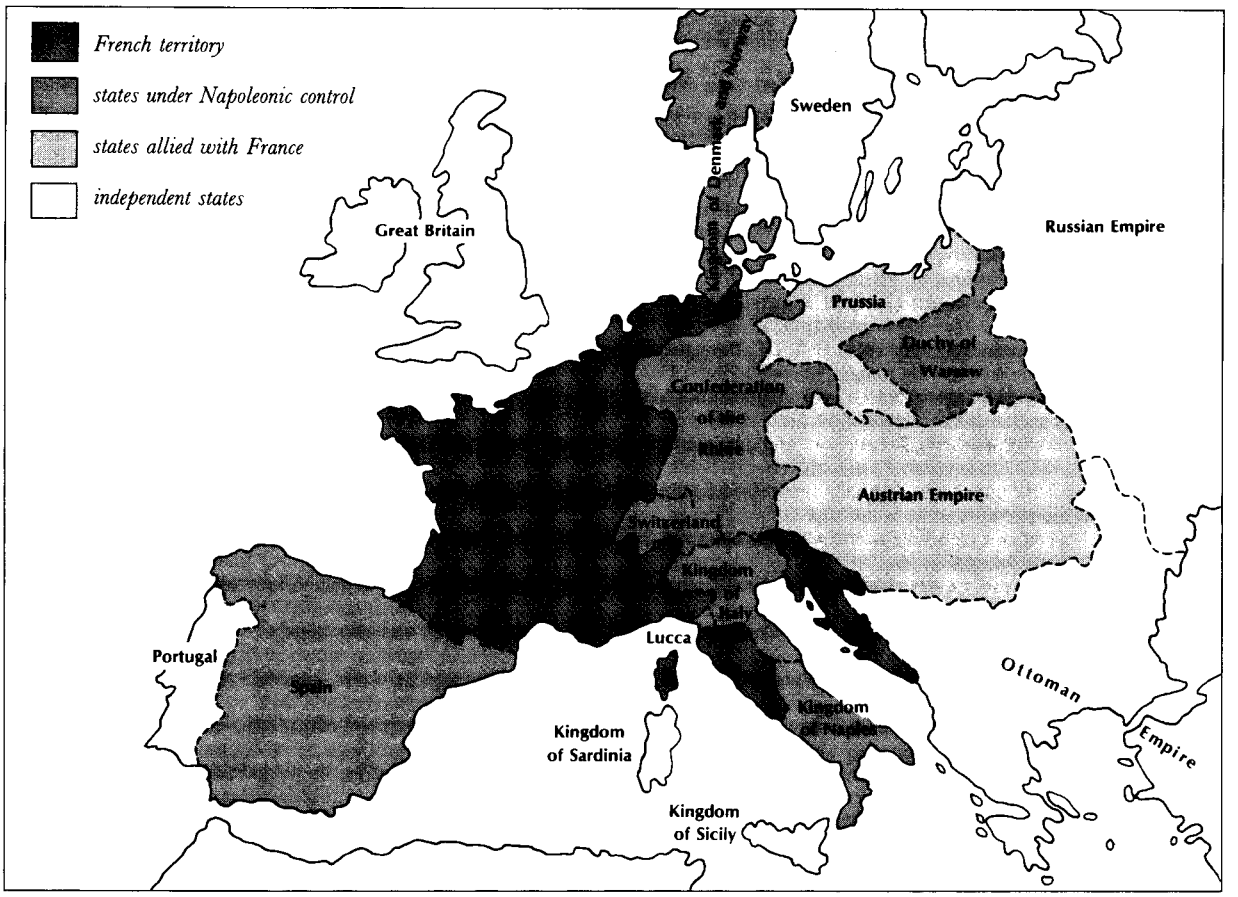
Naphtali: see ISRAEL, TRIBES OF.

Napier, John, 1550–1617, Scottish mathematician, the inventor of LOGARITHMS. He also introduced the decimal point in writing numbers. His *Rabdologiae* (1617) gives various methods for abbreviating arithmetical calculations, including a method of multiplication using a system of numbered rods called Napier's rods, or Napier's bones. Napier was also known as an outspoken exponent of the Protestant cause.

Naples, Ital. *Napoli,* city (1990 pop. 1,204,149), capital of Campania, S central Italy, on the Bay of Naples. A crowded, noisy city, it is a major seaport, and a commercial and industrial center. Naples has long been known for its music. A Greek colony, it was taken by Rome (4th cent. B.C.) and the Byzantines (6th cent. A.D.). It was an independent duchy from the 8th cent., later becoming (1139) part of the kingdom of Sicily. From 1282 it was the capital of the kingdom of Naples (see separate article). It fell (1860) to GARIBALDI and joined united Italy. Historic buildings include the Cathedral of St. Januarius (14th cent. and later), the Castel Nuovo (1282), and the Royal Palace (17th cent.).

Naples, kingdom of, former state in S Italy, with Naples as its capital. In the 11th and 12th cent. the Normans under ROBERT GUISCARD and his successors conquered S Italy from the Byzantines. The pope invested (1139) Roger II, Guiscard's nephew, with the kingdom of Sicily, which included lands in S Italy. The kingdom passed to the house of HOHENSTAUFEN and was ruled successively by FREDERICK II, CONRAD IV, MANFRED, and Conradin. Under them S Italy flowered. In 1266 CHARLES I (Charles of Anjou), founder of the Angevin dynasty, became king. He lost Sicily because of an armed revolt (1282) but retained his mainland possessions, which became known as the kingdom of Naples. The Angevins fought the house of Aragón for Sicily until 1373. After 1380 a struggle for succession in Naples began between Charles of Durazzo (see CHARLES III of Naples) and Louis of Anjou (later Louis I of Naples). In 1442 Naples was seized by ALFONSO V of Aragón. Meanwhile, the Angevin claims had passed to the French crown, and CHARLES VIII of France briefly seized Naples in 1495, thus starting the ITALIAN WARS. The Treaties of Blois (1504–5) gave Naples and Sicily to Spain, and heavy Spanish taxes impoverished the land. In the War of the SPANISH SUCCESSION the kingdom was seized (1707) by Austria, but it was returned (1738) to Spain and ruled by a cadet line of the Spanish BOURBONS. In 1806 the French took Naples, and Joseph Bonaparte (see BONAPARTE, family) was made king. He was succeeded (1808) by Joachim MURAT. In 1815 the Bourbons were restored, and Naples became (1816) part of the kingdom of the TWO SICILIES.

Napoleon I, 1769–1821, emperor of the French; b. Ajaccio, Corsica, son of Carlo and Letizia Bonaparte. This article covers the life of Napoleon, his part in the FRENCH REVOLUTIONARY WARS, and the major events of the **Napoleonic Wars.** Young Napoleon was sent to military schools in France and received a commission in the French artillery in 1785. After the start of the FRENCH REVOLUTION, he took part in the Corsican rebellion against Pasquale PAOLI and was forced to leave the island. Returning to France, Bonaparte was associated with the JACOBINS and gained notice by dislodging (1793) the British from Toulon. He was briefly imprisoned in 1794, but his career was reopened when the Convention was assailed (Oct. 1795) by a Parisian mob, and Napoleon was called on to disperse it. Made commander of the army in Italy, Bonaparte conducted the brilliant Italian campaign (1796–97) against Austria and



Napoleonic Europe (1821)

concluded it with the favorable Treaty of Campo Formio. Bonaparte then drew up a plan to strike at Britain's colonial empire by attacking Egypt. His victory over the Mamluks in the battle of the Pyramids (July 1798) was made useless when the French fleet was destroyed in Aboukir Bay (Aug. 1–2) by British Adm. NELSON. Leaving a hopeless situation in Egypt, Bonaparte returned to France and joined a conspiracy already hatched by Emmanuel SIEYÈS.

The Consulate. The French DIRECTORY was overthrown by the coup of 18 Brumaire (Nov. 9–10, 1799), and the Consulate was set up with Bonaparte as first consul, or dictator. He centralized the administration, stabilized the currency, and reformed the tax system. He also made peace with the Roman Catholic Church by the CONCORDAT OF 1801 and reformed the legal system with the Code Napoléon. In 1800 Napoleon defeated the Austrians at Marengo, Italy (June 14), and the treaties of Lunéville (1801) and Amiens (1802) made peace with Austria and Britain respectively. This phase is generally considered to divide the French Revolutionary Wars from the Napoleonic Wars. In 1802 Napoleon became first consul for life, and in 1803 Britain again declared war on France.

The Empire. Napoleon had himself crowned emperor in 1804 and proclaimed king of Italy in 1805. The Third Coalition was formed (1805) against him by Britain, Austria, Russia, and Sweden, but Napoleon crushed the Austrians at Ulm, and won (Dec. 2, 1805) his most brilliant victory at Austerlitz, over the Austrians and Russians. Prussia, which joined the coalition in 1806, was defeated at Jena (Oct. 14). British sea power, however, grew stronger with Nelson's victory at TRAFALGAR. Napoleon then instituted the Continental System to try to halt British trade with France and her allies. On land, war with Russia continued. The indecisive battle of Eylau (Feb. 8, 1807) was made good by Napoleon at Friedland (June 14). The treaties of Tilsit (July 1807) with Russia and Prussia left Napoleon master of the Continent. The whole map of Europe was rearranged. The HOLY ROMAN EMPIRE was dissolved (1806), and the kingdoms of Holland and Westphalia were created, with Napoleon's brothers Louis and Jérôme Bonaparte (see BONAPARTE, family) as kings. A third brother, Joseph, became (1806) king of Naples and was made (1808) king of Spain. In 1809 Austria's attempt to reopen warfare was squelched at Wagram (July 6), and Napoleon annexed the Papal States to France despite the objections of Pope PIUS VII. In 1809 Napoleon also had his marriage to the Empress JOSEPHINE, whom he had married in 1796, annulled. He then married (1810) MARIE LOUISE of Austria, who bore him a son (see NAPOLEON II).

Decline and Fall. Britain remained an opponent, and the Continental System proved difficult to enforce. Napoleon's first weakness had appeared in the PENINSULAR WAR (1808–14), and his alliance with Russia was tenuous. When Czar ALEXANDER I rejected the Continental System, Napoleon invaded (1812) Russia with the 500,000-strong *Grande Armée.* After the indecisive battle of Borodino (Sept. 7), Napoleon entered Moscow, but the winter and lack of supplies forced him to begin a disastrous retreat that became a rout after his troops crossed the Berezina R. in late November. Napoleon left his army and hastened to Paris to prepare French defenses. Prussia quickly turned against France and was joined in a coalition by Britain, Sweden, and Austria. The allies defeated the emperor at Leipzig (Oct. 1813), pursued him into France, and took Paris (Mar. 1814). Napoleon abdicated (Apr. 11, 1814) and was exiled to the island of Elba, which the allies gave him as a sovereign principality. His victors were still deliberating at the Congress of VIENNA when Napoleon landed at Cannes and marched on Paris. King LOUIS XVIII fled, and Napoleon ruled during the HUNDRED DAYS. He was defeated, however, in the WATERLOO CAMPAIGN (June 12–18, 1815) and abdicated again. Sent as a prisoner of war to the lonely British island of SAINT HELENA, he died there of cancer on May 5, 1821. His remains were returned to Paris in 1840. Estimates of Napoleon's place in history differ widely.

Beyond doubt one of the greatest conquerors of all time, he also promoted the growth of liberalism through his lasting administrative and legal reforms.

Napoleon II, 1811–32, son of NAPOLEON I and MARIE LOUISE; known as the king of Rome (1811–14), as the prince of Parma (1814–18), and after that as the duke of Reichstadt. Although Napoleon I abdicated (1815) in his favor, he never ruled. After 1815 he was a virtual prisoner in Austria.

Napoleon III (Louis Napoleon Bonaparte), 1808–73, emperor of the French (1852–70); son of Louis BONAPARTE, king of Holland; and nephew of NAPOLEON I. He spent his youth in exile and attempted (1836, 1840) two coups against the French government. Sentenced to life imprisonment, he escaped (1846) to England, returning to France after the FEBRUARY REVOLUTION of 1848. Elected to the National Assembly, he defeated (Dec. 1848) Gen. L.E. Cavaignac in the presidential election by a wide margin. Louis Napoleon's success was due largely to his name, which evoked French nostalgia for past Napoleonic glory. As president of the Second Republic, he consolidated powerful conservative support and instigated the coup of Dec. 3, 1851; the legislative assembly was dissolved, and an attempted workers' uprising was brutally suppressed. Louis Napoleon gained dictatorial powers in the new constitution of Jan. 1852, and in November a plebiscite overwhelmingly approved the establishment of the Second Empire. He became emperor as Napoleon III. For eight years he exercised dictatorial rule, tempered by material progress. Railway building was encouraged, and cities were rebuilt. The CRIMEAN WAR (1854–56) and the Congress of PARIS restored French leadership on the Continent. A supporter of Italian nationalism, Napoleon III met with Sardinian premier Camillo CAVOUR and planned a joint campaign with Sardinia to expel Austria from Italy (see RISORGIMENTO). After his costly victory at Solferino (1859), however, Napoleon III made a separate peace with Austria. Having lost popularity, the emperor began a more liberal domestic policy. This "Liberal Empire" (1860–70) enabled opposition leaders such as Jules Favre and Adolphe THIERS to become prominent. Cochin China was acquired, and Napoleon supported the building of the SUEZ CANAL. Less fortunate was his intervention (1861–67) in Mexico; U.S. opposition forced a French withdrawal. The FRANCO-PRUSSIAN WAR (1870–71) brought about his downfall. Napoleon took the field himself and was captured at Sedan. He was deposed (Sept. 4, 1870) by a bloodless revolution in Paris. After peace was restored, he lived in exile in England with his wife, EUGÉNIE. His only son was killed while serving in the British army.

Napoleonic Wars: see NAPOLEON I.

naproxen or **naproxen sodium,** a NONSTEROIDAL ANTI-INFLAMMATORY ANALGESIC DRUG used to alleviate the minor pain of arthritis, menstruation, headaches, and the like, and to reduce fever. Side effects include gastrointestinal distress and dizziness. It was approved for over-the-counter sale in the U.S. in 1994.

Nara, city (1990 pop. 349,356), capital of Nara prefecture, S Honshu, Japan. An ancient cultural and religious center, it was founded in 706 by imperial decree. Nara was (710–84) the first permanent capital of Japan. Nara is a tourist center. Nara Park, Japan's largest (1,250 acres/506 hectares) city park, includes the celebrated Imperial Museum. The East Great Temple of Nara is supposedly the largest wooden structure in the world. Near the city is wooded Mt. Kasuga, the traditional home of the gods; its trees are never cut.

Narayan, R(asipuram) K(rishnaswamy), 1906–, Indian novelist. He writes in English. His witty, perceptive depictions of Indian life include *The Financial Expert* (1952) and *Malgudi Days* (1982), a collection of short stories.

Narcissus, in Greek mythology, beautiful youth who refused all love, including ECHO's. As punishment for his indifference, he was made to fall in love with his own image in a pool, whereupon he pined away, and turned into a flower.

narcissus, showy-blossomed plant (genus *Narcissus*) of the AMARYLLIS family, native chiefly to Asia and the Mediterranean region but now widely distributed. The genus includes the yellow daffodil (*N. pseudo-narcissus*), with a long, trumpet-shaped central corona; the yellow jonquil (*N. jonquilla*), with a short corona; and the narcissus, any of several usually white-flowered species, e.g., the poet's narcissus (*N. poetica*), with a red rim on the corona. The biblical ROSE OF SHARON may have been a narcissus.

narcotic, group of drugs with potent analgesic effects, associated with alteration of mood and behavior. The chief narcotic drugs are OPIUM, CODEINE, MORPHINE, and the morphine derivative HEROIN. Narcotics are thought to act by mimicking and/or enhancing the activity of ENDORPHINS, proteins produced by the brain and believed to modulate pain and other nervous system functions. Narcotics are valuable in numbing the senses, alleviating pain, inducing sleep, and relieving diarrhea. Common side effects include nausea, vomiting, and allergic reactions. In large doses, narcotics can cause respiratory depression, COMA, and death. All narcotics are addictive; synthetic narcotics such as meperidine and METHADONE tend to be less addicting and possess fewer side effects, but they are also less potent. (See DRUG ADDICTION AND DRUG ABUSE).

Narragansett, indigenous people of the Eastern Woodlands (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). They occupied most of Rhode Island. Survivors of the plague of 1617 in other peoples joined the Narragansett, making them powerful. Their chief Canonicus sold land (1636) to Roger WILLIAMS and supported the colonists in the PEQUOT War. They numbered 5,000 in 1674, but KING PHILIP'S WAR destroyed Native American power in the region. In 1990 there were 2,456 Narragansetts in the U.S.

Narses, c.478–c.573, Roman general under JUSTINIAN I, rival and successor of BELISARIUS in Italy. After defeating TOTILA (552) and an army of Franks and Alemanni (554) he became exarch of Italy, but his administration was unpopular.

Naruhito, 1960–, Japanese crown prince, son of AKIHITO. He was officially invested as crown prince in 1991. In 1993 he married Owada Masako, a commoner.

Narváez, Pánfilo de [närvä'ĕth], c.1470–1528, Spanish CONQUISTADOR. In CUBA he served Diego de VELÁZQUEZ, who in 1520 sent him to MEXICO to recall CORTÉS; he failed. Commissioned to conquer FLORIDA, he arrived there in 1528, sent his ships to Mexico, and led his force inland in search of gold. Disappointed and harassed by the indigenous people, they returned to the coast, built crude vessels, and set sail for Mexico. All save CABEZA DE VACA and three others were lost.

NASA: see NATIONAL AERONAUTICS AND SPACE ADMINISTRATION.

Nash, John, 1752–1835, English architect, best known for his town plans, as in the Marylebone section of London, including Regent's Park (1818). He initiated the REGENCY STYLE and the extensive use of stucco for city building facades.

Nash, Ogden, 1902–71, American poet; b. Rye, N.Y. His humorous verses with their cleverly outrageous rhymes appeared in such volumes as *I'm a Stranger Here Myself* (1938), *You Can't Get There from Here* (1957), and *Bed Riddance* (1970).

Nashe or **Nash, Thomas,** 1567–1601, English satirist. An ardent anti-Puritan, he was involved in the pamphlet battles of the MARPRELATE CONTROVERSY. *The Unfortunate Traveller* (1594) was a forerunner of the picaresque adventure NOVEL. His plays include *Summer's Last Will and Testament* (1592), a satirical MASQUE, and *The Isle of Dogs,* a lost comedy written with Ben JONSON (1597).

Nashoba, former community, SW Tenn., near Memphis. It was established (1825) by Frances WRIGHT and others, influenced by the model of NEW HARMONY, to educate specially purchased slaves for freedom. Poor management and disease led to its collapse (1829). In 1830 the slaves were taken to Haiti.

Nashua, city (1990 pop. 79,662), seat of Hillsborough co., S N.H., on the Merrimack and Nashua rivers, near the Mass. line; settled c.1655, inc. as a city 1853. Its water power made it an early textile mill town. Manufactures include office equipment, paper, shoes, plastics, and chemicals.

Nashville, city (1990 pop. 488,374), state capital, central Tenn.; inc. as a city 1806, merged with Davidson co. 1963. A Cumberland R. port, cotton center, and railroad hub, it developed from a 1779 settlement. It was named state capital in 1843 and became (1862) an important Union base during the CIVIL WAR. A major agricultural market and important regional commercial center, it has diversified industries, including insurance, publishing, and various manufactures. Nashville is famous as a country-music center and is the site of the "Opryland" entertainment complex. Vanderbilt and Fisk universities are among its numerous educational institutions. The

The key to pronunciation appears on page xiii.

city has many notable buildings of classical design, including a replica (1897) of the PARTHENON.

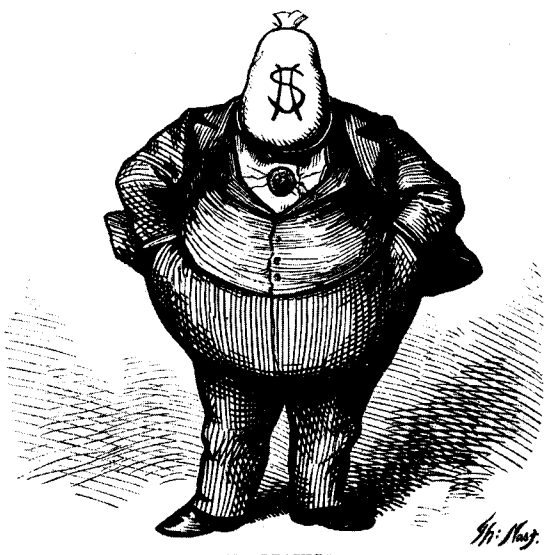
Naskapi: see MONTAGNAIS AND NASKAPI.

Nassau, former duchy, central Germany. Most of it is now included in the state of HESSE; a smaller part is in the state of Rhineland-Palatinate. Wiesbaden was the capital. In 1255 the ruling dynasty split into two main lines. Under the Walramian line Nassau became (1806) a duchy and was absorbed (1866) by PRUSSIA. The Walramians succeeded (1890) to the grand duchy of LUXEMBOURG. The Ottonian line of Nassau settled in the Netherlands and became prominent with WILLIAM THE SILENT. Members of the Dutch line, called the house of Orange, became rulers of the Netherlands.

Nassau, city (1985 est. pop. 135,000), capital of the BAHAMAS. A port on New Providence island, it is the cultural, commercial, and financial heart of the Bahamas and is a famous winter resort. First known as Charles Towne, it was renamed in 1695. Nassau was a rendezvous for pirates in the 18th cent. and was held briefly by American revolutionaries in 1776. It has three old forts.

Nasser, Gamal Abdal, 1918–70, Egyptian army officer and political leader, first president of the republic of Egypt (1956–70). In 1952 he led the coup that deposed King FAROUK. He became premier (1954) and president (1956). He nationalized the Suez Canal in 1956, precipitating the short-lived invasion by Britain, France, and Israel. Nasser suffered a disastrous defeat in the 1967 Six-Day War (see ARAB-ISRAELI WARS), but his political support remained strong. He instituted far-reaching land reforms and economic and social development programs, the most spectacular being the building of the Aswan Dam. A pan-Arabist, he was president (1958–61) of the United Arab Republic, a short-lived merger of Egypt and Syria.

Nast, Thomas, 1840–1902, American cartoonist and painter; b. Germany. He is best known for his forceful political CARTOONS, which were instrumental in defeating Boss TWEED in New York City. Nast created the tiger, elephant, and donkey as symbols of Tammany Hall, the Republican party, and the Democratic party.



THE "BRAINS"

THAT ACHIEVED THE TAMMANY VICTORY AT THE ROCHESTER DEMOCRATIC CONVENTION.

Thomas Nast cartoon of Tammany figure, 1871

nasturtium, herb (genus *Tropaeolum*) native to mountainous areas of the American tropics. The common nasturtiums (*T. majus* and *T. minus*) are cultivated in the U.S. for their red or yellow flowers. The plants are also used for food, e.g., the seeds are pickled as capers and the leaves and flowers are used in salads. *Nasturtium* is also the botanical name for the genus that includes the unrelated WATERCRESSES of the MUSTARD family.

Natchez, city (1990 pop. 19,460), seat of Adams co., SW Miss., on bluffs above the Mississippi R.; founded 1716, inc. 1803. The area was held by England (1763), Spain (1779), and the U.S. (1798), and was capital of the Mississippi Territory (1798–1802) and state capital (1817–21). A great river port and the cultural center of antebellum planter aristocracy, Natchez retains much of its historical character, with many fine homes. The city was taken by Union forces in 1863. It was the southern end of the NATCHEZ TRACE.

Natchez Trace, historic route, 449 mi (723 km) between NATCHEZ, Miss., and NASHVILLE, Tenn. It grew from a series of old Native American trails and was of great military and commercial importance from the 1780s to the 1830s. The Natchez Trace Parkway (est. 1938) generally follows the old route.

Natchitoches [năk'ĭtŏsh], city (1990 pop. 16,609), seat of Natchitoches parish, NW La.; inc. 1819. Its industry centers on processing agricultural products. The first permanent settlement in the LOUISIANA PURCHASE, it was founded c.1714 by the French, on the boundary between French and Spanish territory. It figured in the MEXICAN WAR and the CIVIL WAR.

Nathan, prophet in the time of DAVID and SOLOMON. With his parable of the ewe lamb, he denounced David for his abduction of BATHSHEBA. Later his advice saved the kingdom for Solomon.

Nathan, George Jean, 1882–1958, American editor and drama critic; b. Fort Wayne, Ind. He joined H.L. MENCKEN in editing *Smart Set* (1914–23) and in founding (1924) the *American Mercury,* a magazine that was the arbiter of American literary taste for a decade. Primarily a drama critic, Nathan was famous for his erudite and cynical reviews.

Nathanael, disciple mentioned only in the Gospel of St. JOHN, plausibly identified with St. BARTHOLOMEW.

Nation, Carry (Moore), 1846–1911, American temperance advocate; b. Garrard co., Ky. Convinced of her divine appointment, she gained fame in 1900 by destroying saloon liquor and property with a hatchet. Arrested 30 times, she focused public attention on the cause of PROHIBITION and helped create a mood favorable to passage of the 18th constitutional amendment.

National Academy of Sciences, private organization, est. 1863 by act of Congress, devoted to the furtherance and public uses of science. Members and nonvoting foreign associates are elected in recognition of their distinguished and continuing achievements in original research. The Academy acts as an official adviser to the federal government on matters of science and technology.

National Aeronautics and Space Administration (NASA), U.S. federal civilian agency with the mission of conducting research and developing operational programs in the areas of manned spaceflight (see SPACE EXPLORATION); lunar, planetary, and interplanetary SPACE PROBES; artificial earth-orbital SATELLITES; rocketry; and aeronautics. Its creation on Oct. 1, 1958, was spurred by American unpreparedness at the time the USSR launched (Oct. 4, 1957) *Sputnik 1,* the first artificial satellite. NASA's major installations include the Kennedy Space Center, on Merritt Island, north of Cape Canaveral, Fla., where most launchings occur; the Johnson Space Center, Houston, Tex., where U.S. manned spaceflights are controlled; and the Jet Propulsion Laboratory (operated under contract by the California Institute of Technology), Pasadena, Calif., where the U.S. Viking and Voyager deep-space probes are controlled. NASA superseded the National Advisory Committee on Aeronautics (NACA).

National Archives, official repository for records of the U.S. federal government, established in 1934 by an act of Congress. Located in Washington, D.C., and College Park, Md., it is run by the U.S. archivist.

National Association for the Advancement of Colored People (NAACP), organization of African Americans, with many white members, dedicated to ending racial inequality and segregation; est. 1910 with the merging of the Niagara Movement of W.E.B. DU BOIS and a group of concerned whites. The organization grew quickly, at first directing its efforts to eradicating lynching; by the 1950s this goal was achieved. The 1954 Supreme Court school-desegregation decision (see INTEGRATION) followed a long effort by the independent NAACP Legal Defense and Education Fund. A consistent advocate of nonviolent protest, the NAACP has at times

been accused of passivity by more militant groups. In 1991 it had a membership of 345,000.

National Ballet of Canada, the leading Canadian ballet company. Based in Toronto, it was founded (1951) by Celia Franca and modeled on Sadler's Wells (now the ROYAL BALLET). Its repertoire is grounded on classics in the tradition of DIAGHILEV.

National Bureau of Standards: see NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY.

National Council of the Churches of Christ in the United States of America, agency of 32 Protestant and Orthodox Eastern denominations, formed in 1950. Not a governing body, it promotes interchurch cooperation and is the chief instrument of the ECUMENICAL MOVEMENT in the U.S.

national debt: see DEBT, PUBLIC.

National Gallery, London, one of the permanent national art collections of Great Britain. Its Greek-style building, designed (1832–38) by William Wilkins and shared for 30 years with the Royal Academy of Arts, has been enlarged several times, most recently with the addition (1991) of the Sainsbury wing. The nucleus of the collection was 38 pictures from the Angerstein collection. It has fine collections of 15th- and 16th-cent. Italian paintings, and French, Flemish, and Dutch masters. The National Portrait Gallery was adjoined in 1896.

National Gallery of Art, Washington, D.C., a branch of the SMITHSONIAN INSTITUTION, est. by act of Congress, 1937; opened 1941. Its building and a collection of American portraits were donated by Andrew W. MELLON. The gallery received many bequests. Its outstanding collections include Italian masterpieces, American naive paintings, French art, prints and drawings, and the Index of American Design. Its East Building, designed by I.M. PEI, opened in 1978.

National Guard, U.S. militia authorized by the Constitution. During peacetime it operates under state jurisdiction and can be used by governors to quell local disturbances, as in Newark and Detroit riots in 1967. In times of war and other emergencies, it is absorbed into the standing army and is under the command of the president. It was partially mobilized during the Korean War (1951–53) and the BERLIN crisis of 1961, and some units were mobilized for the Persian Gulf War (1991–92). Enlistment is voluntary.

national health insurance: see HEALTH INSURANCE.

National Institute of Standards and Technology, U.S. government agency, est. 1901 within the Dept. of Commerce as the National Bureau of Standards, with the mission to advance the application of science and technology for the public benefit; it was renamed in 1988. Its headquarters is in Gaithersburg, Md.; additional facilities are at Boulder, Colo. Its research provides a basis for the nation's physical measurement system. The institute also investigates the properties of materials, facilitates the use of available technology, and promotes innovation.

National Institutes of Health (NIH), U.S. agency that conducts and supports biomedical research into the causes, cure, and prevention of disease. NIH maintains its own laboratories, and awards grants and contracts to universities and other private research facilities. Separate national institutes function in specific areas such as cancer; heart, lung, and blood diseases; dental research; child health; allergy and infectious diseases; aging; and mental health.

nationalism, political philosophy holding that the welfare of the nation-state is paramount, an attitude often strengthened when people share a common history, religion, language, or ethnic background. The term also refers to a group state of mind in which patriotism, or loyalty to one's country, is regarded as an individual's principal duty. Nationalism, which in its modern sense can be traced to the time of the FRENCH REVOLUTION, has played an important part in supplementing the formal institutions of society, providing much of the cohesiveness necessary for the orderly conduct of affairs in modern nations. Although it has contributed to excesses of militarism and IMPERIALISM, as in Europe under NAPOLEON I or under German Nazism (see NATIONAL SOCIALISM), it has also inspired movements against such abuses. It remains a powerful force in world politics despite the spread of trade and communications and the growing interdependence of nations, and the end of Soviet hegemony in E Europe and N Asia has led to the rise of many nationalist movements there.

nationalization, acquisition and operation by a country of businesses owned and operated by private individuals or corporations. It is usually done in the name of social and economic equality, often as part of Communist or socialist doctrine. Nationalization of foreign-owned property, e.g., the Suez Canal by Egypt (1958) and the copper-mining industry by Chile (1971), typically attempts to end foreign control of an industry or the economy and poses complex problems for INTERNATIONAL LAW. After World War II, Communist Eastern Europe nationalized all industry and most agriculture, and Western European nations nationalized some key industries, such as transportation. By the 1990s the trend in many former and current Communist countries and Western nations was toward PRIVATIZATION, mainly because political pressures have usually led governments to operate businesses very inefficiently.

National Labor Relations Board (NLRB), independent agency of the U.S. government created under the National Labor Relations Act of 1935 (Wagner Act), which affirmed labor's right to organize and engage in COLLECTIVE BARGAINING, or to refrain from such activities. The Wagner Act was later amended by the Taft-Hartley Labor Act (1947), the Landrum-Griffin Act of 1959, and the Health Care Amendments (1974). The NLRB determines proper bargaining units, conducts elections for union representation, and prevents and remedies unfair labor practices.

National Museum of Anthropology, Mexico City; present building opened 1964. The museum houses an extensive collection of artifacts from pre-Columbian Mexico, notably works of the MAYA and AZTEC civilizations. Exhibitions include studies of the peoples and animals of Mexico.

National Organization for Women (NOW), group est. 1966 to support full equality for women in America; its founder and first president was Betty FRIEDAN. Through legislative lobbying, litigation, and demonstrations it seeks to end discrimination against women. The largest U.S. women's rights group, NOW has some 250,000 members, both women and men. See also FEMINISM.

national parks. Congress laid the foundation of the U.S. National Park System in 1872 by establishing Yellowstone National Park. In 1916 the National Park Service, a bureau of the U.S. Dept. of the INTERIOR, was set up to administer 37 national parks and monuments. The National Park System now comprises more than 350 areas totaling 80,115,984 acres (32,446,973 hectares). The National Park Service directs a wide program of construction and of educational and protective work. In addition to national parks, the system includes national monuments, historic sites, historical parks, memorials, military parks, battlefields, cemeteries, preserves, recreational areas, lakeshores, seashores, parkways, scenic and historic trails, and rivers. See accompanying table.

National Radio Astronomy Observatory (NRAO), federal observatory (founded 1956) for radio astronomy, operated by Associated Universities Inc. under contract with the U.S. National Science Foundation. Its headquarters are at Charlottesville, Va. The principal instrument at its Green Bank, W.Va., facility a paraboloid transit antenna 300 ft (91 m) in diameter, collapsed in 1988; a replacement is expected to be completed in 1995. There are also six smaller antennas at Green Bank and an antenna at Kitt Peak, Ariz. Near Socorro, N.Mex., the NRAO operates the Very Large Array, a collection of 27 mobile antennas placed in a Y-shaped arrangement in order to obtain maps of celestial radio sources. The observatory also operates the Very Long Baseline Array, 10 widely separated antennas that function as a single radio telescope. The antenna sites are located in New Hampshire, Iowa, Saint Croix, Texas, New Mexico (two antennas), Arizona, California, Washington, and Hawaii; the headquarters is located at Socorro.

National Recovery Administration (NRA), 1933–35, U.S. administrative bureau established under the National Industrial Recovery Act to encourage industrial recovery and combat unemployment. Headed by Hugh S. Johnson and symbolized by the Blue Eagle, the NRA drew up over 500 industrial fair practice codes. The Supreme Court decision (May 1935) invalidating the codes crippled the NRA, but many of the NRA labor provisions were reenacted in later legislation (see NATIONAL LABOR RELATIONS BOARD; WAGES AND HOURS ACT).

National Republican party, a short-lived U.S. political party formed to oppose Andrew JACKSON in the 1832 presidential elec-

The key to pronunciation appears on page xiii.

NATIONAL PARKS

Park	*Special Characteristics*
Acadia (1916)* Location: SE Me. Area: 41,888 acres (16,951 hectares)	Comprising areas on Mount Desert Island, Isle au Haut, and other smaller islands, plus the tip of the Schoodic Peninsula, the park features a scenic, wave-eroded coastline, maritime landscapes, and a rugged, glacier-scoured interior. Designated a national park in 1919.
American Samoa (1988) Location: American Samoa Area: 7,000 acres (3,645 hectares)	Comprising areas on the South Pacific islands of Ofu, Ta'u, and Tutuila, the park features the only paleotropical rain forest in the U.S. national park system, and a coral reef.
Arches (1929)* Location: E Utah Area: 73,379 acres (29,695 hectares)	Located in red-rock country overlooking the gorge of the Colorado R., the park includes an extraordinary variety of erosional features in the form of graceful arches, windows, spires, and pinnacles that change color constantly in the sunlight. Designated a national park in 1971.
Badlands (1929)* Location: SW S.D. Area: 243,508 acres (98,548 hectares)	Located in the badlands of South Dakota, with their countless gullies, steep ridges, and other erosional landforms, the park is famous for its scenery, its fossils of prehistoric animals, and its varied wildlife, including bison, bighorn sheep, deer, antelope, and prairie dogs. Designated a national park in 1978.
Big Bend (1935)* Location: W Tex. Area: 801,163 acres (324,219 hectares)	It is a triangle formed by a great bend in the Rio Grande. The park includes deep canyons, e.g., the Santa Elena Canyon. The river, desert, and Chisos mts. offer sharp contrasts in wilderness scenery. Established as a national park in 1944.
Biscayne (1968)* Location: SE Fla. Area: 173,467 acres (70,200 hectares)	Located between Biscayne Bay (W) and the Atlantic Ocean (E), the park is mostly underwater, with excellent snorkeling and scuba-diving around a living coral reef. About 25 small coral islands, or keys, form a chain across the park. Designated a national park in 1980.
Bryce Canyon (1923)* Location: SW Utah Area: 35,835 acres (14,502 hectares)	The park contains giant, horseshoe-shaped amphitheaters lined with innumerable, delicate-looking spires, pinnacles, and other erosional features carved out from layers of multicolored rocks. Authorized as a national park in 1924 and given the present name in 1928.
Canyonlands (1964)* Location: SE Utah Area: 337,570 acres (136,610 hectares)	Located in a desert region, the park contains a maze of deep canyons; many spires, pinnacles, arches, and other geological features carved by wind and water; petroglyphs drawn on rocks c.1,000 years ago; and mesas rising to more than 7,800 ft (2,377 m).
Capitol Reef (1937)* Location: S Utah Area: 241,904 acres (97,895 hectares)	The park features a dome-shaped white rock, said to resemble the U.S. Capitol Building, and a maze of deep canyons, arches, and monoliths cut through a 100-mi (160-km) uplift, known as the Waterpocket Fold, that geologists consider unique because of its size. Designated a national park in 1971.
Carlsbad Caverns (1923)* Location: SE N.Mex. Area: 46,755 acres (18,921 hectares)	These limestone caves, with remarkable stalactite and stalagmite formations and huge chambers, began forming 60 million years ago. The caverns, among the largest in the world, are inhabited by countless bats and have still not been completely explored. Designated a national park in 1930.
Channel Islands (1938)* Location: S Calif. Area: 249,354 acres (100,910 hectares)	The park, which includes Anacapa, Santa Barbara, San Miguel, Santa Cruz (the largest), and Santa Rosa islands, is known for its large rookeries of sea lions, sports fishing, and variety of nesting sea birds. Designated a national park in 1980.
Crater Lake (1902)* Location: SW Oreg. Area: 133,224 acres (74,148 hectares)	Located in the CASCADE RANGE, the park features Crater Lake (20 sq mi/52 sq km), a deep-blue lake with no outlet, in the caldera of Mt. Mazama, an ancient volcanic peak. With a maximum depth of 1,932 ft (589 m), it is the second-deepest lake in North America.
Denali (1917)* Location: S Alaska Area: 4,716,726 acres (1,908,791 hectares)	The park, which is dominated by Mt. MCKINLEY (20,320 ft/6,194 m), the highest mountain in North America, includes glaciers, caribou, sheep, moose, and grizzly bears. Originally established as Mt. McKinley National Park, it was expanded to include adjacent Denali National Monument and was renamed in 1980.
Everglades (1934)* Location: S Fla. Area: 1,506,500 acres (609,659 hectares)	A slow-moving, subtropical, marshy wilderness draining into Florida Bay and covered in places by tall prairie grasses and mangrove forests, the park is known for its rich and varied wildlife, including crocodiles, alligators, manatees, ospreys, bald eagles, and herons. Dedicated in 1947.
Gates of the Arctic (1978)* Location: N Alaska Area: 7,523,888 acres (3,044,809 hectares)	Located N of the Arctic Circle, the park (together with an adjacent preserve of 900,000 acres/364,217 hectares) is a tundra wilderness of broad valleys and razorlike peaks of the Brooks Range, known for its abundance of Arctic caribou, grizzly bears, moose, and wolves. Designated a national park in 1980.

*Date authorized

NATIONAL PARKS

Park	*Special Characteristics*
Glacier (1910)* Location: NW Mont. Area: 1,013,595 acres (410,188 hectares)	Straddling the CONTINENTAL DIVIDE, the park contains some of the most spectacular scenery in the Rocky Mts., including glaciers, high peaks, numerous lakes and streams, and a great variety of wildlife. Adjacent to the park is Canada's Waterton Lakes National Park.
Glacier Bay (1925)* Location: SE Alaska Area: 3,225,284 acres (1,305,226 hectares)	Glaciers descending to the bay from towering, snow-covered mountains create one of the world's most spectacular displays of ice. Muir Glacier, c.265 ft (80 m) high, is the park's most famous. Wildlife includes whales, seals, eagles, and bears. Designated a national park in 1980.
Grand Canyon (1908)* Location: NW Ariz. Area: 1,218,375 acres (493,059 hectares)	The park includes the most spectacular part of the GRAND CANYON of the Colorado R. Along the forested north rim and the more accessible south rim are numerous lookouts; trails wind to the canyon floor. Designated a national park in 1919 and expanded in 1975.
Grand Teton (1929)* Location: NW Wyo. Area: 310,443 acres (125,636 hectares)	Dominated by Grand Teton (13,766 ft/4,169 m), which towers 7,000 ft (2,100 m) above the valley floor, the park embraces the most scenic portion of the glaciated, snow-covered Teton Range and was expanded in 1950 to include part of Jackson Hole. Wildlife includes moose, elk, and trumpeter swans.
Great Basin (1986)* Location: E Nevada Area: 77,100 acres (31,201 hectares)	Located in the South Snake Range, the park has exceptional scenic, biologic, and geologic attractions, including Lehman Caves, Wheeler Peak (the highest point in the park), and Nevada's only glacier. Great Basin also contains groves of bristlecone pines, the oldest living trees.
Great Smoky Mountains (1926)* Location: N.C.-Tenn. Area: 520,269 acres (210,550 hectares)	Reaching a high point of 6,642 ft (2,024 m) at Clingmans Dome, the park straddles the crest of the Great Smokies for 71 mi (114 km) and contains part of the APPALACHIAN TRAIL. The park supports luxuriant and diversified plant life. Established as a national park in 1930.
Guadalupe Mountains (1966)* Location: W Tex. Area: 86,416 acres (34,971 hectares)	The park, which features Guadalupe Peak (8,751 ft/2,667 m), rugged canyons, and unusual flora and fauna, is of special geologic interest for its exposures of one of the world's largest and most significant Permian fossil reefs. Established as a national park in 1972.
Haleakala (1916)* Location: Hawaii Area: 28,655 acres (11,596 hectares)	The park, on Maui island, extends from the summit of the dormant volcano Mt. Haleakala (10,023 ft/3,055 m) down to rainforests and rugged cliffs along the coast. Haleakala Crater, 2,720 ft (829 m) deep, is a major feature. Originally part of Hawaii National Park, it gained separate park status in 1961.
Hawaii Volcanoes (1916)* Location: Hawaii Area: 229,177 acres (92,745 hectares)	The park, on Hawaii island, contains two of the most active volcanoes in the world—Kilauea, with its fire pit, called Halemaumau, and Mauna Loa, with the active Mokuaweoweo Crater on its summit. Originally Hawaii National Park, its name was changed in 1961.
Hot Springs (1832)* Location: Central Ark. Area: 5,839 acres (2,363 hectares)	The park features 47 hot springs of reputed medicinal and healing value. The water of two springs can be seen emerging naturally; that of the other springs is piped to central reservoirs for bathhouse and therapy use. Designated a national park in 1921.
Isle Royale (1931)* Location: NW Mich. Area: 571,796 acres (231,398 hectares)	Comprising Isle Royale, the largest island in Lake Superior, and c.200 other islands, the park remains a roadless, forested wilderness. It is known for abundant wildlife, and exhibits evidence of copper mining by prehistoric Indians. Designated a national park in 1940.
Katmai (1918)* Location: SW Alaska Area: 3,716,000 acres (1,503,812 hectares)	A vast wilderness area, the park preserves volcanic features resulting from the eruption (1912) of Novarupta volcano, which caused the collapse of Mt. Katmai. For many years hot gases rose from the Valley of Ten Thousand Smokes, but the area is no longer very active. Designated a national park in 1980.
Kenai Fjords (1978)* Location: S Alaska Area: 670,000 acres (271,139 hectares)	The park features the great Harding Icefield and its radiating glaciers, many of which descend to tidewater, and a magnificent series of fjords along the coast of the Kenai Peninsula, with rain forests, sea lions, sea otters, seals, and a varied bird life. Designated a national park in 1980.
Kings Canyon (1940)* Location: E Calif. Area: 461,901 acres (186,925 hectares)	Largely wilderness, the park features summit peaks of the High Sierras and two enormous canyons on the Kings R. General Grant Grove, with giant sequoias, is a detached section of the park and was formerly the General Grant National Park (est. 1890). King Canyon adjoins Sequoia National Park.

NATIONAL PARKS

Park	*Special Characteristics*
Kobuk Valley (1978)* Location: N Alaska Area: 1,750,421 acres (708,370 hectares)	Located in rugged terrain N of the Arctic Circle, the park embraces the central valley of the Kobuk R., a centuries-old transportation route with many archaeological sites. Other features include caribou migrating routes and the Great Kobuk Sand Dunes. Designated a national park in 1980.
Lake Clark (1978)* Location: S Alaska Area: 1,750,421 acres (708,370 hectares)	Located across Cook Inlet from Anchorage, the park (and adjacent preserve of 1,214,000 acres/491,289 hectares) features jagged peaks of the Chigmit Mts.; lakes Clark, Fishtrap, and Iliamna; volcanoes, glaciers; and abundant wildlife. Designated a national park in 1980.
Lassen Volcanic (1907)* Location: N Calif. Area: 106,372 acres (43,047 hectares)	At the southern tip of the CASCADE RANGE, the park is dominated by the volcanic Lassen Peak (10,457 ft/3,187 m), which erupted intermittently from 1914 to 1921, and preserves lava flows, hot springs, sulfurous vents, and other evidences of volcanism. Designated a national park in 1916.
Mammoth Cave (1926)* Location: central Ky. Area: 52,419 acres (21,213 hectares)	The chief feature of the park is Mammoth Cave, one of the largest known caves in the world, with more than 190 mi (305 km) of known passageways; arrays of stalactites, stalagmites, and columns; and an underground river. Fully established as a national park in 1941.
Mesa Verde (1906)* Location: SW Colo. Area: 52,122 acres (21,093 hectares)	Set amid forested canyons and flat mesas, the park features some of the most notable and best preserved pre-Columbian cliff dwellings and related works of early man in the U.S. The dwellings cover four archaeological periods from the 1st cent. A.D. to the late 13th cent., when they were abandoned.
Mount Rainier (1899)* Location: SW Wash. Area: 235,613 acres (95,349 hectares)	Located in the CASCADE RANGE, the park is dominated by snow-crowned Mt. Rainier, 14,410 ft (4,392 m) high, a volcano dormant since 1870, from the summit of which radiate 26 glaciers, which form the greatest single-peak glacial system in the U.S. Forests and alpine meadows clothe the lower slopes.
North Cascades (1968)* Location: N Wash. Area: 504,781 acres (204,277 hectares)	Located in the CASCADE RANGE, the park has outstanding alpine scenery, including high jagged peaks, glaciers, icefalls, hanging valleys, and mountain lakes in high glacial cirques. Western slopes are rainy, with rain forests and other luxuriant vegetation; eastern slopes are drier.
Olympic (1909)* Location: NW Wash. Area: 922,654 acres (373,385 hectares)	Located in the highest part of the COAST RANGE, the park features Mt. Olympus (7,965 ft/2,427 m), coniferous rain forests, glaciers, lakes, rare elk, and some 50 mi (80 km) of shoreline along the Pacific coast. Established as a national park in 1938.
Petrified Forest (1906)* Location: E Ariz. Area: 93,533 acres (37,851 hectares)	A part of the Painted Desert, the park features the world's largest display of petrified wood and forests. The trees, dating from the Triassic period, were turned to stone when they were buried under volcanic debris and minerals replaced the original wood cells. Designated a national park in 1962.
Redwood (1968)* Location: NW Calif. Area: 110,132 acres (44,569 hectares)	Magnificent stands of virgin redwood forest are the main attraction, with many of the trees more than 2,000 years old. Other features include the world's tallest tree, 367 ft (112 m) high, 40 mi (64 km) of unspoiled Pacific coastline, and seals, sea lions, and birds living offshore.
Rocky Mountain (1915)* Location: central Colo. Area: 262,191 acres (106,109 hectares)	Straddling the CONTINENTAL DIVIDE in the Front Range of the Rocky Mts., the park features more than 100 peaks towering over 11,000 ft (3,353 m). The highest is Longs Peak (14,255 ft/4,345 m). The park also contains many lakes and waterfalls.
Sequoia (1890)* Location: E Calif. Area: 402,488 acres (162,885 hectares)	Thirty-five groves of giant SEQUOIAS, the largest living things in the world, are the main attraction. Other features include MT. WHITNEY (14,494 ft/4,418 m), highest mountain in the U.S. outside Alaska, and other jagged summits of the High Sierras. Adjoins Kings Canyon National Park.
Shenandoah (1926)* Location: N Va. Area: 196,039 acres (79,334 hectares)	Extending 80 mi (129 km) along the crest of the Blue Ridge in the APPALACHIAN MOUNTAINS, the park features views from the APPALACHIAN TRAIL and Skyline Drive of the Shenandoah valley and the surrounding mountains. Heavily forested, the area was fully established as a national park in 1935.
Theodore Roosevelt (1947)* Location: W N.D. Area: 70,447 acres (28,509 hectares)	The park features scenic badlands along the Little Missouri R., part of Roosevelt's Elkhorn Ranch, prairie land, and a burning coal vein. Designated a national park in 1978.

*Date authorized

NATIONAL PARKS

Park	*Special Characteristics*
Virgin Islands (1956)* Location: Virgin Islands Area: 14,689 acres (5,944 hectares)	Occupying about two thirds of the Caribbean island of St. John, the park features quiet headlands, coves, extensive offshore areas including reefs and underwater marine gardens, palm-fringed white sandy beaches, early Carib Indian relics, and remains of Danish colonial sugar plantations.
Voyageurs (1971)* Location: N Minn. Area: 218,035 acres (88,236 hectares)	The park contains forested lake country that is noted for its sports fishing and glacial features. In the 18th cent. the region was a trade route for French-Canadian voyageurs (fur traders). Fully established as a national park in 1975.
Wind Cave (1903)* Location: SW S.D. Area: 28,295 acres (11,451 hectares)	Located in the BLACK HILLS, the park features Wind Cave, a limestone cavern containing unusual calcite crystal and boxwork formations; strong air currents blow into or out of it, depending on local atmospheric conditions. Herds of elk and bison and colonies of prairie dogs are other attractions.
Wrangell-St. Elias (1978)* Location: SE Alaska Area: 8,331,604 acres (3,371,680 hectares)	The park contains Mt. Saint Elias (18,008 ft/5,489 m) and the nation's greatest collection of glaciers and mountain peaks above 16,000 ft (4,879 m). Wildlife include Dall sheep, migrating caribou, and wolves. Designated a national park in 1980.
Yellowstone (1872)* Location: Idaho, Mont., Wyo. Area: 2,219,791 acres (898,317 hectares)	The world's greatest geyser area, the park features Old Faithful, which erupts at regular intervals, c.200 other geysers, c.10,000 hot springs, high Rocky Mt. peaks, waterfalls, lakes, the Grand Canyon of the Yellowstone R., and grizzly bears, moose, and bison. It is the oldest national park in the U.S.
Yosemite (1890)* Location: E central Calif. Area: 761,170 acres (308,035 hectares)	Located in a glacier-scoured area of great beauty in the Sierra Nevada, the park centers on famed Yosemite Valley, surrounded by cliffs and pinnacles such as El Capitan (7,564 ft/2,300 m); and Yosemite Falls, the highest in North America, with a total drop of 2,425 ft (739 m) in two stages.
Zion (1909)* Location: SW Utah Area: 146,598 acres (59,326 hectares)	The main attractions of this park, noted for its vividly colored cliffs and rock formations, are Zion Canyon, nearly half a mile deep, cut by the north fork of the Virgin R., and the box-shaped Kolob Canyons, with sheer 1,500-ft (457-m) walls. Established as a national park in 1919.

*Date authorized

tion. Favoring high tariffs and a national bank, the party nominated Henry CLAY. Clay was badly defeated, and by 1836 the National Republicans had joined with other anti-Jackson forces to form the WHIG PARTY.

National Rifle Association of America (NRA), group founded (1871) to promote shooting, hunting, firearm safety, and wildlife conservation. It has approximately 3 million members. The NRA has vigorously opposed any form of GUN CONTROL.

National Road, U.S. highway built in the early 19th cent. Begun in 1815 and completed in 1833, it was the most ambitious U.S. road-building project undertaken up to that time. When completed, it extended from Cumberland, Md., to St. Louis, and was the great highway of Western migration. The present U.S. Highway 40 follows its route closely.

National Science Foundation (NSF), independent agency (est. 1950) of the executive branch of the U.S. government, concerned with promoting a national science policy by supporting basic research and education. The NSF does not conduct its own research but provides grants and fellowships to qualified scientists and institutions. It supports the development of improved science curriculum materials and fosters the interchange of scientific ideas nationally and internationally. Among the facilities it supports are the NATIONAL RADIO ASTRONOMY OBSERVATORY, the National Center for Atmospheric Research (Boulder, Colo.), and KITT PEAK NATIONAL OBSERVATORY (Tucson, Ariz.).

National Security Agency (NSA), independent agency within the U.S. Dept. of Defense. Founded in 1952, its primary function is to encode and decode communications intelligence, and it maintains listening posts in many nations. It was long one of the most secret U.S. agencies. It is now also responsible for computer security.

National Security Council (NSC), U.S. federal executive council established (1947) to coordinate the defense and foreign policy of the U.S. Its members are the president, vice president, and secretaries of state and defense. Their statutory advisers are the chairman of the Joint Chiefs of Staff (part of the DEFENSE Dept.) and the director of the CENTRAL INTELLIGENCE AGENCY. The national security adviser (the Assistant to the President for National Security Affairs) heads the council's staff.

National Socialism or **Nazism,** doctrines and policies of the National Socialist German Workers' party, which ruled Germany under Adolf HITLER from 1933 until Germany's defeat (1945) in WORLD WAR II, at which time it was outlawed. Members were first called Nazis as a derisive abbreviation. National Socialism appealed to the masses through nationalism—especially by playing on the humiliation suffered by Germany after its defeat in WORLD WAR I—and by a particularly virulent anti-Semitism. It attracted the bankers and industrialists by its anti-Communism and by its promise to rebuild the German economy. The party began in 1920 with GOERING, GOEBBELS, and HIMMLER among Hitler's followers. Its bible was Hitler's *Mein Kampf* (1923), and its official philosopher was Alfred ROSENBERG. Among the principles of the party were the superiority of the Aryan "master race" led by an infallible Führer (leader); the establishment of a pan-Germanic "Third Reich," which would last a thousand years; and the annihilation of Germany's 'greatest enemies," the Jews and Communists. After Hitler took power, the Nazis became the sole legal party. Its policy was enforced by the Gestapo (secret police), the SS (storm troops), and the SA (the Führer's elite bodyguard). During World War II, the Germans imposed their system and dogma on Europe by force. Millions of Jews, Poles, Russians, and others were interned in CONCENTRATION CAMPS and later executed. Millions more were used for forced labor. Nazism represented a barbarity unprecedented in history.

Native American art, the diverse traditional arts of the indigenous peoples of North America (see NORTH AMERICA, INDIGENOUS PEOPLES OF). These arts were a significant part of the everyday lives of their creators. In each region at least one art form was developed in response to the environment, the ideology and way of life, and the availability of materials. In all regions animal skins were worked. The cultures of the Eastern woodlands, e.g., the tribes of the IROQUOIS CONFEDERACY, made pottery, baskets, quillwork, and beadwork as well as carved wooden masks. The Plains tribes, e.g., the SIOUX, used beads and quills to paint or decorate their hides, which

The key to pronunciation appears on page xiii.

MAJOR NATIVE AMERICAN LANGUAGES *(*Asterisk indicates a dead language)*

Algonquian-Wakashan Languages *(spoken in North America)*

ALGONQUIAN	Algonquin, Arapaho, Blackfoot, Cheyenne, Cree, Delaware, Illinois, Kickapoo, Mahican, Miami, Micmac, Mohegan, Narragansett, Nootka, Ojibwa, Ottawa, Penobscot, Pequot, Sac and Fox, Shawnee, Yurok
SALISHAN	Bella Coola, Clallam, Coeur d'Alene, Colville, Nisqualli, Okanogan, Pend d'Oreille, Puyallup, Salish, Shuswap, Spokan, Tillamook
WAKASHAN	Bella Bella, Kitamat, Kwakiutl, Makah, Nootka, Nitinat

Andean-Equatorial Languages *(spoken mainly in South America)*

ANDEAN	
Araucanian	Huilliche (or Kunko), Mapuche, Picunche
Aymara	Cana, Caranga, Lupaca, Pacasa, Ubina
Quechua (or Kechua or Quichua)	Ayachucho, Chinchaya, Cuzquẽno, Quechua, Quiteno, Tucumano
EQUATORIAL	
Arawakan	Taino* (was spoken in the Caribbean area)
Tupí-Guaraní	
Tupian	Tupí
Guaranian	Guaraní
Jívaroan	Aguaruna, Cofan, Jivaro, Palta, Yaruro

Aztec-Tanoan Languages *(spoken in W North America and Mexico)*

UTO-AZTECAN	
Nahuatlan	Aztec,* Chichimec,* Nahuatl (or Aztec), Nahuatlato,* Pipil, Pochutla, Toltec*
Pima-Sonoran	Huichol, Pima, Tarahumare, Tohono O'Odham, Yaqui
Shoshonean	Comanche, Hopi, Paiute, Shoshone, Ute
TANOAN	Jemez, Kiowa, Taos, Tiwa, Zuñi

Eskimo-Aleut Languages *(spoken in Alaska, Canada, Greenland, and Siberia, and on the Aleutian Islands)*

	Aleut, Eskimo

Ge-Pano-Carib Languages *(spoken in the Carribean region and South America)*

	Bororo, Carib, Cacibo, Ge

Hokan-Siouan Languges *(spoken in North America)*

CADDOAN	Arikara, Caddo, Pawnee, Wichita
COAHUILTECAN	Comecrudan*
HOKAN	Pomo, Seri, Shasta, Washo, Yana*
IROQUOIAN	Cayuga, Cherokee, Mohawk, Oneida, Onondaga, Seneca, Tuscarora, Wyandot (Huron)
JICAQUE	Jicaque
MUSKOGEAN	Chickasaw, Choctaw, Creek Seminole
SIOUAN	Assiniboin, Catawba, Crow, Dakota, Hidatsa, Omaha, Osage, Sioux, Winnebago
YUMAN	Cocopa, Kamia, Maricopa, Mohave, Yavapai, Yuma

Macro-Chibchan Languages *(spoken in Central and South America)*

CHIBCHAN	Chibcha,* Paez, San Blas

Macro-Otomanguean Languages *(spoken in Mexico and Central America)*

	Mixtecan, Otomi, Zapotecan

Nadene Languages *(spoken in W North America)*

ATHABASCAN	Apache, Carrier, Chasta-Costa, Chipewayan, Hoopa (or Hupa), Kutchin, Navaho, Sarsi
EYAK	Eyak
HAIDA	Haida
TLINGIT	Tlingit

Penutian Languages *(spoken in W North America and Central America)*

HUAVE	Huave
MAIDU	Maidu
MAYAN	Huastec, Maya, Quiché
MIXE-ZOQUE	Mixe, Zoque
SAHAPTIN-CHINOOK	Cayuse, Chinook, Modoc, Nez Percé
TOTONACAN	Totonac
TSIMSHIAN	Tsimshian
WINTUN	Nomlaki, Patwin, Wintu
YOKUT	Chauchila, Chukchansi

were used for clothing, containers, and teepees. Using stone, ivory, and bones, the ESKIMO of the Arctic carved fine sculptures of animal life. The peoples of the Northwest Coast, e.g., the KWAKIUTL, used elaborate wood-carving techniques to fabricate houses, huge canoes, and TOTEM poles. In this work human and animal figures were stylized to abstraction. The Southwest tribes had a highly developed art whose tradition went back to pre-Columbian times. An art of strong, graphic, geometric design developed for pottery decoration. The NAVAHO developed sophisticated silver-working techniques, used largely for jewelry. In recent years, works of the ever-diminishing number of North American Indian artisans have come into vogue, e.g., jewelry, ESKIMO ART, textiles, and KACHINA dolls. Museums with major collections of Native American art include the American Museum of Natural History, N.Y.C.; Field Museum of Natural Museum, Chicago; National Museum of the American Indian, Smithsonian Inst., Washington, D.C., and N.Y.C.; and National Museum of Canada, Ottawa. See also PRE-COLUMBIAN ART AND ARCHITECTURE.

Native American Church, religious cult of NAVAHO and others, blending Christian fundamentalism with peyotism, a Native Amer-

Cross-references are indicated by SMALL CAPS.

ican religion that began (c.1890) among KIOWA and honored PEYOTE as a sacramental food. Peyotists of many tribes founded the Native American Church in 1918. The Navaho Tribal Council banned it in 1940 as a threat to both native Navaho culture and Christianized Navahos, but the cult flourished covertly until the council relented in 1967. Up to 80% of the Navahos in the SW are now practicing members. By the 1970s some states had changed their laws to allow the religious use of peyote.

Native American languages, languages of the native peoples of the Western Hemisphere and their descendants. The classification "Native American languages" is geographical rather than linguistic, since these languages do not belong to a single linguistic family, or stock, such as the Indo-European language family. The Native American languages cannot be differentiated as a linguistic unit from other languages of the world, but are grouped into a number of separate linguistic stocks having significantly different phonetics, vocabulary, and grammars. There is no part of the world with as many distinctly different native languages as the Western Hemisphere. For a detailed categorization of Native American languages, in alphabetical order and with geographical location indicated, see the table accompanying this article.

Native Americans: see NORTH AMERICA, INDIGENOUS PEOPLES OF; MIDDLE AMERICA, INDIGENOUS PEOPLES OF; SOUTH AMERICA, INDIGENOUS PEOPLES OF; and individual peoples.

NATO: see NORTH ATLANTIC TREATY ORGANIZATION.

natural childbirth: see under PREGNANCY AND BIRTH.

natural gas, natural mixture of flammable gases found issuing from the ground or obtained from specially driven wells. Largely a mixture of HYDROCARBONS, natural gas is usually 80 to 95% METHANE. The composition varies in different localities, and minor components may include carbon dioxide, nitrogen, hydrogen, carbon monoxide, and helium. Often found with PETROLEUM, natural gas also occurs apart from it in sand, sandstone, and limestone deposits. Natural gas began to be used as an illuminant and a fuel on a large scale in the late 19th cent., when pipelines were built to provide it to large industrial cities. It has also been used on a small scale in recent years as an alternative fuel for automobiles and other vehicles. **Liquified natural gas** (LNG) is natural gas that has been cooled and pressurized to liquify it for convenience in shipping and storage.

naturalism, in literature, an approach to reality grounded in a belief in the determining power of natural forces like heredity and environment. Émile ZOLA, the founder and chief exemplar of the school, theorized in *The Experimental Novel* (1880) that the novelist should observe and record dispassionately, like the scientist. Besides Zola and Guy de MAUPASSANT in France, naturalism included the American novelists Stephen CRANE, Theodore DREISER, and James T. FARRELL, and such modern dramatists as Henrik IBSEN, Gerhart HAUPTMANN, and Maxim GORKY.

naturalism, in philosophy, a position that attempts to explain all phenomena by means of strictly natural (as opposed to supernatural) categories. Generally considered the opposite of IDEALISM, naturalism looks for causes and takes little account of reasons. It is often equated with MATERIALISM, POSITIVISM, and EMPIRICISM. Some naturalists (e.g., COMTE, NIETZSCHE, and MARX) have professed ATHEISM, while others (e.g., ARISTOTLE, SPINOZA, and William JAMES) have accepted some form of a deity. Later thinkers such as WHITEHEAD have sought to unify the scientific viewpoint with the concept of an all-encompassing reality.

natural law, theory that some laws are fundamental to human nature and discoverable by human reason without reference to specific legislative acts or judicial decisions. It is opposed so-called positive law, which is customary or legislated and is conditioned by history and subject to continuous change. ROMAN LAW, drawing on theories of Greek STOICISM, recognized a common cause regulating human conduct; this was the basis for the later development by GROTIUS of the theory of international law. St. THOMAS AQUINAS, SPINOZA, and LEIBNIZ all interpreted natural law as the basis of ethics and morality. J.J. ROUSSEAU regarded it as the basis of democratic principles. The influence of natural law declined greatly in the 19th cent. under the impact of POSITIVISM, EMPIRICISM, and MATERIALISM, but regained importance in the 20th cent. as a corrective to totalitarian theory.

natural selection, important mechanism in Charles DARWIN's theory of EVOLUTION. As a result of various factors in the environment (e.g., temperature and the quantity of food and water available) and the geometrically increasing overproduction of plants and animals that results from the process of reproduction, a struggle for existence arises. In this struggle, according to Darwin, those organisms better adapted to the environment (that is, those having favorable differences or variations) survive and reproduce, while those least fitted do not. Favorable variations among members of the same species are thus transmitted to the survivors' offspring and spread to the entire species over successive generations. Natural selection suggests that the origin and diversification of species results from the gradual accumulation of individual modifications. Artificial selection, the selection by humans of individuals best suited for a specific purpose, is common in plant and animal breeding.

Nature Conservancy, nonprofit organization established in 1951 to preserve or aid in the preservation of natural environments. It protects wilderness areas in the U.S. and Canada and is affiliated with similar groups in Latin America and the Caribbean. It maintains the world's largest private system of nature sanctuaries.

Nauru, officially Republic of Nauru, independent nation (1992 est. pop. 9,500), c.8 sq mi (20 sq km), atoll in the Pacific Ocean near the equator. One of the world's smallest nations, it has an economy almost entirely dependent on phosphate mining, but the deposits are expected to be exhausted by the year 2000. The government has attempted to develop airline and shipping businesses, and mining income has been invested overseas with some success. Nauruans (nearly 60% of the population) are predominantly Polynesian with a mix of Micronesian and Melanesian strains. There is a large Pacific Islander minority and smaller groups of Chinese and Europeans. Nearly all the inhabitants are Christians. The official language is Nauruan, but English is commonly used in government and commerce. Nauru was discovered and named Pleasant Island by the British in 1798. It was annexed by Germany in 1888 and returned to its original name of Nauru. Occupied by Australia in World War I, it was administered by Australia until granted independence in 1968. In 1993 Australia agreed to pay Nauru $73 million for environmental damage caused by mining before independence. Nauru is a parliamentary republic with a president elected by the legislature. See PACIFIC OCEAN map.

nautilus, mollusk with a spirally coiled shell consisting of a series of chambers; as the nautilus grows, it builds larger chambers, sealing off the old ones. A CEPHALOPOD, the animal lives in the largest and newest chamber, breathing by means of gills and feeding on crabs and other animals it catches with long, slender tentacles. Nautiluses are found in deep waters of the S Pacific and Indian oceans. The PAPER NAUTILUS, which is not a true nautilus, is related to the OCTOPUS.

Navaho or **Navajo** [nä'vəhō], indigenous people of the Southwest (see NORTH AMERICA, INDIGENOUS PEOPLES OF) with an Athabascan language of the Nadene stock (see NATIVE AMERICAN LANGUAGES). Thought to have migrated from the north, the nomadic Navaho assimilated with the Shoshone and Yuma, but remained a distinct social group with over 50 clans. They farmed, hunted, and gathered plants, but became primarily pastoral after sheep were introduced in the 17th cent. Matrilineal, they have elaborate ceremonies and myths; many practice peyotism (see NATIVE AMERICAN CHURCH). Navaho metalworking, as in silver jewelry, and weaving are famous. The Navaho raided the PUEBLO and Spanish settlements in New Mexico until Kit CARSON subdued them (1863–64) by killing their sheep. In 1868, c.9,000 Navaho were given a reservation that has since grown to 16 million acres in Arizona, New Mexico, and Utah, today sustaining such enterprises as lumber, mining, and farming. Navaho-owned enterprises are growing, including the largest Native American newspaper in the U.S. and Navaho Community College, the first Native American–operated college. With a population of 219,198 in 1990, the Navaho constitute the second largest tribe in the U.S.

Navaho or **Navajo,** language belonging to the Athabascan branch of the Nadene linguistic family of North America. See NATIVE AMERICAN LANGUAGES (table).

naval conferences, series of international assemblies that met to

consider the limitation of naval armaments, the rules of naval war, and other matters relating to peace. **1 London Naval Conference** (1908–9), see LONDON, DECLARATION OF. **2 Washington Conference** (1921–22), called by Pres. HARDING after WORLD WAR I, resulted in several treaties. The Five-Power Treaty (U.S., Great Britain, France, Italy, Japan) called for the scrapping of a number of ships so that an agreed-upon ratio could be reached. With the Four-Power Treaty (U.S., France, Japan, Great Britain) the signatories agreed to respect each others' possessions in the Pacific. Another treaty outlawed the use of poison gas in warfare. **3 Geneva Conference** (1927) failed to reach agreement on more comprehensive limitations on warships. **4 London Conference** (1930) saw Japan succeed in raising its ratios of warships, although France and Italy objected. Also agreed upon was an escalator clause allowing the powers to raise the number of their ships where national security was threatened. **5 London Conference** (1935) was called after Japan announced (1934) that it was withdrawing from the Washington Conference treaties. Despite this, the other powers continued to limit their warships until the outbreak of WORLD WAR II in 1939.

Navarino, battle of, Sept. 1827, naval engagement in the Greek War of Independence. It resulted from the refusal of the OTTOMAN EMPIRE (Turkey) to accept the armistice demanded by the European powers (Britain, France, and Russia). Turkey's ally Egypt had a fleet anchored at Plyos (then Navarino); it was destroyed by the fleet of the European powers. The defeat led Egypt to leave (1828) the war.

Navarre, Span. *Navarra,* autonomous region and province (1989 est. pop. 524,000), N Spain, bordered by France, between the W Pyrenees and the Ebro R. Pamplona is the capital. Navarre's mountain slopes provide cattle pastures and yield hardwoods, and its fertile valleys produce sugar beets, grains, vegetables, and grapes. Manufactures include processed food and metal products. The population is mainly of BASQUE stock. The kingdom of Navarre reached its zenith under Sancho III (r.1000–1035), who ruled most of Christian Spain. Much reduced in area, it came under French rule (1305–28) and regained importance in the HUNDRED YEARS WAR under CHARLES II (r.1349–87). Most of Navarre was annexed (1515) by Spanish king FERDINAND V. Lower Navarre, N of the Pyrenees, remained an independent kingdom until annexed (1589) by France.

navigation, science and technology of finding the position, and directing the course, of vessels and aircraft. In ancient times navigation was based on observing landmarks along the coast and the positions of the sun and the stars. A tremendous advance took place with the introduction (c.12th cent.) of the COMPASS into Europe. Instruments used to find latitude in medieval times included the ASTROLABE, the cross-staff, and the quadrant. The problem of finding the longitude, however, was not satisfactorily solved until the 18th-cent. inventions of the CHRONOMETER and the SEXTANT and the appearance (1765) of the British *Nautical Almanac.* The next great revolution in navigation occurred in the 20th cent., when radio signals came into wide use. The development of RADAR, LORAN, and radio direction-finding during World War II and, subsequently, of NAVIGATION SATELLITES caused fundamental changes in navigational practice. Inertial guidance systems, used in submarines, aircraft, and spacecraft, do not require contact with a ground base. A computer navigates the vehicle, using a gyroscope to indicate direction and an accelerometer to measure changes in speed and direction. See AIR NAVIGATION.

Navigation Acts, in English history, name given to the British Acts of Trade. An outgrowth of MERCANTILISM, the acts were designed to expand the English carrying trade, to provide England with raw materials, and to develop colonial markets for English manufactures. The threat to English shipping posed by the Dutch led to the Navigation Act of 1651. This legislation was substantially reenacted in the First Navigation Act of 1660, which gave England monopolies of certain colonial produce. In 1663 shipment from English ports was required of all foreign goods bound for the American colonies. The Molasses Act of 1733 forced colonists to buy more expensive British West Indian sugar and led to an increase in smuggling. The acts also caused colonial unrest prior to the AMERICAN REVOLUTION. Their adverse effects were felt in Ireland, in Scotland (before 1707), and in the Channel Islands, which did not share England's favored position. The acts were repealed in 1849.

navigation satellite, artificial SATELLITE designed expressly to aid navigation at sea, in the air, and on land. Two major navigational satellite systems have been launched into orbit, both by the U.S. In the Transit system (first launch, 1960), a navigator determines a ship's position by measuring the Doppler shift (see DOPPLER EFFECT) in radio signals from a Transit satellite passing overhead. In the NAVSTAR Global Positioning System (GPS), which had its first launch in 1989 and replaces the Transit system, each satellite broadcasts time and position messages continuously. A total of 24 NAVSTAR satellites are used. Precise to within a few feet for military uses and about 300 ft (90 m) for non-military uses, the GPS can also be used for non-navigation purposes, such as surveying, tracking migrating animals, and plotting the crop yields of small sections of farmland.

Navratilova, Martina, 1956–, Czech-American tennis player; b. Prague. After holding the Czech singles title (1972–74), she defected (1975) to the U.S. Known for her aggressive style, Navratilova has won more professional tennis titles (165) than any other player. From 1978 to 1987 she won the Wimbledon tournament eight times, the U.S. Open four times, the Australian Open three times, and the French Open twice; she also dominated women's doubles competition. In 1990 she won Wimbledon for the ninth time, a record.

Nazarenes, group of early 19th-cent. German artists who attempted to revive Christian art. Known as the Brotherhood of St. Luke, they worked in an unused monastery in Rome. They used early Italian and medieval German pictures as models, working within the limits of religious dogma. They influenced German art and the PRE-RAPHAELITES in England.

Nazareth, town (1989 est. pop. 51,000), N Israel, in Galilee, the home of JESUS. It is a place of pilgrimage and the trade center of a farming area. Although first mentioned in the New Testament, it predates historic times. Part of the Ottoman Empire (1517–1918), and of Britain's Palestine mandate (1922–48), Nazareth has been held by Israel since 1948.

Nazarite or **Nazirite,** in the OLD TESTAMENT, a man dedicated to God. After taking a special vow, he abstained from intoxicating beverages, never cut his hair, and avoided corpses. SAMUEL, the prophet, and SAMSON were Nazarites.

Nazca or **Nasca,** ancient indigenous culture of S Peru, fl. before A.D. 1000. The Nazca are known for their polychrome pottery and skillful weaving and dyeing. Aerial exploration of the arid tableland surrounding their valley has revealed a network of lines interspersed with giant animal forms—probably related to Nazca astronomy and religion.

Nazi, term for member of the National Socialist German Workers' party. Led by Adolf HITLER after 1920, the Nazis advocated rabid NATIONALISM, ANTI-SEMITISM, and anti-Communism. Their rule (1933–45) in GERMANY ended in defeat during WORLD WAR II. See NATIONAL SOCIALISM; see also CONCENTRATION CAMP; WAR CRIMES.

Nazianzen: see GREGORY NAZIANZEN, SAINT.

Nazimova, Alla [nəzĭ'məvə], 1879–1945, Russian-American actress. A student of STANISLAVSKY, she emigrated to the U.S. (1905), becoming its foremost IBSEN interpreter.

Nb, chemical symbol of the element NIOBIUM.

Nd, chemical symbol of the element NEODYMIUM.

Ndebele or **Matabele,** Bantu-speaking people inhabiting North and South Matabeleland, W Zimbabwe. The Ndebele originated as a tribal following in 1823 when Mzilikazi, a general under the ZULU King Shaka, fled with a number of warriors into the Transvaal; they were driven north into their present homeland by the BOERS and the Zulu. After the British suppressed an 1896 revolt, the Ndebele abandoned warfare, becoming herders and farmers. They number about 2 million.

Ndjamena [ənjä'mänä], city (1988 est. pop. 595,000), capital of Chad, on the Chari R. The city is a central African transportation hub, Chad's main administrative center, and a market for livestock, salt, dates, and grains. Founded by the French as Fort-Lamy in 1900, it was renamed in 1973.

Ndola, city (1988 est. pop. 418,000), N central Zambia, near Zaïre. It is a commercial, manufacturing, and mining center located in

the rich Copperbelt, where copper was mined long before the coming of the Europeans (c.1900). Industries include cement, footwear, soap, and motor vehicle assembly.

Ne, chemical symbol of the element NEON.

Neanderthal man or **Neandertal man,** type of early human, existing 125,000–35,000 years ago and generally considered a subspecies of *Homo sapiens* (see HUMAN EVOLUTION), whose fossil remains were first found (1856) in Neanderthal, W Germany. The Neanderthals' middle Paleolithic culture (see STONE AGE) included stone tools, fire, burial, and cave shelters. The so-called classic Neanderthals were robust and had a large, thick skull, a sloping forehead, a chinless jaw, and a brain somewhat larger than that of modern humans; they stood slightly over 5 ft (152 cm). It is unclear whether Neanderthals were replaced by *Homo sapiens sapiens* or interbred with other early humans.

nearsightedness or **myopia,** defect of vision in which far objects appear blurred, but near objects are seen clearly. Because the eyeball is too long or the eye's refractive power too strong, the image is focused in front of the retina of the EYE rather than upon it. Eyeglasses with concave lenses can compensate for the refractive error (see LENS). Radial keratotomy, a surgical procedure, can repair the defect by flattening the eye, but it weakens the cornea.

Nebraska, midwestern state of the U.S.; bordered by Iowa and Missouri, across the Missouri R. (E), Kansas (S), Colorado (SW), Wyoming (NW), and South Dakota (N).

Area, 77,227 sq mi (200,018 sq km). *Pop.* (1990) 1,578,385, a 0.5% increase over 1980 pop. *Capital,* Lincoln. *Statehood,* Mar. 1, 1867 (37th state). *Highest pt.,* 5,426 ft (1,655 m), Kimball Co.; *lowest pt.,* 840 ft (256 m), SE corner of state. *Nickname,* Cornhusker State. *Motto,* Equality before the Law. *State bird,* Western meadowlark. *State flower,* goldenrod. *State tree,* cottonwood. *Abbr.,* Nebr.; NE.

Land and People. The land gradually rises east to west from the fertile, loess-covered GREAT PLAINS to the sand hills and then to the foothills of the ROCKY MOUNTAINS. The great, shallow Platte R. originates in Nebraska and flows west to east across the state to join the MISSOURI R. The continental climate is marked by intensely hot summers and severely cold winters. Over 65% of the population lives in metropolitan areas. OMAHA is the largest city, followed by LINCOLN and Grand Island. In 1990 the state was 94% white and 4% African American.

Economy. Agriculture is by far the chief source of income. The leading products are cattle, corn, hogs, soybeans, wheat, hay, and sorghum. The major industry, food processing, utilizes the state's farm output. It is followed in terms of revenue by the manufacturing of nonelectrical machinery and electrical equipment. Mining is dominated by petroleum and natural-gas extraction. Both Omaha and Lincoln are centers of the insurance industry.

Government. The state constitution (adopted 1875) provides for a governor elected to a four-year term. Nebraska is the only state with a unicameral legislature; 49 nonpartisan members are elected every four years. Nebraska is represented in the U.S. Congress by two senators and three representatives and has five electoral votes.

History. The PAWNEE, CHEYENNE, ARAPAHO, and SIOUX were among the Native American peoples that lived by hunting buffalo when the area was visited (1541) by the Spanish explorer Francisco Vásquez de CORONADO. The fur trade had been established by the French by the time the U.S. acquired the region by the LOUISIANA PURCHASE (1803). During the mid-19th cent. thousands of wagon trains passed through Nebraska on their way farther west, and the famous landmarks of Chimney Rock and Scotts Bluff are now both preserved as parts of the U.S. National Parks system. The HOMESTEAD ACT (1862) and the arrival (1867) of the railroad resulted in a land rush as settlers occupied the free land. Nebraska farmers were active in the POPULIST PARTY of the 1890s, and William Jennings BRYAN, a Nebraskan, became the national leader of both Populists and Democrats. Nebraska farmers were severely affected by drought during the GREAT DEPRESSION. Since World War II, such huge federal projects as the Missouri R. basin project have helped to make the best use of the state's water resources, particularly for crop irrigation. The state's economy remained strong, with relatively low unemployment, during the national economic difficulties of the late 1980s and early 90s. Nebraska has successfully diversified its economy by encouraging the growth of the service sector, particularly in its largest cities.

Nebuchadnezzar [nĕb"əkədnĕz'ər], d. 562 B.C., king of BABYLONIA (c.605–562 B.C.). In 597 B.C. he quelled a revolt by Judaea and set ZEDEKIAH on the throne. Putting down a new revolt, he destroyed Jerusalem (586 B.C.) and took the king and many nobles captive, thus beginning the BABYLONIAN CAPTIVITY. Under Nebuchadnezzar Babylonia flourished, and BABYLON became magnificent. His palace and temples have been excavated. The Old Testament book of Daniel depicts Nebuchadnezzar as a conceited and domineering king, and tells of his going mad and eating grass.

nebula, immense body of highly rarified gas and dust in the interstellar spaces of galaxies. A diffuse nebula, such as the CRAB NEBULA, is irregular in shape and ranges up to 100 light-years in diameter. A bright emission nebula, composed primarily of hydrogen gas ionized by nearby hot blue-white stars, radiates its own light; a bright reflection nebula, located near cooler stars, reflects the starlight. A dark nebula, which neither emits nor reflects light because it is too distant from any star, appears as an empty patch in a field of stars or as a dark cloud obscuring part of a bright nebula in the background. A planetary nebula consists of a well-defined shell of gaseous material that glows from the radiation emitted by the central hot star it surrounds. The shell, measuring about 20,000 ASTRONOMICAL UNITS in diameter, is slowly expanding, indicating that it was expelled in a nova or SUPERNOVA explosion.

Necho [nē'kō], pharaoh (609–593 B.C.) of EGYPT, of the XXVI dynasty. In the first part of his reign he invaded PALESTINE and SYRIA; his aim was to aid the Assyrians, who were besieged by NEBUCHADNEZZAR and the Babylonians. Defeated on the Euphrates in 605, he returned to Egypt. He later tried to reexcavate the Nile–Red Sea canal and sent Phoenicians on an expedition that may have circumnavigated Africa.

Necker, Jacques [nĕkĕr'], 1732–1804, French financier and statesman; b. Switzerland. In 1750 he went to Paris and became a banker. He opposed the free trade policies of A.R.J. TURGOT, was named director of the treasury (1776) by LOUIS XVI, and later became director general of finances (1777). By reform and retrenchment measures, and by borrowing at high interest to finance French involvement in the AMERICAN REVOLUTION, he sought to restore the nation's finances. In 1781 he demanded greater reform powers, but opposition from the comte de Maurepas caused Necker to resign. Louis XVI recalled him (1788) as director general of finances and minister of state. Acclaimed by the populace, he supported the summoning of the STATES-GENERAL to effect reforms. His dismissal (1789) led to the storming of the BASTILLE. Necker was once more recalled to office, but he resigned in 1790.

nectarine, name for a tree (*Prunus persica nectarina*) of the ROSE family and for its fruit, a smooth-skinned variety of the PEACH. In appearance, culture, and care the nectarine tree is almost identical to the peach tree. Occasionally a nectarine tree will produce peaches and a peach tree nectarines.

Nefertiti [nĕf"ərtē'tē] or **Nefretete** [nĕf"rĕtē'tē], fl. c.1372–1350 B.C., queen of EGYPT; wife of IKHNATON and aunt of TUTANKHAMEN. The famous and exquisite limestone bust of Nefertiti is in the Berlin Museum.

Negev or **Negeb,** hilly desert region of S Israel, c.5,140 sq mi (13,310 sq km), bordered by the Judaean Hills, the Wadi Arabah, the Sinai peninsula, and the narrow Mediterranean coastal plain; it comprises more than one half of Israel's land area. In the NW Negev, irrigation by the Israelis has reclaimed some fertile land. The region also yields copper, phosphates, and natural gas. BEERSHEBA, Arad, and ELAT are the Negev's principal cities. Israel's nuclear research center is at Dimona.

negligence, failure to act with the care required by law to protect the rights and property of others. Unless more specifically defined by the terms of a CONTRACT, "care" is the behavior of a "reasonable, prudent" person. Negligence takes innumerable forms, and negligence claims, many involving vehicular accidents, are the chief sources of current civil litigation in the U.S. See also TORT.

negotiable instrument, bill of exchange, check, promissory note, or other written CONTRACT for payment that may serve as a substitute for money. Transfer of negotiable instruments is easily accomplished and gives the holder of the contract the right to enforce

fulfillment. Like COMMERCIAL PAPER, they were developed to meet the needs of trade.

Negro: see RACE.

Negroid: see RACE.

Nehemiah, book of the Bible: see EZRA.

Nehru, Jawaharlal, 1889–1964, Indian statesman, first prime minister of INDIA (1947–64). He was educated at Harrow and Cambridge, and practiced law. After the British massacre of Indian nationalists at Amritsar (1919) he became a nationalist. He was a leader of the INDIAN NATIONAL CONGRESS and an associate of GANDHI, although unlike Gandhi he favored industrialization and socialism. He participated in the negotiations that created an independent India in 1947 and served as its prime minister until his death. Although an advocate of nonviolence and neutralism in foreign affairs, he did not hesitate to employ force in opposing Pakistan in Kashmir, in seizing (1961) Goa from the Portuguese, and in resisting (1962) Chinese border incursions. He was the father of Indira GANDHI.

Nelson, Horatio Nelson, Viscount, 1758–1805, English naval hero of the FRENCH REVOLUTIONARY WARS. His destruction of the French fleet at Aboukir crippled NAPOLEON I's Egyptian expedition. Later stationed at Naples, Nelson fell in love with Lady HAMILTON, who became his mistress; he was suspected of prolonging his stay on her account. In 1801, Nelson defeated the Danes at Copenhagen. In 1805 he achieved his greatest victory, defeating the combined fleets of France and Spain at TRAFALGAR, but was mortally wounded.

nematode, member of a phylum (Nematoda) that comprises the roundworms. Nematodes live in the water or soil. Many species, such as pinworms and HOOKWORMS, are parasites of plants and animals, including humans. Some parasitic nematodes are used as biological pesticides to control insect pests.

Nemerov, Howard, 1920–91, American writer; b. N.Y.C. His poetry ranges from light to philosophical in such works as *Image and the Law* (1947) and *Collected Poems* (1977; Pulitzer). Nemerov also wrote fiction and criticism.

Nemesis, in Greek religion, the avenger; personification of the gods' retribution for violation of sacred law.

Nemirovich-Danchenko, Vladimir [nāmērō'vĭch-dän' chĕngkō], 1859–1943, Russian stage director. With STANISLAVSKY he founded (1897) the Moscow Art Theatre (see THEATER, table).

neoclassicism: see CLASSICISM.

neodymium (Nd), metallic element, discovered in 1885 by C.A. von Welsbach. A lustrous, silver-yellow RARE-EARTH METAL in the LANTHANIDE SERIES, it is present in MONAZITE and bastnasite. Neodymium is used in the manufacture of certain lasers. Its oxide is used in coloring eyeglasses and in an alloy in cigarette-lighter flints. See ELEMENT (table); PERIODIC TABLE.

neoexpressionism, international art movement that originated in the late 1970s and early 80s. Drawing on the traditions of 20th-cent. EXPRESSIONISM and rejecting a sleek modernism and the depersonalization of such movements as MINIMALISM, neoexpressionism is characterized by violent and often erotic subject matter, an ironic use of kitsch imagery, drawing that is often crude and childlike, and a vigorous painting style. Among the many artists in this varied and individualistic movement are: in the U.S., Julian Schnabel and David Salle; in Italy, Francesco Clemente and Sandro Chia; and in Germany, A.R. Penck and Georg Baselitz.

neo-impressionism: see POSTIMPRESSIONISM.

Neolithic period: see under STONE AGE.

neon (Ne), gaseous element, discovered in 1898 by William RAMSAY and M.W. Travers. A colorless, odorless, and tasteless INERT GAS, it emits a bright-red glow when conducting electricity in a tube. Neon is used in advertising signs, LASERS, Geiger counters, PARTICLE DETECTORS, and high-intensity beacons. Liquid neon is a cryogenic refrigerant. See ELEMENT (table); PERIODIC TABLE.

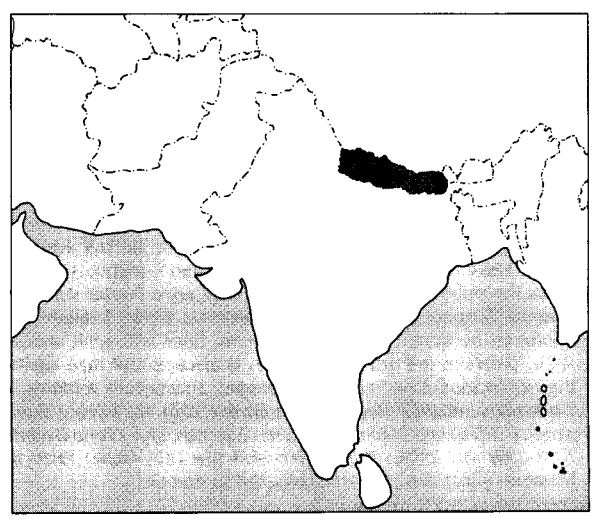
Neopaganism, polytheistic religious movement, practiced in small groups by partisans of pre-Christian religious traditions, e.g., Egyptian, Greek, Norse, Celtic. Neopagans are either nature-oriented or magical, and often incorporate elaborate, arcane rituals into their practices. See also WITCHCRAFT.

Neoplatonism, ancient mystical philosophy based on the later doctrines of PLATO, especially those in the *Timaeus.* Considered the last of the great pagan philosophies, it was developed in the 3d cent. A.D. by PLOTINUS. Rejecting DUALISM, he saw reality as one vast hierarchical order containing all the various levels and kinds of existence. At the center is the One, an incomprehensible, all-sufficient unity that flows out in a radiating process called emanation, giving rise to the Divine Mind, or Logos. The Logos contains all intelligent forms of all individuals. This in turn generates the World Soul, which links the intellectual and material worlds. Despite his mysticism, Plotinus' method was thoroughly rational, based on the logical traditions of the Greeks. Later Neoplatonists grafted onto its body such disparate elements as Eastern mysticism, divination, demonology, and astrology. Neoplatonism, widespread until the 7th cent., was an influence on early Christian thinkers (e.g., ORIGEN) and medieval Jewish and Arab philosophers. It was firmly joined with Christianity by St. AUGUSTINE, who was a Neoplatonist before his conversion. Neoplatonism has had a lasting influence on Western metaphysics and MYSTICISM. Philosophers whose works contain elements of Neoplatonism include St. THOMAS AQUINAS, BOETHIUS, and HEGEL.

NEP: see NEW ECONOMIC POLICY.

Nepal, officially Kingdom of Nepal, independent kingdom (1992 est. pop. 20,086,000), c.54,000 sq mi (139,860 sq km), central Asia, bordered by China (N) and India (W, S, E). Nepal comprises three major areas: forests and cultivatable land in the south; the towering HIMALAYAS, including Mt. EVEREST, in the north; and moderately high mountains in the central region, which contains the Katmandu valley and most of the population. The capital is KATMANDU. The economy is predominantly agricultural. Rice, corn, wheat, millet, jute, timber, and potatoes are the principal products. Livestock raising is also important, and manufactures include textiles and processed foods. Tourism is a major source of foreign income. The population is a mixture of Indo-Aryan, Tibetan, and other peoples; about 90% of the total are Hindus. Nepali, an Indo-European tongue, is the official language, but there are some 20 Nepalese languages.

History. A Hindu-Buddhist culture flourished in the Katmandu valley by the 4th cent. A.D. In the Middle Ages many small principalities were established. One of these, the GURKHAS, became dominant in 1768. In 1816, after a war with the British, Nepal adopted a policy of seclusion from foreign contacts. Internal power struggles led in 1846 to the dominance of the Rana family, which controlled the country until 1951. Under the Ranas, Nepal was isolated from foreign influence, and there was little economic modernization. Nepal was granted independence in 1923, and a limited constitutional monarchy was established in 1951. After a brief period of democracy (1959–60), political activity was banned. A form of partyless government, the panchayat system, was set up (1962), with executive power resting in the king. This system was narrowly approved (1980) in a national referendum. In 1990 protests led to the abolition of the panchayat system and the reestablishment of democracy and a constitutional monarchy. In the sub-



sequent elections (1991) the centrist Nepali Congress party won a slim majority in the new parliament, and Girija Prasad Koirala became prime minister. Long influenced by India, Nepal has recently developed closer ties with China.

nephrite: see JADE.

nephritis: see under KIDNEY.

nephrosis: see KIDNEY.

Neptune, in astronomy, 8th PLANET from the sun, at a mean distance of 2.7941 billion mi (4.4966 billion km); PLUTO is closer to the sun from 1978 to 2000, however, due to its highly elliptical orbit. It has an equatorial diameter of c.30,700 mi (49,400 km), a solid core, and a thick atmosphere composed of hydrogen, helium, methane, and ammonia. Its atmosphere has zones like Jupiter's and a giant storm (the Great Dark Spot). Neptune was the first planet to be discovered on the basis of theoretical calculations; such calculations, based on the observed irregularities in the motion of the planet URANUS, were made independently by John Couch ADAMS and Urbain LEVERRIER. The German astronomer Johann Galle discovered Neptune on Sept. 23, 1846, within 1° of the position predicted and sent to him by Leverrier. Neptune had two known natural satellites prior to 1989: **Triton** (discovered 1846) has a diameter of 1,700 mi (2,700 km), travels in an unusual retrograde orbit, and has several active "geysers" of nitrogen ice and gas; **Nereid** (discovered 1949) has an estimated diameter of 145 to 290 mi (235 to 470 km). The *Voyager 2* SPACE PROBE encountered Neptune in 1989, discovering six smaller, dark moons (Naiad, Thalassa, Despina, Galatea, Larissa, and Proteus) and confirming the existence of a ring system with three major bands.

Neptune, in Roman mythology, god of water. Probably an indigenous fertility god, he was later identified with POSEIDON, the Greek god of the sea.

neptunium (Np), radioactive element, discovered in 1940 by E.M. McMillan and P.H. Abelson by neutron bombardment of uranium. It is a silvery metal in the ACTINIDE SERIES and is the first TRANSURANIUM ELEMENT. Neptunium is found in very small quantities in nature in association with uranium ores. The neptunium-237 isotope has a half-life of 2 million years. See ELEMENT (table); PERIODIC TABLE.

Nereid, in astronomy, natural satellite of NEPTUNE.

nereids: see NYMPH.

Nero (Nero Claudius Caesar), A.D. 37–68, Roman emperor (A.D. 54–68), the son of Lucius Domitius Ahenobarbus and Agrippina II, who was the great-grandaughter of AUGUSTUS. Agrippina married (A.D. 49) CLAUDIUS I and persuaded him to adopt Nero. In A.D. 55, Agrippina saw that she was losing control of Nero and intrigued in favor of Claudius' son, Britannicus, but Nero poisoned the boy. Poppaea Sabina became Nero's mistress, and according to rumor she was to blame for the worst of his behavior. In A.D. 59 he murdered his mother and in A.D. 62 his wife Octavia; he later married Poppaea. When half of Rome was burned in a fire (A.D. 64), Nero accused the Christians of starting it and began the first Roman persecution. In A.D. 65 there was a plot to make Caius Calpurnius Piso emperor. The detection of this plot began a string of violent deaths, e.g., of Seneca, Lucan, and Thrasea Paetus. Nero had ambitions to be a poet and artist. Revolts in A.D. 68 caused him to commit suicide. Among his last words were, "What an artist the world is losing in me!"

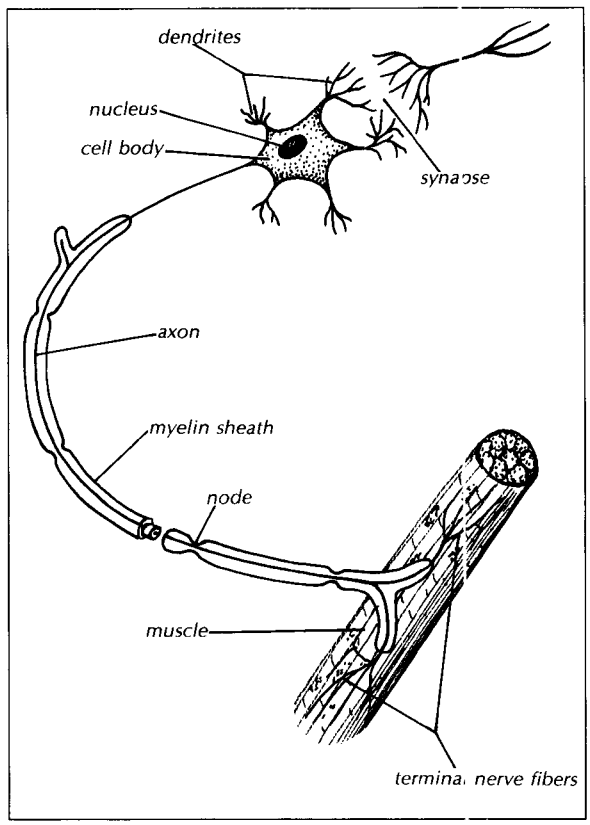
Neruda, Jan [nĕ'rōōdä], 1834–91, Czech poet. His *Stories from Malá Strana* (1878) typify early Czech realism. His lyrical poetry, resembling that of HEINE, is contained in *Ballads and Romances* and *Plain Themes* (both: 1883).

Neruda, Pablo [nārōō'thä], 1904–73, pseud. of **Neftalí Ricardo Reyes Basualto,** Chilean poet, diplomat, and Communist leader. From the publication of the early *Twenty Love Poems and One Song of Despair* (1924) his highly personal poetry brought him enormous acclaim. His evocative poems, filled with grief and despair, proclaim the dramatic Chilean landscape and rage against the exploitation of its indigenous people. Subsequent volumes include the surrealistic *Residence on Earth* (1933), the famous *Canto general* (1950) celebrating all of Latin America, and *A New Decade: 1958–1967* (tr. 1969). Neruda received the 1971 Nobel Prize for literature while serving as ambassador to France.

nerve: see NERVOUS SYSTEM.

nerve gas: see POISON GAS.

Nervi, Pier Luigi, 1891–1979, Italian architectural engineer. In the mid-1940s he developed *ferro-cemento,* a strong, light material consisting of steel mesh and concrete that enabled him to achieve complicated building units for vast, complex structures. His innovations made possible such intricate, beautiful buildings as the exposition halls in Turin (1949–50) and the Olympic buildings in Rome (1956–59).



Nerve cell (neuron)

nervous system, network of specialized tissue that controls actions and reactions of the body, enabling it to adjust to its environment. The system functions by receiving signals from all parts of the body, relaying them to the BRAIN and SPINAL CORD, and then sending appropriate return signals to muscles and body organs. Virtually all multicellular animals have at least a rudimentary nervous system; in vertebrates the system is most complex. The basic unit of the nervous system is the nerve cell (neuron). Of the billions of neurons in humans, half are in the brain. The neuron consists of a cell body, containing the cell nucleus; dendrites, branchlike extensions that receive incoming signals; and the axon, the long cell extension that carries signals long distances. A neuron works by receiving chemical signals—some excitatory, some inhibitory—through its dendrites and sending electrical impulses along its axon. Chemicals (NEUROTRANSMITTERS) released at the terminal fibers of the axon diffuse across a junction called the synapse and bind to dendrites of recipient neurons. Dendrites and axons are called nerve fibers; a nerve is a bundle of nerve fibers. The nervous system has two divisions: the central nervous system and peripheral nervous system. The central nervous system, consisting of the brain and spinal cord, receives impulses from receptors in the skin and organs via sensory (afferent) nerve fibers; it returns impulses via motor (efferent) fibers to terminals in muscles and glands. Peripheral nerves mediate these pathways. The peripheral nervous system comprises cranial nerves, controlling face and neck; spinal nerves, radiating to other parts of the body; and autonomic nerves, which

form a subsidiary system regulating the iris of the eye and muscles of heart, glands, lungs, stomach, and other visceral organs. The autonomic nervous system, in turn, comprises the sympathetic nervous system, which functions in response to short-term stress (e.g., increasing heart rate), and the parasympathetic nervous system, which acts in opposition to the sympathetic (e.g., lowering heart rate).

Ness, Loch, lake, 22 mi (35 km) long, N central Scotland, part of the Caledonian Canal. Ice-free all year and more than 700 ft (213 m) deep, it was first reported to be inhabited by a "monster," 40–50 ft (12–15 m) long, in newspaper accounts of 1868. Several alleged sightings have occurred since then.

Nestorianism, 5th-cent. heresy advanced by Nestorius (d. 451?), patriarch of Constantinople. It declared that Jesus was two distinct persons, one human, one divine. Nestorius opposed the title of Mother of God for the Virgin, contending that she bore Jesus only as a man. The councils of Ephesus (431) and Chalcedon (451) clarified the orthodox Catholic view that Jesus' two natures are inseparably joined in one person and partake of the one divine substance. The Nestorian Church that was formed in Persia has few connections today with Nestorianism.

Netanyahu, Benjamin, 1949–, Israeli diplomat and politician. A member of the Likud party, he served as Israel's UN representative (1984–88), deputy foreign minister (1988–91), and deputy prime minister (1991–92). In 1993 he was elected leader of the Likud party.

Netherlands, Dutch *Nederland,* officially Kingdom of the Netherlands, constitutional monarchy (1992 est. pop. 15,112,000), 15,963 sq mi (41,344 sq km), NW Europe, popularly known as Holland; bordered by the North Sea (N and W), Belgium (S), and Germany (E). Major cities include AMSTERDAM, the capital; The HAGUE, the seat of government; and ROTTERDAM. About 40% of the land is situated below sea level and is guarded by dunes and dikes. The country is crossed by drainage canals, and the main rivers are interconnected with artificial waterways. Some 27% of its land has been reclaimed from the sea over the past 1,000 years. Faced with widespread species depletion and pollution from fertilizers, the Dutch began (1990) returning 600,000 acres (almost 10% of its farmland) to natural forests, wetlands, and lakes. Despite one of the world's highest population densities, the Netherlands maintains a high standard of living. Industry provides 40% of national income, primarily from textiles, machinery, electrical equipment, iron and steel, refined petroleum, processed foods, ships, and chemicals. Agricultural commodities include dairy products (especially cheese), poultry, tobacco, and horticultural goods (especially bulbs). Foreign trade, the financial industry, and tourism are very important. Large natural gas reserves supply over half of the country's energy needs; natural gas is a major export. The population has nearly equal numbers of Protestants (mostly Calvinists) and Roman Catholics. Dutch is the almost universal language.

History. Settled in Roman times by Germanic tribes, the Low Countries (the Netherlands, Belgium, Luxembourg) passed successively to the Franks (4th–8th cent.), the Holy Roman Empire (10th cent.), and the dukes of Burgundy (14th–15th cent.); they came under Hapsburg rule after 1477 (see NETHERLANDS, AUSTRIAN AND SPANISH). In 1579 the northern provinces under WILLIAM THE SILENT broke away from Spain and formed the Union of Utrecht. Independence was declared in 1581, but the new nation—the United Provinces—was not formally recognized until 1648, after the THIRTY YEARS WAR. The 17th cent., the Netherlands' golden age, was a time of commercial prosperity, colonial expansion, religious tolerance, and cultural achievement (see DUTCH WARS; DUTCH WEST INDIA COMPANY; EAST INDIA COMPANY, DUTCH; REMBRANDT; SPINOZA; VERMEER). In the 18th cent. this supremacy was lost to England and France. Conquered by the French during the FRENCH REVOLUTIONARY WARS, the United Provinces were reconstituted (1795) as the BATAVIAN REPUBLIC; transformed (1806) by NAPOLEON I into the kingdom of Holland under Louis Bonaparte (see BONAPARTE, family); and finally, at the Congress of VIENNA (1814–15), united with present-day Belgium as the kingdom of the Netherlands. Belgium seceded in 1830. Neutral in World War I, the Netherlands suffered severely during the German occupation (1940–45) in WORLD WAR II. Postwar recovery was rapid, despite the loss of its eastern colonies (the

Netherlands gave INDONESIA independence in 1949 and relinquished Netherlands NEW GUINEA in 1962) and disastrous floods in 1953. Under a series of coalition governments, the Dutch economy (especially the industrial sector) expanded greatly and the country took a leading role in Western European integration. Queen BEATRIX ascended the nation's throne in 1980. Ruud Lubbers, a Christian Democrat, has been prime minister since 1982.

Netherlands, Austrian and Spanish, that part of the Low countries controlled from 1482 to 1794 by the HAPSBURG dynasty. The harsh rule of the Spanish Hapsburgs led to a revolt (16th–17th cent.) by which the northern provinces gained independence as the United Provinces of the NETHERLANDS. The Peace of Utrecht transferred (1714) the remaining Spanish lands to the Austrian branch of the Hapsburgs. French armies seized the area in 1794. For its later history, see BELGIUM and LUXEMBOURG.

Netherlands Antilles, islands (1992 est. pop. 184,000), 371 sq mi (961 sq km), West Indies, an autonomous part of the Netherlands. They are in two groups. The Leewards—Bonaire and CURAÇAO—lie off Venezuela. The Windwards—Saba, St. Eustatius, and SAINT MARTIN—are east of Puerto Rico. Tourism, oil refining, and offshore banking are the economic mainstays. Autonomy was granted in 1954; ARUBA was separated from the Netherland Antilles in 1986.

nettle, common name for the family Urticaceae, fibrous herbs, small shrubs, and trees found chiefly in the tropics and subtropics. Several species are covered with small stinging hairs that on contact emit formic acid, a skin irritant. Stinging nettles in the U.S. include species of *Urtica,* widely distributed, and *Laportea canadensis,* a characteristic plant of eastern forests.

network, in computing, two or more computers connected for the purposed of exchanging messages and sharing data and system resources. A LOCAL AREA NETWORK (LAN) connects personal computers and workstations (each called a node) over dedicated, private communications links. A wide area network (WAN) connects large numbers of nodes over long-distance communications links, such as common carrier telephone lines. An internet is a connection between networks. The **Internet** is a WAN that connects thousands of disparate networks in the U.S., Canada, Europe, and Asia, providing global communication between nodes on government, educational, and industrial networks.

Netzahualcóyotl [nātsäwälkō'yō təl], city (1990 pop. 1,259,543), S central Mexico. A communications center and residential area, it is one of Mexico City's largest and poorest suburban municipalities.

Neumann, Saint John Nepomucene, 1811–60, American Roman

Catholic bishop, the first American male to be canonized (1977); b. Bohemia. After studying at Prague he settled (1836) in the U.S., where he later entered the Redemptorist order. He was appointed bishop of Philadelphia in 1852. Neumann was responsible for building 80 churches and nearly 100 parochial schools. Feast: Jan. 5.

neuralgia, acute, throbbing pain along a peripheral sensory nerve, commonly in the area of the facial, or trigeminal, nerve. Its causes include SHINGLES, infections, and extreme cold. Unlike NEURITIS, neuralgia does not involve degeneration of the nerve tissue.

neural network, COMPUTER architecture modeled upon the BRAIN's interconnected system of neurons. Most neural networks are software simulations run on conventional computers. In neural computers, TRANSISTOR circuits serve as the neurons and variable RESISTORS act as the interconnecting axons and dendrites. A neural network on an INTEGRATED CIRCUIT, with 1024 silicon "neurons," has also been developed. Neural networks imitate the brain's ability to sort out patterns and learn from trial and error, discerning and extracting the relationships that underlie the data with which it is presented. They are well suited for pattern recognition, foreign language translation, process control, medical data interpretation, and PARALLEL PROCESSING implementations of conventional processing tasks.

neuritis, inflammation of a peripheral nerve, often accompanied by degenerative changes in nerve tissue. Sensory nerve involvement causes a tingling sensation or loss of sensation, while symptoms of motor nerve involvement range from slight loss of muscle tone to paralysis. Neuritis commonly occurs in DIABETES, SHINGLES, rheumatoid ARTHRITIS, and other disorders. Treatment varies, depending on the cause.

neurosis, a broad category of psychological disturbance, encompassing various mild forms of mental disorder. Until fairly recently, the term was broadly employed in contrast with PSYCHOSIS, which denoted much more severe, debilitating mental disturbances. Those disorders classified as neuroses have varied with time and with different schools of psychiatry, but they traditionally include Sigmund FREUD'S subtypes: ANXIETY, PHOBIAS, OBSESSIVE-COMPULSIVE NEUROSIS, and HYSTERIA. Refinement in diagnostic criteria led, in the 1980s, to the abandonment of the term *neurosis* in psychiatry in favor of more precise nomenclature.

neurotransmitter, chemical that transmits information across the junction (synapse) that separates one nerve cell (neuron) from another nerve cell or a muscle. Neurotransmitters are stored in the nerve cell's bulbous end (axon). When an electrical impulse traveling along the nerve reaches the axon, the neurotransmitter is released and travels across the synapse, either prompting or inhibiting continued impulses. There are more than 300 known neurotransmitters, including the ENDORPHINS and ACETYLCHOLINE.

Neutra, Richard Joseph, 1892–1970, American architect; b. Vienna. In Los Angeles after 1926, he adhered to a functionalist approach (see MODERN ARCHITECTURE), e.g., his Lovell "Heath House" (1929) and Northridge Medical Arts Building (1968).

Neutrality Act, 1935, law designed to keep the U.S. out of a possible European war by banning shipment of war matériel to belligerents and forbidding U.S. citizens to travel on belligerent vessels. Later revisions and the LEND-LEASE Act of 1941 made the law practically inoperable even before American neutrality ended with PEARL HARBOR.

neutralization: see ACIDS AND BASES; TITRATION.

neutrino, ELEMENTARY PARTICLE emitted during the decay of certain other particles. It was first postulated in 1930 by Wolfgang PAULI in order to maintain the law of conservation of energy during beta decay (see BETA PARTICLE; RADIOACTIVITY). Further studies showed that the neutrino was also necessary to maintain the conservation laws of momentum and spin. The neutrino was not detected directly until 1956. The neutrinos associated with the electron and other particles are distinct; each has its own antiparticle. Neutrinos are stable; they are created and destroyed only by particle decays involving the WEAK INTERACTION. Neutrinos appear to have little or no mass, although some experiments have suggested otherwise.

neutrino astronomy, study of stars by means of their emission of NEUTRINOS, ELEMENTARY PARTICLES that result from nuclear reactions in the stellar core and are emitted by stars along with light. Because neutrinos do not interact with matter very readily, they are very difficult to detect. Neutrino "observatories" are located in deep mines, where hundreds of feet of rock shield out COSMIC RAYS that would mask the fragile effects due to neutrinos. The sun is the most intense source of neutrinos (due to its closeness) and was the first object studied. Neutrinos have also been detected from SUPERNOVA 1987A in the Large Magellanic Cloud.

neutron, uncharged subatomic particle, discovered by James CHADWICK in 1932, of slightly greater mass than the PROTON. The stable isotopes of all elements except hydrogen and helium contain within the nucleus a number of neutrons equal to or greater than the number of protons. The preponderance of neutrons becomes more marked for very heavy nuclei. A neutron bound within the nucleus may be stable. A nucleus with an excess of neutrons, however, is radioactive; the extra neutrons (as well as any free neutrons not bound within a nucleus) convert by beta decay (see RADIOACTIVITY) into a proton, an electron, and an antineutrino. The antineutron, the neutron's antiparticle (see ANTIMATTER), was discovered in 1956. The neutron is made up of still smaller particles called QUARKS. See ELEMENTARY PARTICLES.

neutron bomb: see HYDROGEN BOMB.

neutron star, extremely small, extremely dense star roughly double the sun in mass but only a few miles in radius. According to current theories, the core of a neutron star is composed of ELEMENTARY PARTICLES and is surrounded by a fluid composed primarily of NEUTRONS squeezed in close contact. The fluid in turn is encased in a rigid, extremely dense crust a few hundred miles thick. Evidence of the existence of neutron stars is provided by PULSARS radio sources that fluctuate in intensity in a manner that indicates that they may be rotating neutron stars. Neutron stars are believed to be the dead stellar corpses remaining after the SUPERNOVA explosion of an intermediate-mass star. See GRAVITATIONAL COLLAPSE; STELLAR EVOLUTION.

Nevada, far western state of the U.S.; bordered by Utah and Arizona (E), California (SW, W), and Oregon and Idaho (N).

Area, 110,540 sq mi (286,299 sq km). *Pop.* (1990) 1,201,833, a 50.4% increase over 1980 pop. *Capital,* Carson City. *Statehood,* Oct. 31, 1864 (36th state). *Highest pt.,* Boundary Peak, 13,143 ft (4,009 m); *lowest pt.,* Colorado R., 470 ft (143 m). *Nickname,* Silver State. *Motto,* All for Our Country. *State bird,* mountain bluebird. *State flower,* sagebrush. *State tree,* single-leaf piñon. *Abbr.* Nev.; NV.

Land and People. Nevada lies mostly within the GREAT BASIN, its mountain ranges and high plateaus alternating with valleys running north to east. The COLORADO R., which flows along the state's southwestern border, is dammed by HOOVER DAM to create Lake MEAD, the largest of many water projects in this arid state. Winters are extremely cold in the north and west; summers in the south approach ovenlike heat. Over 80% of Nevada's land is controlled by the federal government, the highest percentage in the U.S. During the 1970s and 1980s Nevada experienced the fastest rate of population increase of any state, more than doubling in size. Most new residents have settled in the two rapidly growing major cities, LAS VEGAS and RENO; over 88% of the population lives in urban areas. In 1990 Nevada was 84% white, 7% African American, and 3% Asian American.

Economy. Because of the state's legalized gambling, tourism is the largest source of income, with Las Vegas, also known for its nightlife, the most popular destination. Natural landmarks, including Lake TAHOE, on the California border, are also popular. Traditionally, mining formed the backbone of the economy; today Nevada leads the country in the extraction of gold, silver, mercury, and barite, and also produces fluorspar, pumice, tungsten, and sand and gravel. Industry is dominated by the manufacture of gaming devices, chemicals, and aerospace products. Agriculture is not highly developed because of the arid climate and rough terrain, but cattle, dairy products, hay, and potatoes are produced.

Government. The constitution (adopted 1864) provides for a governor elected to a four-year term. The legislature consists of a senate whose 20 members serve four-year terms and an assembly with 42 members elected to two-year terms. Nevada is represented in the U.S. Congress by two senators and two representatives and has four electoral votes.

History. The American explorer Jedediah S. Smith passed through Nevada in 1827, and it was subsequently explored (1843–46) by John C. FRÉMONT. Mexico ceded (1846) the area to the U.S., and MORMONS established (1858) the first permanent settlement. Real population growth, however, came after the discovery (1858) of the silver-rich COMSTOCK LODE, at Virginia City, now a restored mining town. Nevada's economic fortunes have tended to fluctuate with the unstable prices of its minerals, and its residents supported the FREE SILVER movement of the 1890s. During the 20th cent. the federal government has played an active role in the state, building huge water projects and military installations. During the 1970s opposition to federal control of land resources resulted in the so-called Sagebrush Rebellion, in which the state was authorized to sue for possession of federal lands. Nonetheless, in 1990 the U.S. owned over 85% of Nevada's land. A huge expansion of high-technology industries during the 1970s and 80s helped to make Nevada one of the fastest growing states in the SUNBELT.

Nevelson, Louise, 1900–88, American sculptor; b. Russia. Using pieces of wood, found objects, cast metal, and other materials, she constructed huge walls or enclosed boxes of complex rhythmic abstract shapes. Painted black, white, or gold, her works have a sense of structural importance and an air of mystery. They are included in such collections as the Whitney Museum and Museum of Modern Art, N.Y.C.

Nevins, Allan, 1890–1971, American historian; b. Camp Point, Ill. A prolific writer in many areas of history, he taught at Columbia Univ. (1928–58). His masterful biographies include *Grover Cleveland* (1932; Pulitzer) and *Hamilton Fish* (1936; Pulitzer). *The Ordeal of the Union* (6 vol., 1947–60) is a comprehensive history of the CIVIL WAR era. Nevins established the nation's first oral-history program at Columbia.

New Age, term popularized in the 1980s to describe a wide-ranging set of beliefs and practices. Growing from 1960s and 70s U.S. counterculture, the New Age movement maintains that a spiritual era is dawning in which individuals and society will be transformed. New Age beliefs and practices include the realization of one's spiritual self, HOLISTIC MEDICINE (including the use of crystals for healing), reincarnation, and ASTROLOGY. In music, the term refers to meditative, relaxing, usually instrumental styles.

Newark, city (1990 pop. 275,221; met. area 1,824,321), seat of Essex co., NE N.J., on the Passaic R. and Newark Bay; settled 1666, inc. as a city 1836. Only 8 mi (13 km) from New York City, it is the largest city in New Jersey, and a major port. Among its diversified industries, leather, jewelry manufacture, and insurance have long histories. Newark is also a financial center and has many state-government offices. The city has lost industry since the 1930s, and its population has declined since the 1950s, dropping by 28% from 1970 to 1990. It has a high minority population, about 58% African American and nearly 19% Hispanic. Newark's landmarks include Trinity Cathedral (1810), the Newark Museum (1909), and Cass GILBERT's courthouse (1906) with BORGLUM's statue of Lincoln. Aaron BURR and Stephen CRANE were born in the city.

New Bedford, city (1990 pop. 99,922), seat of Bristol co., SE Mass., at the mouth of the Acushnet R., on Buzzards Bay; settled 1640, inc. as a city 1847. During the AMERICAN REVOLUTION it sheltered American privateers and was burned by the British in 1778. Once one of the world's leading whaling ports, later (1840s–1920s) a cotton textile center, it has diversified industries, including fishing, and electrical and electronic manufactures. It has a substantial Portuguese-speaking population.

New Brunswick, province (1991 pop. 723,900), 28,354 sq mi (73,436 sq km), E Canada, bounded by Quebec prov. (N), the Gulf of St. Lawrence and Nova Scotia (E), the Bay of Fundy (S), and Maine (W). One of the Maritime Provinces, New Brunswick has a rolling countryside, traversed by rivers that include the St. John and the Miramichi. Its irregular coastline supports an extensive fishing industry. Lumbering and the production of pulp and paper are the major industries, and agriculture is also important. Since World War II, manufacturing and mining (chiefly zinc, silver, lead, and copper) have expanded. Tourist attractions include the spectacular FUNDY tides—the highest in the world—and the "reversing falls" at SAINT JOHN, New Brunswick's principal city. Other major cities are MONCTON and FREDERICTON, the capital.

History. The first white settlement was made in 1604 at the mouth of the St. Croix River by the French under CHAMPLAIN and sieur de MONTS. Together, Nova Scotia and the New Brunswick coast became known to the French as ACADIA. The British gained control of the area in 1713, and many of the French Acadians were later expelled (1755, 1758). Thousands of UNITED EMPIRE LOYALISTS settled in New Brunswick after the American Revolution, and a separate colony was organized (1784). Responsible (cabinet) government was achieved in 1849, and in 1867 New Brunswick joined with other colonies to form the Dominion of Canada. At present about half of the population lives in urban areas. The Progressive Conservatives controlled provincial government from 1970 to 1987, when the Liberals swept the election. New Brunswick sends 10 senators (appointed) and 10 representatives (elected) to the national parliament.

New Caledonia, French overseas territory (1992 est. pop. 175,000), land area 7,082 sq mi (18,342 sq km), in the South Pacific. It comprises New Caledonia, the Isle of Pines, the Loyalty Islands, and smaller islands; Nouméa is the capital. Industries include iron and nickel mining, and coffee and copra production. About 42% of the people are Melanesian and 37% European. Captain COOK sighted (1774) the main island; France annexed it in 1853. In the 1980s Melanesians campaigned, sometimes violently, for independence, but the population voted to remain a French territory. Under a 1988 accord New Caledonia was granted substantial autonomy.

Newcastle, city (1991 urban agglomeration pop. 432,600), New South Wales, SE Australia, on the Pacific Ocean. It is a major port and the center of the country's largest coal-mining area. Manufactures include steel, chemicals, and ships. The city was settled in 1804.

New Church: see NEW JERUSALEM, CHURCH OF THE.

Newcomen, Thomas, 1663–1729, English inventor of an early atmospheric STEAM ENGINE (c.1711) used to pump water. It was an improvement over Thomas Savery's engine (patented 1698).

New Deal, in U.S. history, term for the domestic reform program of Pres. Franklin Delano ROOSEVELT. It had two phases. The first (1933–34) attempted to provide recovery and relief from the GREAT DEPRESSION through programs of agricultural and business regulation, inflation, price stabilization, and public works; numerous emergency organizations, e.g., the NATIONAL RECOVERY ADMINISTRATION, were established. The second (1935–41) provided for social and economic legislation, e.g., SOCIAL SECURITY, to benefit the mass of working people. A number of New Deal measures were invalidated by the SUPREME COURT, and the program, which had been enthusiastically endorsed by agrarian, liberal, and labor groups, was increasingly criticized. Nonetheless, at the end of World War II most New Deal legislation was still intact.

New Delhi [dĕl'ē], city (1991 pop. 294,000), capital of India, Delhi union territory, N central India. Built (1912–29) to replace CALCUTTA as the capital, it was inaugurated in 1931. Planned by Edward LUTYENS, New Delhi's broad streets provide vistas of historic monuments and magnificent government buildings.

New Democratic party (NDP), Canadian political party, founded (1961) when the Cooperative Commonwealth Federation (CCF) reorganized and became associated with Canadian labor unions. The NDP adopted much of the CCF's democratic-socialist agenda, but broadened its appeal by putting less emphasis on specific socialist proposals. Led since 1989 by Audrey McLaughlin, the first woman to head a Canadian national party, the NDP is strongest in W Canada.

New Economic Policy (NEP), official economic program of the USSR, 1921–28. Initiated by LENIN, the NEP replaced the "war Communism" of the 1918–21 civil war period, which had caused scarcity and popular unrest. Under the NEP peasants could sell some of their produce for a profit and small businesses could operate privately. The first Five-Year Plan supplanted the NEP.

New England, region of the NE U.S., comprising MAINE, NEW HAMPSHIRE, VERMONT, MASSACHUSETTS, RHODE ISLAND, and CONNECTICUT. Agriculture was never important due to the poor, rocky soil, but excellent harbors and fisheries made it a commercial center. Manufacturing grew rapidly in the 19th cent. and has since dominated the economy. Traditional industries, e.g., shoe and textile, have largely been superseded by electronics and tourism. New England

was the center of many of the historical events that led to the AMERICAN REVOLUTION.

New England Confederation or **United Colonies of New England,** 1643–1684, union for "mutual safety and welfare" formed by the British colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven. It was weakened by rivalry among the colonies and its inability to do more than advise. Its most important action was to break the power of Native Americans in KING PHILIP'S WAR.

New England Primer, American school book, first published before 1690; compiled by Benjamin Harris in Boston. It featured moralizing couplets and woodblock illustrations. About 2 million copies were sold during the 18th cent.

Newfoundland, province (1991 pop. 568,474), E Canada, consisting of the island of Newfoundland, 43,359 sq mi (112,299 sq km), and the mainland area of Labrador, 112,825 sq mi (292,218 sq km). Newfoundland island lies at the mouth of the Gulf of St. Lawrence and is bounded by the Atlantic Ocean (N, E, S). Labrador, northwest of the island, is bordered by the Atlantic Ocean (E) and by Quebec prov. (S, W). Newfoundland has a rocky, irregular coast and a generally cool and moist climate. The cod-fishing area of the GRAND BANKS, southeast of the island, is probably the best in the world and cod, lobster, herring, and salmon are caught in the coastal waters. In Labrador, cold temperatures and lack of transportation have retarded economic development. Labrador, however, is rich in mineral resources (iron, zinc, copper, asbestos, lead, oil, natural gas), and mining is the main industry. The lake district in the southwest is particularly rich in iron deposits. Timber and water power are also plentiful, and pulp and paper are important provincial products. SAINT JOHN'S, the capital, and Corner Brook, both on Newfoundland, are the province's chief cities.

History. VIKINGS visited the area (c.1000) and briefly established a settlement on Newfoundland. Sir Humphrey GILBERT claimed the island for England in 1583, but France contested English claims and the island changed hands several times. In 1763 the treaty of Paris definitely awarded Newfoundland and Labrador to Britain. Representative government was introduced in 1832 and parliamentary government in 1855. Voters rejected union with Canada in 1869, and further negotiations for union, begun in 1895, were unsuccessful. Possession of Labrador was disputed between Newfoundland and Quebec until 1927, when Newfoundland's claims were upheld by the British Privy Council. During the depression of the 1930s Britain suspended Newfoundland's self-government, and actual authority was exercised by a joint commission of Newfoundlanders and British. In 1949 Newfoundland became Canada's 10th province. The iron-centered economy suffered in the recession of the 1980s and fishing declined dramatically in the early 1990s, but offshore oil deposits show promise. Newfoundland sends six senators (appointed) and seven representatives (elected) to the national parliament.

New Granada, former Spanish colony, N South America, that included at its greatest extent modern Colombia, Ecuador, Panama, and Venezuela. Colonized by Spain in the 16th cent., the area was called "the new realm of Granada" by the explorer JIMÉNEZ DE QUESADA. Civil government was established in 1549 and the area was made a viceroyalty in 1717. After independence (1819) it became the state of Greater Colombia, but by 1830 Ecuador and Venezuela had seceded. The remainder (Colombia and Panama) became the Republic of New Granada and later (1886) the Republic of Colombia, from which Panama seceded in 1903.

New Guinea, world's second largest island (after Greenland), c.342,000 sq mi (885,780 sq km), in the SW Pacific Ocean N of Australia. It is c.1,500 mi (2,410 km) long and c.400 mi (640 km) wide. Djaja Peak (16,503 ft/5,030 m) is the highest point in the mountainous interior. The island is politically divided between Indonesia (W) and Papua New Guinea (E). Headhunting and cannibalism are still practiced in some inaccessible regions. The inhabitants include Melanesians, Papuans, and Negritos. New Guinea is the most linguistically diverse region in the world, with about 1,000 separate languages.

New Hampshire, one of the New England states of the NE U.S.; bordered by Massachusetts (S), Vermont, with the Connecticut R. forming the boundary (W), the Canadian province of Quebec (NW), and Maine and a short strip of the Atlantic Ocean (E).

Area, 9,304 sq mi (24,097 sq km). *Pop.* (1990) 1,109,252, a 20.5% increase over 1980 pop. *Capital,* Concord. *Statehood,* June 21, 1788 (9th of the original 13 states to ratify the Constitution). *Highest pt.,* Mt. Washington, 6,288 ft (1,918 m); *lowest pt.,* sea level. *Nickname,* Granite State. *Motto,* Live Free or Die. *State bird,* purple finch. *State flower,* purple lilac. *State tree,* white birch. *Abbr.,* N.H.; NH.

Land and People. Most of New Hampshire is hilly or mountainous, with the highest peaks in the White Mts., part of the APPALACHIAN system. Winters are severe, with heavy snows in the mountains; summers are relatively cool. The mountains give way to the Connecticut R. valley in the west and a coastal plain in the east. New Hampshire has had the most rapid population growth in New England, with most of the increase occurring in the south, which is part of the BOSTON metropolitan area, and over 50% of the population now lives in urban areas. MANCHESTER is the largest city, followed by NASHUA and CONCORD. In 1990 the state was 98% white.

Economy. Year-round tourism is now New Hampshire's major source of income, with visitors attracted to the state's beaches, mountains, and lakes. Manufacturing, which dominated the state's economy from the late 19th to late 20th cent., today produces such goods as nonelectrical machinery, electrical and electronic products, fabricated metals, paper, leather goods, and textiles. Intensive agriculture is hampered by stony soil and rugged terrain, but dairy products, eggs, greenhouse products, hay, vegetables, fruit, and maple syrup are key farm products. Forestry is also important.

Government. The constitution of 1784 provides for a governor serving a two-year term. The general court, the largest legislature in the country, consists of a 24-seat senate and a 400-seat assembly, with members of both bodies elected to two-year terms. New Hampshire is represented in the U.S. Congress by two senators and two representatives and has four electoral votes.

History. Puritans (see PURITANISM) from Massachusetts began settling New Hampshire during the 1620s and 30s, and it became a separate colony in 1741. New Hampshire was the first colony to declare (1776) its independence from Great Britain and to establish its own government. In the early 1800s water-powered textile manufacturing began to replace shipping (at Portsmouth), agriculture, and lumbering in economic importance. Textile manufacturing seriously declined during the GREAT DEPRESSION, and efforts were made to broaden the state's economic activities. The establishment of new industries, including electronics in S New Hampshire, successfully counterbalanced the departure of older industries to other states until the national recession of the late 1980s and early 90s caused widespread unemployment.

New Harmony, town (1990 pop. 846), SW Ind., on the Wabash R.; founded 1814 by the Harmony Society under George Rapp. In 1825 Robert OWEN established a communistic colony that became a cultural and scientific center. The nation's first kindergarten, first free public school, and first free library were established there. Some 25 Rappite buildings remain.

New Haven, city (1990 pop. 130,474), S Conn., a port where the Quinnipiac and other rivers enter Long Island Sound; inc. 1784. An educational center, the city is the seat of Yale Univ. (chartered 1701, moved to New Haven 1716) and other institutions. Its manufactures include firearms, timepieces, rubber and paper goods, and textiles. Founded (1637–38) by Puritans as a theocratic community, it was united with the Connecticut Colony in 1665.

New Hebrides: see VANUATU.

Newhouse, Samuel Irving, 1895–1979, American newspaper and magazine publisher. From 1922 to the 1970s, he acquired 31 dailies in 22 cities, including the Newark *Star Ledger.* He also controlled such magazines as *Vogue, House and Garden,* and *Mademoiselle,* and several radio stations and cable-television systems.

Ne Win, U [ōō nā wĭn], 1911–, Burmese general and political leader; b. Shu Muang. He became prime minister by twice deposing (1958, 1962) U NU in military coups. Ne Win's "Burmese Way to Socialism" made Myanmar a police state and failed to improve the economy. In 1974 he became president under a new constitution. He resigned the presidency in 1981, and in 1988, in the face of widespread antigovernment demonstrations, he resigned the chairmanship of Myanmar's ruling party.

New Jersey, mid-Atlantic state of the U.S.; bordered by the Atlantic

Ocean (E), Delaware, across Delaware Bay (S), Pennsylvania, across the Delaware R. (W), and New York State (N).

Area, 7,836 sq mi (20,295 sq km). *Pop.* (1990) 7,730,188, a 5% increase over 1980 pop. *Capital,* Trenton. *Statehood* Dec. 18, 1787 (3d of original 13 states to ratify the Constitution). *Highest pt.,* High Point Mt., 1,803 ft (550 m); *lowest pt.,* sea level. *Nickname,* Garden State. *Motto,* Liberty and Prosperity. *State bird,* Eastern goldfinch. *State flower,* purple violet. *State tree,* red oak. *Abbr.,* N.J.; NJ.

Land and People. More than half the state is covered by coastal plains that give way to the Piedmont plains inland and to the ridges of the APPALACHIAN highlands in the northwest. One of the smallest states in area, New Jersey is the ninth most populous, the most densely settled (987 per sq mi/381 per sq km), and the most highly urbanized state, with nearly 90% of the population living in urban areas. The largest city is NEWARK; other important cities are JERSEY CITY, PATERSON, and TRENTON. Many communities are suburbs of NEW YORK CITY and PHILADELPHIA. In 1990 the state was 80% white, 13% African American, and 4% Asian American.

Economy. Service industries now provide New Jersey's largest source of income, with huge commercial expansion taking over much of its farmland. Manufacturing produces chemicals and pharmaceuticals, electronic and electrical equipment, nonelectrical machinery, fabricated metals, processed foods, and many other products. Tourism is also important, with the Atlantic shore the most popular destination. New Jersey's farms producing hay, corn, soybeans, tomatoes, blueberries, peaches, cranberries, dairy products, and other crops. The state's well-developed transportation and shipping network includes part of the Port of New York–New Jersey.

Government. The constitution (adopted 1947) provides for a governor serving a four-year term. The legislature consists of a senate whose 40 members serve four-year terms and a house of assembly with 80 members elected to two-year terms. New Jersey is represented in the U.S. Congress by 2 senators and 13 representatives and has 15 electoral votes.

History. The region was the home of the DELAWARE when Europeans, including Henry HUDSON, explored it during the early 17th cent. Although the Dutch were the first to establish a permanent settlement (1660), the area was seized by the British (1664), who held it until New Jersey became one of the Thirteen Colonies to declare (1776) its independence. Many important Revolutionary War battles were fought there, including those at Trenton, PRINCETON, and MONMOUTH (see AMERICAN REVOLUTION). Following the Revolution, a period of enormous economic expansion occurred, and industry, making use of water power for textile mills, was established. Economic growth was accompanied by political corruption, which continued until Gov. Woodrow WILSON sponsored (1910–12) a reform movement. The state's highly industrial economy expanded significantly during and after World War II. In 1976 New Jersey voters approved casino gambling in ATLANTIC CITY, which revitalized that aging seaside resort and the state's tourist trade. Visitors have also been attracted by the multi-stadium Meadowlands Sports Complex (built 1976–81), in East Rutherford. New Jersey was hard hit by recession in the early 1990s as economic growth slowed and the state suffered the effects of overdevelopment.

New Jerusalem, Church of the, or **New Church,** religious body instituted by followers of Emanuel SWEDENBORG, who are generally called Swedenborgians. It was first organized (1787) in London. In the U.S. Swedenborg's teachings had been introduced by James Glen in 1784. A New Church society was formed (1792) in Baltimore, and the church held a general convention in 1817. Its polity is modified episcopacy, with each society enjoying great freedom. A separatist group, the General Church of the New Jerusalem, was formed in the 1890s.

Newlands, John Alexander Reina, 1838–98, British chemist. He prepared the first PERIODIC TABLE of the elements arranged in the order of atomic weights. His observation that every eighth element has similar properties (the "Law of Octaves") was accepted only after Dmitri MENDELEEV's work five years later.

New Laws: see LAS CASAS, BARTOLOMÉ DE.

Newman, Barnett, 1905–71, American artist; b. N.Y.C. Forming a link between ABSTRACT EXPRESSIONISM and COLOR FIELD PAINTING, his influential canvases are frequently monumental planes of flat color cut by slender vertical bands.

Newman, John Henry, 1801–90, English churchman, Roman Catholic cardinal, a founder of the OXFORD MOVEMENT. Ordained (1824) in the Church of England, he began (1833) his series *Tracts for the Times* and helped guide the Oxford Movement. *Tract 90* (1841), which demonstrated that the Thirty-nine Articles (see CREED) were consistent with Catholicism, outraged Anglicans, and Newman converted to Catholicism in 1845. He was one of the most influential English Catholics of all time, and his *Apologia pro vita sua* (1864) is a masterpiece of religious autobiography. Newman, unlike H.E. MANNING, disapproved of the enunciation of papal infallibility in 1870; though he did not oppose the dogma itself, he lost favor with the papacy until 1879, when he was made a cardinal.

New Mexico, state in the SW U.S. At its northwestern corner are the so-called Four Corners, where Colorado, New Mexico, Arizona, and Utah meet at right angles; New Mexico is also bordered by Oklahoma (NE), Texas (E, S), and Mexico (S).

Area, 121,666 sq mi (315,115 sq km). *Pop.* (1990) 1,515,069, a 16.5% increase over 1980 pop. *Capital,* Santa Fe. *Statehood,* Jan. 6, 1912 (47th state). *Highest pt.,* Wheeler Peak, 13,161 ft (4,014 m); *lowest pt.,* Red Bluff Reservoir, 2,817 ft (859 m). *Nickname,* Land of Enchantment. *Motto, Crescit Eundo* [It Grows as It Goes], *State bird,* chaparral ("roadrunner"). *State flower,* yucca. *State tree,* piñon. *Abbr.,* N. Mex.; NM.

Land and People. New Mexico is roughly bisected by the RIO GRANDE, its principal river. Much of the topography consists of broken mesas and the high peaks of the ROCKY MOUNTAINS, which run north to south through the state. Broad, semiarid plains cover S New Mexico. Summer days of ovenlike heat are followed by cool nights, while winter brings below-freezing temperatures in most areas and heavy snowfall in the high ranges. Federally controlled land—33.2% of the total—includes Carlsbad Caverns National Park (see NATIONAL PARKS, table) and many national monuments, such as WHITE SANDS, Chaco Canyon, and Bandelier. About 73% of the population lives in urban areas. ALBUQUERQUE is the largest city, followed by Las Cruces and SANTA FE. In 1990 more than 38% of the population was Hispanic—the highest percentage in the country—9% was Native American and 76% white. The NAVAHO reservation (in New Mexico and Arizona) is the country's largest; other tribes in the state include the APACHE, PUEBLO, and UTE.

Economy. Because opportunities for irrigation are few, most farmland is used for the grazing of cattle and sheep. Hay, onions, wheat, pecans, corn, cotton, and sorghum are the principal crops. New Mexico derives much of its wealth from mining. It leads the states in production of uranium, potash, and perlite; is a large producer of natural gas; and has significant deposits of coal, oil, and other minerals. Manufacturing is dominated by the production of processed food, machinery, apparel, chemicals, and electrical equipment. About a quarter of the land is forested, and lumbering is an important activity. Tourism is a major source of income.

Government. The constitution of 1912 provides for a governor serving a four-year term. The legislature consists of a senate of 42 members elected to four-year terms and a house of 70 members serving two-year terms. New Mexico elects two U.S. senators and three representatives and has five electoral votes.

History. Prehistoric cultures long preceded the civilization of the Pueblos encountered in the 16th cent. by the Spanish, who established missions and ranches in the area despite fierce resistance by the indigenous people. With Mexico's independence (1821), the area became one of its provinces, although U.S. settlers began arriving (1822) via the SANTA FE TRAIL. At the end of the MEXICAN WAR, New Mexico was ceded (1848) to the U.S. Native American resistance finally ended with the defeat of GERONIMO, chief of the Apache, in 1886. By then a ranching boom had begun, accelerated by the arrival (1879) of the railroad. In 1943 the U.S. government built LOS ALAMOS as a center for atomic research, and the continued growth of military installations has greatly contributed to the state's economic and population growth. Service2Dsector employment is growing and is projected to constitute almost one third of the state's jobs by the year 2000.

New Netherland, American territory granted by Holland to the DUTCH WEST INDIA COMPANY in 1621. The first permanent settlement

was at Fort Orange (now Albany, N.Y.), in 1624. New Amsterdam (later New York City) was bought from Native Americans in 1626. In 1664 the territory was taken by the English, who divided it into the colonies of New York and New Jersey.

New Orleans, city (1990 pop. 496,938; met. area 1,238,816), coextensive with Orleans parish, SE La., between the Mississippi R. and Lake Pontchartrain, 107 mi (172 km) from the river mouth; founded 1718, inc. 1805. Built on a bend in the river (hence called the Crescent City), it is protected by levees. A major international port and a center of business and banking, it is one of the largest and most important cities in the South. Its imports include coffee, and bananas; its exports, oil, chemicals, cotton, and grains. Coastwise traffic is heavy. Food processing is a major enterprise, and the area has oil, aerospace, and chemical industries; shipyards; and diverse manufacturing plants. The capital (from 1722) of the French colony, it became a cosmopolitan city; French influence (Creole culture) and the city's reputation for glamour and gaiety have lasted to the present. The French Quarter (Vieux Carrée), around Jackson Square, retains much of its early elegance. Contemporary landmarks include the Superdome (1975) and the Hibernia Tower. Two manifestations of the city's heterogeneous culture are its famous MARDI GRAS festival and the development of JAZZ. The city was the site of the 1984 World's Fair, and gambling was legalized in 1992, with the first casino opening on a riverboat in 1993.

Newport, city (1990 pop. 28,227), seat of Newport co., SE R.I., on Aquidneck (or Rhode) Island; settled 1639, inc. 1784. The U.S. naval base in Newport closed in 1974, causing much unemployment. A refuge for Quakers, Jews, and other religious groups in its early history, the city became in the 19th cent. one of the world's most famous resorts. Its palatial mansions are now a tourist attraction. Newport is also noted for yachting (the America's Cup races were held there for many years). Its many points of interest include the old colony house (1739), the Newport Tower (17th cent.), and the Touro Synagogue (1763), the oldest in the U.S.

Newport News, city (1990 pop. 170,045), SE Va., on the Virginia peninsula, at the mouth of the James R., off HAMPTON ROADS; inc. 1896. It is one of the world's major shipbuilding and repair centers, and a port handling raw materials in great volume. Settled c.1620, it did not grow appreciably until 1880, when the railroad arrived. In 1862 the MONITOR AND MERRIMACK fought offshore.

New South Wales, state (1992 est. pop. 5,962,000), 309,443 sq mi (801,457 sq km), SE Australia, bounded by the Pacific Ocean (E). The capital is SYDNEY; NEWCASTLE and WOLLONGONG are among the other urban centers. New South Wales produces most of Australia's steel; other manufactures include machinery, electrical products, clothing, textiles, and chemicals. The state mines about two thirds of Australia's coal and has one of the world's richest silver and zinc deposits, at BROKEN HILL. Agricultural products include beef, wool, dairy products, wheat, sugar, and fruits. New South Wales was settled in 1788 as a penal colony and until 1825 included all of Australia east of long. 135°E. It became a British colony in 1846 and was federated as a state of Australia in 1901. The AUSTRALIAN CAPITAL TERRITORY, site of CANBERRA, Australia's capital, was ceded (1911, 1915) by New South Wales to the federal government.

New Stone Age: see under STONE AGE.

New Style dates: see CALENDAR.

New Sweden, Swedish colony on the Delaware R., in parts of present-day Pennsylvania, New Jersey, and Delaware. It was founded in 1638 by the New Sweden Company, led by Peter MINUIT, with the capital at Tinicum Island. It was captured by the Dutch under Peter STUYVESANT in 1655.

newt: see SALAMANDER.

New Testament, the distinctively Christian portion of the BIBLE, 27 books dating from the earliest Christian period, transmitted in *koiné*, a popular form of Greek spoken in the biblical regions from the 4th cent. B.C. The conventional order is: four biographies of JESUS, namely the GOSPELS, Matthew, Mark, Luke, and John; a history of missionary activity, the ACTS OF THE APOSTLES; 21 letters written in apostolic times, called epistles, named (first 14) for their addressees or (last 7) for their supposed author—ROMANS, First and Second CORINTHIANS, GALATIANS, EPHESIANS, PHILIPPIANS, COLOSSIANS, First and Second THESSALONIANS, First and Second TIMOTHY, TITUS, PHILEMON, HEBREWS, JAMES, First and Second PETER, First, Second, and Third JOHN, and JUDE; and finally a prophecy, the REVELATION or Apocalypse. There are many more than these 27 early Christian works. Selection of New Testament books as canonical was slow, the present canon appearing for the first time in the Festal Epistle of St. Athanasius (A.D. 367). All major Christian churches use the same canon.

Newton, Sir Isaac, 1642–1727, English mathematician and natural philosopher (physicist); considered by many the greatest scientist of all time. He was Lucasian professor of mathematics (1669–1701) at Cambridge Univ. Between 1664 and 1666 he discovered the law of universal GRAVITATION, began to develop the CALCULUS, and discovered that white light is composed of every color in the SPECTRUM. In his monumental *Philosophiae naturalis principia mathematica* [Mathematical Principles of Natural Philosophy] (1687), he showed how his principle of universal gravitation explained both the motions of heavenly bodies and the falling of bodies on earth. The *Principia* covers DYNAMICS (including Newton's three laws of MOTION), FLUID MECHANICS, the motions of the planets and their satellites, the motions of the comets, and the phenomena of TIDES. Newton's theory that LIGHT is composed of particles—elaborated in his *Opticks* (1704)—dominated optics until the 19th cent., when it was replaced by the wave theory of light; the two theories were combined in modern QUANTUM MECHANICS. Newton also built (1668) the first reflecting TELESCOPE, anticipated the calculus of variations, and devoted much energy towards alchemy, theology, and history. He was president of the Royal Society from 1703 until his death.

newton: see FORCE.

New Year's Day, the first day of the year. Christians usually celebrated New Year's Day on Mar. 25 until the Gregorian CALENDAR (1582) moved it to Jan. 1. The Jewish New Year (1 Tishri) falls sometime in September or early October. The Chinese New Year falls between Jan. 10 and Feb. 19.

New York, mid-Atlantic state of the U.S.; bordered by Vermont, Massachusetts, Connecticut, and the Atlantic Ocean (E), New Jersey and Pennsylvania (S), Lakes Erie and Ontario and the Canadian province of Ontario (NW), and the province of Quebec (N).

Area, 49,576 sq mi (128,402 sq km). *Pop.* (1990) 17,990,455, a 2.5% increase over 1980 pop. *Capital,* Albany. *Statehood,* July 26, 1788 (11th of original 13 states to ratify the Constitution). *Highest pt.,* Mt. Marcy, 5,344 ft (1,630 m); *lowest pt.,* sea level. *Nickname,* Empire State. *Motto, Excelsior* [Ever Upward]. *State bird,* bluebird. *State flower,* rose. *State tree,* sugar maple. *Abbr.,* N.Y.; NY.

Land and People. A great valley, formed by Lakes CHAMPLAIN and George and the Hudson R., traverses the state north to south. To the west of the lakes are the wild and rugged ADIRONDACK MOUNTAINS. Most of the southern part of the state is part of the Allegheny plateau, which rises in the southwest to the Catskill Mts. Winters may vary from cold, with heavy snow, along Lakes Erie and Ontario, to mild or moderate in the southeastern coastal area; summers are generally hot, except in the Adirondacks. Nearly 85% of the population lives in metropolitan areas. NEW YORK CITY is the largest city in the U.S. and is the nation's leading financial and cultural center. Other major cities include BUFFALO, ROCHESTER, SYRACUSE, and ALBANY. New York, which ranks second only to California in population, was 74% white and 16% African American in 1990. The state also had the third largest Hispanic American population (2,214,026), after California and Texas, and the second largest Asian-American population (693,760), after California.

Economy. New York follows first-ranked California in value of industrial output. The leading industries are printing and publishing, and the production of apparel, pharmaceuticals, instruments, nonelectrical machinery, toys and sporting goods, electronic equipment, and processed foods. The service sector is an important part of the economy and now employs the largest percent of the state's workers. New York is a fertile agricultural state: it ranks second in the country in output of apples; is among the largest producers of dairy cows and products; and grows grapes for its wine industry, vegetables, greenhouse products, hay, and many other crops. Mineral resources include crushed stone, cement, salt, and zinc. Year-round tourism is a major industry, with New York City, the Adirondacks and Catskills, and NIAGARA FALLS popular destinations.

Government. The constitution (adopted 1894) provides for a gov-

ernor serving a four-year term. The legislature consists of a 60-seat senate and 150-seat legislature, with members of both bodies serving two-year terms. New York is represented in the U.S. Congress by 2 senators and 31 representatives and has 33 electoral votes.

History. Present-day New York was inhabited by Native Americans, including the MOHEGANS and the Iroquois (see IROQUOIS CONFEDERACY). Early explorers included Giovanni da VERRAZANO (1524) and Henry HUDSON (1609). The Dutch founded New Amsterdam on the lower tip of Manhattan Island in 1624. The British took the region in the Second Dutch War (1664–67) and held New York, with its busy shipping and fishing fleets and expanding farms, until the colony declared (1776) its independence. About one third of the engagements of the AMERICAN REVOLUTION took place in the state, including the key defeat of the British in the SARATOGA CAMPAIGN (1777). From the 1780s commerce increased, aided by the opening (1825) of the ERIE CANAL. Industries, beginning with textiles, also expanded. This commercial and economic growth marked the turn away from the old, primarily agricultural economy. New York was a center of numerous 19th-cent. reform movements, including Abolitionism (see ABOLITIONISTS) and WOMAN SUFFRAGE. The 1840s marked the beginning of the huge waves of European immigration that continued throughout the century, with many immigrants settling in New York City. The state's governorship has been a fertile proving ground for many 20th-cent. leaders of national prominence, including Alfred E. SMITH, Franklin D. ROOSEVELT, Thomas E. DEWEY, and Nelson A. ROCKEFELLER. New York's post–World War II shift in population from the cities to the suburbs was accompanied by the departure of many businesses to outlying areas, a trend that continued into the 1990s.

New York, City University of, at New York City; founded 1847 as the Free Academy, reorganized 1929 as the College of the City of New York, expanded and renamed 1961 as a result of legislation. It includes a graduate division, 11 four-year colleges, and several two-year community colleges in the various city boroughs. It is city- and state-supported. With an enrollment of over 180,000, it is one of the nation's largest universities.

New York, State University of, est. 1948 by the amalgamation under one board of trustees of 29 educational institutions. It now comprises all of New York's state-supported institutions of higher learning, except the colleges of the City University of New York. There are over 70 units throughout the state (including medical centers, agricultural and technical colleges, and community colleges), with a total enrollment of over 400,000, the largest in the U.S. Major university centers are in Albany, Binghamton, Stony Brook, and Buffalo (formerly the Univ. of Buffalo). Graduate degrees are offered at more than a score of campuses, and university-wide research is conducted at the Atmospheric Sciences Research Center (with headquarters at Albany), the Center for Immunology (Buffalo), the Institute for Theoretical Physics (Stony Brook), and several other facilities.

New York City (N.Y.C.), city (1990 pop. 7,322,564; met. area 8,546,846; 1992 greater met. area est. 19,600,000), SE N.Y., on New York Bay, at the mouth of the Hudson R.; chartered 1898. Each of its five boroughs is a county: Manhattan (New York co.), an island; the Bronx (Bronx co.), on the mainland, NE of Manhattan across the Harlem River; Queens (Queens co.), on Long Island, E of Manhattan across the East River; BROOKLYN (Kings co.), also on Long Island, on the East River adjoining Queens and on New York Bay; and Staten Island (Richmond co.), an island SW of Manhattan across the Upper Bay. The nation's largest city, New York is a major U.S. port, the country's trade center, and, with its banks and stock exchanges, the financial center of the world. Manufacturing accounts for a large but declining proportion of employment; clothing, chemicals, and processed foods are major products. Publishing, television and radio, advertising, and tourism are major industries. Theaters, nightclubs, shops, and restaurants draw millions of visitors.

History. Giovanni da VERRAZANO may have been the first European to explore the region, and Henry HUDSON visited it, but Dutch settlements truly began the city. In 1624 the town of New Amsterdam was established on lower Manhattan; Peter MINUIT supposedly bought the island from its Native American inhabitants for about $24 worth of trinkets. In 1664 the English seized the colony and renamed it; during the AMERICAN REVOLUTION they held it from 1776 to 1781. New York was briefly (1789–90) the U.S. capital and was state capital until 1797. By 1790 it was the largest U.S. city, and the opening (1825) of the ERIE CANAL, linking New York with the GREAT LAKES, led to even greater expansion. In 1898 a new charter was adopted, making the city Greater New York, a metropolis of five boroughs. Massive immigration, mainly from Europe, swelled the city's population in the late 19th and early 20th cent. The Flatiron building (1902) ushered in the SKYSCRAPER era that brought New York its famous skyline, and the city's first subway opened in 1904. After World War II, many African Americans from the South, Puerto Ricans, and Latin Americans migrated to the city in search of jobs. In the 1970s the city narrowly avoided bankruptcy. Its increasingly services-oriented economy boomed in the 1980s, until the stock market crashed (Oct. 1987). In the early 1990s the city again faced fiscal crisis. David DINKINS became the city's first African-American mayor in 1990, but he lost to Rudy GIULIANI in 1993. Staten Island residents voted to secede from the city in 1993, but such a move would require state approval.

Points of Interest. Noted sights include the EMPIRE STATE BUILDING, the WORLD TRADE CENTER, ST. PATRICK'S CATHEDRAL, the Cathedral of SAINT JOHN THE DIVINE, the Statue of LIBERTY, BROADWAY and Fifth Avenue, GREENWICH VILLAGE, and Central Park. Among New York's bridges are the BROOKLYN BRIDGE (opened 1883), the George Washington Bridge (1931), and the VERRAZANO-NARROWS BRIDGE (1964). ELLIS ISLAND and Castle Garden (at the Battery) were entry points for many immigrants. The UNITED NATIONS has its headquarters in New York. Cultural institutions include LINCOLN CENTER FOR THE PERFORMING ARTS and Carnegie Hall; the METROPOLITAN MUSEUM OF ART, MUSEUM OF MODERN ART, WHITNEY MUSEUM OF AMERICAN ART, and many other museums; and the New York Public Library (see library, table) and other research facilities. Among the numerous educational institutions are the City Univ. of New York, Columbia Univ., and New York Univ.

New York City Ballet, a foremost American dance company of the 20th cent. It was founded (1946) by George BALANCHINE and Lincoln Kirstein. In 1964 it moved from City Center to Lincoln Center for the Performing Arts. Under Balanchine's direction, it developed an American style that combined European tradition, austere emotion, and musicality. The company's dancers have included Jacques d'AMBOISE, Suzanne FARRELL, Melissa Hayden, Peter MARTINS (the company's present director), Maria Tallchief, and Edward VILLELLA.

New York Public Library: see LIBRARY (table).

New York Shakespeare Festival: see PAPP, JOSEPH.

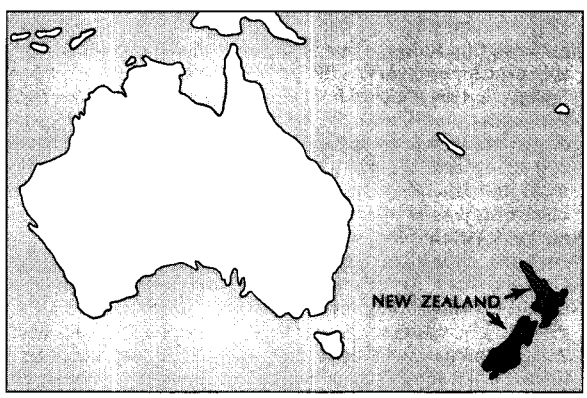
New York Stock Exchange: see STOCK EXCHANGE.

New York Times Company v. Sullivan, case decided in 1964 by the U.S. SUPREME COURT. In overturning a LIBEL judgment against the *Times,* the Court held that debate on public issues would be inhibited if public officials could recover damages for honest error that produced false statements. It limited the right of recovery to cases in which actual malice (knowing publication of falsehood, or reckless disregard of the truth) could be proved.

New Zealand, island country (1991 pop. 3,434,950), 103,736 sq mi (268,676 sq km), in the South Pacific Ocean, 1,000 mi (1,600 km) SE of Australia. The major cities are WELLINGTON (the capital), AUCKLAND, and CHRISTCHURCH. New Zealand comprises two main islands, North Island and South Island, separated by Cook Strait; Stewart Island; the Chatham Islands; and several small outlying islands, of which only Raoul, in the Kermadec group, and Campbell Island are inhabited. Also part of New Zealand are the Ross Dependency, in Antarctica, and the TOKELAU ISLANDS. Residents of the self-governing COOK ISLANDS and NIUE share New Zealand citizenship. North Island, with its active volcanoes and hot springs around Lake Taupo, is subtropical in the north and temperate in the south. It contains New Zealand's major river, the Waikato. On South Island are the massive Southern Alps, with many peaks over 10,000 ft (3,048 m) high; the productive Canterbury Plains, the country's chief lowland area; acres of virgin forest; and many fjords. Among the unusual animals native to New Zealand are the ALBATROSS and KIWI. Sheep and cattle, the mainstays of the economy, provide New Zealand with exports of frozen meat (especially lamb), dairy products (especially butter), and wool. Food processing dominates the industrial sector, which also produces wood,

paper products, and textiles. Tourism is of increasing importance. Most of the people are of British descent. The MAORI, native New Zealanders of Polynesian descent, numbered about 300,000 in the early 1990s; most live on North Island. English is the official language; Maori is spoken by many of the indigenous people. More than 80% of the population is Christian.

History. The Maori are thought to have migrated to the islands prior to A.D. 1400. Abel TASMAN was the first European to visit (1642) the islands, which were named for the Dutch province of Zeeland, but they attracted little interest until described in detail by Capt. James COOK, who visited them four times between 1769 and 1777. Whalers, missionaries, and traders followed, and in 1840 the first permanent European settlement was established at Wellington by E.G. WAKEFIELD. The same year the Maori signed the Treaty of Waitangi, by which they recognized British sovereignty in exchange for guaranteed possession of their land. Nevertheless, wars over land between the Maori and white settlers were waged until 1870. Originally part of the Australian colony of New South Wales, New Zealand became a separate colony in 1841 and was made self-governing in 1852. Dominion status was attained in 1907, and full independence was conferred by the Statute of Westminster (1931), which was confirmed by New Zealand in 1947. New Zealand was a leader in passing social legislation, e.g., woman suffrage (1893) and social security (1898), and it aided Britain in both world wars. Since 1983 the country has moved toward closer cooperation with Australia on economic matters. Legislative power rests with a unicameral parliament; executive power is vested in a governor general, representing the crown, and a cabinet and prime minister. The chief political parties are the National and the Labor. In 1993 the National party, in power since 1990 and led by Prime Min. James Brendan Bolger, was narrowly returned to office.



Nexø, Martin Andersen: see ANDERSEN NEXØ, MARTIN.

Ney, Michel [nā'], 1769–1815, marshal of France. Called "the bravest of the brave" by NAPOLEON I, he rose to glory rapidly in the FRENCH REVOLUTIONARY WARS. He gave decisive aid to Napoleon at Friedland (1807) and brilliantly defended the rear during Napoleon's retreat (1812) from Moscow. After Napoleon's abdication (1814) he was raised to the peerage by LOUIS XVIII, but he rejoined Napoleon for the HUNDRED DAYS and fought in the WATERLOO CAMPAIGN (1815). After Napoleon's defeat, Ney was condemned for treason by the house of peers and was shot.

Nez Percé, indigenous people of the Plateau (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with a Sahaptin-Chinook language of the Penutian stock (see NATIVE AMERICAN LANGUAGES). They lived in W Idaho, NE Oregon, and SE Washington, subsisting typically on salmon and plant roots. After acquiring the horse, they became noted horse breeders and adopted other Plains traits, including the buffalo hunt. A fraudulent land cession extracted from them (1863) during the gold rush led to an uprising (1877) under Chief JOSEPH. Today those living on the Idaho reservation are mostly farmers. In 1990 there were 4,113 Nez Percé in the U.S.

Ngugi wa Thiong'o, 1938–, Kenyan writer, also known as James Ngugi. His novels include *Weep Not, Child* (1964) and *A Grain of Wheat* (1967), both about the MAU MAU uprising, and the politically controversial *Petals of Blood* (1977). A popular 1977 play written in Kikuyu was banned and led to his imprisonment (1978–79), which is described in *Detained: A Writer's Prison Diary* (1981).

Ni, chemical symbol of the element NICKEL.

niacin: see COENZYME; VITAMIN (table).

Niagara Falls, city (1990 pop. 61,840), W N.Y., at the great falls of the Niagara R.; inc. 1892. Tourism is one of its oldest industries; there are many state parks and a Native American museum. Industries include mechanical and electrochemical products. The effects of chemical dumping at the city's Love Canal drew national attention in 1978.

Niagara Falls, internationally famous waterfall, on the U.S.–Canada border between Niagara Falls, N.Y., and Niagara Falls, Ont., formed where the Niagara R. drops from Lake ERIE to Lake ONTARIO. Goat Island splits the cataract into the American Falls (167 ft/51 m high; 1,060 ft/323 m wide) and the Horseshoe, or Canadian, Falls (158 ft/48 m high; 2,600 ft/792 m wide), and overlooks the Niagara Gorge (c.7 mi/11 km long) with its Whirlpool Rapids and Whirlpool. Under terms of the Niagara Diversion Treaty (1950), water is diverted in New York to power the 13 generators of the Robert Moses Niagara Power Plant (1,950,000-kw capacity; opened 1961) and in Ontario into the Sir Adam Beck Generating Stations (1,775,000 kw; opened 1954). The falls were formed c.10,000 years ago and are retreating upstream faster in the Horseshoe Falls because of the greater volume of water there.

Niagara-on-the-Lake, town (1991 pop. 12,945), S Ontario, Canada, part of the regional municipality of Niagara (1991 pop. 393,936), on Lake ONTARIO. Located near NIAGARA FALLS, it is a popular tourist center known for its 19th-cent. atmosphere and architecture and for the annual Shaw Festival, held during the summer. Niagara-on-the-Lake was originally settled as Butlersburg in 1784. Renamed Newark, it served (1792–96) as the first capital of Upper Canada (now Ontario). The city was destroyed, along with Fort George (built 1796–99 to defend it), by the Americans in the WAR OF 1812. Subsequently rebuilt, it took its present name in 1906.

Niamey [nyämā'], largest city (1988 pop. 398,265) and capital of Niger, SW Niger, a port on the Niger R. At the crossroads of two main highways, the city handles trade for an agricultural region specializing in peanuts. Manufactures include bricks, food products, and cement. A small town when the French colonized the area (late 19th cent.), Niamey grew after it became the capital of Niger in 1926.

Nibelungen [nē'bəlŏŏng"ən] or **Nibelungs,** in Germanic myth, an evil family possessing a magic hoard of gold. The *Nibelungenlied* [-lēt"] is a Middle High German epic by a south German poet of the early 13th cent., recounting the story of Siegfried, who wins the hoard, marries Kriemhild, and captures Queen Brunhild for Kriemhild's brother Gunther. Brunhild contrives Siegfried's death, and Kriemhild wreaks vengeance on Gunther's court. *The Ring of the Nibelungs* is an operatic tetralogy by Richard WAGNER, comprising *Das Rheingold, Die Walküre, Siegfried,* and *Götterdämmerung.*

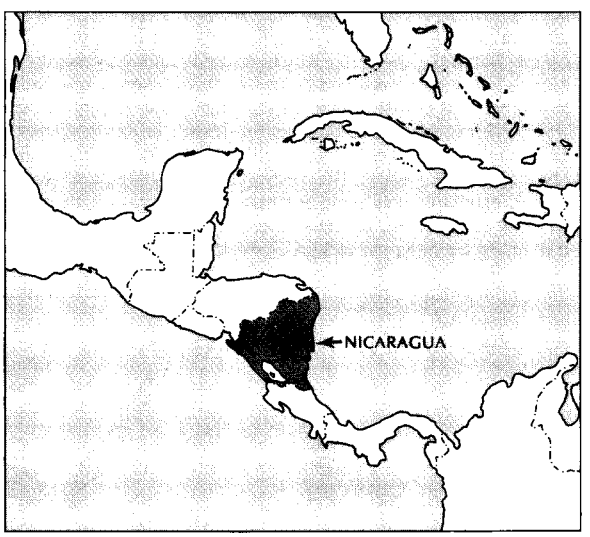
Nicaea, Councils of, two ecumenical councils of the Christian Church. The first council (325), convened by the Emperor CONSTANTINE I, rejected ARIANISM and established the divinity and equality of the Son in the Trinity. The second council (787), called to refute ICONOCLASM, declared that religious images ought to be venerated (but not worshiped).

Nicaea, empire of, 1204–61, one of the Greek states that arose after the Fourth CRUSADE set up the Latin empire of Constantinople. Founded by Theodore I, Nicaea continued the institutions of Byzantium, including emperors and patriarchs. Theodore and his successors became supreme in Asia Minor. The Nicaean emperor MICHAEL VIII captured Constantinople (1261) and restored the Byzantine Empire.

Nicaragua, officially Republic of Nicaragua, republic (1992 est. pop. 3,878,000), 49,579 sq mi (128,410 sq km), Central America; bordered by Honduras (N), the Caribbean Sea (E), Costa Rica (S), and the Pacific Ocean (SW). The capital is MANAGUA. Mountainous in the northeast, Nicaragua is the least densely populated Central American nation; the people live mainly on a narrow, volcanic belt between the Pacific and Lakes Managua and Nicaragua. The country is subject to destructive earthquakes. There are gold and tung-

sten mines, timbering, and some manufacturing, but the country is primarily agricultural, exporting coffee, cotton, sugarcane, bananas, seafood, and meat. The population is mainly Spanish-speaking, Roman Catholic, and predominantly mestizo. There is an English-speaking minority on the Altantic coast.

History. The first Spanish colonial cities in the area, LEÓN and Granada, were founded in 1524. Ruled as part of GUATEMALA, Nicaragua achieved independence in 1821. After brief periods as part of the Mexican Empire and the Central American Federation, Nicaragua became a separate republic in 1838. Marked by extreme liberal-conservative antagonism, the country has had an unusually violent history. Foreign interference was frequent, especially by the U.S., which from the early 19th cent. expressed interest in a possible inter-ocean waterway in Nicaragua. U.S. marines intervened in a civil war in 1912, remaining in the country until 1933. In 1937 Anastasio SOMOZA became president. The nation was ruled dictatorially by members of the Somoza family until 1979, when their regime was overthrown, after bloody fighting, by the SANDINISTAS. The Sandinistas formed a government that at first included moderate conservatives, but moved rapidly to the political left in the early 1980s. In 1984, a Sandinista leader, Daniel Ortega Saavedra, was elected president. The effects of land redistribution, literacy programs, and other reforms were nullified by costly warfare between the Sandinistas and the contras, right-wing guerrillas based outside the country and supported by the U.S. In 1990 a presidential election resulted in the unexpected defeat of Ortega by opposition candidate Violeta Barrios de Chamorro, and the Sandinista government and the contras agreed to a cease-fire. Under Chamorro, the army and police continued to be led by Sandinistas, but economic reforms were instituted and inflation reduced. The economy remained stagnant and unemployment high, however, and tense relations between the Sandinistas and their opponents threatened to undermine Chamorro's government.



Nice [nēs], city (1990 pop. 342,439), capital of Alpes-Maritimes dept., SE France, on the Mediterranean Sea. This famous French Riviera resort relies mostly on tourists, but electronics and other manufactures are important. Nice probably originated as a Greek colony in the 5th cent. B.C. Sardinia held it from 1814 to 1860, when a plebiscite gave it to France.

Nicephorus [nĭsĕf'ərəs], Byzantine emperors. **Nicephorus I,** d. 811 (r.802–811), deposed Empress IRENE. He reformed the treasury and taxation, and asserted the supremacy of emperor over church, a doctrine opposed by the monastic reformer St. Theodore of Studium. **Nicephorus II** (Phocas), c.912–969, a general under ROMANUS II, married the emperor's widow and usurped the throne (963–69). Disliked for taking land from monasteries and imposing heavy taxes to finance his wars, he was murdered by his wife's lover, who succeeded to the throne as JOHN I.

Nicholas, Saint, patron of children and sailors, of Greece, Sicily, and Russia, and of many other persons and places. Traditionally he is identified with a 4th-cent. bishop of Myra in Asia Minor. In the Netherlands and elsewhere his feast (Dec. 6) is a children's holiday. The English in New York adopted him from the Dutch, calling him Santa Claus.

Nicholas I, Saint (Nicholas the Great), c.825–867, pope (858–67), a Roman. He established the right of a bishop to appeal to Rome against his superior and blocked the divorce of LOTHAIR of Lotharingia. He supported St. IGNATIUS OF CONSTANTINOPLE over PHOTIUS as patriarch of Constantinople and sought Roman ecclesiastical jurisdiction over Bulgaria. Feast: Nov. 13.

Nicholas, czars of Russia. **Nicholas I,** 1796–1855 (r.1825–55), was the third son of PAUL I. On his first day as czar he crushed the uprising of the DECEMBRISTS. During his reign laws were codified, the first Russian railroad was completed and the condition of SERFS belonging to the state somewhat improved, but political progress was stifled and minorities were persecuted under the slogan "autocracy, orthodoxy, and nationality." Intellectual ferment generated the SLAVOPHILES AND WESTERNIZERS, and GOGOL, LERMONTOV, and PUSHKIN began a golden age in literature. Nicholas brutally suppressed the uprising in POLAND (1830–31) and in 1849 helped Austria crush the revolution in HUNGARY. He died during the disastrous CRIMEAN WAR and was succeeded by his son ALEXANDER II. **Nicholas II,** 1868–1918 (r.1894–1917), was the son of ALEXANDER III. As a youth he received little training in affairs of state. His reign continued the suppression of political opposition and persecution of minorities. Revolutionary groups proliferated, while liberals demanded constitutional government. An aggressive policy in E Asia led to defeat in the RUSSO-JAPANESE WAR (1904–5). In Jan. 1905 a peaceful crowd of petitioners was fired upon in front of the Winter Palace; this "bloody Sunday" began the 1905 Revolution. In October Count WITTE induced Nicholas to sign a manifesto promising constitutional government and basic civil liberties, but the czar dissolved the DUMA shortly after it began to sit, and Witte was replaced as premier by STOLYPIN in 1906. WORLD WAR I began in 1914; in 1915 Nicholas took command of the army, leaving Czarina ALEXANDRA FEODOROVNA and her adviser, RASPUTIN, in control of the government. Discontent spread, the army tired of war, food shortages worsened, the government tottered, and in March 1917 Nicholas was forced to abdicate (see RUSSIAN REVOLUTION). He and his family were shot in Yekaterinburg on July 16, 1918.

Nicholas of Cusa, 1401–64, German theologian and philosopher. He was a legal adviser to Church officials and a papal representative on several embassies before becoming (1440) a Cardinal. His writings, which emphasize the limits of rational investigation, are associated with NEOPLATONISM.

Nicholson, Ben, 1894–1982, English painter. Developing the purism of de STIJL with great elegance, he produced geometric abstractions of landscapes and still lifes, e.g., *Relief* (Mus. Mod. Art, N.Y.C.).

Nicholson, Jack, 1937–, American film actor. His first success was *Easy Rider* (1969), and he won Academy awards for *One Flew over the Cuckoo's Nest* (1975) and *Terms of Endearment* (1983). His other films include *Chinatown* (1974), *Prizzi's Honor* (1985), and *Batman* (1989).

Nicias [nĭsh'ēəs], d. 413 B.C., Athenian statesman and general. An opponent of CLEON and his war party, he favored peace with SPARTA during the PELOPONNESIAN WAR, and in 421 B.C. he arranged the truce known as the Peace of Nicias. Although he had opposed the project, he was placed in command of an expedition to SYRACUSE. His vacillation led to an Athenian defeat; Nicias was captured and executed.

nickel (Ni), metallic element, discovered in 1751 by A.F. Cronstedt. It is a silver-white, hard, malleable, ductile, and lustrous metal whose chief use is in the preparation of alloys, to which it brings strength, ductility, and resistance to corrosion and heat. Many stainless STEELS contain nickel. It is also used in storage batteries. Nickel's chief ores are garnierite, pentlandite and pyrrhotite. Nickel is present in most METEORITES. Trace amounts are found in plants and animals. See ELEMENT (table); PERIODIC TABLE.

Nicklaus, Jack (William), 1940–, American golfer; b. Columbus, Ohio. Considered the greatest golfer of all time, he mastered every

shot. Nicknamed the "Golden Bear," he won two national amateur titles (1959, 1961) while a student at Ohio State Univ. By winning the Masters title in 1986, he raised his total of major championships to 18, far more than any other player. These included the Masters (six), the PGA (five), the U.S. Open (four), and the British Open (three).

Nicolson, Sir Harold, 1886–1968, English biographer and historian, a diplomat and a member of Parliament; b. Iran. His biographies include those on Swinburne (1926) and GEORGE V (1953). Among his other works are *Diplomacy* (1939), *The Congress of Vienna* (1946), and *The Age of Reason* (1961). He was married to V. SACKVILLE-WEST.

Nicomedia, ancient city (modern Izmit, Turkey), NW Asia Minor. It was the residence of the kings of BITHYNIA from 264 B.C. Diocletian chose it as the eastern imperial capital, but it was soon superseded by Byzantium.

Nicosia, city (1989 est. pop. 169,000), capital of Cyprus. An agricultural trade center, it manufactures textiles, leather, plastics, and other goods. It was the residence of the Lusignan kings of CYPRUS from 1192 and a Venetian possession (15th cent.) before it fell (1571) to the Turks. From Cypriot independence (1960) to the Turkish invasion (1974), it was the scene of conflict between Greeks and Turks. Its museums house notable antiquities.

Niebuhr, Barthold Georg [nē'bo͝or], 1776–1831, German historian; b. Denmark. His history of Rome (3 vol., 1811–32) may be said to have inaugurated modern scientific historical method. In it he related individual events to the political and social institutions of ancient Rome.

Niebuhr, Reinhold, 1892–1971, American religious and social thinker; b. Wright City, Mo. He taught (1928–60) at Union Theological Seminary, New York City, and became interested in social problems. In the early 1930s he shed his liberal Protestant hopes for the church's moral rule of society and became a political activist and a socialist. His writings include *Moral Man and Immoral Society* (1932), *Christianity and Power Politics* (1940), and *The Nature and Destiny of Man* (2 vol., 1941–43). His brother, **Helmut Richard Niebuhr,** 1894–1962, joined the faculty of Yale Divinity School in 1931. His thought was early influenced by KIERKEGAARD and BARTH; later, however, he turned his attention to the personal nature of humanity's relationship to God and advocated a reworking of Christianity in light of the developments of the 20th cent.

nielsbohrium (Ns), artificial radioactive TRANSURANIUM ELEMENT. Claims for its production have been made by a Soviet group at Dubna, who in 1976 bombarded bismuth with chromium ions to obtain, apparently, the Ns^{261} isotope, and by a West German group at Darmstadt, who in 1981 bombarded bismuth with chromium ions to obtain the Ns^{262} isotope. It is also called unnilseptium (Uns). See ELEMENT (table); PERIODIC TABLE.

Niemeyer (Soares), Oscar, 1907–, Brazilian architect. Influenced by LE CORBUSIER, he is noted for projects like the Ministry of Education, Rio de Janeiro (1937–43), and, especially, for his direction of the creation of the Brazilian federal capital, Brasília (1950–60).

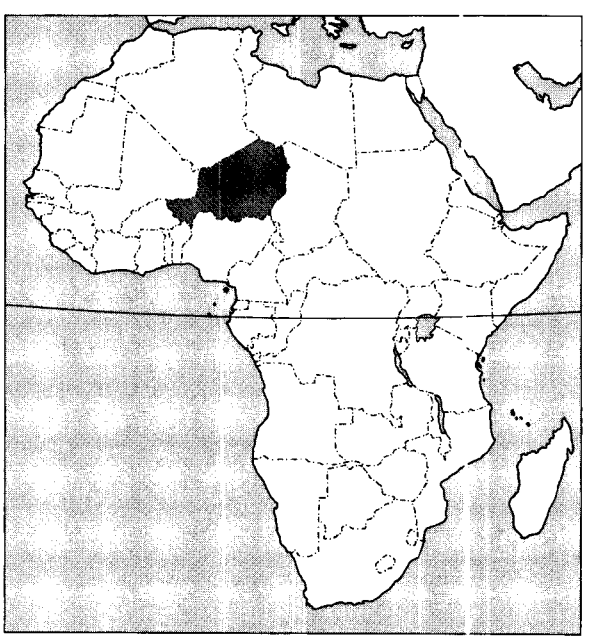
Niemoeller or **Niemöller, Martin** [nē'mölər], 1892–1984, German Protestant churchman. A submarine commander in World War I, he later led the CONFESSING CHURCH and opposed the religious policies of HITLER's regime. He was imprisoned from 1938 to 1945. He later became (1947) president of the Evangelical Church in Hesse-Nassau and was also president (1961–68) of the World Council of Churches.

Niepce, Joseph Nicéphore [nyĕps], 1765–1833, French chemist. He originated a process of photography (see PHOTOGRAPHY, STILL) that was later perfected by Louis Daguerre. A nephew, **Claude Félix Abel Niepce de Saint-Victor,** 1805–70, also a chemist, introduced the use of albumen in photography and produced photographic engravings on steel.

Nietzsche, Friedrich Wilhelm, 1844–1900, German philosopher. An individualistic moralist rather than a systematic philosopher, influenced by SCHOPENHAUER and by his early friendship with Richard WAGNER, he passionately rejected the "slave morality" of Christianity for a new, heroic morality that would affirm life. Leading this new society would be a breed of supermen whose "will to power" would set them off from the "herd" of inferior humanity. His writings, e.g., *Thus Spake Zarathustra* (1883–91) and *Beyond Good and Evil* (1886), were later used as a philosophical justification for NAZI doctrines of racial and national superiority; most scholars, however, regard this as a perversion of Nietzsche's thought.

Niger, officially Republic of Niger, republic (1992 est. pop. 8,053,000), 489,189 sq mi (1,267,000 sq km), W Africa, bordered by Burkina Faso and Mali (W), Algeria and Libya (N) Chad (E), Nigeria and Benin (S). NIAMEY is the capital. The landlocked country is largely semidesert or part of the SAHARA, except along the NIGER R. and near the southern border. The Aïr mts., in N central Niger, rise to c.5,900 ft (1,800 m). The economy is increasingly supported by high-grade uranium ore deposits, which have been worked since the early 1970s; Niger is one of the world's leading producers. Other minerals extracted include cassiterite (tin ore), phosphates, and coal. About 90% of the work force is engaged in farming, largely of a subsistence type; major crops include millet, sorghum, cassava, and peanuts. Stock raising (cattle, sheep, goats) is also important. Manufacturing is limited mainly to basic consumer goods. There is some fishing along the Niger R. and on Lake Chad. The main ethnic groups are the Hausa (56%) and Djerma (22%). The nomadic Tuareg live in N Niger and, along with others from MALI, fought for greater autonomy in the early 1990s. About 80% of the people are Muslim; most of the rest follow traditional beliefs. French is the official language, but Hausa and Djerma are widely spoken.

History. About 1300 the TUAREG established a state centered at Agadès (Agadez), situated on a major trans-Saharan caravan route, and in the 14th cent. the Hausa founded several city-states in S Niger. Parts of the region came under the SONGHAI empire in the early 16th cent., the state of Bornu in the late 16th cent., and the Fulani people in the early 19th cent. After the Conference of BERLIN (1884–85) placed the territory of Niger within the French sphere of influence, France established military posts in the south but for a time met concerted Tuareg resistance. In 1922 Niger became a separate colony within FRENCH WEST AFRICA. Nationalist political activity, which began in 1946, was led at first by the Niger Progressive party (PPN) and in the mid-1950s by a leftist party (later called Sawaba). The PPN, which favored autonomy within the FRENCH COMMUNITY, regained power in 1958, when a referendum supported that course. Niger became fully independent in 1960, with PPN leader Hamani Diori as president (he was reelected in 1965 and 1970). Niger enjoyed political stability and maintained close ties with France. The severe Sahelian drought (1968–75) caused economic disruption and civil unrest, however, leading to an army coup (1974), suspension of the constitution, and military rule under a regime led by Lt. Col. Seyni Kountché. The new gov-



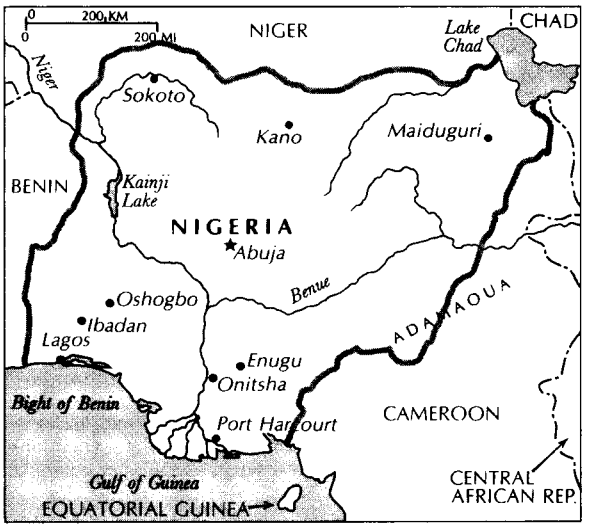
The key to pronunciation appears on page xiii.

ernment curtailed French influence in the rich uranium industry, concluded a more favorable economic agreement with France, and later brought civilians into the administration. On Kountché's death (1987), Brig. Gen. Ali Saïbou became president, and he continued Niger's slow return to democracy. In 1991 a national political conference stripped Saïbou of power and installed a transitional civilian government. In free elections in 1993, Mahamane Ousmane won the presidency.

Niger, chief river of W Africa, flowing c.2,600 mi (4,180 km) in a circuitous, generally eastward course from SW Guinea to a vast delta on the Gulf of Guinea, in Nigeria. An inland delta in central Mali is irrigated by a large dam at Sansanding. The chief tributary of the Niger is the Benue R.

Nigeria, officially Federal Republic of Nigeria, republic (1991 pop. 88,514,501), 356,667 sq mi (923,768 sq km), W Africa, bordered by the Gulf of Guinea (S), Benin (W), Niger (NW and N), Chad (NE), and Cameroon (E). Nigeria is the most populous country on the continent. The nation is divided into 30 states and a federal capital territory. Major cities include LAGOS, IBADAN, OGBOMOSHO, and KANO; in 1991 the nation's capital was moved from Lagos to ABUJA. Nigeria's main geographical regions include a 500-mi (800-km) coastline of sandy beaches, behind which lies a belt of mangrove swamps and lagoons; a broad, hilly region north of the coastal lowlands, with rain forests in the south and savanna in the north; and the great plateau, a region of plains covered largely with savanna. The highest point (c.6,700 ft/2,040 m) is in the Adamawa Massif, in the east. Most of the country is drained by the NIGER R. and its tributaries. Petroleum production, which began in the late 1950s, is the mainstay of the economy; by 1987 petroleum accounted for 95% of exports. The decline in petroleum prices in the 1980s depressed economic growth and led to greatly increased international debt, and corruption has also hurt the economy. Other minerals include tin, coal, columbite, iron ore, lead, zinc, and uranium. Agriculture employs about 70% of the work force. The chief crops grown in the north include sorghum, millet, soybeans, peanuts, and cotton; those in the south include corn, rice, palm products, cacao, and rubber. Livestock raising, forestry, and fishing are also important. Growth in the manufacturing sector slowed in the 1980s; major industries include oil refining, food processing, brewing, and production of cement, aluminum, motor vehicles, and textiles. The inhabitants of Nigeria are divided into about 250 ethnic groups, but the Hausa, Yoruba, Ibo, and Fulani together make up two thirds of the population. About half the people are Muslim, living mostly in the north, and some 40% are Christian, almost all in the south; the rest follow traditional beliefs. English is the official language, but Hausa, Yoruba, Ibo, and a number of other indigenous tongues are regionally importan

History. Before the coming of the British in the late 19th cent., a series of states and city-states were established by various ethnic groups. These included the state of Kanem-Bornu, which expanded into present-day Nigeria in the 11th cent., followed by seven independent Hausa city-states (11th cent.), the Yoruba states of Oyo and BENIN (14th cent.), and the SONGHAI Empire (16th cent.). Portuguese navigators, arriving in the late 15th cent. were joined by British, French, and Dutch traders, and a lucrative slave trade developed that continued until about 1875. In the 19th cent. Muslim culture flourished in the Fulani empire, while both Bornu and the Oyo Empire were rent by civil wars. Sir George Goldie's commercial activities in the region enabled Britain to claim S Nigeria at the Conference of BERLIN (1884–85). By 1906 Britain controlled all of Nigeria and had established a protectorate over it. Under British rule, the economy grew and the country became more urbanized. In the 1950s new constitutions led to the emergence of political parties and elected representation, and Nigeria was divided (1954) into three regions: Eastern, Western, and Northern, plus Lagos. By 1959 the regions had gained internal autonomy; in 1960 Nigeria attained full independence. It became a republic in 1963, with B.N. Azikiwe as president. Severe conflicts within and between regions marked the early years of independence, climaxed by an Ibo-led coup in 1966 that resulted in the deaths of Prime Minister A.T. Balewa and two regional prime ministers, and ended civil government. A second coup that year by Hausa army officers installed a new military regime headed by Lt. Col. Yakuba Gowon. The Ibos of the Eastern Region proclaimed the independent republic of BIAFRA in 1967, precipitating a disastrous civil war that continued until Biafra's surrender in 1970. Gowon was overthrown in a military coup in 1975, but the new regime restored civilian rule in 1979, when a democratic constitution took effect and Alhaji Shehu SHAGARI became president in free elections. However, four years later a coup deposed Shagari and reestablished military rule. Maj. Gen. Ibrahim Babangida became president (1985) after another coup and later announced plans to restore civilian rule. A new constitution (1990) set national elections for 1992, but Babangida annulled the presidential results, claiming fraud. Moshood Abiola apparently won (1993) a new election, but Babangida again charged fraud. Unrest led to Babangida's resignation. Ernest Shonekan, a civilian appointed as interim leader, was forced out after three months by Gen. Sani Abacha, who became president and banned all political institutions.



Nightingale, Florence, 1820–1910, English nurse, the founder of modern NURSING; b. Italy. Her life was dedicated to the care of the sick and war-wounded. She organized (1854) a unit of 38 women nurses for the Crimean War, and by war's end she had become a legend. In 1860 Nightingale established a nursing school at St. Thomas's Hospital, London. In 1907 she became the first woman to be given the British Order of Merit.

nightingale, migratory Old World BIRD of the THRUSH family, celebrated for the song the male sings during the breeding season. The common nightingale of England and W Europe (*Luscinia megarhynchos*), reddish-brown above and grayish-white below, winters in Africa.

nightshade, common name for the family Solanaceae, herbs, shrubs, and trees of warm regions. Many are climbing or creeping types. Rank-smelling foliage typifies many species; the odor is due to the presence of various ALKALOIDS, e.g., scopolamine, nicotine, and atropine. The chief drug plants of the family are BELLADONNA, MANDRAKE, Jimson weed, and TOBACCO. The family also includes important food plants, e.g., POTATO, TOMATO, red PEPPER, and EGGPLANT, and ornamentals, e.g., PETUNIA. The name *nightshade* is commonly restricted to members of the genus *Solanum,* typified by white or purplish star-shaped flowers and orange berries. Among the better-known species are Jerusalem cherry (*S. pseudocapsicum*), a house plant popular for its scarlet berries, and the BITTERSWEET, or woody nightshade.

Niigata, city (1990 pop. 486,087), capital of Niigata prefecture, N Honshu, Japan, on the Sea of Japan. It is the main port for W Honshu, and exports oil, machinery, and textiles. Niigata has an important chemical industry based on the area's coal and natural

gas deposits and is also the site of one of the largest flower farms in E Asia.

Nijinsky, Vaslav [nyĭzhĕn'skē], 1890–1950, Russian ballet dancer and choreographer. He made his debut (1907) in St. Petersburg, and later became premier danseur with DIAGHILEV. He initiated many of ballet's greatest roles, including ones in *Petrouchka*, *Afternoon of a Faun*, and *Sacre du Printemps*. He is considered the greatest 20th-cent. male dancer. His career was cut short (1919) by insanity.

Nike [nī'kē], in Greek myth, goddess of victory. The daughter of Pallas and Styx, she presided over all contests. Representations of her winged form include the *Victory (Nike) of Samothrace* (LOUVRE), one of the greatest Greek sculptures.

Nikko, town (1990 pop. 20,128), central Honshu, Japan, in Nikko National Park. It is a tourist resort and religious center famous for its ornate temples and shrines dating from the Edo period (1600–1868); particularly noteworthy is the great shrine housing the tomb of IEYASU.

Nikolais, Alwin, 1910–93, American dancer and choreographer; b. Southington, Conn. He formed (1949) his own company in New York City; he merged it with Murray Louis's company in 1989. His abstract, exhilarating works include *Imago* (1963), *Gallery* (1978) and *Crucible* (1985).

Nile, great river of Africa. The longest river in the world, it flows generally north c.4,160 mi (6,695 km) from its remotest headstream, the Luvironza R. (in Burundi), to enter the Mediterranean Sea through a vast, triangular delta in N Egypt. Its trunk stream is formed at Khartoum (Sudan) by the convergence of the Blue Nile (c.1,000 mi/1,610 km) and the White Nile (c.2,300 mi/3,700 km). The Blue Nile, rising in Lake Tana in a region of summer rains, was the source of Egypt's soil-replenishing annual floods prior to construction of the ASWAN HIGH DAM. The White Nile, rising in Lake VICTORIA, has a more nearly constant flow. Waters from the Nile, which nourished the most long-lived of the great ancient civilizations (see EGYPT), now supply hydroelectricity and support irrigated agriculture in Egypt and in the Sudan's Gezira.

Nilotes, people of E Africa, including the Nuer and Masai, who speak Nilotic languages. Originally from E Sudan, they now inhabit S SUDAN, N UGANDA, and N KENYA. Noted for their tall stature, they are primarily pastoralists.

Nilsson, Birgit, 1918–, Swedish soprano. Possessed of a powerful voice, she is noted for her Wagnerian roles (see WAGNER, Richard). She won international notice in Munich (1955–56) and made her U.S. debut in 1959.

Nimeiry, Muhammad Gaafur al- [nĭmĕr'ē], 1930–, Sudanese army officer and political leader. In 1969 he led the leftist military coup that toppled the civilian government. He was elected (1971) president and became (1972) prime minister. His imposition of Islamic law over both the north and non-Islamic south of Sudan in 1983 eventually led to his overthrow (1985).

Nimitz, Chester William, 1885–1966, American admiral; b. Fredericksburg, Tex. He commanded the U.S. Pacific Fleet throughout WORLD WAR II, becoming admiral of the fleet (five-star admiral) in 1944. He later served as chief of naval operations (1945–47).

Nin, Anaïs [nēn], 1903–77, American writer; b. Paris. Although she wrote several novels, including *A Spy in the House of Love* (1954), Nin is best known for six volumes of diaries (1966–76; unexpurgated ed., 1986–), recording her psychological and artistic development. She also wrote criticism and essays.

Nineveh [nĭn'əvə], ancient city, capital of the Assyrian empire, on the Tigris R. opposite modern Mosul, Iraq. Nineveh reached its full glory under SENNACHERIB and ASSURBANIPAL. Excavations have revealed palaces and a CUNEIFORM library. The city fell in 612 B.C. to a coalition of Babylonians, Medes, and Scythians. It is mentioned often in the Bible.

niobium (Nb), metallic element, discovered in 1801 by Charles Hatchett. Called columbium by metallurgists, it is a rare, soft, malleable, ductile, gray-white metal that is used in high-temperature-resistant alloys and special stainless steels. See ELEMENT (table); PERIODIC TABLE.

nirvana, in BUDDHISM, JAINISM, and HINDUISM, a state of supreme bliss; liberation from suffering and from *samsara*, one's bondage to the repeating cycle of death and rebirth, which is brought about by desire. Nirvana is attainable in life through moral discipline and the practice of YOGA, leading to the extinction of all attachment and ignorance. See also KARMA.

nitric acid, chemical compound (HNO_3), colorless, highly corrosive, poisonous liquid that gives off choking fumes in moist air. It is miscible with water in all proportions. Commercially, it is usually available in solutions of 52% to 68% nitric acid in water. Solutions containing over 86% nitric acid are commonly called fuming nitric acid. Nitric acid is a strong oxidizing agent. It reacts with metals, oxides, and hydroxides, forming nitrate salts. See also AQUA REGIA; Wilhelm OSTWALD.

nitric oxide (NO), colorless, poisonous gas formed by the combustion of nitrogen and oxygen. In the environment, it is a precursor of SMOG and ACID RAIN. In the body, it serves as a chemical messenger with a wide range of functions. It acts as a NEUROTRANSMITTER and is necessary for penile erection. It affects blood pressure and is produced by the immune system to help defend against infection and cancer. Despite its usefulness, nitric oxide can have a toxic effect on body cells and has been implicated in HUNTINGTON'S DISEASE, ALZHEIMER'S DISEASE, and arthritis.

nitrogen (N), gaseous element, discovered by Daniel Rutherford in 1772. Nitrogen is a colorless, odorless, tasteless, diatomic gas that is relatively inactive chemically; it occupies about 78% (by volume) of dry air. Its chief importance lies in its compounds, which include NITROUS OXIDE, NITRIC ACID, AMMONIA, many EXPLOSIVES, CYANIDES, FERTILIZERS, and PROTEINS. Nitrogen is present in the PROTOPLASM of all living matter; it and its compounds are necessary for the continuation of life (see NITROGEN CYCLE). See ELEMENT (table); PERIODIC TABLE.

nitrogen cycle, the continuous flow of nitrogen through the BIOSPHERE by the processes of nitrogen fixation, ammonification (decay), nitrification, and denitrification. Nitrogen is an essential constituent of all protoplasm. To enter living systems, however, it must first be "fixed" (combined with oxygen or hydrogen) into compounds that plants can utilize, such as nitrates or ammonia. Most fixation is performed by certain bacteria living in the soil or in nodules in the roots of leguminous plants (see PULSE, in botany). Plants elaborate the fixed nitrogen into plant protein then animals consume the plants and convert plant protein into animal protein. Organic nitrogen is returned to the soil as ammonia when animal remains and wastes decay. Then nitrifying bacteria oxidize the ammonia to nitrites and the nitrites to nitrates, which can, like ammonia, be taken up by plants. Still other soil microorganisms can reduce ammonia nitrates to molecular nitrogen. See also ECOLOGY.

nitroglycerin ($C_3H_5N_3O_9$), colorless, oily, liquid EXPLOSIVE. An unstable compound that decomposes violently when heated or jarred, nitroglycerin is made less sensitive to shock when mixed with an absorbent material to form DYNAMITE. Nitroglycerin is also a component of smokeless powder and is used in medicine for relief from the symptoms of angina pectoris. It was first produced commercially by Alfred NOBEL.

nitrous oxide, chemical compound (N_2O), colorless gas with a sweetish taste and odor. Although it does not burn, it supports combustion because it decomposes into oxygen and nitrogen when heated. A major use is in dental anesthesia. It is often called laughing gas because it produces euphoria and mirth when inhaled in small amounts. It is also used in making certain canned pressurized foods, e.g., instant whipped cream.

Niue, self-governing coral island (1992 est. pop. 1,800), 100 sq mi (260 sq km), in the South Pacific Ocean, freely associated with New Zealand. Alofi is the chief town. Niue has fertile soil and exports copra, honey, and fruit. The inhabitants are mainly Polynesian.

Nixon, Richard Milhous, 1913–94, 37th president of the U.S. (1969–74); b. Yorba Linda, Calif. As a Republican U.S. representative from California (1947–51) he gained national prominence for his investigation of Alger HISS. In the Senate (1951–53) he attacked the Democratic administration as favorable to Socialism. He was elected to the vice presidency on the Republican ticket with Dwight D. EISENHOWER in 1952; they were reelected in 1956. Kept closely informed, Nixon played an important role in government affairs. He ran for president in 1960 but was defeated by John F. KENNEDY, and in 1962 he was defeated in the race for governor of California. In

1968 he again won the Republican presidential nomination and, with his running mate, Spiro T. AGNEW, defeated Hubert H. HUMPHREY and George C. WALLACE. As president, Nixon achieved a cease-fire in the VIETNAM WAR, but only after he had ordered invasions of Cambodia (1970) and Laos (1971) and the saturation bombing of North Vietnam. In other areas of foreign affairs, he initiated strategic arms limitation talks with the Soviet Union (1959) and visited (1972) the People's Republic of China. At home, he reversed many of the social and economic welfare programs of Pres. JOHNSON's administration and, hoping to woo the South into the Republican party, weakened the federal government's commitment to racial equality. His administration was plagued by economic woes that led to the imposition (1971) of wage and price controls. Despite these problems, he and Agnew were easily reelected in 1972, winning a landslide victory over George S. MCGOVERN. (Agnew was forced to resign in 1973 and was replaced by Gerald R. Ford.) Investigations into the WATERGATE AFFAIR and studies by the Internal Revenue Service revealed pervasive corruption in Nixon's administration, and in 1974 the U.S. House of Representatives began impeachment proceedings. After completing its investigations, the House Judiciary Committee recommended (July 27–30) three articles of impeachment: obstruction of justice, abuse of power, and failure to comply with congressional subpoenas. On Aug. 5 Nixon admitted that he had ordered the FBI to stop investigating the Watergate burglary. On Aug. 9 he became the first president to resign. His successor, Gerald R. FORD, granted him a full pardon, quashing the possibility of criminal proceedings.

Nizhny Novgorod, city (1990 est. pop. 1,440,000), E European Russia, on the Volga and Oka rivers. A major river port, it has one of the largest automobile plants in Russia, as well as steel-making and other industries. Founded in 1221, it was a center of trade with the East. From 1932 to 1990 it was named Gorky for Maxim GORKY, who was born there.

Nkrumah, Kwame [nkro͞o'mä], 1909–72, prime minister (1957–60) and president (1960–66) of GHANA. He was a leader in the struggle to gain independence for the British Gold Coast (now Ghana). His leadership of the new nation grew increasingly dictatorial and autocratic, and he was ousted in 1966.

NKVD: see CHEKA; KGB.

No, chemical symbol of the element NOBELIUM.

Noah [nō'ə] or **Noe** [nō'ē], in the BIBLE, the builder of the ARK, at divine direction, that saved human and animal life from the deluge. After the flood God established a covenant with Noah. Noah's sons, Shem, Ham, and Japheth, are eponymous ancestors of races, as humanity is divided in the Bible.

Nobel, Alfred Bernhard, 1833–96, Swedish chemist and inventor. He was involved, with his family, in the development and manufacture of explosives, and his invention of DYNAMITE, a mixture of nitroglycerine and inert filler, greatly improved the safety of explosives. Inclined toward pacifism and concerned about the potential uses of the explosives he had invented, he established a fund to provide annual awards, called NOBEL PRIZES, in the sciences, literature, and the promotion of international peace.

nobelium (No), radioactive element, first produced artificially in 1958 by A. Ghiorso, T. Sikkeland, J.R. Walton, and Glenn T. SEABORG by carbon-ion bombardment of curium. It is a TRANSURANIUM ELEMENT in the ACTINIDE SERIES. Seven isotopes are known. See ELEMENT (table); PERIODIC TABLE.

Nobel Memorial Prize in Economic Science: see under NOBEL PRIZE.

Nobel Prize, award, est. and endowed by the will of Alfred NOBEL, given annually for outstanding achievement in one of five fields. By the terms of Nobel's will, the physics and chemistry prizes are judged by the Royal Swedish Academy of Sciences; the physiology or medicine prize, by Sweden's Royal Caroline Medico-Chirurgical Institute; the literature prize, by the Swedish Academy; and the peace prize, by a committee of the Norwegian parliament. Each recipient is presented with a gold medal and a monetary award (or a share of it) worth about $825,000 in 1993. The five awards were first given in 1901. The prizes are not always awarded every year, and from 1940 to 1942 no awards were made. A sixth, related award, the **Nobel Memorial Prize in Economic Science,** was established and endowed in 1968 by Sveriges Riksbank, the Swedish national bank. First awarded in 1969, it is judged by the Royal Swedish Academy of Sciences.

NOBEL MEMORIAL PRIZE IN ECONOMIC SCIENCE

1969	Ragnar Frisch and Jan Tinbergen	1980	Lawrence R. Klein
1970	Paul A. Samuelson	1981	James Tobin
1971	Simon Kuznets	1982	George J. Stigler
1972	Sir John R. Hicks Kenneth J. Arrow	1983	Gerard Debreu
1973	Wassily Leontief	1984	Richard Stone
1974	Gunnar Myrdal Friedrich A. von Hayek	1985	Franco Modigliani
1975	Leonid V. Kantorovich Tjalling C. Koopmans	1986	James M. Buchanan
1976	Milton Friedman	1987	Robert M. Solow
1977	James E. Meade Bertil Ohlin	1988	Maurice Allais
1978	Herbert A. Simon	1989	Trygve Haavelmo
1979	Sir Arthur Lewis Theodore W. Schultz	1990	Harry M. Markowitz, William F. Sharpe, and Merton H. Miller
		1991	Ronald H. Coase
		1992	Gary S. Becker
		1993	Robert W. Fogel and Douglass C. North

noble gas: see INERT GAS.

node, either of two points at which the ORBIT of a celestial body crosses a reference plane. The south-to-north crossing occurs at the ascending node; the north-to-south crossing at the descending node. Perturbations due to other bodies cause the nodes to move along the reference plane. See also ECLIPSE.

Nō drama: see *Japanese drama* under ASIAN DRAMA.

Noel-Baker, Philip John Noel-Baker, Baron, 1889–1982, British statesman. After helping to draft (1919) the Covenant of the LEAGUE OF NATIONS, he served (1929–31, 1936–70) as a Labour member of Parliament. After World War II he helped draft the UNITED NATIONS Charter and worked actively for world disarmament. He was awarded the Nobel Peace Prize in 1959.

Noether, (Amalie) Emmy [nö'tər], 1882–1935, German mathematician. She made important contributions to the development of abstract algebra, which studies the formal properties, e.g., ASSOCIATIVE LAW, COMMUTATIVE LAW, and DISTRIBUTIVE LAW, of algebraic operations. After finally gaining an official appointment at Göttingen Univ. in 1919, she developed the theories of ideals and of noncommutative algebras. After the Nazis dismissed her and other Jewish professors in 1933, she worked in the U.S. at Bryn Mawr College and at the Institute for Advanced Study, Princeton.

no-fault insurance: see INSURANCE.

Noguchi, Hideyo [nōgō'chē], 1876–1928, Japanese bacteriologist; came to U.S., 1900. He made important studies of snake venoms and of smallpox and yellow-fever vaccines. In 1913 Noguchi isolated the *Treponema pallidum* from a syphilis patient, proving that this spirochete was the cause of syphilis; he also developed a skin test for this disease.

Noguchi, Isamu, 1904–88, American sculptor; b. Los Angeles. Noguchi, who studied under BORGLUM and BRANCUSI, is best known for his abstract sculptures designed as adjuncts to architecture. He has also designed many playgrounds and stone sculpture gardens, e.g., the UNESCO garden in Paris.

Noguchi Yone(jiro), 1875–1947, Japanese poet and critic. Writing in both English and Japanese, he helped stimulate Western interest in many Japanese artists. His works include *Japan and America* (1921) and *Selected Poems* (written in English, 1921).

dustrial activities at levels and/or frequencies harmful to health or welfare. Transportation vehicles (e.g., trains) and construction equipment (e.g., pneumatic drills) are particular offenders in this regard. Federal estimates indicate that more than one in three Americans is affected by noise pollution. Apart from hearing loss, excessive noise can cause lack of sleep, irritability, heartburn, indigestion, ulcers, and high blood pressure. Noise-induced stress can create severe tension in daily living and may contribute to mental illness. The Noise Control Act of 1972 empowers the ENVIRONMENTAL PROTECTION AGENCY to determine the noise limits required to protect health and to set noise emission standards (see ENVIRONMENTALISM).

Noland, Kenneth, 1924–, American painter; b. Asheville, N.C. Associated with COLOR FIELD PAINTING, Noland is best known for stained canvases in target or chevron designs.

Nolde, Emil, 1867–1956, German expressionist painter and graphic artist; b. Emil Hansen. He was a member of the BRÜCKE group. His bold, arresting landscapes, and violent, clashing colors, combined with distortions of shape, caused bitter controversy. Among his best-known works are the woodcut *The Prophet* (1912, National Gall., Wash., D.C.) and *Christ among the Children* (Mus. Mod. Art, N.Y.C.).

nominalism, in philosophy, theory holding that universal words (*nomina*) or concepts have no objective reality outside the mind, and that only individual things and events exist objectively. The theory, contrasted to Platonic IDEALISM and, in the Middle Ages, to REALISM, is appropriate to MATERIALISM and EMPIRICISM.

Nonaligned Movement, organized movement of nations that attempted to form a third world force through a policy of nonalignment with the U.S. and the USSR. Its members, mainly from Asia, Africa, and Latin America and representing more than half the world's people, include true neutrals and many nations that were in fact aligned with one of the superpowers during the COLD WAR. Yugoslavia, India, and Indonesia were instrumental in founding (1961) the movement, which meets regularly to discuss the common interests of its members. By the early 1990s it had 111 members and, in light of the Cold War's end, was reassessing its role and redefining its identity.

nonbank, financial organization that handles public and private funds and offers some of the services, such as demand deposits or

The key to pronunciation appears on page xiii.

loans, that banks and savings institutions offer. Nonbanks either take deposits or make commercial loans but cannot legally do both. Nonbanks include MONEY-MARKET FUNDS and other investment companies and finance companies, and play an important role in the U.S. economy. See BANKING.

nonconformists, in religion, those who refuse to conform to the requirements (in doctrine or discipline) of an established church. The term is especially applied to Protestant dissenters from the Church of England, who arose soon after the REFORMATION. The Act of Uniformity (1662) made episcopal ordination compulsory and a distinct split unavoidable.

non-Euclidean geometry, branch of GEOMETRY in which the fifth postulate of EUCLIDEAN GEOMETRY is replaced by one of two alternative postulates. EUCLID's fifth postulate states that one and only one line parallel to a given line can be drawn through a point external to the line. The first alternative, which allows two parallels through any external point, leads to the hyperbolic geometry developed independently by Nikolai LOBACHEVSKY (1826) and János Bolyai (1832). The second, which allows no parallels through any external point, leads to the elliptic geometry developed by G.F.B. RIEMANN (1854). The results of these two types of non-Euclidean geometry are identical with those of Euclidean geometry in every respect except for the propositions involving parallel lines, either explicitly or implicitly.

Nonintercourse Act: see EMBARGO ACT OF 1807.

nonlinear dynamics, popularly called **chaos theory**, interdisciplinary science that attempts to reveal structure in seemingly unpredictable dynamic systems. In a linear system a small change produces a small and easily quantifiable systematic change, but a nonlinear system exhibits a sensitive dependence on initial conditions: small or virtually unmeasurable differences in initial conditions can lead to wildly differing results. (This is sometimes called the "butterfly effect," in reference to a 1979 address by meteorologist E.M. Lorenz entitled "Predictability: Does the Flap of a Butterfly's Wings in Brazil Set Off a Tornado in Texas?") The evolution of nonlinear dynamics was made possible by the application of high-speed computers, particularly in the area of computer graphics, to innovative mathematical theories developed during the first half of the 20th cent. Three branches of study are recognized: classical systems in which friction and other dissipative forces are paramount, such as turbulent flow in a liquid or gas; classical systems in which dissipative forces can be neglected, such as charged particles in a PARTICLE ACCELERATOR; and quantum systems, such as molecules in a strong electromagnetic field. Nonlinear dynamics has been applied to the study of diverse phenomena, such as dripping faucets, population growth, the beating heart, and the economy, to better understand the complex relationships among the various elements involved.

nonsporting dog, class of dogs formerly bred to hunt or work but now raised chiefly as pets. See individual breeds, e.g., BOSTON TERRIER, BULLDOG, CHOW CHOW, DALMATIAN, POODLE.

nonsteroidal anti-inflammatory drug (NSAID), a drug, such as IBUPROFEN, that relieves pain and suppresses inflammation in a manner similar to STEROIDS, but without the side effects of steroids. NSAIDs are commonly used to treat arthritis, gout, bursitis, and painful menstruation.

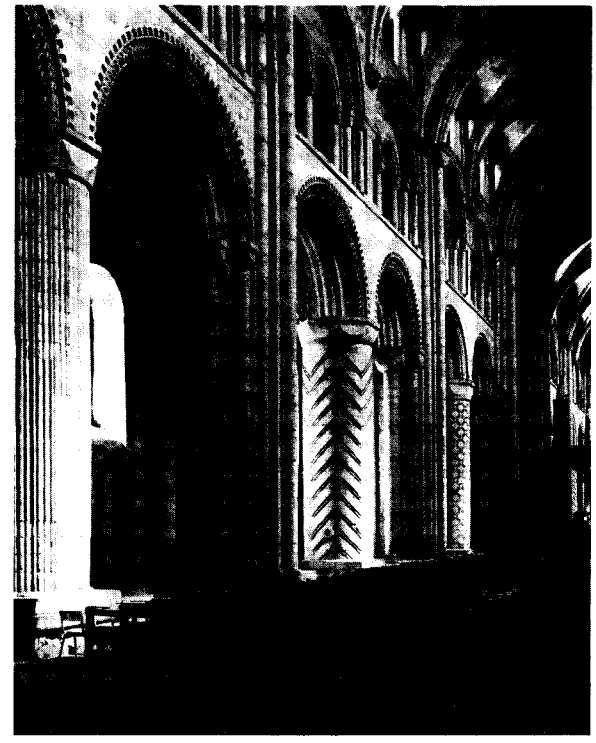
Nordhoff, Charles [nôrd'hŏf], 1830–1901, American journalist and author; b. Germany. A leading political writer and Washington correspondent, he also wrote books and articles about the sea and ships. His grandson, **Charles Bernard Nordhoff** (1887–1947), b. London, was co-author with James Norman Hall of *Mutiny on the Bounty* (1932) and other works (see BOUNTY).

norepinephrine or **noradrenaline,** the NEUROTRANSMITTER that mediates chemical communication in the sympathetic NERVOUS SYSTEM. Like other neurotransmitters, it is released at synaptic nerve endings to transmit the signal from a nerve cell to other cells. It is almost identical in structure to EPINEPHRINE. The sympathetic nervous system functions in response to short-term stress (the fight or flight response); hence norepinephrine and epinephrine increase the heart rate as well as blood pressure, increase the rate of glycogen conversion for energy, and relax bronchial smooth muscle to assist breathing.

Norfolk, city (1990 pop. 261,229), SE Va., on the Elizabeth R. and the southern side of HAMPTON ROADS; founded 1682, inc. as a city 1845. The U.S.'s largest naval base is located in its port. Virginia's largest city, Norfolk is also a major coal and grain exporter. Shipbuilding is the leading industry. The city was the object of fighting in the AMERICAN REVOLUTION and in the CIVIL WAR. Landmarks include St. Paul's Church (1738) and Fort Norfolk (1794).

Norfolk Island, external territory of Australia (1992 est. pop. 2,600), 13 sq mi (34 sq km), c.1,035 mi (1,670 km) NE of Sydney. Now a resort, the island was discovered by Capt. James COOK in 1774 and served as a convict settlement (1788–1813, 1826–55). In 1856, 194 descendants of the *Bounty* mutineers were transferred there from PITCAIRN ISLAND. Limited self-rule was granted in 1979.

Noriega, Manuel Antonio, 1938–, Panamanian general. As commander of the National Defense Forces (1982–89), he ousted the civilian president (1985) and became the de facto leader of Panama. After he was implicated in drug trafficking, the sale of U.S. secrets to Cuba and the USSR (he was also in the pay of the U.S. Army and CIA from 1955 to 1986), and other illegal activities, U.S. officials urged him to step down (Jan. 1988). A U.S. indictment on drug charges and subsequent economic sanctions proved ineffective. In Dec. 1989 the U.S. invaded Panama, captured Noriega, and brought him to Miami, where he was convicted (1992) on racketeering and conspiracy charges relating to drug trafficking.



Round Norman arches of Durham Cathedral

Norman architecture, term applied to buildings erected in lands conquered by the Normans: N France, England, S Italy, and Sicily. In France and England, Norman buildings were based on the ROMANESQUE ARCHITECTURE of Lombardy. Churches, abbeys, and castles were massive and sparsely decorated, and featured round arches. The style was developed from 1066 to 1154. The great French works include the beginnings of MONT-SAINT MICHEL and two abbeys at Caen. In England the Normans began nearly all the great cathedrals, including Westminster Abbey, where only foundations remain. The only intact design is the small St. John's Chapel (c.1087) at the TOWER OF LONDON. English and French churches were cruciform and square-towered. Blind arcades, carved moldings, and grotesque sculptured animal forms were common. The ribbed vault at Durham Cathedral (begun 1093) indicated a shift

from Norman to GOTHIC ARCHITECTURE. In Italy and Sicily, Byzantine and Arabic elements modified the massive Norman style.

Norman Conquest, period in English history following the defeat (1066) of King HAROLD of England by William, duke of Normandy (see WILLIAM I). The conquest was formerly thought to have brought about broad changes in English life. More recently historians have stressed the continuity of English law, institutions, and customs, but the subject remains controversial. The initial military conquest was quick and brutal. By 1070 most of the Anglo-Saxon nobles were dead or had been deprived of their land, and a Norman aristocracy was superimposed on the English. William used the existing Anglo-Saxon administrative system, and the English church gained closer ties with Europe. Norman French was spoken at the court and had a great impact on the English language. NORMAN ARCHITECTURE was also introduced into England.

Normandy, region and former province, NW France, bordering on the English Channel. Its economy is based on cattle, fishing, and tourism. Rouen, Le Havre, and Cherbourg have heavy industry. Conquered by the Romans and later (5th cent.) by the FRANKS, the area was repeatedly raided (9th cent.) by the NORSEMEN, or Normans, for whom the region is named. Normandy was ceded (991) by CHARLES III of France to their chief, Rollo, the 1st duke of Normandy. In 1066 Duke William invaded England, where he became king as WILLIAM I. During the HUNDRED YEARS WAR Normandy was permanently restored (1450) to France. The region was the scene of an Allied invasion (1944) during WORLD WAR II.

Normandy campaign: see WORLD WAR II.

Norns, Norse FATES, who spun and wove the web of life. They were usually three: Urth (Wyrd), past; Verthandi, present; and Skuld, future. The three weird sisters in Shakespeare's *Macbeth* are probably Scottish equivalents of the Norns.

Norodom Sihanouk [nōrōdŭm' sĭhənŭk'], 1922–, king (1941–55, 1993–) of CAMBODIA. In 1955 he abdicated in favor of his father and became premier. After his father's death (1960) he again became head of state, but not king. He was deposed (1970) by LON NOL. When the KHMER ROUGE won control of Cambodia, Sihanouk returned as head of state (1975–76) but was subsequently placed under house arrest. In 1981–82, Sihanouk, in exile, forged a coalition with the Khmer Rouge and others to oppose the Vietnamese-imposed Cambodian government. After the signing of the UN-sponsored peace treaty (1991), Sihanouk returned to Cambodia, now allied with Prime Min. Hun Sen and opposed to the Khmer Rouge. He became head of state (1991) and, under a new constitution, king (1993).

Norris, Frank (Benjamin Franklin Norris), 1870–1902, American novelist; b. Chicago. Influenced by the NATURALISM of ZOLA, he wrote the novel *McTeague* (1899), on greed, and two powerful novels attacking the American railroad and wheat industries, *The Octopus* (1901) and *The Pit* (1903).

Norris, George William, 1861–1944, U.S. representative (1903–13) and senator (1914–43) from Nebraska; b. Sandusky co., Ohio. A liberal Republican, he worked to reform the rules of the House. In the Senate he voted against U.S. participation in World War I, wrote (1932) the 20th amendment to the Constitution, cosponsored (1932) the Norris-LaGuardia labor law, and fathered the bills creating (1933) the TENNESSEE VALLEY AUTHORITY.

Norse, another name for the North Germanic, or Scandinavian, group of the Germanic subfamily of the Indo-European family of languages. Norse is the language of Norway and Iceland at any period. Old Norse was the language of the EDDAS and SAGAS. See LANGUAGE (table).

Norsemen, Scandinavian VIKINGS who raided and settled on the coasts of NW Germany, the Low Countries, France, and Spain in the 9th and 10th cent. Among the causes of the influx were the desire for wealth, power, and adventure and the attempt of HAROLD I of Norway to subjugate the independent Norwegian nobles, forcing them to look to foreign conquests. The Norsemen's impact was especially lasting in N France, where they began (c.843) to sail up the French rivers, attacking, looting, and burning such cities as Rouen and Paris and ruining commerce and navigation. In 911 one of their leaders, Rollo, was given the duchy of NORMANDY by CHARLES III. Rollo's successors expanded their lands and were only nominal vassals of the French kings. The Norsemen accepted Christianity, adopted French law and speech, and continued in history as Normans.

North, Frederick, 2d **earl of Guilford,** 1732–92, British statesman, known as Lord North. As prime minister (1770–82) under GEORGE III, he pursued awkward colonial policies that led to the AMERICAN REVOLUTION. North later formed (1783) a coalition ministry with Charles James FOX.

North Africa, campaigns in, fighting in WORLD WAR I for control of the southern coast of the Mediterranean. It began in September 1940, after the swift Italian conquest of British Somaliland. The Italian army in Libya was routed, but the German Afrika Korps, commanded by Gen. ROMMEL, came to their aid. In May 1941 Rommel drove the British back to the Egyptian border, but the British mounted (Nov. 1941) a successful counterattack. Or May 26, 1942, the British suffered a major defeat but dug in around ALAMEIN. Commanded by Gen. MONTGOMERY, they withstood German attacks until reinforcements arrived. Montgomery's thrust began on Oct. 23, 1942, and was a brilliant success. The Germans were forced to retreat all the way to Tunisia, where they were bottled up. Meanwhile, U.S. and British troops were occupying territories west of Rommel—Algiers, Oran, and Casablanca. In May 1943, Rommel's troops were attacked from the west by U.S. troops under Gen. EISENHOWER, from the south by Montgomery's troops, and from the southwest by a Free French army. On May 12 about 250,000 Axis soldiers capitulated. Earlier, the British had reconquered most of East Africa.

North America, third largest continent, c.9,400,000 sq mi (24,346,000 sq km), usually considered to include all the lands and adjacent islands in the Western Hemisphere located N of the Isthmus of Panama (which connects it with South America). The countries of the continent are the U.S. and Canada, known as Anglo-America; Mexico; the nations S of Mexico, known as CENTRAL AMERICA; and the island countries of the WEST INDIES (the many islands located in and around the CARIBBEAN SEA off the SE mainland coast). GREENLAND and the French islands of ST. PIERRE AND MIQUELON are also part of North America. The principal topographic feature is the North American Cordillera, a complex mountain region in the west that includes the ROCKY MTS. Mt. MCKINLEY (20,320 ft/6,194 m), in Alaska, is the highest point; the lowest point is 282 ft (86 m) below sea level, in Death Valley (see DEATH VALLEY NATIONAL MONUMENT). The climate ranges from polar to tropical, with arid and semiarid conditions predominating over much of the interior.

North America, indigenous peoples of. This article deals with the peoples who inhabited North America before the arrival of the Europeans. Now often called Native Americans, they have long been called Indians because it was initially believed that COLUMBUS had reached the East Indies. Migrating in waves from Asia (see AMERICAS, PREHISTORY OF THE), these peoples spoke widely varying NATIVE AMERICAN LANGUAGES, but all had straight black hair, dark eyes, and yellow- to red-brown skin. In 1492 they numbered 1 to 2 million N of Mexico, in six major cultural areas: Northwest Coast, Plains, Plateau, Eastern Woodlands, Northern, and Southwest.

Northwest Coast. Peoples of the Northwest Coast (e.g., KWAKIUTL, HAIDA, MODOC, TSIMSHIAN) lived along the Pacific from S Alaska to N California and spoke Nadene, Wakashan, and Tsimshian languages. They subsisted chiefly on salmon, sea and land mammals, and wild fruits, and built wooden houses and boats. Their arts included weaving, basketry, masks, and TOTEM poles. Their generally stratified societies, whose ceremonial displays of wealth included the POTLATCH, were not affected by whites until the late 18th cent.

Plains. Plains peoples lived in the grasslands from the Mississippi R. to the Rocky Mts. and from S Canada to Texas, speaking mainly Algonquian-Wakashan, Aztec-Tanoan, and Hokan-Siouan languages. Sedentary tribes (e.g., OMAHA, MANDAN, PAWNEE) farmed the river valleys and lived in walled villages of domed earth lodges. The nomadic tribes (e.g., BLACKFOOT, CHEYENNE, COMANCHE) hunted buffalo—on foot until they acquired horses in the 18th cent.—for food, clothing, and TEPEES. Their culture was characterized by warrior clans, the coup (a war honor awarded for striking an enemy with conspicuous bravery), the SUN DANCE, and bead-and-feather artwork. A mutually intelligible sign language developed among

the nomadic Plains tribes, who were the last to submit to white encroachments.

Plateau. Peoples of the Plateau (e.g., Kootenai, NEZ PERCÉ, PAIUTE), from S Canada to California and the Southwest, were diverse in language and culture. Sedentary California Native Americans, living in brush shelters or lean-tos, gathered edible plants, made acorn bread, and hunted small game. Their basketry was highly developed. The harsh environment between the Cascades and the Rockies demanded a simple social, religious, and political life; Native Americans there lived in partly buried lodges and hunted small game, fished with nets and spears, and gathered insects. The adoption (c.1730) from the Plains tribes of the horse and tepee changed the plateau culture markedly.

Eastern Woodlands. In the Eastern Woodlands, Algonquian-Wakashan and Hokan-Siouan speakers predominated. Peoples from the Atlantic to the Mississippi (e.g., DELAWARE, HURON, IROQUOIS CONFEDERACY, MOHEGANS) were deer hunters; the women also grew corn, squash, and beans. Their houses included the dome-shaped wigwam and the longhouse; they used the birchbark canoe. Males wore deerskin clothing, face and body paint, and scalp locks. Peoples in the area from the Ohio R. to the Gulf of Mexico (e.g., CHEROKEE, CHOCTAW, Natchez, SEMINOLE) developed a farming and trading economy featuring a high technology and excellent pottery. A stratified society observed elaborate rites including sun worship; burial mounds (see MOUND BUILDERS) were unique to these groups.

Northern Tribes. In the semiarctic Northern area, covering most of Canada, Algonquian-Wakashan and Nadene tongues predominated. Nomadic hunters (e.g., Kutchin, MONTAGNAIS AND NASKAPI) followed caribou migrations for food, clothing, and shelter; the

snowshoe was important to their material culture. Their religion centered on the SHAMAN.

Southwest. Peoples of the Southwest (e.g., APACHE, NAVAHO, PUEBLO) spoke mainly Aztec-Tanoan languages and reflected the advanced culture of the AZTECS to the south. By 700 B.C. the basketmakers had mastered intensive agriculture and pottery making. The CLIFF DWELLERS later built terraced community houses and ceremonial KIVAS on cliff ledges. The Pueblo tribes further developed farming, pottery, textiles, and a complex mythology and religion.

Contemporary Native American Life. After the long struggle (see INDIAN WARS) between whites and Native Americans came to an end in the 1890s, Native Americans settled into a life dominated by poverty, poor education, unemployment, and gradual dispersal. U.S. government policy, administered by the Bureau of INDIAN AFFAIRS, encouraged converting tribal lands into individual holdings, many of which were sold to whites. The Indian Reorganization Act of 1934 aimed at revitalization of Native American economic life, but also at assimilation into white society; the policy of the 1950s to terminate tribes aggravated the situation. In the 1970s the AMERICAN INDIAN MOVEMENT was organized, and various tribes filed suits to reclaim formerly seized lands from the U.S. Government. Beginning in the late 1970s some tribes opened high-stakes bingo halls to generate income, and the 1988 Indian Gaming Regulatory Act has led to the widespread establishment of gambling casinos by Native Americans. Of approximately 1.9 million Native Americans in the U.S. today, most live in the Southwest and mountain states. Survivors of many Eastern tribes live among whites in OKLAHOMA, while unassimilated native culture is strongest among the Pueblos of Arizona and New Mexico and among some tribes of the Pacific Northwest. See also articles on individual tribes.

North American Free Trade Agreement (NAFTA), accord establishing a free-trade zone in North America; it was signed in 1992 by Canada, Mexico, and the U.S and took effect Jan. 1, 1994. NAFTA will eliminate tariffs on goods produced by the signatory nations by 2005 and remove most barriers to cross-border investment and to the movement of goods and services. The pact contains provisions for the inclusion of additional member nations.

North Atlantic Drift, warm ocean current in the N Atlantic Ocean. It is a continuation of the GULF STREAM, the merging point being at lat. 40°N and long. 60°W. Off the British Isles, it splits into two branches, one north and one south. It is responsible for the warm climate of W Europe.

North Atlantic Treaty Organization (NATO), military alliance established (1949) by Belgium, Canada, Denmark, France, Great Britain, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, and the U.S., and later joined by Greece and Turkey (1952), West Germany (1955; now Germany), and Spain (1982). Its aim is to safeguard member nations from attack, originally from the threat of Soviet aggression. With the end of the COLD WAR, NATO members agreed to the use of its forces as peacekeepers in countries outside the alliance. NATO's policies are determined and coordinated by the North Atlantic Council, which has headquarters in Brussels, Belgium, and is under the chairmanship of NATO's secretary general. The Military Committee, located in Washington, D.C., includes representatives of all members except France, which ended the military integration of its forces with NATO in 1966. In the early 1990s many East European nations sought NATO membership as a counterbalance to Russian power, but they were offered more limited "partnerships" that do not require NATO members to defend them from attack.

North Carolina, state in the SE U.S.; bordered by the Atlantic Ocean (E), South Carolina and Georgia (S), Tennessee (W), and Virginia (N).

Area, 52,586 sq mi (136,198 sq km). *Pop.* (1990) 6,628,637, a 12.8% increase over 1980 pop. *Capital,* Raleigh. *Statehood,* Nov. 21, 1789 (12th of original 13 states to ratify the Constitution). *Highest pt.,* Mt. Mitchell, 6,684 ft (2,039 m); *lowest pt.,* sea level. *Nickname,* Tar Heel State. *Motto, Esse Quam Videri* [To Be Rather than to Seem]. *State bird,* cardinal. *State flower,* dogwood. *State tree,* pine. *Abbr.,* N.C.; NC.

Land and People. The low-lying coastal tidewater country, marked by Capes HATTERAS, Lookout, and Fear, gives way inland to the FALL LINE and then to the rolling hills of the Piedmont plateau, where most of the population lives. In the west the land rises to the BLUE RIDGE and GREAT SMOKY MOUNTAINS, where a NATIONAL PARK (see table) runs along part of the Tennessee border. Both ranges are part of the APPALACHIAN system. The warm, temperate climate is generally uniform throughout the state, and rainfall is abundant. A little more than 50% of the population lives in urban areas, mostly in and around CHARLOTTE, the largest city, which is followed in size by RALEIGH, GREENSBORO, and WINSTON-SALEM. In 1990 the state was 76% white and 22% African American. The state also has the largest Native American population, mainly CHEROKEE, in the SE U.S.

Economy. North Carolina leads the country in the production of tobacco and is a major producer of textiles and furniture. Electrical and electronic equipment, chemicals, and machinery are among its other leading manufactured goods. Tobacco is supplemented by the production of cattle, broiler chickens, hogs, turkeys, dairy items, soybeans, corn, and peanuts. The state is a major source of feldspar, mica, lithium, phosphate, and other minerals. The abundant forests support lumbering and allied industries, and fishing is important along the coast. Mountain and coastal resorts attract many visitors.

Government. The constitution (adopted 1970) provides for a governor elected to a four-year term. The general assembly consists of a 50-seat senate and 120-seat house, with members of both bodies serving two-year terms. The state is represented in the U.S. Congress by 2 senators and 12 representatives and has 14 electoral votes.

History. Giovanni da VERRAZANO explored the coast in 1524, and during the 1580s Sir Walter RALEIGH tried unsuccessfully to create the first British settlement in the New World, on ROANOKE ISLAND. Small farms were gradually established by c.1635 but political strife between settlers and the proprietors of the colony (who were from Virginia), as well as conflicts with the indigenous tribes, slowed settlement. North Carolina promulgated (1775) the MECKLENBURG DECLARATION OF INDEPENDENCE. After the American Revolution, however, the state, which opposed a strong central government, did not ratify the U.S. Constitution until Nov. 1789. By 1835 the final forced removal of the Cherokees began, further encouraging westward expansion. Despite considerable antislavery sentiment, the state fought on the Confederate side in the CIVIL WAR. RECONSTRUCTION saw the beginning of the modern era, with tremendous growth of industry in the Piedmont and replacement of the old plantation system by farm tenancy, which still exists. During the 1950s the value of manufactured goods surpassed that of agriculture, and industrialization continued in the 1970s and early 80s at a rate unsurpassed by any other southern state. Relatively untouched by the national recession of the early 1990s, the state has successfully shifted from traditional low-skill manufactures to high-technology industries.

North Cascades National Park: see NATIONAL PARKS (table).

Northcliffe, Alfred Charles William Harmsworth, Viscount, 1865–1922, English journalist, one of the most spectacular of popular journalists and publishers in the history of the British press; b. Ireland; brother of Harold, Viscount ROTHERMERE. He launched *Answers to Correspondents,* a weekly, in 1888 and in five years increased circulation to more than a million copies. In 1894 he bought the London *Evening News,* later founding the *Daily Mail* (1896) and the *Daily Mirror* (1903). Gaining control of the dying *Times* (1908), he put it back on its feet. His newspaper campaigns in WORLD WAR I influenced England's conduct of the war.

North Dakota, state in the N central U.S.; bordered by Minnesota (E), South Dakota (S), Montana (W), and the Canadian provinces of Saskatchewan and Manitoba (N).

Area, 70,665 sq mi (183,022 sq km). *Pop.* (1990) 638,800, a 2.2% decrease from 1980 pop. *Capital,* Bismarck. *Statehood,* Nov. 2, 1889 (39th state). *Highest pt.,* White Butte, 3,506 ft (1,069 m); *lowest pt.,* Red R., 750 ft (229 m). *Nicknames,* Sioux State; Flickertail State. *Motto,* Liberty and Union, Now and Forever, One and Inseparable. *State bird,* Western meadowlark. *State flower,* wild prairie rose. *State tree,* American elm. *Abbr.,* N.D.; ND.

Land and People. Low-lying plains in the east give way to the rolling hills of the drift prairie. In the west, across the MISSOURI R., lies an irregular plateau. In its southwestern portion, wind and rain erosion have shaped the terrain into the unusual clay and sand

formations of the Badlands, part of Theodore Roosevelt National Park (see NATIONAL PARKS, table). The west is semiarid, but the east has an average annual rainfall of 22 in. (55 cm) which falls mostly in the crop-growing months. North Dakota is one of the most sparsely populated states. The population is roughly divided between urban and rural areas; the largest city is FARGO, with 74,111 residents (1990). In 1990 the population was almost 95% white, with the remainder largely Native American.

Economy. North Dakota's rich chernozem soils and fertile grasslands make agriculture the leading source of income. The most profitable farm product is wheat, followed by cattle; barley, flax, rye, and oats are also important. North Dakota possesses abundant mineral resources, especially oil, which is refined in the state; natural gas; and the country's largest reserves of lignite. Most industries are based on the processing of the state's agricultural and mineral commodities.

Government. The constitution of 1889 provides for a governor elected to a four-year term. The legislature consists of 53 senators elected to four-year terms and 106 representatives serving two-year terms. The state has two U.S. senators and one representative, and it casts three electoral votes.

History. The French explorer Pierre de la VÉRENDRYE visited the area in 1738, and he was followed by the LEWIS AND CLARK EXPEDITION (1804–5). The U.S. obtained the northwestern portion of the state by the LOUISIANA PURCHASE (1803) and the southeastern half from the British (1818). The first Europeans arrived (1812) as part of the short-lived Red River settlement, but the first permanent farming community was not established until 1851. The Dakota Territory was organized in 1861, although settlement was hampered until the indigenous tribes had been defeated militarily during the 1860s. Thousands of European immigrants subsequently arrived in the 1870s and 1880s. Growing agrarian discontent resulted in the growth of the POPULIST party, and many statewide reforms were enacted (1919). Oil was discovered in the northwest in 1951, and the national energy crisis of the 1970s spurred further exploitation of the state's energy resources. Dependence on wheat and oil, however, has made North Dakota extremely vulnerable to price fluctuations in these commodities.

Northeast Passage, water route along the northern coast of Europe and Asia, between the Atlantic and Pacific oceans. The British, seeking an all-water route to India, made (1550s) the first attempts to find the passage. The Dutch explorers Willem BARENTZ and Henry HUDSON continued the search, as did the Russians. In 1878–79 N.A.E. Nordenskjöld of Sweden first traversed the passage. Russian icebreakers now keep the route open from June to October.

Northern Indians: see NORTH AMERICA, INDIGENOUS PEOPLES OF.

northern lights: see AURORA.

Northern Mariana Islands, commonwealth of the U.S. (1992 est. pop. 47,000), c.185 sq mi (479 sq km), comprising 16 islands (6 inhabited) of the Marianas (all except GUAM), in the W Pacific Ocean; formerly part of the U.S. Trust Territory of the PACIFIC ISLANDS. The three main islands are SAIPAN, the capital of the Northern Marianas and administrative center of the trust territory; Rota; and Tinian. U.S. aid, tourism, garment making, construction, and the production of small amounts of copra, beef, and sugar are mainstays of the economy. Most of the people are Chamorros (i.e., of mixed Spanish, Filipino, and Micronesian descent). The islands were discovered (1521) and named the Ladrones (Thieves) Islands by MAGELLAN, and renamed (1668) by Spanish Jesuits. Germany purchased them from Spain in 1899. In 1914 they were captured by Japan and were made a Japanese mandate by the League of Nations in 1920. U.S. forces occupied the Marianas in 1944 during WORLD WAR II, and in 1947 they became part of the U.S. trust territory. Voters approved separate status for the islands as a U.S. commonwealth in 1975; they became internally self-governing in 1978.

Northern Territory, territory (1992 est. pop. 169,000), 520,280 sq mi (1,347,525 sq km), N central Australia. DARWIN is the capital, largest city, and chief port. Australian aborigines, nearly one fourth of the population, live on 15 reservations totaling 94,000 sq mi (243,460 sq km). Mining is the principal industry; uranium, bauxite, manganese, and copper are the most valuable mineral resources. Beef cattle, grazed in the hot, semiarid plains of the interior, are the leading agricultural product. The Northern Territory was transferred to direct rule by the commonwealth in 1911 after being part of NEW SOUTH WALES (1825–63) and SOUTH AUSTRALIA (1863–1911). It became self-governing in 1978, in preparation for eventual statehood.

Northern War, 1700–21, European conflict, the main purpose of which was to break the power of the Swedish empire, then a great world power. Sweden's chief antagonists were Russia, under PETER I, and Poland, with Denmark and England early allies of Russia. Russia was also anxious to seize some of Sweden's territories. CHARLES XII, the young Swedish king, met with initial success. After forcing Denmark out of the war he turned eastward, where he defeated a superior Russian force at Narva (1700). He invaded Poland, took Warsaw and Cracow (1702), and forced the election of STANISLAUS I as king of Poland. He was less successful in Russia. After invading Ukraine (1707) with the help of MAZEPA, he was cut off and utterly defeated by Peter at Poltava (1709). Forced into exile in Bessarabia, he induced the sultan to declare war on Russia (see RUSSO-TURKISH WARS). Meanwhile, the Swedish possessions in the north were being taken over by Russia and its allies: Denmark and Poland (which had expelled Stanislaus and again switched sides), Saxony, Hanover, and Prussia. Charles returned north in 1714 but was killed (1718) while fighting in Norway. His successors sued for peace. The war marked the end of Swedish power and the emergence of Russia as a great European power.

North Pole, northern end of the earth's axis, lat. 90°N, long. 0°, distinguished from the north MAGNETIC POLE. It was reportedly first reached by Robert E. PEARY in 1909.

North Sea, arm of the Atlantic Ocean, c.222,000 sq mi (574,980 sq km), NW Europe, separating Great Britain from Norway and central Europe. Long known for its rich cod and herring fisheries, it is now more important for the substantial oil and gas deposits discovered (1970) under its floor.

Northumbria, kingdom of, one of the Anglo-Saxon kingdoms in England. It was formed by the union (early 7th cent.) of the kingdoms of Bernicia and Deria, which had been settled (c.500) by invading Angles. At the Synod of Whitby (663) King Osiu established the Roman Church over the Celtic Church. The late 7th and 8th cent. were Northumbria's cultural golden age. In the 9th cent. much of the kingdom fell to invading Danes, but in 920 all Northumbria recognized Edward the Elder of WESSEX as overlord.

Northwest Coast Indians: see NORTH AMERICA, INDIGENOUS PEOPLES OF.

North West Company, fur-trading organization (1784–1821) which explored western Canada. Organized by Montreal trading companies, it established new trading routes and posts in the Pacific Northwest. "Northwesters" included the noted explorers Sir Alexander MACKENZIE, David Thompson, and Alexander Henry. The company's aggressive rivalry with the HUDSON'S BAY COMPANY led to ruinous warfare over the RED RIVER SETTLEMENT and to amalgamation of the two companies in 1821.

Northwest Ordinance: see ORDINANCE OF 1787.

Northwest Passage, water routes along the northern coast of North America, between the Atlantic and Pacific oceans. The idea of a short route to India and China prompted many expeditions to find the passage. The English explorer Sir Martin FROBISHER explored (1576–78) the eastern approaches to the passage. Subsequent explorations were made by John Davis, Henry HUDSON, William BAFFIN, and Sir John FRANKLIN, whose mission ended in tragedy. The expedition (1850–54) of Robert J. Le M. MCCLURE proved the passage existed, but it was not traversed until 1903–6, when Roald AMUNDSEN of Norway first accomplished the feat. In the 1960s the discovery of oil on Alaska's North Slope (see PRUDHOE BAY) renewed commercial interest in the route.

Northwest Territories, territory (1991 pop. 57,649), 1,304,896 sq mi (3,379,684 sq km), NW Canada, W of Hudson Bay, N of lat. 60°N, and E of the Yukon. It also includes the islands in Hudson and James bays and in Hudson Strait. The area is divided into three administrative districts: Keewatin, W of Hudson Bay; Mackenzie, E of the Yukon; and Franklin, in the north, including the Arctic Archipelago. Geographically the area is divided by the tree line that runs northwest to southeast from the MACKENZIE R. delta to the

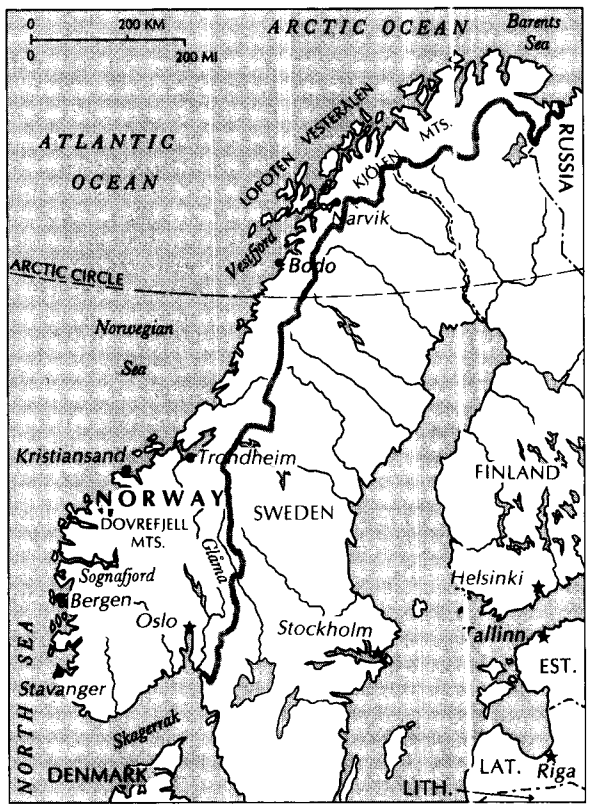
Churchill area, on HUDSON BAY. TUNDRA, inhabited by Eskimos and Native Americans, extends over much of the north and east. Much development has taken place in the Mackenzie district, which is heavily forested and rich in minerals. The district contains the large Great Bear and GREAT SLAVE lakes. Mining is the major industry, and deposits of lead, zinc, oil, gold, and copper have been exploited. Trapping, the region's oldest industry, ranks second in economic importance. Great Slave Lake has a thriving fishing industry. Highways and railways are limited, and air transportation remains important. YELLOWKNIFE is the territorial capital.

History. Henry HUDSON discovered Hudson Bay in 1610, and for several decades the HUDSON'S BAY COMPANY sent explorers and traders into the area. In 1870 the company sold the region to the Canadian confederation, and the Territories' present boundaries were set in 1912. In 1992 voters in the Territories approved the division of the territory and the creation of NUNAVUT, an Eskimo-dominated territory, in the eastern half. In the western part, where the division was largely opposed, Native American and Métis (mixed race) residents are negotiating for the creation of a territory to be called Denendeh. The Northwest Territories are presently governed by a commissioner and a 24-member council and send one senator (appointed) and two representatives (elected) to the national parliament.

Northwest Territory, first national territory of the U.S., including present-day Ohio, Indiana, Illinois, Michigan, Wisconsin, and part of Minnesota. Explored by the French in the 1600s, it was ceded to Britain (1763) after the FRENCH AND INDIAN WARS, and to the U.S. (1783) after the AMERICAN REVOLUTION. The ORDINANCE OF 1787 set up the machinery for organization of the territory. British-American rivalry for control of the area continued, however, until the Treaty of GHENT (1814), ending the WAR OF 1812, gave the region irrevocably to the U.S.

Norway, Nor. *Norge,* officially Kingdom of Norway, constitutional monarchy (1992 est. pop. 4,295,000), 125,181 sq mi (324,219 sq km), N Europe, on the W Scandinavian peninsula; bordered by the North Sea (SW), the Skagerrak (S), Sweden (E), Finland and Russia (NE), the Barents Sea (N), and the Atlantic Ocean (W). Major cities include OSLO (the capital), BERGEN, and Trondheim. Norway is a rugged, mountainous country. Its 1,700-mi (2,740-km) coastline is fringed with islands and deeply indented by fjords; from the coast the land rises precipitously to high plateaus, reaching 8,098 ft (2,468 m) in the Jotunheimen range and including Jostedalsbreen, the largest glacier field in Europe. Norway's economy was transformed in the late 1960s by the discovery of large oil and gas reserves in the NORTH SEA; petroleum and gas account for over 40% of export earnings. Manufacturing, food processing, shipbuilding, forestry, fishing, the shipping and trading carried on by Norway's great merchant fleet, and the production of aluminum, pulp and paper, and electrochemicals are also important. Less than 4% of the land is cultivated; cattle, sheep, and reindeer are raised on the mountain pastures. The many rapid rivers furnish hydroelectric power, allowing most of the petroleum to be exported. The majority of the people are of Scandinavian stock, but there are many Lapps and Finns in the north. Two forms of Norwegian, Bokml and Nynorsk, are official languages. The Lutheran Church is established.

History. In the 9th cent. Norway was still divided into numerous petty kingdoms. The move toward political unity began c.900 under its first king, HAROLD I, and Christianity was established by OLAF II (r.1015–28). Dynastic feuds wracked the country until the 12th cent., when King Sverre consolidated royal power, and Norway enjoyed peace and prosperity under HAAKON IV and MAGNUS VI in the 13th cent. In 1397 the Kalmar Union united Norway, Denmark, and Sweden; Sweden broke away in 1523, but Norway was ruled by Danish governors until 1814, when Denmark ceded it to Sweden. In the 19th cent. Norwegian nationalism emerged as a potent force, and in 1905 the union with Sweden was dissolved and Norway became an independent constitutional monarchy under HAAKON VII. Norway was neutral in World War I but was occupied (1940–45) by German forces in WORLD WAR II; the Norwegian merchant fleet, however, was placed in Allied service. Postwar recovery was rapid. Economic policy included a degree of socialization under the Labor party, which dominated the government until 1965. Norway broke from its traditional neutrality by joining NATO in 1949. King Haakon, who had reigned for 52 years, died in 1957 and was succeeded by OLAF V. He died in 1991 and was succeeded by HAROLD V. Gro Harlem Brundtland, Norway's current (and first woman) prime minister, has led Labor governments in 1981, from 1986 to 1989, and since 1990.



Norwegian language, member of the North Germanic, or Scandinavian, group of the Germanic subfamily of the Indo-European family of languages. Today there are two official forms of Norwegian: *bokmål* [book language] (also called *riksmål* [national language] and Dano-Norwegian), which is the language of the cities, the official and professional classes, and literature; and *nynorsk* [new Norwegian] (also called *landsmål* [country language]), which is a standardization of rural dialects and is spoken primarily in rural areas. See LANGUAGE (table).

nose, organ of breathing and smell. The external nose consists of bone and cartilage. The hollow internal nose, above the roof of the mouth, is divided by the septum (wall) into two nasal cavities extending from the nostrils to the PHARYNX. The cavities are lined with a mucous membrane, which is covered with fine hairs that help to filter dust and impurities from the air before it reaches the lungs; the air is also moistened and warmed in its passage. High in each nasal cavity is a small tract of mucous membrane containing olfactory cells. Hairlike fibers in these nerve cells, responding to various odors, send impulses along the olfactory nerve to the brain and thus produce the sense of smell.

Notre-Dame de Paris, cathedral of Paris, a major achievement of early GOTHIC ARCHITECTURE, on the Île de la Cité, in the Seine R. The cornerstone was laid in 1163, the high altar consecrated in 1183, and the nave completed except for roofing in 1196. In 1230 the nave was reconstructed and flying BUTTRESSES added. Chapels were soon added between the buttresses, altering the building's plan and aesthetic. The cathedral was not completed until the 14th cent. Its majestic west front is famous for its portals, sculptures, and huge ROSE WINDOW.

Nouakchott [nwäkshôt'], city (1987 est. pop. 285,000) capital of

The key to pronunciation appears on page xiii.

Mauritania, on the Atlantic Ocean. A small village in 1957, when it became Mauritania's capital, Nouakchott has grown into the country's largest city. Its ocean port, c.4 mi (6.4 km) from the city proper, has modern storage facilities, especially for petroleum, and a deepwater harbor was built in the 1980s. The city is situated on a major highway and has an international airport.

nova: see VARIABLE STAR; SUPERNOVA.

Novalis [nōvä'lĭs], pseud. of **Friedrich von Hardenberg,** 1772–1801, German poet. Influenced by FICHTE, he was one of the great German romantics. His major work, the novel *Heinrich von Ofterdingen* (1802), describes symbolically the artist's romantic search for a "blue flower." *Hymns to the Night* (1800) is a collection of deeply religious lyrics composed after the death of his young love, Sophie von Kühn.

Nova Scotia, province (1991 pop. 899,942), 21,425 sq mi (55,491 sq km), E Canada, bordered by the Gulf of St. Lawrence (N), the Atlantic Ocean (E, S), and New Brunswick and the Bay of Fundy (E). It comprises a mainland peninsula and the adjacent CAPE BRETON ISLAND. One of the Maritime Provinces, Nova Scotia has a moderate climate and abundant rainfall. The rocky east coast has numerous bays and coves. Considerable mining (coal, gypsum, barite, salt) occurs in Nova Scotia and fishing (for cod, lobster, haddock) is next in importance. In the northwest are dairies and orchards. The province also contains a variety of manufacturing industries, including fish and food processing. Lumbering is prevalent inland, and the pulp and paper industry is significant. HALIFAX, the capital, and Sydney are among the important cities.

History. Port Royal (now ANNAPOLIS ROYAL) was settled by the French in 1605. For over 150 years the English and French bitterly contested the area, which was called ACADIA and which also included NEW BRUNSWICK and PRINCE EDWARD ISLAND. From 1713 Britain controlled the Nova Scotian peninsula, but the French retained Cape Breton Island, with its fortress of Louisbourg (see LOUISBURG). During the French and Indian War (1754–63) the British expelled (1755, 1758) most of the French Acadians and seized Louisbourg. Many UNITED EMPIRE LOYALISTS settled in Nova Scotia after the American Revolution, and Cape Breton was made (1784) a separate colony. It rejoined Nova Scotia in 1820. In 1848 Nova Scotia became the first colony to achieve responsible (cabinet) government. It joined the Canadian confederation in 1867. In recent years it has struggled to stabilize its shaky economy. The province sends 10 senators (appointed) and 11 representatives (elected) to the national parliament.

novel, sustained work of prose fiction, as distinguished from the SHORT STORY. The term derives from the Italian Renaissance *novella,* a compact, realistic tale exemplified in BOCCACCIO's *Decameron* (14th cent.). The novel also descended from the often supernatural medieval romance. A realistic precursor of the novel is PETRONIUS' *Satyricon* (1st cent.); the *Metamorphoses* (2d cent.) of APULEIUS is a fantastic prototype. The two strains converge in CERVANTES's *Don Quixote* (17th cent.). The novel established itself in England in the 18th cent. through the realistic works of Daniel DEFOE, Samuel RICHARDSON, and Henry FIELDING. During the 19th cent. it became the dominant form of literature, and many nations produced great novelists: England, Jane AUSTEN, W.M. THACKERAY, Charles DICKENS, George ELIOT, and Thomas HARDY; France, Victor HUGO, Honoré de BALZAC, and Gustave FLAUBERT; Russia, Leo TOLSTOY and Fyodor DOSTOYEVSKY; and the U.S., Nathaniel HAWTHORNE, Herman MELVILLE, Mark TWAIN, and Henry JAMES. In the 20th cent. novelists strove for greater freedom of form and expression. In superbly associative psychological novels James JOYCE, Marcel PROUST, Virginia WOOLF, and William FAULKNER represented their characters' thoughts and feelings. Thomas Mann (see MANN, family) wrote philosophical novels; Franz KAFKA produced influential symbolic novels treating the anxiety-ridden condition of modern humanity; Edith WHARTON, John O'HARA, and John UPDIKE explored complex social interactions; and Kurt VONNEGUT and Thomas BERGER created surreal fantasies on late-20th-cent. American life.

novella: see NOVEL.

November: see MONTH.

Novgorod, city (1989 pop. 229,000), NW European Russia, on the Volkhov R. Its products include chemicals, fertilizer, and furniture; tourism is also important. Among the old Russian cities, it was a medieval center of trade and culture, and the capital of the Russian state founded by Rurik (A.D. 862). Although KIEV became the capital in 886, Novgorod remained the center of foreign trade. In 1136 it became the capital of an independent republic comprising all of N Russia to the Urals. One of the four chief trade centers of the HANSEATIC LEAGUE, Novgorod levied tribute, founded colonies, and repulsed Teutonic, Livonian, and Swedish invasions. In 1478 it came under the control of MOSCOW. Its commercial importance waned after Saint Petersburg was built (1703). Many of its medieval architectural treasures were damaged during the German occupation (1941–44) in World War II.

Novosibirsk, city (1991 est. pop. 1,444,000), S Siberian Russia, on the Ob R. and the Trans-Siberian RR. A hub of river, rail, and air transport, it is SIBERIA's major industrial center producing heavy machinery, textiles, chemicals, and metals. Founded as Novonikolayevsk in 1893, during construction of the railroad, it grew as a trade center and was renamed in 1925.

Novotný, Antonín, 1904–75, Czechoslovakian Communist leader. He participated in the Communist coup of 1948 and after 1953 headed both the government and the party. His regime was characterized by repression and economic stagnation. In 1968 he was removed from power by a liberal majority headed by DUBČEK.

NOW: see NATIONAL ORGANIZATION FOR WOMEN.

Noyes, John Humphrey, 1811–86, American reformer; b. Brattleboro, Vt. Advancing a "perfectionist" doctrine that man's innate sinlessness could be regained by communion with Jesus, he developed religious and social experiments in communal living. After an earlier attempt, he founded (1848) the Oneida Community. When it failed in 1879, he moved to Canada.

Np, chemical symbol of the element NEPTUNIUM.

Ns, chemical symbol of the element NIELSBOHRIUM.

NSAID: see NONSTEROIDAL ANTI-INFLAMMATORY DRUG.

Nu, U [o͞o no͞o], 1907–, premier of MYANMAR (1948–56, 1957–58, 1960–62). He helped to secure (1948) Myanmar's independence from Britain and was its first premier. In 1962 he was deposed in a military coup led by NE WIN.

Nubia [no͞o'bēə], ancient state of NE Africa, which extended from Khartoum in the Sudan almost to Aswan in Egypt. In the 8th and 7th cent. B.C., Egypt was ruled by a Nubian dynasty. Later, in the 3d cent. A.D., an African people, the Nobatae, settled in Nubia and formed a powerful kingdom. Converted to Christianity in the 6th cent., it succumbed to the Muslims in 1366. MUHAMMAD ALI of Egypt conquered the area in the 19th cent.

nuclear disarmament: see DISARMAMENT, NUCLEAR.

nuclear energy, the energy stored in the nucleus of an ATOM and released through fission, fusion, or RADIOACTIVITY. In these processes a small amount of mass, equal to the difference in mass before and after the reaction, is converted to energy according to the relationship $E = mc^2$, where E is energy, m mass, and c the speed of light (see RELATIVITY). In fission processes, a fissionable nucleus absorbs a neutron, becomes unstable, and splits into two nearly equal nuclei. In fusion processes, two nuclei combine to form a single, heavier nucleus. Fission occurs for very heavy nuclei, while fusion occurs for the lightest nuclei. Nuclear fission was discovered in 1938 by Otto HAHN and Fritz Strassman, and was explained in 1939 by Lise MEITNER and Otto Frisch. Fission energy can be obtained by bombarding the fissionable isotope URANIUM-235 with slow neutrons in order to split it. Because this reaction releases an average of 2.5 neutrons, a chain reaction is possible, provided at least one neutron per fission is captured by another nucleus and causes a second fission. In an ATOMIC BOMB the number of neutrons producing additional fission is greater than 1, and the reaction increases rapidly to an explosion. In a NUCLEAR REACTOR, where the chain reaction is controlled, the number must be exactly 1 in order to maintain a steady reaction rate. Uranium-233 and PLUTONIUM-239 can also be used but must be produced artificially. Moreover, the fuel for fusion reactors, deuterium, is readily available in large amounts. Temperatures greater than 1,000,000°C are required to initiate a fusion, or thermonuclear, reaction. In the HYDROGEN BOMB such temperatures are provided by the detonation of a fission bomb. Sustained, controlled fusion reactions, however, require the containment of the nuclear fuel at extremely high temperatures long enough to allow the reactions to take place. At these

temperatures the fuel is a PLASMA, and magnetic fields have been used in attempts to contain this plasma. To produce fusion energy, scientists have also used high-powered laser beams aimed at tiny pellets of fission fuel. In 1993 U.S. researchers achieved a fusion reaction that lasted a few seconds and generated about 6.4 million watts, using deuterium and tritium in a magnetically confined plasma. The use of tritium lowers the temperature required and increases the rate of the reaction, but it also increases the release of radioactive NEUTRONS.

nuclear magnetic resonance (NMR): see MAGNETIC RESONANCE.

nuclear physics, study of the components, structure, and behavior of the nucleus of the ATOM. It is especially concerned with the nature of matter and with NUCLEAR ENERGY. The subject is commonly divided into three fields: low-energy nuclear physics, the study of RADIOACTIVITY; medium-energy nuclear physics, the study of the force between nuclear particles; and high-energy, or particle, physics, the study of the transformations among subatomic particles in reactions produced in a PARTICLE ACCELERATOR. See ELEMENTARY PARTICLES.

nuclear reactor, device for producing nuclear energy by controlled nuclear reactions. It can be used for either research or power production. The reactor is so constructed that the fission of atomic nuclei produces a self-sustaining nuclear chain reaction, in which the produced neutrons are able to split other nuclei. A fission reactor consists basically of (1) a fuel, usually uranium or plutonium, enclosed in shielding; (2) a moderator—a substance such as graphite, beryllium, or heavy water—that slows down the neutrons so that they may be more easily captured by the fissionable atoms; and (3) a cooling system that extracts the heat energy produced. The fuel is sometimes enriched—i.e., its concentration of fissionable isotopes is artificially increased—to increase the frequency of neutron capture. The breeder reactor is a special type of reactor that produces more fissionable atoms than it consumes by using surplus neutrons to transmute certain nonfissionable atoms into fissionable atoms. The design of fusion reactors is still in an experimental stage because of the problems involved in containing the PLASMA fuel and attaining the high temperatures needed to initiate the reaction. The best fusion results (see NUCLEAR ENERGY) have been obtained (1993) using deuterium-tritium fuel (see HYDROGEN) in a tokamak reactor, which uses a powerful magnetic field to confine the plasma in a doughnut-shaped chamber.

Nuclear Regulatory Commission (NRC), independent U.S. agency (est. 1975) responsible for licensing and regulating the civilian use of nuclear energy, including setting safety standards for and overseeing the building of nuclear plants. It took over the functions of the former Atomic Energy Commission, established in 1946 to regulate the development and operation of the U.S. atomic energy program.

nuclear waste disposal: see WASTE DISPOSAL.

nuclear winter, a controversial predicted effect of a nuclear war. The theory holds that the dust and particles thrown into the atmosphere by a massive exchange of nuclear weapons would block a large percentage of sunlight, resulting in global cooling and severe, winterlike weather that would kill crops and other plants.

nucleic acid, organic substance, found in all living cells, in which the hereditary information is stored and from which it can be transferred. Nucleic acid molecules are long chains that generally occur in combination with proteins. The two chief types are DNA (deoxyribonucleic acid), the main constituent of GENES, and RNA (ribonucleic acid), which is involved in protein synthesis and transmission of DNA's genetic information. Each nucleic acid chain is composed of subunits called nucleotides, each containing a sugar, a phosphate group, and one of four bases: adenine (symbolized A), guanine (G), cytosine (C), and thymine (T). RNA contains the sugar ribose instead of the deoxyribose of DNA and the base uracil (U) instead of thymine. The specific sequences of nucleotides determine the cell's genetic information: each three-nucleotide DNA sequence specifies one particular amino acid. The long sequences of DNA nucleotides thus correspond to the sequences of amino acids in the cell's proteins. In order to be expressed as protein, the genetic information is carried to the protein-synthesizing machinery of the cell, usually in the cell cytoplasm. Forms of RNA mediate this process. DNA not only provides information but also acts as a blueprint for its own exact replication: The cell replicates its DNA by making a complementary copy of its exact nucleotide sequence: T for every A, C for every G, G for every C, A for every T. Although the triplet nucleotide code seems to be universal, the actual sequences of the nucleotides vary according to the species and individual. See also GENE; GENETIC ENGINEERING; MUTATION.

nucleus: **1** in biology, see CELL. **2** in physics, see ATOM; NUCLEAR PHYSICS.

Nuevo Laredo, city (1990 pop. 217,912), NE Mexico, across the Río Grande from Laredo, Texas. Founded in 1755, it is a major trade and transportation hub and the chief point of entry for U.S. tourists driving into Mexico. Plants that assemble goods for export to the U.S. are important to its economy.

Nuffield Radio Astronomy Laboratories, radio-astronomy observatory (founded 1945) located at Jodrell Bank, Macclesfield, Cheshire, England, and administered by the Univ. of Manchester. Its principal antenna is a fully steerable, parabolic dish 250 ft (76 m) in diameter.

nuisance, in law, an act that without legal justification interferes with safety, comfort, or use of property. A nuisance may be private (affecting only a few persons) or public (affecting many persons). Nuisances, usually treated as TORTS, may be restrained by INJUNCTION or remedied by the award of damages. Public nuisances, injurious to the community, may be prosecuted as crimes.

Nukualofa, town (1986 pop. 21,300), capital and chief port of TONGA, in the S Pacific Ocean.

nullification, in U.S. history, an extremist doctrine of STATES' RIGHTS holding that a state can declare null and void any federal law it deems unconstitutional. The KENTUCKY AND VIRGINIA RESOLUTIONS (1799) were the first notable expressions of the doctrine. The principle was invoked by SOUTH CAROLINA in 1832, at the instigation of Sen. John C. CALHOUN, to protest federal tariffs favoring Northern interests. Some senators proposed to use force against the nullifiers, but Pres. Andrew JACKSON, believing the South had a real grievance, agreed to the compromise tariff bill of 1833. South Carolina then rescinded its ordinance nullifying the tariff acts. Nullification was a forerunner of the doctrine of secession that brought about the CIVIL WAR.

number, entity describing the magnitude or position of a mathematical object or extensions of these concepts. Cardinal numbers describe the size of a collection of objects; ordinal numbers refer to position relative to an ordering, such as first, second, third, etc. Both types can be generalized to infinite collections (see INFINITY). The finite cardinal and ordinal numbers, represented by the numerals 1, 2, 3, . . . , are called the *natural numbers.* The *integers* are the natural numbers with their negatives and zero. The ratios a/b, where a and b are integers and $b \neq 0$, constitute the *rational numbers,* which may be also be represented by repeating decimals (see DECIMAL SYSTEM), e.g., $\frac{1}{2} = 0.500 \ldots$, $\frac{2}{3} = 0.666 \ldots$. The *real numbers* are all numbers representable by an infinite decimal expansion, which may be repeating or nonrepeating; they are in a one-to-one correspondence with the points on a straight line. Real numbers that have nonrepeating decimal expansions, i.e., that cannot be represented by any ratio of integers, are called *irrational.* The Pythagoreans knew in the 6th cent. B.C. that $\sqrt{2}$ was irrational. The number $\sqrt{2}$ is also an example of an algebraic number, i.e., it is the root of a POLYNOMIAL equation, in this case $x^2 - 2 = 0$. Numbers that are not algebraic are called *transcendental; e* (see separate article) and π (PI) are examples. The *imaginary numbers* were invented to deal with equations, such as $x^2 + 2 = 0$, that have no real roots. The basic imaginary unit is $i = \sqrt{-1}$. Imaginary numbers take the form yi, where y is a real number, e.g., $\sqrt{-2} = (\sqrt{2})i$. Numbers of the form $x + yi$, where x and y are real (e.g., $8 + 7i$), are called *complex numbers.* The complex numbers are in a one-to-one correspondence with the points on a plane, with one axis defining the real parts of the numbers and another axis defining the imaginary parts.

Numbers, book of the OLD TESTAMENT, fourth of the five books of the PENTATEUCH ascribed by tradition to MOSES. It continues the narrative of EXODUS, beginning at Sinai and ending at Moab on the eve of the entry into Palestine. Bare in geographical detail, it includes accounts of the curse of Balaam and other events.

number theory, branch of mathematics concerned with the prop-

erties of the integers (the NUMBERS 0, 1, −1, 2, −2, . . .). Modern number theory made its first great advances through the work of Leonhard EULER, Carl GAUSS, and Pierre de FERMAT. Much of the focus is on the analysis of prime numbers, i.e., those integers p greater than 1 that are divisible only by 1 and p; the first few primes are 2, 3, 5, 7, 11, 13, 17, and 19. The fundamental theorem of arithmetic asserts that any positive integer a is a product of primes that are unique except for the order in which they are listed. For example, the number 20 is uniquely the product $2 \times 2 \times 5$. This theorem was known to the Greek mathematician EUCLID, who also proved that there are an infinite number of primes.

numeration, in mathematics, process of designating NUMBERS according to a particular system. In any system of numeration a base number is specified, and groupings are then made by powers of the base number. The most widely used system of numeration is the DECIMAL SYSTEM, which uses base 10. In the decimal system the numeral 302 means $(3 \times 10^2) + (0 \times 10^1) + (2 \times 10^0)$, or $300 + 0 + 2$. The binary system, used in most computers, has a base of 2 and only two digits, 0 and 1. The binary numeral 101 means $(1 \times 2^2) + (0 \times 2^1) + (1 \times 2^0)$, i.e., $4 + 0 + 1$, or 5 in the decimal system. The decimal numeral 5 and the binary numeral 101 thus represent the same number. The ancient Babylonians used a system of base 60, which survives in our smaller divisions of time and angle, i.e., minutes and seconds.

Numidia [nōōmĭd'ēə], ancient country of NW Africa, roughly modern Algeria. In the PUNIC WARS, its king MASINISSA sided with Rome and won freedom from CARTHAGE. Jugurtha fought a fatal war with Rome, but Juba II was restored as a prince subject to Rome (1st cent. A.D.). Numidia declined after the Arabs came (8th cent.).

nun: see MONASTICISM.

Nunavut [Inuktituk, = our land], proposed Inuit (ESKIMO) territory in N Canada, embracing c.770,000 sq mi (1,994,000 sq km) of the eastern NORTHWEST TERRITORIES (approx. 60% of the entire N.W.T.). The area has a population of about 20,000, over 85% of which is Inuit. An agreement signed (1991) by Canadian and Inuit leaders provides for the transfer of 135,000 sq mi (349,650 sq km) of land to the Inuit and a cash settlement, paid over 14 years, amounting to $1.4 billion, but many specifics, such as those relating to the powers of the territorial government, remain to be settled. In 1992 residents of the Northwest Territories voted to approve the creation of Nunavut.

Nunn, Sam(uel Augustus, Jr.), 1938–, U.S. politician, b. Perry, Georgia. A lawyer, he was a member of the Georgia House of Representatives (1968–72) and became a U.S. senator in 1972. A conservative Democrat, he is one of the Senate's most powerful leaders, particularly in his role as chairman (1987–) of the Armed Services Committee.

Nuremberg, city (1989 est. pop. 480,000), Bavaria, S Germany, on the Pegnitz R. It is an industrial center with such manufactures as electrical and optical equipment and machinery. Founded by 1050 and chartered in 1219, it became a free imperial city and a trade center on the route from Italy. Humanism, science, and art flourished there during the German RENAISSANCE (15th–16th cent.), with such artists as DÜRER in residence. The city declined after the THIRTY YEARS WAR but became a center of industry during the 19th cent. A shrine of NATIONAL SOCIALISM (Nazism) and a site of armaments factories, Nuremberg was heavily bombed during WORLD WAR II; it was rebuilt after 1945. Its historic structures include the city walls (14th–17th cent.) and the Church of St. Sebald (13th cent.). Nuremberg was the site (1945–56) of a WAR CRIMES tribunal.

Nuremberg Trials: see WAR CRIMES.

Nureyev, Rudolf [nōōrĕ'yĕf], 1938–93, Russian ballet dancer. A soloist with the KIROV BALLET from 1958, he defected (1961) while on tour in Paris. Considered the leading classical ballet dancer of his generation, he was known for his stage presence, athletic skill, and fiery grace. He had a much acclaimed partnership with Margot FONTEYN at the ROYAL BALLET. He revised and staged numerous works, and from 1983 to 1989 he was the director of the Paris Opéra Ballet.

nursery school, educational institution for children aged two to four. Chiefly private, philanthropic, or cooperative, it serves primarily to promote social and educational adjustment rather than to provide daytime child care (see DAY-CARE CENTER). The first nursery schools were opened in London in 1907; pioneers in the U.S. include Teachers College, Columbia Univ.

Rudolf Nureyev and Dame Margot Fonteyn

nursing, profession dealing with prevention of illness and the care and rehabilitation of the sick, encompassing the physical and emotional well-being of the patient as a whole. Nursing includes individualized care on a continuing basis, the carrying out of medical regimens, coordination of necessary interdisciplinary services, and health counseling. Until the middle of the 19th cent. nurses were trained in hospitals to provide bedside care. The first school designed primarily to train nurses—rather than provide nursing service for the hospital—was established (1860) in London by Florence NIGHTINGALE. The specialty of nursing anesthesia originated at the turn of the century, and the profession in recent years has expanded to include nurse practitioners, nurse midwives (see MIDWIFERY), and nurse clinicians. Although traditionally most nurses have been women, the number of males in the profession has increased. Training includes classroom and clinical experience, as well as knowledge of automated equipment, artificial organs, and computers.

nut, in botany, a dry, one-seeded, usually oily FRUIT. True nuts include the acorn, chestnut, and hazelnut. The term *nut* also refers to any seed or fruit with a hard, brittle covering around an edible kernel, e.g., the peanut pod (a LEGUME) and almond (a drupe fruit). Others that are not true nuts are the CASHEW, COCONUT, LITCHI, PISTACHIO, and WALNUT. Nuts are a valuable food and are often cultivated in nut orchards.

nutation, slight wobbling motion of the earth's axis, superimposed on that which produces the PRECESSION OF THE EQUINOXES. Caused by the difference in gravitational attraction exerted by the sun and the moon, it has an 18.6-yr period.

nutmeg, evergreen tree (*Myristica fragrans*) native to the Moluccas. Its fruit is the source of two spices: whole or ground nutmeg, from the seed; and mace, from the fibrous seed covering that separates the seed from the husk.

nutria or **coypu,** aquatic, plant-eating RODENT, *Myocastor coypus*, of South America, resembling a small beaver with a ratlike tail. The nutria is up to 25 in. (64 cm) long, excluding the 15-in. (38-cm) sparsely haired, round tail. It has long, coarse, brown outer fur; its soft, gray undercoat is valued commercially. Descendants of nutrias escaped from fur farms are found in wetlands in the S U.S., where they are destructive pests.

Nyasa, Lake: see MALAWI, LAKE.

Nyerere, Julius Kambarage [nī"ərā'rā], 1922–, Tanzanian politician. He was the leading nationalist of Tanganyika and became prime minister upon independence (1961) and president (1962). He was the architect of the union (1964) of Tanganyika and Zanzibar as the republic of TANZANIA and served as president (1964–85). In 1990 he stepped down as chairman of the country's single, ruling party.

nylon: see SYNTHETIC TEXTILE FIBERS.

O

O, chemical symbol of the element OXYGEN.

Oahu [ōä'hō͞o], island (1990 est. pop. 850,000), 593 sq mi (1,536 sq km), third largest and chief island of Hawaii. Oahu consists of two parallel mountain ranges separated by a rolling plain. Mt. Kaala (4,040 ft/1,231 m) is its highest peak. Oahu has many extinct volcanos, notably DIAMOND HEAD, HONOLULU, Hawaii's capital, and PEARL HARBOR are on the urbanized S coast. There are many fine beaches, including Waikiki. Fishing and pineapple, sugarcane, and dairy farms are important, but tourism is the economic mainstay.

oak, tree or shrub (genus *Quercus*) of the BEECH family, found in north temperate zones and POLYNESIA; the more southerly species are usually evergreen. Oaks are cultivated for ornament and are a major source of hardwood lumber. Their durable, attractively grained WOOD is valued for shipbuilding, construction, flooring, furniture, barrels, and veneer. The black oaks (e.g., scarlet, pin, willow, live, and shingle oaks) are typified by leaves with sharp-tipped lobes and by acorns that mature in two years. White oaks (e.g., the white, post, cork, and holly oaks) have smooth-lobed leaves and acorns that mature in one year. *Q. alba,* the white oak, is the most valuable timber tree of the genus; the cork oak (*Q. suber*) supplies CORK. Acorns, the fruit of oak trees, are a source of food, tannin, oil, and hog feed. Poison oak (see POISON IVY) belongs to the SUMAC family.

Oakland, city (1990 pop. 372,242; met. area 2,082,914), seat of Alameda co., W Calif., on the eastern side of San Francisco Bay; inc. 1852. It is a leading container port and railhead with shipyards, chemical plants, glassworks, and food-processing plants. It is connected by the Bay Bridge (1936), tunnels, and the Bay Area Rapid Transit system with SAN FRANCISCO and other nearby cities. There are major military supply facilities in Oakland, and it is the site of a large urban renewal project. Parts of the city were severely damaged by an earthquake in 1989, and a wind-driven fire devastated the city's northeastern section in 1991.

Oakley, Annie, 1860–1926, American markswoman; b. Darke co., Ohio, as Phoebe Anne Oakley Mozee. She was a star attraction (1885–1902) of BUFFALO BILL'S Wild West Show.

Oak Ridge, city (1990 pop. 27,310), E Tenn., on the Clinch R.; founded 1942 by the U.S. government, inc. 1959. The site during World War II of development of nuclear bomb materials, Oak Ridge continues to be a major nuclear physics center, with ties to a consortium of Southern universities.

OAS: see ORGANIZATION OF AMERICAN STATES.

Oates, Joyce Carol, 1938–, American writer; b. Lockport, N.Y. In realistic novels, tinged with surrealism, she has often explored the connection between violence and love in American life. Extraordinarily prolific, she has written such novels as *A Garden of Earthly Delights* (1967), *Childwold* (1976), *Bellefleur* (1980), *Solstice* (1985), *Because It Is Bitter, and Because It Is My Heart* (1990), and *Foxfire* (1993), as well as stories, poems, criticism, and a book on boxing.

Oates, Titus, 1649–1705, English conspirator. He invented (1678) the story of the Popish Plot, describing it as a Jesuit plan to assassinate CHARLES II. In the ensuing frenzy many innocent Roman Catholics were persecuted and killed.

oats, cereal plants (genus *Avena*) of the GRASS family. Most species are annuals growing in moist temperate regions. Oats are valued chiefly as a pasturage and hay crop and for crop rotation; less than 5% of the oats grown in the U.S. is for human consumption. The common cultivated species, *A. sativa,* is native to Eurasia.

OAU: see ORGANIZATION OF AFRICAN UNITY.

Oaxaca [wähä'kä], city (1990 pop. 212,943), S Mexico, capital of Oaxaca state. A commercial and tourist center famed for its gardens and colonial churches, it is the chief city of S Mexico and one of the nation's most historic cities. It was founded (c.1500) by the AZTECS and was taken (1522) by the Spaniards. Benito JUÁREZ and Porfirio DÍAZ were born there.

Ob, one of the great rivers of Siberia, Russia, flowing generally north c.2,300 mi (3,700 km) into an estuary on the ARCTIC OCEAN. With its chief tributary, the IRTYSH R., it forms the world's fourth-longest river (c.3,460 mi/5,600 km). Although frozen for almost half the year and subject to flooding in its middle course, the Ob is a major trade and transportation route. NOVOSIBIRSK and Barnaul are the chief ports.

Obadiah or **Abdias,** book of the OLD TESTAMENT, 31st in the Authorized Version, fourth and shortest of the Minor PROPHETS, with 21 verses. Dated from the 8th to 6th cent. B.C., it calls down doom on Edom and says Israel will triumph.

obbligato [Ital., = obligatory], in music, originally a term by which a composer indicated that a certain part was indispensable to the music. Misunderstanding of the term, however, resulted in a reversal of its meaning, so that if a part added to a song is today designated "obbligato," the part may be omitted if desired.

obelisk, slender, four-sided, tapering monument, usually a monolith, terminating in a pointed or pyramidal top. The ancient Egyptians dedicated them to the sun god and placed them in pairs at the sides of temple portals. A line of incised hieroglyphs, giving the names and titles of the pharaoh, commonly ran down each of their sides. Many obelisks were taken from Egypt, notably those called CLEOPATRA'S NEEDLES in New York City (Central Park) and London (Thames embankment). A familiar American obelisk is the WASHINGTON MONUMENT.

Oberon, in astronomy, natural satellite of URANUS.

Oberth, Hermann Julius, 1894–1989, German astronautical pioneer; b. Romania. Beginning his studies in astronautics before World War I, he proposed a liquid-propellant ROCKET in 1917 and in 1923 published his unsuccessful Ph.D. dissertation, *The Rocket into Interplanetary Space,* which discussed many aspects of rocket travel. He expanded this small pamphlet into a larger work, *The Road to Space Travel* (1929), which won wide recognition.

object-oriented programming, a modular approach to COMPUTER PROGRAM (software) design. Each module, or object, combines data

and procedures (sequences of instructions) that act on the data; in traditional, or procedural, programming the data are separated from the instructions. A group of objects that have properties, operations, and behaviors in common is called a class. By reusing classes developed for previous applications, new applications can be developed faster with improved reliability and consistency of design.

oboe or **hautboy:** see WIND INSTRUMENT.

Obote, (Apollo) Milton, 1925–, president of UGANDA (1966–71, 1980–85). He became (1962) prime minister after Uganda's independence and staged (1965) a revolution to make himself president. He was overthrown (1971) by Idi AMIN, returned to power after Amin's downfall (1979), and later deposed for corrupt activities.

Obregón, Álvaro, 1880–1928, president of MEXICO (1920–24). A successful general in the Mexican revolution (1910–17), he rose (1920) against Pres. CARRANZA and became president. His administration enacted agrarian, labor, and educational reforms. Chosen president again in 1928, the anticlerical Obregón was assassinated by a fanatical Roman Catholic before he could take office.

Obrenović or **Obrenovich,** Serbian dynasty founded by Miloš Obrenović that ruled 1817–42 and 1858–1903. Its longtime rival was the KARADJORDJEVIĆ dynasty. King ALEXANDER of Serbia was the last Obrenović ruler.

O'Brien, Flann, pseud. of Brian O Nuallain, 1911–66, Irish author. O'Brien's wildly comic sense, brilliant word play, and absurdist vision are exhibited in such novels as *At Swim-Two Birds* (1939) and *The Dalkey Archive* (1964). A career civil servant, he also wrote a long-running, bitingly satirical political column for *The Irish Times* under the pseudonym Myles na Gopaleen.

observatory, astronomical, scientific facility especially equipped to detect and record astronomical phenomena. Early civilizations established primitive observatories to regulate the calendar and predict the changes of season. Later observatories were established to compile accurate star charts and an annual ephemeris that would be of use to navigators in determining longitude at sea. Early instruments used included the armillary sphere, the ASTROLABE, the quadrant, and the SEXTANT. The 17th-cent. invention of the TELESCOPE permitted not only more accurate measurement of the positions and motions of celestial bodes, but also analysis of the physical nature of the bodies. The 19th-cent. development of dry-plate photography, which permitted long exposure times, offered a much more sensitive method of recording images than the drawings made from visual observations by earlier observers. The spectroscopic study of starlight by various instruments has provided information on the temperature and chemical composition of stars, stellar motions, and magnetic fields. Optical observatories are generally located at high altitudes in sparsely populated areas to minimize adverse seeing conditions caused by weather disturbances, air turbulence, air glow, or any source of extraneous illumination. Since the mid-20th cent., astronomical observations have been extended to wavelengths outside the visible spectrum and to the neutrino (see GAMMA-RAY ASTRONOMY, INFRARED ASTRONOMY, NEUTRINO ASTRONOMY, RADIO ASTRONOMY, ULTRAVIOLET ASTRONOMY, and X-RAY ASTRONOMY) by, among other means, the use of artificial satellites equipped with telescopes (see OBSERVATORY, ORBITING).

observatory, orbiting, research SATELLITE designed to study solar radiation, ELECTROMAGNETIC RADIATION from distant stars, the earth's atmosphere, or the like. The Orbiting Solar Observatory program comprised seven satellites, launched between 1962 and 1971, to study the sun's atmosphere and the sunspot cycle. The Orbiting Geophysical Observatory program consisted of six satellites, launched between 1964 and 1969, that provided data on the earth's ATMOSPHERE, ionosphere, and magnetosphere and on the SOLAR WIND. The Orbiting Astronomical Observatory program comprised four satellites, launched between 1966 and 1972, to study astronomical phenomena at ultraviolet and X-ray wavelengths inaccessible to earthbound equipment. Because the atmosphere interferes with astronomical observations from the ground, the past two decades have seen increasing emphasis on space-based observatories. The largest such observatory is the HUBBLE SPACE TELESCOPE, launched in 1990. Other observatories include the Gamma-Ray Observatory and proposed Advanced X-Ray Astrophysics Facility. ROSAT [*RO*entgen *SAT*ellite], a joint German-U.S.-British project launched in 1990, studies both X rays and ultraviolet wavelengths never before imaged from space. It has detected a new class of bright stars that shine only in the ultraviolet part of the spectrum. The Cosmic Background Explorer (1989–93) studied microwave background radiation that no star or other known object could emit—it is believed to have come from the creation of the universe (see COSMOLOGY). See also SPACE PROBE; SPACE STATION.

obsessive-compulsive disorder, type of psychological disturbance marked by persistent unwanted patterns of thought (obsession) coupled with repetitive, ritualistic behavior designed to alleviate discomfort or dread (compulsion). The individual recognizes the thoughts and rituals as unrealistic or even repugnant, but is still unable to control them, as in the case of a person who has such recurring fears about germs that he must wash his hands excessively throughout the day. **Obsessive-compulsive personality disorder** is a separate disorder characterized by perfectionism and inflexibility that interfere with a person's ability to finish a task.

obsidian, volcanic glass, commonly black, but also red or brown, formed by LAVA that has cooled too quickly for crystals to form. Chemically it is rich in silica and similar to GRANITE. Obsidian was used extensively by primitive peoples to make knives, arrowheads, and other weapons and tools.

obstetrics: see under GYNECOLOGY.

O'Casey, Sean, 1884–1964, Irish dramatist, important in the Irish literary renaissance. His great early plays, *The Shadow of a Gunman* (1923), *Juno and the Paycock* (1924), and *The Plough and the Stars* (1926), are grim, satirical, and not always kind to the Irish people. After the last one set off a riot in the Abbey Theatre, he moved to England. His later plays, e.g., *The Silver Tassie* (1929), are more experimental. *Mirror in My House* (1956) is a collection of his six earlier autobiographical volumes.

occupational disease, illness resulting from the conditions or environment of employment. Some time usually elapses between exposure to the cause and development of the symptoms of an occupational disease. Among the causes of such diseases are toxic chemicals, such as benzene and dioxin. RADIATION SICKNESS can result from unprotected workplace exposure to radioactivity from X-ray machines and nuclear power facilities. Among the dust-related disorders are brown lung disease caused by cotton dust inhaled by textile workers, and the lung diseases caused by SILICA, ASBESTOS, iron ore, and other metals to which miners and others are exposed (see PNEUMOCONIOSIS). Health care workers have to use special care to avoid infection with infectious agents including the AIDS virus, and those who work at computers are prone to REPETITIVE STRESS INJURY. In the U.S. the OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION and the ENVIRONMENTAL PROTECTION AGENCY are charged with assuring workplace health and safety.

Occupational Safety and Health Administration (OSHA), U.S. agency established (1970) in the Dept. of Labor to develop and enforce regulations for the safety and health of workers engaged in interstate commerce. OSHA conducts inspections of workplaces, issuing citations and penalties for noncompliance, and has sought to limit the exposure of workers to hazardous substances such as lead and toxic chemicals.

ocean, interconnected mass of water covering about 71% of the surface of the earth. It is subdivided into the PACIFIC, INDIAN, ATLANTIC, and ARCTIC OCEANS. The world ocean has an area of about 139,400,000 sq mi (361,000,000 sq km), an average depth of about 12,230 ft (3,730 m), and a total volume of about 322,280,000 cu mi (1,347,000,000 cu km). Its salinity averages about 3.5% by weight. The best-known regions of the oceans, where virtually all petroleum and fishery reserves are found, are the relatively shallow waters above the continental shelves surrounding the CONTINENTS. The deep ocean floor consists mainly of vast abyssal plains. A significant feature of the ocean basins is the mid-ocean ridge system, where new oceanic crust has been forming continuously for at least 200 million years in a process of volcanic activity called seafloor spreading (see CONTINENTAL DRIFT; PLATE TECTONICS). Current theory holds that ocean water also originated through this activity. The ocean's deepest parts are the trenches, located near the margins of continents. Ocean water retains heat, and ocean currents, vitally important in dispersing heat energy, are intimately tied to

planetary wind systems. The marine environment of the ocean is divided into two major realms, the benthic (ocean floor) and the pelagic (all waters above the benthic). See also DEEP SEA DRILLING PROJECT; OCEAN DRILLING PROGRAM; OCEANOGRAPHY.

Ocean Drilling Program, international project to drill and study cores of the earth's crust from beneath the oceans; it is the successor to the DEEP SEA DRILLING PROJECT. Begun in 1984 and supported by a U.S.-led international consortium of 19 nations, the program employs the drillship *JOIDES Resolution* and is administered by the National Science Foundation.

Oceania or **Oceanica,** collective name for the approximately 25,000 small islands scattered across the Pacific Ocean away from the Asian mainland. It is generally considered synonymous with the term South Seas and is divided ethnologically into MELANESIA, MICRONESIA, and POLYNESIA. Only a few thousand of the islands are inhabited, and many of these are little more than coral atolls.

Oceanian languages, aboriginal languages spoken in the region known as OCEANIA. If Oceania is restricted to the Melanesian, Micronesian, and Polynesian islands, the indigenous tongues spoken on these islands belong for the most part to the Malayo-Polynesian family of languages. If it is extended to include Australia and Malaysia, the indigenous languages of the Australian group spoken in Australia may be added as tongues of this region. In fact, the term "Oceanian languages" amounts to a geographical rather than a linguistic classification. See LANGUAGE (table).

Oceanic art, works produced by the island peoples of the S and NW Pacific, including MELANESIA (New Guinea and the islands to its north and east), MICRONESIA (the Marianas, Caroline, Marshall, and Gilbert islands), and POLYNESIA (Hawaii, New Zealand, the Marquesas, and Easter Island). Melanesian artifacts—woodcarvings and ritual masks—are often brilliantly colored and dramatically sexual in nature. They were decorated with reference to a complex mythology and influenced 20th-cent. European artists, e.g., Henry MOORE. Micronesian art objects are functional, streamlined, and highly finished, e.g. graceful canoes. Rows of figures placed on Mortlock Atoll illustrate mythological events and were thought to protect the islanders from typhoons. Very little Polynesian art survived the influx of Western missionaries, who, regarding it as idolatrous and pornographic, destroyed it. The greenish pottery of Fiji and examples of Hawaiian featherwork remain. The Marquesa islanders developed the tattoo into a fine art. On EASTER ISLAND, the abundant reddish stone, tufa, was carved into gargantuan human figures weighing as much as 20 tons. The ritual significance of most Polynesian art has been lost.

oceanids: see NYMPH.

oceanography, study of the sea integrating marine applications of geography, geology, physics, chemistry, marine biology, and meteorology. Comprehensive study of the sea dates from the 1872–76 Challenger expedition. Today there are about 250 oceanographic institutions, notably the Scripps Institution of Oceanography in California, the Woods Hole Oceanographic Institution in Massachusetts, and the Lamont-Doherty Geological Observatory of Columbia Univ. Oceanography is important to shipping, fisheries, the laying of telegraph cables, and climatological studies.

Oceanside, city (1990 pop. 128,398), San Diego co., S Calif., on the Gulf of Santa Catalina; inc. 1888. A rapidly growing residential city, it is also a commercial and trading center for a farm area. It manufactures rubber goods and has a large nursery industry; deep-sea fishing and tourism are also important. The Camp Pendleton marine base is nearby.

ocelot, medium-sized CAT (*Felis pardalis*) of Central and South America, sometimes found as far north as Texas. About 30 in. (76 cm) long, excluding the tail, and weighing up to 35 lb (18 kg), it has a yellow-brown coat with black spots, rings, and stripes. Ocelots live in forests, preying on small animals. They are hunted for their fur.

Ochoa, Severo [ōchō'ä], 1905–93, Spanish-American biochemist. He came to U.S. in 1940. For his synthesis of ribonucleic acid (RNA; see NUCLEIC ACID) Ochoa shared with Arthur KORNBERG the 1959 Nobel Prize in physiology or medicine.

Ochs, Adolph S. [ŏks], 1858–1935, American newspaper publisher; b. Cincinnati. In 1896 he acquired the failing New York *Times* and made it one of the greatest newspapers in the world. Unlike the sensationalist journalists of his day, Ochs stressed nonpartisan, almost clinical, news reporting.

O'Connell, Daniel, 1775–1847, Irish political leader. He founded (1823) the Catholic Association, whose pressure led to the CATHOLIC EMANCIPATION Act of 1829. In the British Parliament, he worked for repeal of the union of Great Britain and Ireland, for the reform of the government of Ireland, for the disestablishment of the Church of Ireland, and for a solution to the IRISH LAND QUESTION.

O'Connor, John, 1920–, American Roman Catholic cardinal, b. Philadelphia. A military chaplain for 27 years, he was ordained a bishop (1979) and became (1983) bishop of Scranton, Pa. In 1984 he was appointed archbishop of the New York archdiocese. Elevated to cardinal (1985), he has been an outspoken conservative on church doctrine and many social issues.

O'Connor, (Mary) Flannery, 1925–64, American author; b. Savannah, Ga. In the novels *Wise Blood* (1952) and *The Violent Bear It Away* (1960), and the short stories in *A Good Man Is Hard to Find* (1955) and *Everything That Rises Must Converge* (1965), she portrays contemporary Southern life as a grotesque and gothic combination of brutal comedy and violent tragedy.

O'Connor, Sandra Day: see SUPREME COURT, UNITED STATES (table 1).

octane number, a quality rating for GASOLINE indicating the ability of the fuel to resist premature detonation and to burn evenly when exposed to heat and pressure in an INTERNAL COMBUSTION ENGINE. Premature detonation, indicated by knocking and pinging noises, wastes fuel and may cause engine damage. The octane number can be increased by varying the relative amounts of the different HYDROCARBONS that make up the gasoline or by additives, e.g., tetraethyl lead. Federal regulations in the U.S. require commercial gasoline pumps to indicate the octane number, which is usually 87 or 89 for regular grade gasoline and 93 for premium grade. Since the early 1970s most AUTOMOBILES have been built to operate on low octane gasoline with little or no lead added.

Octavia, Roman matrons. **1** d. 11 B.C., sister of Emperor AUGUSTUS and wife of Marc ANTONY. She helped to maintain peace between her brother and her husband until Antony deserted her for CLEOPATRA. **2** A.D. 42–62, daughter of Emperor CLAUDIUS I and MESSALINA, and wife of NERO, who deserted her for Poppaea. She was falsely accused of adultery, banished, and put to death.

Octavian or **Octavius:** see AUGUSTUS.

October: see MONTH.

October Revolution, in Russian history: see RUSSIAN REVOLUTION.

octopus, marine mollusk, with a pouch-shaped body and eight muscular arms or tentacles; a CEPHALOPOD. It seizes its prey with the sucker-bearing arms and paralyzes it with a poisonous secretion. Octopus species range in size from only 2 in. (5 cm) in the North Atlantic to 30 ft (9 m) in the Pacific. Octopuses can change color, from pinkish to brown, and eject a dark "ink" from a special sac when disturbed. They are used for food in many parts of the world.

ode, elaborate and stately poem of some length, dating back to Greek choral songs. PINDAR's odes were poems of praise or glorification in stanzas patterned in sets of three—strophe, antistrophe, and the differently structured epode. The odes of HORACE and CATULLUS used a simpler LYRIC form. Later Europeans wrote in both Pindaric and Horatian form. Pierre de RONSARD in France and Ben JONSON, Robert HERRICK, and Andrew MARVELL in England were major RENAISSANCE odists. In general, the odes of such 19th-cent. poets as KEATS, P.B. SHELLEY, SWINBURNE, G.M. HOPKINS, and others tended to be freer in form and subject matter than the classical ode.

Oder, river, 562 mi (904 km) long, the second longest river of Poland. It rises in the NE Czech Republic and flows generally NW through Poland, then N along the Polish-German border to the Baltic Sea. Navigable from Racibórz, Poland, the Oder connects the industrial region of SILESIA with the sea. WROCŁAW, FRANKFURT-AN-DER-ODER, and SZCZECIN are the chief cities on the river.

Oder-Neisse line, post–World War II frontier between Germany and Poland along the Oder and W Neisse rivers from the Baltic Sea to the Czechoslovak (now the Czech Republic) border, proposed (1945) by the Allies at the Yalta and Potsdam conferences. The border was recognized as permanent by East Germany and Poland in 1950, but not accepted by West Germany until 1971. In 1990 a

treaty between Poland and a reunified Germany reaffirmed the border.

Odessa or **Odesa,** city (1989 pop. 1,115,000), S UKRAINE, a port on the Odessa Bay of the Black Sea. It is a rail junction, the major Ukrainian port, a naval base, and the home port of fishing fleets. Shipbuilding and oil refining are among its industries. Nearby are health resorts. The city supposedly occupies the site of an ancient Miletian Greek colony. Between the 14th and 18th cent. it was held by the Lithuanians, Crimean Tatars, and Turks; in 1792 it passed to Russia. In the 19th and early 20th cent. Odessa was a center of Ukrainian and Jewish culture and of various political movements. It was the scene of a 1905 revolt led by sailors from the battleship *Potemkin.* Contested by opposing forces in the Russian civil war, it fell to the Red Army in 1920. During WORLD WAR II it was held by the Romanians and Germans (1941–44), who killed or deported c.280,000 civilians, mostly Jews.

Odets, Clifford, 1906–63, American dramatist; b. Philadelphia. Regarded as the most gifted of the American social-protest playwrights of the 1930s, he is known for such works as *Waiting for Lefty* (1935); *Awake and Sing* (1935), considered his finest play; and *Golden Boy* (1937). His later plays include *Clash by Night* (1942) and *The Country Girl* (1950).

Odin, Norse god: see WODEN.

Odoacer [ōdōā'sər] or **Odovacar,** c.435–493, Germanic chieftain. He and his soldiers were mercenaries for Rome when, in 476, the Heruli, a Germanic tribe, revolted and named Odoacer king. He seized RAVENNA and deposed ROMULUS AUGUSTULUS, last Roman emperor of the West, signifying the end of the West Roman Empire. Odoacer's authority was recognized by ZENO, emperor of the East, but in 488 Zeno sent THEODORIC THE GREAT to expel Odoacer, and Theodoric treacherously assassinated Odoacer.

Odysseus [ōdĭs'ēəs], Lat. *Ulysses,* in Greek myth, king of Ithaca; husband of PENELOPE. A Greek leader in the TROJAN WAR, HOMER depicted him as wise and cunning. In later legends he is wily, lying, and evil. His wanderings have figured prominently in world literature, notably in the *Odyssey.*

Odyssey: see HOMER.

Oedipus [ĕd'ĭpəs, ē'dĭ-], in Greek mythology, son of King Laius of THEBES and Queen Jocasta. Warned by an oracle that Oedipus would kill his father and marry his mother, his parents left the baby on a mountainside. However, he was adopted by the king of CORINTH. When grown, Oedipus heard the prophecy and, ignorant of his real parentage, fled to Thebes. On the way he met, quarreled with, and killed Laius. At Thebes he solved the SPHINX's riddle and married Jocasta. After many years he learned the truth and, in horror, blinded himself. Jocasta committed suicide. Oedipus was exiled, and Jocasta's brother, Creon, became king. Later, Oedipus' sons battled for the throne (see SEVEN AGAINST THEBES). The story of Oedipus is brilliantly dramatized in SOPHOCLES' *Oedipus Rex;* his later life is described in the same playwright's *Oedipus at Colonus.*

Oedipus complex: see COMPLEX.

Oersted, Hans Christian [ör'stĭth], 1777–1851, Danish physicist and chemist. His discovery that a magnetic needle is deflected by a conductor carrying an electric current showed a relation between ELECTRICITY and MAGNETISM and initiated the study of electromagnetism. The unit of magnetic field strength, the oersted, is named for him. Oersted was the first to isolate ALUMINUM.

O'Faoláin, Seán [ōfā'lən], 1900–91, Irish writer, b. John Francis Whelan. He is best known for his short stories about the Irish and Ireland, collected in *Midsummer Night Madness* (1932), *The Heat of the Sun* (1966), *The Talking Trees* (1971), and other volumes. He also wrote novels and biographies of DE VALERA (1932) and O'CONNELL (1938).

Offa, d. 796, king of MERCIA (757–96). Gradually he extended Mercian power to most of S England and gained the rulers of WESSEX and NORTHUMBRIA as sons-in-law. In 796 he and CHARLEMAGNE signed the first recorded English commercial treaty. He also built the entrenchment called Offa's Dyke.

Offenbach, Jacques Levy, 1819–80, French composer; b. Germany. He is famous for his OPERETTAS, of which he wrote over 100. His masterpiece was the opera *Tales of Hoffmann* (1881), after E.T.A. HOFFMANN.

offset printing: see PRINTING.

O'Flaherty, Liam, 1897–1984, Irish novelist. He wrote realistic stories about the common people, including *The Informer* (1925) and *The Assassin* (1928). *Famine* (1937) and *Land* (1946) are among his novels of 19th-cent. Ireland.

Ogaden [ōgä'dän], region, Harar prov., SE Ethiopia, bordering Somalia. It is an arid region inhabited mainly by Somali pastoral nomads. Since the 1960s it has been the focus of a secessionist movement by Somali nationalists demanding union of the Ogaden with Somalia. Somali troops invaded the region in 1977 but were repulsed a year later by Ethiopian forces with Soviet support. Warfare continued intermittently until 1988.

Ogbomosho, city (1987 pop. 582,900), SW Nigeria. It is the trade center for an agricultural region, and cotton textiles are woven. Founded in the 17th cent., the city resisted invasions by the Fulani people in the early 19th cent. and grew by absorbing refugees from Fulani attacks.

Ogden, city (1990 pop. 63,909), seat of Weber co., N Utah, at the confluence of the Ogden and Weber rivers; inc. 1851. Settled by MORMONS in the 1840s, it is surrounded by mountains, and many resorts are nearby. Aerospace and defense industries provide much employment.

Oglethorpe, James Edward, 1696–1785, English general and philanthropist. In 1733 he founded the American colony of GEORGIA as an asylum for debtors. He assured the colony's survival by defeating a Spanish force in 1742.

OGPU: see CHEKA; KGB.

O'Hara, Frank, 1926–66, American poet; b. Baltimore. O'Hara was a founder of the Poet's Theatre and later the center of the New York School of Poets. His writings include *Collected Poems* (1971).

O'Hara, John, 1905–70, American writer; b. Pottsville, Pa. An extremely popular author, he proved an acid observer of American life and diction in such novels as *Appointment in Samarra* (1934), *A Rage to Live* (1949), and *From the Terrace* (1958). His short stories, sometimes regarded as his finest works, are in such collections as *Hellbox* (1947) and *The Cape Cod Lighter* (1962).

O. Henry, pseud. of **William Sydney Porter,** 1862–1910, American short-story writer; b. Greensboro, N.C. Convicted of embezzlement and sent to prison, O. Henry later won fame and success as a writer. His short, simple stories are noted for their careful plotting, ironic coincidences, and surprise endings. Over 300 of them are collected in *Cabbages and Kings* (1904), *The Four Million* (1906), and other volumes.

O'Higgins, Bernardo, 1778–1842, South American revolutionary ruler (1817–23) of Chile. The illegitimate son of Ambrosio O'Higgins, governor of Chile (1789–96), he and SAN MARTÍN liberated (1817) Chile from Spanish rule. He became supreme director, but his reforms aroused so much opposition that he was deposed (1823).

Ohio, midwestern state of the U.S.; bordered by Pennsylvania and West Virginia (E), Kentucky (SW), Indiana (W), and Michigan and Lake Erie (N).

Area, 41,222 sq mi (106,765 sq km). *Pop.* (1990) 10,847,115, a 0.5% increase over 1980 pop. *Capital,* Columbus. *Statehood,* Mar. 1, 1803 (17th state). *Highest pt.,* Campbell Hill, 1,550 ft (473 m); *lowest pt.,* Ohio R., 433 ft (132 m). *Nickname,* Buckeye State. *Motto,* With God, All Things Are Possible. *State bird,* cardinal. *State flower,* scarlet carnation. *State tree,* buckeye. *Abbr.,* OH.

Land and People. Except for a hilly area near West Virginia, most of Ohio's land is relatively flat. Its principal river is the OHIO, which flows along the southern border. The continental climate is humid, with large variations in seasonal temperatures. About 74% of the population lives in urban areas, notably COLUMBUS (the largest city), which is followed in size by CLEVELAND, CINCINNATI, TOLEDO, and AKRON. In 1990 the state was 88% white and 11% African American.

Economy. Even though economic downturns beginning in the 1970s and lasting into the 1990s adversely affected Ohio's manufacturing sector, it is one of the nation's leading industrial states. Its leading industries produce such goods as transportation equipment, nonelectrical machinery, primary and fabricated metals, and rubber. Rich farmlands produce corn, dairy products, cattle, hay, wheat, and soybeans. Ohio's mineral output includes lime, stone and clay, and coal. Much of the state's prosperity is based on its

superb transportation network, including the Lake ERIE ports of Toledo and Cleveland, which benefited from the opening (1959) of the SAINT LAWRENCE SEAWAY.

Government. The constitution of 1851 provides for a governor serving a four-year term. The general assembly consists of a senate whose 33 members serve four-year terms and a house whose 99 members are elected every two years. Ohio is represented in the U.S. Congress by 2 senators and 19 representatives and has 21 electoral votes.

History. The remains of Ohio's early inhabitants, the MOUND BUILDERS, are preserved at Mound City Group National Monument. The area was the home of the Erie, MIAMI, SHAWNEE, and OTTAWA when Robert Cavalier, sieur de LA SALLE, explored (1669) the Ohio R. valley and claimed it for France. Rivalry with England over control of the region resulted in the outbreak (1763) of the last of the FRENCH AND INDIAN WARS. Britain emerged victorious, but hostilities with Native Americans continued until their defeat at Fallen Timbers (1794). Ohio was part of the NORTHWEST TERRITORY, established by Congress in 1787. During the WAR OF 1812 considerable fighting took place on Ohio soil. After the Civil War, industrial development, aided by previous construction of canals and railroads, increased rapidly. The petroleum industry developed around Cleveland. Flooding by the Ohio and its tributaries had long been a serious problem, and a devastating flood in 1913 resulted in the construction of many state and federal water-control projects. Ohio's farmers and factory workers were hard hit by the GREAT DEPRESSION. World War II brought prosperity that continued until the late 1970s and early 80s, when the state's heavy industries were affected by the nationwide economic slowdown. The coal industry boomed, however, as a result of the national energy crisis. Weakness in the manufacturing sector triggered a new emphasis on service industries, which by the early 1990s employed over a quarter of the state's population.

Ohio, major U.S. river, flowing 981 mi (1,579 km) from the confluence of the Allegheny and Monongahela rivers at Pittsburgh, Pa., W to the Mississippi R. at Cairo, Ill. It is regulated by a modern system of locks and dams, built since 1955 to replace older structures, and is navigable by barges and pleasure craft for its entire length. Reportedly seen by LA SALLE in 1669, the river passed to British control in 1763 and to the U.S. in 1783. From then until the opening of the ERIE CANAL (1825), it was the principal route to the West.

Ohio Company, organization formed (1747) by American land speculators to settle 200,000 acres (80,940 hectares) at the forks of the Ohio R. Its activities challenged the French in the region and helped to bring on the final FRENCH AND INDIAN WAR (1754–63).

Ohio Company of Associates, in U.S. history, organization (1786–96) that bought 1,780,000 acres (720,349 hectares), at the confluence of the Ohio and Muskingum rivers, from the federal government for $1 million. The purchase hastened congressional passage of the Northwest ORDINANCE OF 1787. The first settlement, under Gen. Rufus Putnam (see under PUTNAM, ISRAEL), was at Marietta, Ohio, in 1788.

Ohlin, Bertil [ōō'lĭn], 1889–1979, Swedish economist and political leader. He taught (1924–29) at the Univ. of Copenhagen and later at the Stockholm School of Economics. Ohlin also led Sweden's Liberal party (1944–67) and was minister of commerce (1944–45). He shared the 1977 Nobel Prize in economics for his pioneering studies of international trade.

ohm, symbol Ω, unit of electrical RESISTANCE, defined as the resistance to the flow of a steady electric current offered by a column of mercury 14.4521 grams in mass with a length of 1.06300 m and with an invariant cross-sectional area, when at a temperature of 0°C.

ohmmeter, instrument used to measure, in OHMS, the electric RESISTANCE of a conductor. It is usually included in a single package with a VOLTMETER and often an AMMETER. In normal usage, the ohmmeter operates by using the voltmeter to measure a voltage drop, then converting this reading into a corresponding resistance reading through OHM'S LAW.

Ohm's law, law stating that the electric current i flowing through a given RESISTANCE r is equal to the applied voltage v divided by the resistance, or $i = v/r$. In alternating-current (AC) circuits, where INDUCTANCES and CAPACITANCES may also be present, the law must be amended to $i = v/z$, where z is the IMPEDANCE. The law was formulated by the German physicist **Georg Simon Ohm,** 1787–1854.

oils: see ESSENTIAL OILS; FATS AND OILS; PETROLEUM.

Oisin: see OSSIAN.

Ojibwa or **Chippewa,** indigenous people of the Eastern Woodlands and Plains (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). In the 17th cent. they occupied the shores of Lake Superior, and drove the SIOUX across the Mississippi R. in a contest for the wild rice lands of their region. Some Ojibwa continued west to North Dakota and became the Plains Ojibwa. The sedentary Woodlands Ojibwa subsisted on fish, deer, corn, squash, and wild rice. One of the largest Native American peoples north of Mexico—over 100,000 in the U.S. alone—the Ojibwa pursue various occupations in Canada and in Michigan, Minnesota, Wisconsin, and other states.

okapi, nocturnal, ruminant MAMMAL (*Okapi johnstoni*) of the rain forests of the upper Congo R., unknown to zoologists until the early 20th cent. In shape it resembles the related GIRAFFE, but is smaller and has a shorter neck. It is red-brown with zebra-striped hindquarters.

Okeechobee, Lake, freshwater lake, SE Florida, N of the EVERGLADES, into which some of its waters drain. Though nowhere more than 15 ft. (4.6 m) deep, its c.700-sq-mi (1,800-sq-km) area makes it the fourth largest lake wholly within the U.S. There are canals (part of the Okeechobee Waterway) and extensive flood-control levees in the south.

O'Keeffe, Georgia, 1887–1986, American painter; b. Sun Prairie, Wis. Her works are marked by organic abstract forms painted in clear, strong colors. They are often strongly sexual in their symbolism, particularly her flower paintings. O'Keeffe lived much of her life in New Mexico and frequently employed Southwestern motifs in her works, e.g., *Cow's Skull, Red, White, and Blue* (1931; Metropolitan Mus.). She was married (1924–46) to Alfred STIEGLITZ, in whose gallery her work was first exhibited.

Okefenokee Swamp, large (c.600 sq mi/1,550 sq km) swamp, SE Georgia, extending into N Florida, noted for its varied and abundant wildlife. It is a saucer-shaped depression, with small islands rising above the water and its thick cover of vegetation. In Georgia, part of the swamp makes up most of the Okefenokee National Wildlife Refuge.

Okhotsk, Sea of, c.590,000 sq mi (1,528,100 sq km), NW arm of the Pacific Ocean, between the KAMCHATKA Peninsula and the KURIL ISLANDS, Russia. Ice-bound from Nov. to June and subject to heavy fogs, it connects with the Sea of Japan through the Tatar and La Pérouse straits. Magadan and Korsakov are the chief ports.

Okinawa, island (1990 pop. 1,222,458), 454 sq mi (1,176 sq km), W Pacific Ocean, SW of Kyushu; part of Okinawa prefecture, Japan. Okinawa is the largest of the RYUKYU ISLANDS. Naha is the largest city, chief port, and the site of some light industry. Sugarcane and rice are grown, and fishing is important. In a bloody campaign during WORLD WAR II, U.S. forces seized (Apr.–June 1945) the island from Japan. The Japanese lost 103,000 troops; U.S. casualties were 48,000. Okinawa was returned to Japan in 1972, but the U.S. retained its military bases.

Oklahoma, state in SW U.S.; bordered by Missouri and Arkansas (E), Texas (S, W), New Mexico, across the narrow edge of the Oklahoma panhandle (W), and Colorado and Kansas (N).

Area, 69,919 sq mi (181,090 sq km). *Pop.* (1990) 3,145,585, a 4% increase over 1980 pop. *Capital,* Oklahoma City. *Statehood,* Nov. 16, 1907 (46th state). *Highest pt.,* Black Mesa, 4,973 ft (1,517 m); *lowest pt.,* Little R., 287 ft (88 m). *Nickname,* Sooner State. *Motto, Labor Omnia Vincit* [Labor Conquers All Things]. *State bird,* scissor-tailed flycatcher. *State flower,* mistletoe. *State tree,* redbud. *Abbr.,* Okla.; OK.

Land and People. The high prairies of the west are part of the GREAT PLAINS and thus are frozen by winter winds and baked by summer heat. Elevations decline toward the east, except for the highland areas of the OZARK plateau and the Ouachita Mts. More than 67% of the population lives in urban areas, principally OKLAHOMA CITY, the largest urban center, and TULSA. Oklahoma has the largest Native American population (252,420 in 1990) of any state.

The key to pronunciation appears on page xiii.

In 1990 the state was 82% white, 8% Native American, and 7% African American.

Economy. Mining, one of the principal sources of income, forms the base of the industrial sector. Oklahoma remains one of the country's largest producers of natural gas and oil, although by the early 1990s production was declining. The leading industries produce nonelectrical machinery, fabricated metals, and refined oil. Most farm income is derived from cattle, wheat, hay, cotton, dairy products, and peanuts.

Government. The constitution of 1907 provides for a governor elected to a four-year term. The legislature consists of a senate whose 48 members serve four-year terms and a house with 101 members elected for two years. Oklahoma is represented in the U.S. Congress by two senators and six representatives and has eight electoral votes.

History. The area was the home of Plains tribes, including the OSAGE, KIOWA, COMANCHE, and APACHE, when it came under U.S. control through the LOUISIANA PURCHASE (1803). Soon the federal government forced the so-called FIVE CIVILIZED TRIBES of the E U.S.—the CHEROKEE, CHOCTAW, CHICKASAW, CREEK, and SEMINOLE—to settle there, in what was to become the INDIAN TERRITORY. After the Civil War the government began assigning some of the tribes' lands to other, more recently displaced, Native Americans. With the opening of such cattle routes through the territory as the CHISHOLM TRAIL, white settlers pressed for the right to move there. A strip was opened for settlement in 1889, precipitating a huge land rush as settlers competed to claim the best lands. Later, the remaining lands of the Indian Territory were made available (1906) to white settlers. By the 1890s Oklahoma had become a major oil-producing state. During the GREAT DEPRESSION, NW Oklahoma was part of the DUST BOWL, and thousands of farmers were forced to leave their lands to become migrant laborers. The economy was revitalized during World War II, and for decades energy-related industries maintained Oklahoma's position as one of the fastest-growing SUNBELT states. Beginning in the mid-1980s, however, the state's economy was hurt (as it had been in the 1930s) by its dependence on the oil industry.

Oklahoma City (1990 pop. 444,719), state capital and seat of Oklahoma co., central Okla., on the North Canadian R.; inc. 1890. Settled overnight (1889) in a land rush, it became state capital in 1910. Oil, cattle, grain, and cotton were the major industries in its development. Today it has diversified manufactures and is the commercial center of the region. Vast in area, the city has many parks and tourist attractions.

okra: see MALLOW.

Olaf or **Olav,** kings of Norway. **Olaf I** (Olaf Tryggvason), c.963–1000 (r.995–1000), was the great-grandson of HAROLD I. A Christian convert, he overthrew Haakon (995) and undertook the conversion of Norway. After his death in battle, SWEYN of Denmark and Olaf of Sweden divided Norway. His nephew **Olaf II** (Saint Olaf), c.995–1030 (r.1015–28), continued to Christianize Norway. An uprising of nobles (1028) supporting CANUTE of England and Denmark forced him to flee. In 1030 he tried to wrest the crown from Canute's son Sweyn but died in battle. His son MAGNUS I later ruled Norway. **Olaf V,** 1903–91 (r.1957–91), was the son of HAAKON VII. After the Germans invaded Norway (1940), he led the Norwegian struggle for liberation. An extremely popular figure, he was succeeded by his son, HAROLD V.

Olbers, Heinrich Wilhelm Matthäus, 1758–1840, German physician and astronomer. Inventor (1797) of the first successful method for calculating the orbits of comets, he discovered the comet of 1815, now known as Olbers's comet, and two asteroids, Pallas (1802) and Vesta (1807).

Old Catholics, Christian denomination, established by German clergy and laymen who separated from the Roman Catholic Church when they rejected the dogma of papal infallibility issued (1870) by the First VATICAN COUNCIL. By 1874 a new church had been established with a bishop consecrated by a Dutch Jansenist bishop. It retained Roman ritual (in the vernacular), allowed priests to marry, and made confession optional.

Old Church Slavonic: see CHURCH SLAVONIC.

Oldenbarneveldt, Johan van, 1547–1619, Dutch statesman. He aided WILLIAM THE SILENT and MAURICE OF NASSAU in the struggle for independence from Spain. With Oldenbarneveldt as permanent advocate of Holland (from 1586) commerce expanded greatly and the Dutch EAST INDIA COMPANY was formed. His negotiation (1609) of a 12-year truce with Spain gave the Dutch virtual independence. As leader of those favoring control of state affairs by the States-General he clashed with the party of the nobles and the house of Orange, which used his affiliation with the Remonstrants, a sect at odds with the strict Calvinists, as a pretext for his execution.

Old English: see ENGLISH LANGUAGE.

old English sheepdog, large WORKING DOG; shoulder height, 21–25 in. (53.3–63.5 cm); weight, 55–65 lb (24.9–29.5 kg). It has a profuse double coat of gray, grizzle, blue, or blue-merle, with or without white. The breed was raised in W England in the 19th cent. as a sheep and cattle drover.

Old Stone Age: see under STONE AGE.

Old Testament, Christian name for the Hebrew Scriptures, which forms the first portion of the Christian Bible (see NEW TESTAMENT). It consists of a varying number of books, in varying order. The canon of the JEWS, adopted A.D. c.100, is drawn from one Hebrew source, the Masora, whose origin is unknown. The contemporary Jewish reckoning of the Old Testament is as follows: (1) the five books of the Law (TORAH or PENTATEUCH), i.e., GENESIS, EXODUS, LEVITICUS, NUMBERS, and DEUTERONOMY; (2) the Prophets (e.g., JOSHUA, ISAIAH) and the twelve Minor Prophets; (3) the Writings (Hagiographa), including such books as PSALMS and JOB; the Scrolls (*Megillot*), e.g., SONG OF SOLOMON and RUTH; and others. The Old Testament long used in the Christian church was based on a different text, the Septuagint, a Hellenistic Jewish translation into Greek about the 3d cent. B.C. The Latin Bible's official form was the VULGATE of St. JEROME, close to the Septuagint; the Vulgate's list and order were the canon of the Western Church. At the REFORMATION, the English Protestants considered only those books appearing in the Masora canonical; the others, regarded as suitable for instruction but not necessarily inspired, were placed by translators of the Authorized Version (AV) in an appendix to the Old Testament, the APOCRYPHA (see BIBLE). Thus the Reformed canon became the Masoretic text, but in Western order. The AV compares with the Douay Version (published by Roman Catholic scholars in France in 1610), representing the Western canon, as follows, the names in parentheses being the usual Douay names when different from AV, those in italics not appearing in AV: Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua (Josue), Judges, Ruth, First and Second Samuel (First and Second Kings), First and Second Kings (Third and Fourth Kings), First and Second Chronicles (First and Second Paralipomenon), Ezra (First Esdras), Nehemiah (Second Esdras), *Tobias, Judith,* Esther, Job, Psalms, Proverbs, Ecclesiastes, Song of Solomon (Canticle of Canticles), *Wisdom, Ecclesiasticus,* Isaiah (Isaias), Jeremiah (Jeremias), Lamentations, *Baruch,* Ezekiel (Ezechiel), Daniel, Hosea (Osee), Joel, Amos, Obadiah (Abdias), Jonah (Jonas), Micah (Micheas), Nahum, Habakkuk (Habacuc), Zephaniah (Sophonias), Haggai (Aggeus), Zechariah (Zacharias), Malachi (Malachias), *First* and *Second Maccabees.* Dating of the Bible is difficult; before 1000 B.C. there are few outside sources against which to check. From the time of DAVID, a chronology with checks is possible; no single system, however, is widely accepted. Authorship is known from tradition or internal evidence. Scholarship of the 19th cent. assaulted traditions about the Bible, particularly in regard to the "historical" books; but 20th-cent. archaeology has tended to support, rather than contradict, the narratives. Generally modern critics hold that in the 10th cent. B.C. the first of a series of editors began to collect folkloric and historical material. Two dominant early compilations can be traced. These were combined by in the southern kingdom of Judah some time after the fall of the northern kingdom (Israel) and form much of the Old Testament through First and Second Samuel. Other important sources of the non-prophetic books are an author or authors associated with the temple priests and the author of Deuteronomy.

Olduvai Gorge, ravine, c.295 ft (90 m) deep, in N Tanzania, at the E edge of the GREAT RIFT VALLEY. Famous hominid fossils found there by the anthropologists Louis S.B. and Mary LEAKEY and others indicate that human ancestors lived in the area as many as 1.8 million years ago.

Oligocene epoch: see GEOLOGIC ERA (table).

olive, common name for the family Oleaceae, trees and shrubs of warm, temperate climates and the Old World tropics, and for the true olive tree (*Olea europaea*), the most important member of the family commercially. Native to Asia Minor, the true olive is a small evergreen that bears a fruit (also called olive), which is pressed to obtain olive oil or is eaten. Green olives for eating are picked when full grown but unripe; purplish-black olives are usually ripe and richer in oil. The Mediterranean region is the chief area of olive production. Olive wood and ASH, also of the olive family, are hardwoods used in furniture. Popular ornamentals in the family include the LILAC, true JASMINE, and FORSYTHIA. The olive branch has been a symbol of peace since ancient times.

Oliver, Joseph "King," 1885–1938, American jazz musician; b. Abend, La. After playing in New Orleans and establishing himself as a master cornetist, he moved (1918) to Chicago. He led (1920–23) the Creole Jazz Band, which became the greatest exponent of the Dixieland JAZZ idiom. His style was exuberant and had great range. He strongly influenced Louis ARMSTRONG.

Olives, Mount of, or **Olivet,** ridge E of Jerusalem. In the OLD TESTAMENT it is associated with DAVID, Ezekiel, and Zechariah. According to the NEW TESTAMENT, it was a frequent resort of JESUS and the scene of his Ascension.

Olivier, Laurence Kerr (Baron Olivier of Brighton), 1907–89, English actor, director, and producer, often called the greatest actor of the 20th cent. Olivier was successful both in the classics, e.g., as Oedipus Rex, Richard III, and Othello, and in modern dramas, e.g., John OSBORNE's *The Entertainer* (1957) and Eugene O'NEILL's *Long Day's Journey into Night* (1971). He made several outstanding films, including *Wuthering Heights* (1939), *Henry V* (1944), and *Hamlet* (1948; Academy Award). After appearing with the Old Vic, he was director (1962–73) of the National Theatre of Great Britain (see THEATER, table). Knighted in 1947, he was the first actor to be created (1970) a life peer.

Olmec, culture of ancient peoples (1300–400 B.C.) of the E Mexico lowlands (see MIDDLE AMERICA, INDIGENOUS PEOPLES OF). A highly developed agricultural society, they left sculptured stone heads weighing over 20 tons. Earthen platforms and pyramidal mounds were common features of their major settlements. The Olmec are often regarded as the mother culture of later Middle American civilizations. The epi-Olmec, the peoples who subsequently inhabited the same lands and were probably descended at least in part from the Olmec, seem to have been the earliest users (from 31 B.C.) of the bar and dot system of recording time. Both the Olmec and epi-Olmec had hieroglyphic writing systems.

Olmsted or **Olmstead, Frederick Law,** 1822–1903, American landscape architect and writer; b. Hartford, Conn. In the 1850s he attained fame for his travel books, which describe slaveholding society in the South. When Central Park, N.Y.C., was projected (1856), he and Calvert Vaux prepared the plan that was accepted, and he supervised its execution. This was the first of many parks he designed; others are in Brooklyn (Prospect Park), Chicago, Montreal, Buffalo, and Boston. He laid out the grounds for the 1893 Columbian Exposition, Chicago (now Jackson Park).

Olympia, city (1990 pop. 33,840), state capital and seat of Thurston co., W Wash., a port at the southern tip of Puget Sound; inc. 1859. State government, lumber products, brewing, and oyster fishing are important. Olympia was settled in 1846 and became (1853) the capital of the Washington Territory. Mt. Rainier and the Olympic Mts. are in view of the city.

Olympia, ancient Greek sanctuary in the W PELOPONNESUS, near the Alpheus River. It was an important center of the worship of ZEUS and the site of the OLYMPIC GAMES. Excavation revealed the great temple, one of the SEVEN WONDERS OF THE WORLD, which housed a gold-adorned statue of Zeus by PHIDIAS.

Olympian, in Greek myth, one of the 12 gods who ruled the universe from their home on Mt. Olympus. Led by ZEUS, they were: HERA, his sister and wife; POSEIDON and PLUTO (HADES), his brothers; HESTIA, his sister; and his children, ARES, HERMES, APOLLO, HEPHAESTUS, ATHENA, APHRODITE, and ARTEMIS. Similar to humans in appearance and character, the Olympians are known to us mainly from the works of HOMER and HESIOD.

Olympias, d. 316 B.C., wife of PHILIP II of Macedon and mother of ALEXANDER THE GREAT. She reputedly had great influence in molding her son. After his death she tried to seize power, but CASSANDER had her executed.

Olympic games, series of international amateur sports contests that originated in ancient Greece. The Greek games were held once every four years, beginning (according to tradition) in 776 B.C. The games reached their height in the 5th and 4th cent. B.C., later fell into disfavor because of professionalism, and were discontinued at the end of the 4th cent. A.D. The first Olympics were confined to running, but many events were added. The modern revival of the games began in Athens in 1896. They have since been staged at four-year intervals (except during the world wars) in cities around the world. The number of entrants, of competing nations, and of sports and athletic events has steadily increased. The modern games were originally only open to amateur male athletes. Women first competed in 1912, a separate series of winter games was begun in 1924, and professional athletes began competing in some sports in 1988. After 1992 the winter games were rescheduled so that they would alternate, at two-year intervals, with the summer games. The International Olympic Committee is the governing body of the games.

OLYMPIC GAMES, 1896–1984

Summer Games

Year	*Site*		
1896	Athens, Greece	1960	Rome, Italy
1900	Paris, France	1964	Tokyo, Japan
1904	St. Louis, Mo.	1968	Mexico City, Mexico
1908	London, England	1972	Munich, West Germany
1912	Stockholm, Sweden	1976	Montreal, Canada
1920	Antwerp, Belgium	1980	Moscow, USSR (now Russia)
1924	Paris, France	1984	Los Angeles, Calif.
1928	Amsterdam, The Netherlands	1988	Seoul, South Korea
1932	Los Angeles, Calif.	1992	Barcelona, Spain
1936	Berlin, Germany	1996	Atlanta, Ga.
1948	London, England	2000	Sydney, Australia
1952	Helsinki, Finland		
1956	Melbourne, Australia		

Winter Games

1924	Chamonix, France	1960	Squaw Valley, Calif.
1928	St. Moritz, Switzerland	1964	Innsbruck, Austria
1932	Lake Placid, N.Y.	1968	Grenoble, France
1936	Garmisch-Partenkirchen, Germany	1972	Sapporo, Japan
1948	St. Moritz, Switzerland	1976	Innsbruck, Austria
1952	Oslo, Norway	1980	Lake Placid, N.Y.
1956	Cortina, Italy	1984	Sarajevo, Yugoslavia
		1988	Calgary, Alberta
		1992	Albertville, France
		1994	Lillehammer, Norway
		1998	Nagano, Japan

Olympic National Park: see NATIONAL PARKS (table).

Olympus, mountain range, c.25 mi (40 km) long, N Greece. It rises to c.9,570 ft (2,920 m) at Mount Olympus, described in Greek mythology as the home of the OLYMPIAN gods.

Olynthus [ōlĭn'thəs], ancient city of GREECE, on the Chalcidice peninsula. It headed the Chalcidian League, and opposed ATHENS and SPARTA. Originally allied with PHILIP II of Macedon against Athens, it later sought Athens' aid against Philip. DEMOSTHENES' *Olynthiac* orations urged Athens to help. Athens complied, but Philip razed the city (348 B.C.).

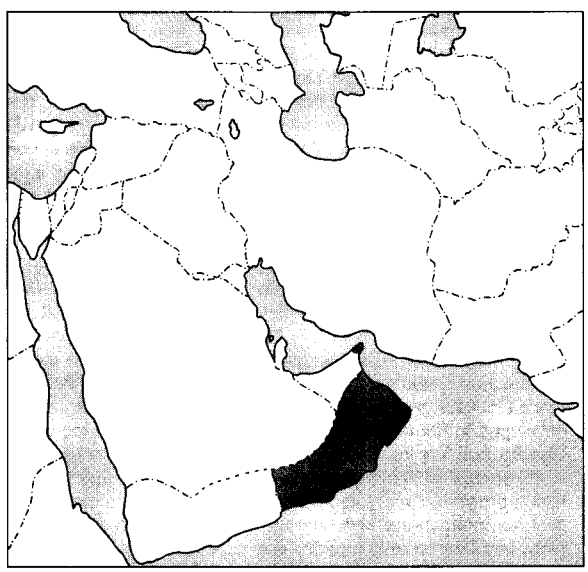
Omaha, indigenous people of the Plains (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with a Siouan language of the Hokan-Siouan stock (see NATIVE AMERICAN LANGUAGES). They migrated west from the Ohio valley to Iowa and then to NE Nebraska. In the mid-19th

cent. they sold much of their land to the U.S., and after 1882 they began to own land individually. In 1990 there were 4,143 Omahas in the U.S.

Omaha, city (1990 pop. 335.795), seat of Douglas co., E Nebr., on the Missouri R.; inc. 1857. Settled in 1854, it grew as a supply point for westward migration. The largest city in the state, located in the heart of the country's farm region, it is a busy port and one of the world's great livestock markets and meat-processing centers. The city has diversified manufactures, and insurance, banking, and medical treatment and research are major enterprises. Offutt Air Force Base, headquarters of the Strategic Command (formerly the Strategic Air Command), is south of the city.

Oman, officially Sultanate of Oman, formerly Muscat and Oman, independent sultanate (1993 pop. 2,017,591), c.82,000 sq mi (212,380 sq km), SE Arabian peninsula, bounded by the Gulf of Oman (E), the Arabian Sea (S), Yemen and Saudi Arabia (W), and the United Arab Emirates (N), which separate the main portion of the country from an exclave that juts into the Strait of HORMUZ. The capital is MUSCAT. Oman comprises a coastal plain and an interior region of hills and desert. Dates, limes, nuts, and vegetables are cultivated in the north and livestock are raised in the southwest, but the major product is oil. Natural gas production and copper mining were developed in the early 1980s to diversify the economy. The population is predominantly Muslim Arab, with Pakistani, Indian, and Zanzibari minorities.

History. Occupied by Portugal in 1508 and Turkey in 1659, Oman came under Ahmad ibn Said of Yemen, founder of the present royal line, in 1741. It has had close ties with Britain since the 19th cent. In 1970 Qabus bin Said overthrew the strict regime of his father, Sultan Said bin Timur, and instituted a program of liberalization and modernization and put down (1975) leftist guerrilla forces operating in Dhofar prov., in the south. In 1980 the U.S. obtained the use of ports and airfields in Oman in exchange for economic and military aid. In 1981 Oman joined other Arab Persian Gulf nations in founding the Gulf Cooperation Council.



Omar Khayyam [kīäm'], fl. 11th cent., Persian poet and mathematician. He wrote mathematical studies and participated in a calendar reform, but he is best known for his *Rubaiyat* (epigrammatic quatrains), which express a hedonistic philosophy. A paraphrased English translation (1859) by Edward FITZGERALD popularized his work in the West.

ombudsman, independent official appointed to investigate citizen complaints against abuses by government officials and agencies. The ombudsman makes recommendations and in some cases has the power to make binding decisions. The office, which originated (1809) in Sweden, has been adopted by many countries and U.S. states and localities. Businesses, universities, and other private organizations also employ ombudsmen to investigate complaints.

Omdurman, city (1983 pop. 526,287), central Sudan, on the White Nile opposite KHARTOUM. It is the country's chief commercial center and part of a tri-city metropolitan area (with Khartoum and Khartoum North). The MAHDI, who is buried in the city, based his forces here for the attack on Khartoum (1885), and his successor, Khalifa Addallah, made it his capital. The battle of Karari (1898), near Omdurman, marked the defeat of the Mahdist state by an Anglo-Egyptian army under Lord KITCHENER.

Omsk, city (1989 pop. 1,148,000), SW Siberian Russia, at the confluence of the Irtysh and Om rivers, and on the Trans-Siberian RR. It is a major river port and has oil refineries and plants producing railroad equipment, farm machinery, and clothing. Founded in 1716 as a fortress, it became a transportation and administrative center in the 19th cent.

Onassis, Aristotle Socrates, 1906?–1975, Greek shipowner and financier; b. Turkey. After reviving the family tobacco business in Argentina, he received (1925) Argentinian and Greek citizenship. He bought his first ships in the early 1930s and later entered the tanker business. He was related by marriage to the Greek shipowners Stavros Livanos and Stavros Niarchos; together they formed the most powerful shipping clan in the world. He also founded (1957) Olympic Airways of Greece. In 1968 Onassis married Jacqueline Bouvier Kennedy, widow of U.S. Pres. J.F. KENNEDY.

Onassis, Jacqueline Bouvier, 1929–, American first lady; b. Southampton, N.Y. She married John Fitzgerald KENNEDY in 1953. While he was U.S. president, she supervised the restoration of the WHITE HOUSE. After her husband's assassination, she returned to private life and later married (1968) Aristotle ONASSIS.

oncology: see CANCER.

Oneida: see IROQUOIS CONFEDERACY.

O'Neill, Eugene (Gladstone), 1888–1953, widely acknowledged as America's foremost playwright; b. N.Y.C. The son of an actor, he was a prospector, seaman, derelict, and newspaper reporter—experiences he used in his plays. He created many one-act plays before writing *Beyond the Horizon* (1920; Pulitzer), the first of his full-length plays to be performed. The dramas that followed included *The Emperor Jones* (1920); *Anna Christie* (1921; Pulitzer); *The Hairy Ape* (1922); *Desire under the Elms* (1924), considered his first great play; *Strange Interlude* (1928; Pulitzer); the mighty trilogy *Mourning Becomes Electra* (1931); *Ah, Wilderness!* (1933), his only comedy; *The Iceman Cometh* (1946), often regarded as his finest work; and *A Moon for the Misbegotten* (1947). His last years were filled with family tragedy and ill health. At his death he left several important plays in manuscript, including the autobiographical masterpiece *Long Day's Journey into Night* (produced 1956; Pulitzer). Although uneven and often clumsily experimental, O'Neill's powerful work is filled with poetry and genius. He was awarded the Nobel Prize in literature in 1936.

O'Neill, Tip (Thomas Philip O'Neill, Jr.), 1912–94, American politician, Speaker of the U.S. House of Representatives (1977–87); b. Cambridge, Mass. He entered the House in 1953 as a Democrat from Massachusetts. A skillful strategist, he became majority whip in 1971 and majority leader in 1973 and was Speaker of the House from 1977 to 1987.

onion, plant (genus *Allium*) of the LILY family, of the same genus as the chive (*A. schoenoprasum*), garlic (*A. sativum*), leek (*A. porrum*), and shallot (*A. ascalonium*). Believed native to SW Asia, these plants are typified by an edible bulb composed of sugar-rich food-storage leaves that are also the source of a pungent oil. Their long, tubular, above-ground leaves are also eaten. The onion (*A. cepa*) is a cultivated biennial with many varieties; it is no longer found in the wild form. Common varieties include the red onion, the yellow onion, the white onion, and the large, delicately-flavored Bermuda and Spanish onions. The more pungent garlic, a perennial, has a bulb consisting of small bulbils called cloves. The perennial shallot has clusters of small, onionlike bulbs; the biennial leek has a single small bulb. The chive, found wild in Italy and Greece, is a perennial whose leaves are the desirable portion. *Scallion* is a popular term for any edible *Allium* species with a reduced bulb, especially the leek and shallot.

Onondaga: see IROQUOIS CONFEDERACY.

Ono no Komachi [ō'nō nō kō'mä chē], fl. c.833–857, Japanese poet. Celebrated for her beauty and erotically charged poetry, she was among the most prominent poets of her day, displaying skill in the elegant waka form. Many legends have arisen about her love affairs and bitter end as a wandering hag.

Ontario, province (1991 pop. 10,084,885), 412,580 sq mi (1,068,582 sq km), east-central Canada. It is bordered by Hudson and James bays (N); Quebec (E); the St. Lawrence River, Lakes Ontario, Erie, Huron, and Superior, and the U.S. (S); and Manitoba (W). The most populous and third largest province, Ontario has three main geographic regions: the mineral-rich CANADIAN SHIELD area, in the west and central part of the province; the HUDSON BAY Lowlands, in the north; and the GREAT LAKES–SAINT LAWRENCE lowlands, in the south, where 90% of the population lives and where industry and agriculture are concentrated. The Toronto-Hamilton area is the most highly industrialized. Major industrial products include transportation equipment, foods, metals, electrical goods, machinery, and chemicals. Agriculture is also important, with cattle, dairy products, and hogs producing the most income; other crops are corn, wheat, and potatoes. Mining is important in the Canadian Shield area, where iron ore, copper, zinc, gold, silver, and uranium are found. The SUDBURY area is especially rich in copper and nickel. Ontario also produces lumber, and the pulp and paper industry is important. Major cities include TORONTO, the provincial capital, OTTAWA, the national capital, HAMILTON, WINDSOR, LONDON, and THUNDER BAY.

History. Ontario was explored by the French in the early 17th cent., but settlement was slow. The British, who had established (late 17th cent.) trading posts on Hudson Bay, gained control of Ontario and all of French Canada by the Treaty of Paris (1763). Many UNITED EMPIRE LOYALISTS migrated to Ontario after the American Revolution, and in 1791 it was split from Quebec and called Upper Canada. The area was a major battleground in the WAR OF 1812. In 1841 Upper Canada and Lower Canada (Quebec) were merged into a united province, but it proved unworkable because of conflict between English and French residents. In 1867 Ontario and Quebec entered the Canadian confederation as separate provinces. During the 20th cent. the mineral wealth of the Canadian Shield was exploited and the province's economy expanded enormously. Ontario's main political parties are the Liberals (most powerful in the late 19th cent.), the Conservatives (who governed from 1905 to 1985 with three Liberal interludes), and the New Democrats (who won a substantial majority in 1990). The province sends 24 senators (appointed) and 99 representatives (elected) to the national parliament.

Ontario, city (1990 pop. 133,179), San Bernardino co., SE Calif., near Los Angeles; inc. 1891. A fast-growing city, it has benefited from the success of its high-technology firms. Other industries produce aircraft and aircraft parts, wine, tile, electrical equipment, and plastics. Ontario is the site of a speedway and an international airport.

Ontario, Lake, smallest (7,540 sq mi/19,529 sq km), lowest (elevation 246 ft/75 m), and easternmost of the GREAT LAKES, between the U.S. and Canada. It is 193 mi (311 km) long and up to 53 mi (85 km) wide and 778 ft (237 m) deep. The lake is part of the St. Lawrence & Great Lakes Waterway and opens to the SAINT LAWRENCE SEAWAY and W to Lake Erie via the WELLAND SHIP CANAL. Toronto is the principal port.

onychophoran, onychophore, or **velvet worm,** wormlike animal with unsegmented, stumpy legs and velvety skin; member of the phylum Onychophora. Because onychophorans possess characteristics of both ANNELID WORMS and ARTHROPODS, they have been considered to be the "missing links" between the two groups, but DNA testing suggests that they are arthropods most closely related to spiders and scorpions.

onyx, variety of CHALCEDONY, similar to AGATE but with parallel, regular bands. Black-and-white specimens are used for cameos. Sardonyx has alternate layers of onyx and carnelian, or sard.

oolite, sedimentary rock composed of small concretions, usually of calcium carbonate, containing a nucleus and clearly defined concentric shells. In Britain, oolitic LIMESTONE is characteristic of the Jurassic geologic period.

Oort, Jan Hendrik, 1900–92, Dutch astronomer. He confirmed (1927) Bertil Lindblad's theory of the Milky Way galaxy's rotation. In the 1950s he and his colleagues used radio astronomical means to map the spiral-arm structure of the galaxy. Oort proposed (1950) that COMETS originate in a spherical cloud of material orbiting the sun at great distance (now called the Oort cloud) and that they are occasionally deflected into the inner solar system by gravitational perturbation from the passing of nearby stars.

opal, hydrous silica mineral ($SiO_2 \cdot nH_2O$), formed at low temperatures from silica-bearing water, that can occur in cavities and fissures of any rock type. Gem opal has rich iridescence and a remarkable play of colors, usually in red, green, and blue. Most precious opals come from South Australia; the opal is Australia's national gemstone. Other sources include Mexico (fire opal) and parts of the U.S.

op art, movement in the U.S. and Europe in the mid-1960s that sought to produce a purely optical art stripped of perceptual associations. Vibrating colors and pulsating moiré patterns characterized op works by such practitioners as Victor Vasarely, Richard Anusziewicz, and Bridget Riley.

OPEC: see ORGANIZATION OF PETROLEUM EXPORTING COUNTRIES.

open cluster: see STAR CLUSTER.

Open Door, maintenance in a certain territory of equal commercial and industrial rights for all countries. It is associated with CHINA, which in the 19th cent. was divided into spheres of influence by the major world powers. The U.S., as a lesser power feared that an actual partition of China would damage American trade and sought to preserve equal privileges. U.S. Secy. of State John HAY advanced the Open Door policy in two notes (1899, 1900), asking the major powers to uphold the free use by all nations of the treaty ports within their spheres of influence and to respect Chinese territorial and administrative integrity. Disregard for the Open Door policy, especially by Japan (see TWENTY-ONE DEMANDS), led to the Nine-Power treaty (1922), which reaffirmed the policy but failed to stop Japanese aggression. After World War II China's full sovereignty was recognized, and the Open Door policy ceased to exist.

open-end investment company: see MUTUAL FUND.

open-hearth process, method of producing STEEL from varying proportions of limestone, scrap metal, and PIG IRON. Known in Europe as the Siemens-Martin process, it is characterized by a hearth open directly to the flames that melt the raw materials. Although the open-hearth process takes longer to refine a batch of steel, it superseded the BESSEMER PROCESS because it could use up to 100% scrap metal, could refine pig iron that had a high phosphorus content, and could produce less brittle steels. It has now largely been replaced by the BASIC OXYGEN PROCESS and ELECTRIC ARC PROCESS.

open shop: see UNION, LABOR.

opera, drama set to music. There may be spoken dialogue, but more often the music is continuous, with set pieces (solos, duets, etc.) designed to dramatize the action and display the vocal skills of the singers. Opera began in Florence, Italy, where a group of scholars and musicians promoted the principle of simple melodic declamation, emulating ancient Greek drama. Jacopo Peri's *Euridice* (1600) is generally considered the first opera. BAROQUE opera developed in Rome and Venice, reaching its peak with the work of Claudio MONTEVERDI. In 1637 the first public opera house in the world opened in Venice. The *opera seria* of the 17th and 18th cent. featured mythological themes and great pageantry. In the mid-17th cent. an international style emerged, emphasizing individual virtuosity, and interest in antiquities was superseded by a trend toward comedy. French opera from 1669 was led by J.B. LULLY and J.P. RAMEAU. The Neapolitans favored the *opera seria* of Alessandro SCARLATTI, but now added *opera buffa,* or comic opera, as in the works of Giovanni PERGOLESI. After the death of Henry PURCELL, opera in England was dominated by the Italian style championed by G.F. HANDEL. By the 18th cent. German opera had developed the *singspiel,* comic opera with spoken dialogue, which reached its culmination in the works of W.A. MOZART. Yet Italian *opera seria* dominated through the 18th cent., until the compositions of C.W. von GLUCK served to emphasize the dramatic over the musical aspects of opera. Romantic elements entered 19th cent. opera, as in Ludwig van BEETHOVEN's *Fidelio* (1805) and Carl Maria von WEBER's *Der Freischütz* (1821). These paved the way for the grandiose mu-

sic dramas of Richard WAGNER. Spectacular opera became popular in France and Italy after the French Revolution, and grand opera was founded in Paris, exemplified by the works of Giacomo MEYERBEER, featuring historical themes and violent passions. Opera with spoken dialogue, or *opéra comique*, led toward OPERETTA, but also toward the serious, lyrical works of Georges BIZET and Charles GOUNOD. The works of G.A. ROSSINI, Gaetano DONIZETTI, and Vincenzo BELLINI continued to feature melody and voice, and the lyric-dramatic Italian style was exemplified by Giuseppe VERDI and, later, Giacomo PUCCINI. The 19th cent. also saw the birth of Russian opera (P.I. TCHAIKOVSKY, Modest MOUSSORGSKY, Nicolai RIMSKY-KORSAKOV). Foremost in the early 20th cent. were the romantic, dissonant works of Richard STRAUSS and the atonal operas of Alban BERG and Arnold SCHOENBERG. Contemporary operas are typically either traditional in idiom, as the works of Benjamin BRITTEN, Gian-Carlo MENOTTI, and Samuel BARBER; or avant garde, often atonal and experimental, as the compositions of H.W. HENZE, Philip GLASS, and Werner Egk.

operetta, type of light OPERA with a frivolous, sentimental story, often employing parody and satire, and containing spoken dialogue and much light, pleasant music. It developed from 19th-cent. *opéra comique.* Noted operetta composers include OFFENBACH, J. STRAUSS the younger, LEHÁR, A. SULLIVAN (with librettist W.S. GILBERT), and Victor HERBERT.

Ophir [ō'fər], seaport or region, mentioned in the BIBLE, from which the ships of SOLOMON brought great treasures, including gold, jewels, and ivory. The location of Ophir is unknown, although it has been variously identified.

ophthalmology, branch of medicine specializing in the function and diseases of the eye. It is concerned with prevention of BLINDNESS; treatment of disorders, e.g., GLAUCOMA; and surgery, including CATARACT removal and corneal TRANSPLANTATION. **Optometry** is concerned with correcting visual abnormalities (e.g., NEARSIGHTEDNESS) and the prescription of corrective lenses, including CONTACT LENSES.

Opitz, Martin [ō'pĭts], 1597–1639, leader of the Silesian school of German poetry. He was influential as a poet, critic, and metrical reformer. *Book on German Poetry* (1624) was his greatest literary contribution.

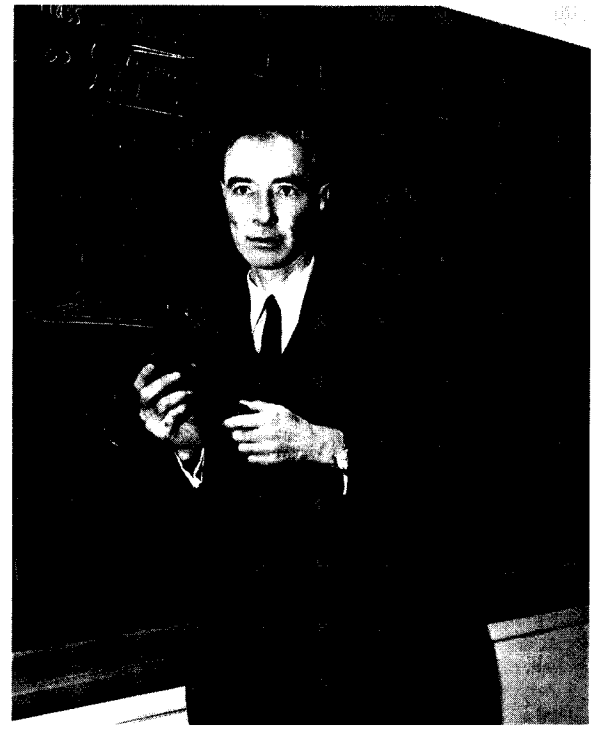
opium, dried milky juice of unripe seedpods of the opium poppy (*Papavera somniferum*). The chief constituents of opium are the alkaloids CODEINE, papaverine, noscapine, and MORPHINE, from which HEROIN is synthesized. Opium is grown worldwide; despite international laws and agreements to control its use, an illicit opium traffic persists. See NARCOTIC.

Opium War, 1839–42, conflict between Great Britain and China. Britain, seeking to end restrictions made by China on foreign trade, found a pretext for war when China prohibited the import of opium and British opium was destroyed at Guangzhou. The British were easy victors, and by the Treaty of Nanking (1842) China ceded Hong Kong to Britain and opened five ports to British trade. A second war (1856–58) ended with the treaties of Tientsin (1858), to which France, Russia, and the U.S. were party. These treaties opened 11 more ports.

Oporto, Port. *Pôrto,* city (1987 est. pop. 350,000), capital of Pôrto dist., NW Portugal, near the mouth of the Douro R. Portugal's second largest city and an Atlantic port, it is known for the wine (port) it exports, which is named for the city. Textiles and wood and leather goods are produced. The ancient settlement, probably of pre-Roman origin, became known as Portus Cale (the source of the name Portugal). It was held (716–1092) by the MOORS and was later and for some time the chief city of Portugal. Its landmarks include the Dom Luis bridge (1881–87) and the Torre dos Clérigos, a baroque tower.

opossum, name for several MARSUPIALS of the family Didelphidae, native to Central and South America, with one species in the U.S. Mostly arboreal and nocturnal animals, opossums have long noses, naked ears, prehensile tails, and black-and-white fur. They eat small animals, eggs, insects, and fruit. When frightened they collapse as if dead. Opossums are hunted as pests as well as for food and sport.

Oppenheimer, J. Robert, 1904–67, American physicist; b. N.Y.C. He taught at the Univ. of California and the California Institute of Technology and was from 1947 director of the Institute for Advanced Study at Princeton. Director (1942–45) of the laboratory at Los Alamos, N.Mex., that designed and built the first ATOMIC BOMBS (see MANHATTAN PROJECT), Oppenheimer later became a main proponent of the civilian and international control of atomic energy. He was chairman (1946–52) of the general advisory committee of the U.S. Atomic Energy Commission, but in 1953 the AEC suspended him as an alleged security risk. Oppenheimer strongly opposed (1949), on both technical and moral grounds, the development of the HYDROGEN BOMB.



J. Robert Oppenheimer

opposition, in astronomy: see SYZYGY.

optical activity, ability of asymmetrical compounds to rotate the plane of polarized light. Optical activity is measured using right- and left-hand polarized light: the amount of optical rotation is a measure of a compound's effect on the light's velocity; the amount of circular dichroism is a measure of the absorption of the light. Compounds that rotate polarized light are called enantiomers, or optical ISOMERS. Molecular groups that possess high optical activity due to mobile electrons that interact with light are called chromophores; they are responsible for the color of certain objects (e.g., the CHLOROPHYLL chromophore in plant leaves). See also POLARIZATION OF LIGHT.

optical character recognition (OCR), method for the machine-reading of typeset, typed, and, in some cases, hand-printed letters, numbers, and symbols using OPTICAL SCANNING and a computer. The light reflected by a printed text is recorded as patterns of light and dark areas by an array of PHOTOELECTRIC CELLS in a optical scanner. A computer program analyzes the patterns and identifies the characters they represent, with some tolerance for less than perfect and uniform text. See also COMPUTER GRAPHICS.

optical disk, any of a variety of information storage disks that are played or read using a LASER. Optical disks include COMPACT DISCS (CDs and CD-ROMs) and laser discs (see VIDEO DISC). WORM [*W*rite *O*nce/*R*ead *M*any] disks can be used to record data, but once data is recorded it cannot be altered except by obliterating the old version and storing the new version on a previously unused portion of the disk. **Magneto-optical disks,** such as the rewritable optical disk and the recordable disk used with the Mini Disc player,

have a special layer, as of barium ferrite, that can be magnetically polarized by a recording head when heated with a laser. Data or sound may be recorded to and erased from any portion of a magneto-optical disk multiple times.

optical sensing, in general, any method of detecting light and translating it into electric signals. This is usually accomplished by the use of various photoelectric devices, such as a PHOTOELECTRIC CELL. Optical sensing typically involves recording variations in intensity or another property of light as the light is transmitted or reflected. Optical sensing is used in various pattern-recognition systems, e.g., in BAR-CODE scanners, OPTICAL CHARACTER RECOGNITION, military reconnaissance, and astronomical observation, and in photographic development, to enhance detail and contrast.

optics, scientific study of LIGHT. Physical optics is concerned with the genesis, nature, and properties of light; physiological optics with the part light plays in vision (see EYE); and geometrical optics with the geometry involved in the REFLECTION and REFRACTION of light as encountered in the study of the MIRROR and the LENS.

optometry: see under OPHTHALMOLOGY.

oracle, in Greek religion, priest or priestess who imparted a god's response to a human questioner; also the response itself and the shrine. Methods of divination included interpretation of dreams, observation of signs, and interpretation of the actions of entranced persons. Among the famous oracles were those of ZEUS at Dodona and of APOLLO at DELPHI.

oral contraceptive or **the pill,** method of BIRTH CONTROL, usually consisting of an estrogen and a progestin (a PROGESTERONE-like substance) in pill form. Taken cyclically for 21 days each month, it elevates levels of these hormones in the blood, suppressing production of the pituitary hormones that would normally cause a woman to ovulate. Side effects include nausea, weight gain, and increased blood-clotting tendency. The use of oral contraceptives may increase the risk of cervical cancer but decrease the risk of cancer of the ovaries and endometrium, benign breast cysts, premenstrual syndrome, and iron-deficiency anemia.

Oran, city (1987 pop. 628,558), NW Algeria, on the Gulf of Oran of the Mediterranean Sea. Algeria's second largest city, Oran is a major port exporting wheat, wine, and other goods, and a commercial, industrial, and financial center. Nearby are important petrochemical installations. The site of modern Oran has been inhabited since prehistoric times, but the city's founding (10th cent.) is generally attributed to Moorish traders from Andalusia. Held alternately (1509–1791) by the Spanish and the Ottoman Turks, Oran fell to the French in 1831 and was developed as a naval base. During WORLD WAR II the city was held (1940–42) by Vichy forces. It played an important role in the Algerian independence struggle (1954–62).

Orange, city (1990 pop. 110,658), Orange co., S Calif.; inc. 1888. A citrus and nut packing, processing, and shipping center, the city grew rapidly in the 1980s. Rubber products, electronic components, and industrial furnaces are manufactured. Orange is the seat of Chapman College.

Orange, major river of S Africa, flowing generally west c.1,300 mi (2,090 km) from Lesotho through parts of the Namib and KALAHARI deserts to the Atlantic Ocean. Much of its water is diverted through two long tunnels to provide hydroelectricity and irrigation in South Africa.

orange, tree (genus *Citrus*) of the RUE family, native to China and Indochina, and its fruit. A CITRUS FRUIT, the orange is rich in VITAMIN C. Among the commercially important species are the sweet, or common, orange (*C. sinensis*), which furnishes varieties such as the navel and Valencia; the sour, or Seville, orange (*C. aurantium*), used as an understock on which to bud sweet orange varieties and in marmalade; and *C. reticulata,* which includes the mandarin orange, the tangerine, and the hardy Satsuma varieties. Oranges hybridize readily. The citrange is a cross between two varieties of orange; the tangelo is produced by crossing a tangerine and a grapefruit. Oranges may be artificially colored before marketing. They are eaten fresh, made into juice, or used in preserves and confections. Essential oils from orange rind, flowers, and leaves are used in perfumes. The orange blossom is Florida's state flower.

Orangemen, members of the Loyal Orange Institution, a society in Northern Ireland, est. 1795 to maintain Protestant ascendancy. Its name was taken from the family name of WILLIAM III of England, who defeated (1690) the Catholic JAMES II.

orangutan, APE (*Pongo pygmaeus*) found in swampy coastal forests of Borneo and Sumatra. With their extremely long arms and short, bowed legs, orangutans are highly specialized for arboreal life and rarely descend to the ground. An adult male is about 4½ ft (1.4 m) tall and weighs about 150 lb (68 kg); the body is covered with reddish fur.

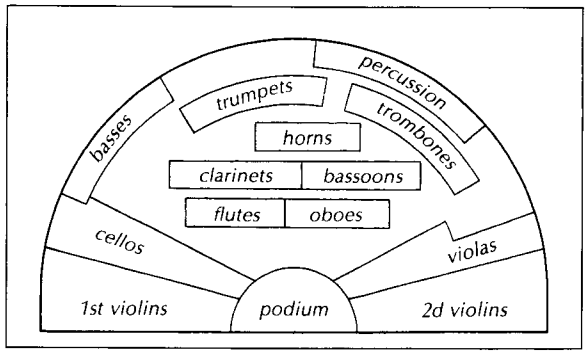
oratorio, musical composition employing chorus, orchestra, and soloists and usually, but not necessarily, a setting of a sacred libretto without stage action or scenery; originally performed in an oratory of the Church of St. Philip Neri at Rome. Outstanding oratorios are by METASTASIO, SCHÜTZ, J.S. BACH, HANDEL, F.J. HAYDN, and MENDELSSOHN.

orbit, path in space described by a smaller body revolving around a second, larger body where the motion of the orbiting body is dominated by their mutual gravitational attraction (see CELESTIAL MECHANICS; GRAVITATION; KEPLER'S LAWS). The size and shape of an orbit are specified by (1) the semimajor axis (the average distance of the smaller body from the larger body) and (2) the eccentricity (the distance of the larger body from the center of the orbit divided by the length of the orbit's semimajor axis). The position of the orbit in space is determined by three factors: (3) the inclination, or tilt, of the orbital plane to the reference plane (the ECLIPTIC for sun-orbiting bodies; a planet's EQUATOR for natural and artificial satellites); (4) the longitude of the ascending NODE (measured from the vernal EQUINOX to the point where the smaller body cuts the reference plane moving south to north); and (5) the argument of pericenter (measured from the ascending node in the direction of motion to the point at which the two bodies are closest). These five quantities, plus the time of pericenter passage, are called orbital elements. The gravitational attractions of bodies other than the larger body causes perturbations in the smaller body's motions that can make the orbit shift, or precess, in space or cause the smaller body to wobble slightly.

Orcagna or **Arcagnolo,** c.1308–1368, Florentine painter, sculptor, and architect; b. Andrea di Cione. The figures in his famous altarpiece *Christ in Glory with Saints Thomas and Peter* (Santa Maria Novella, Florence) are Byzantine types. He was chief architect of the cathedral at Orvieto.

orchestra and orchestration. An orchestra is a musical ensemble, under the direction of a conductor, employing four classes of instruments: the STRINGED INSTRUMENTS, which convey the melody and the expressive qualities of the music; the woodwinds, adding color and, in some passages, the melody; the brass, adding dynamic sound (see WIND INSTRUMENTS); and the PERCUSSION INSTRUMENTS, those used to emphasize rhythm. The strings, except the harp, have several players for each part, the others usually only one. The orchestra in the modern sense did not exist before the 17th cent. Earlier instrumental music was chamber music, and parts were not assigned to specific instruments. The first known example of specific orchestration occurs in the *Sacrae symphoniae* (1597) of Giovanni Gabrieli (see under GABRIELI, ANDREA). MONTEVERDI's *Orfeo* (1607), one of the first OPERAS, demands a large, varied group of instruments. Throughout the BAROQUE period, orchestras were small, and the basso continuo was an integral part of the scoring, requiring that a harpsichord or other chord-playing instrument fill in the harmonies above the FIGURED BASS. In the latter half of the 18th cent. the continuo fell out of use, and by the late works of F.J. HAYDN and W.A. MOZART the classical orchestra was standardized. The 19th cent. saw major mechanical improvements in instruments, and the size of the orchestra expanded. Composers of the 20th cent. have generally preferred a moderate-sized orchestra and have been interested in diverse instrumental combinations (often stressing percussion) and the original exploitation of the instruments' capabilities. For a list of selected American symphony orchestras, see table.

orchid, name for the Orchidaceae, a large family of perennial herbs distributed worldwide, but most abundant in tropical and subtropical forests. The family includes many EPIPHYTES and SAPROPHYTES. Orchid flowers have three petals and three sepals, the central one modified and specialized to secrete insect-attracting nectar. The diverse flower forms are apparently complicated adaptations for



Typical seating plan of a symphony orchestra

POLLINATION by specific insects. Orchids are highly prized ornamentals. Many are native to North America, and most are bog plants or flowers of moist woodlands and meadows, e.g., the pink-blossomed lady's-slipper, or moccasin flower (*Cypripedium acaule*). A species of the tropical American genus *Vanilla* is the source of natural VANILLA flavoring.

orders of architecture. In classical styles of architecture, columnar types fall in general into five so-called classical orders: Doric, Ionic, Corinthian, Composite, and Tuscan. Each comprises the column and the entablature, and each has a distinctive character as to proportions and detail. The Roman writer Vitruvius attempted to formulate the proportioning of the three Greek orders. Doric, the earliest, was used for the PARTHENON and most Greek temples. The Doric column, thought to have developed from earlier wood construction, was massive, fluted, without a base, and topped with a simple capital; the entablature was also fairly plain. The Ionic order, largely Asiatic in origin, had a scroll-shaped capital above a more slender, fluted column; the entablature was more intricate than that of the Doric. In Greece, the only major example of the Ionic is the ERECHTHEUM. The third Greek order, the Corinthian, was little used until the Romans adopted it. It was the latest (fully developed in the 4th cent. B.C.) and the most ornate. The delicate, foliated details of the capital are its distinctive feature. The Romans used it widely in monumental architecture and developed a variant, or Composite, order that combined the Corinthian foliate pattern with a molding similar to the Ionic. The 16th-cent. Italians established a simplified form of Doric, or Tuscan, order, with unfluted columns and unadorned capital and entablature. The Renaissance saw variations of the orders, but during the CLASSIC REVIVAL strict adherence to the Greek and Roman originals was the rule.

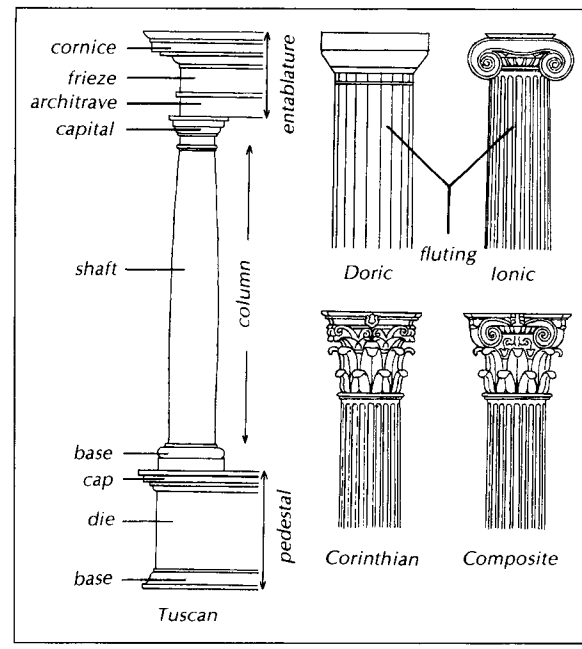
Ordinance of 1787, in U.S. history, adopted by the Congress of Confederation to create and govern the NORTHWEST TERRITORY. It marked the beginning of Western expansion in the U.S. and set the form by which territories became states. It provided for an elected legislature when the population totaled 5,000 voting citizens, and for statehood when the population reached 60,000.

Ordovician period: see GEOLOGIC ERA (table).

ore, metal-bearing MINERAL mass that can be profitably mined. Nearly all rocks contain some metallic minerals, but often the concentration of metal is too low to justify MINING. Ores often occur in veins in rock, varying in thickness from fractions of an inch to several hundred feet. Minerals with no commercial value, called gangue minerals, are usually found mixed with the ore in the vein. Recovering minerals from their ores is one area in the field of METALLURGY.

oregano, name for several herbs used in cooking. Plants of the genus *origanum,* of the MINT family, are the usual sources of the spice sold as oregano in the U.S. and Mediterranean countries. The flavor is similar to that of MARJORAM but slightly less sweet. A related herb, *Coleus amboinicius,* is known as oregano in Mexico and the Philippines.

Oregon, one of the northwestern states of the U.S.; bordered by Washington across the Columbia R. (N), Idaho (E), Nevada and California (S), and the Pacific Ocean (W).



Orders of architecture

Area, 96,981 sq mi (251,181 sq km). *Pop.* (1990) 2,842,321, an 8% increase over 1980 pop. *Capital,* Salem. *Statehood,* Feb. 14, 1859 (33d state). *Highest pt.,* Mt. Hood, 11,239 ft (3,428 m); *lowest pt.,* sea level. *Nickname,* Beaver State. *Motto,* The Union. *State bird,* Western meadowlark. *State flower,* Oregon grape. *State tree,* Douglas fir. *Abbr.,* Oreg.; OR.

Land and People. Much of Oregon is covered by highlands, including the COAST RANGES, located inland from the Pacific; the CASCADE RANGE, which runs north to south through the state farther east; and the COLUMBIA PLATEAU, in the northeast. The most extensive lowlands are the river valleys of the COLUMBIA and its major tributary, the Willamette. Almost 50% of the land is controlled by the federal government. Rainfall is frequent in the west, while dry air and continental climate prevail in the east. About 70% of the population lives in urban areas, principally PORTLAND, the largest city; EUGENE; and SALEM. In 1990 the state's population was about 93% white.

Economy. Oregon's farms are famous for their apples and other fruits; greenhouse products, hay, wheat, cattle, dairy products, potatoes, and peppermint are also valuable agricultural products. Lumbering is the state's leading industry, and wood products its major manufacture. About half of the land is covered by pine forests, and Oregon has been the country's foremost lumbering state since 1950. Food processing, printing and publishing, and the manufacture of machinery, fabricated metals, and paper are also important. Oregon's salmon-fishing industry is one of the world's largest; other principal catches are tuna and crabs. Oregon's beaches, lakes, mountains, and scenic sites such as Crater Lake National Park (see NATIONAL PARKS, table) attract tourists year-round.

Government. The constitution (adopted 1857) provides for a governor serving a four-year term. The legislature consists of a senate whose 30 members are elected to four-year terms and a house with 60 members elected for two-year terms. Oregon is represented in the U.S. Congress by two senators and five representatives and has seven electoral votes.

History. Native American tribes living in the area when Capt. James COOK explored (1778) the coast in search of the NORTHWEST PASSAGE included the Bannock, Chinook, Klamath, and NEZ PERCÉ. The region became the center of an active fur trade, and representatives of John Jacob ASTOR'S AMERICAN FUR COMPANY established (1811) Astoria, the first permanent settlement. New settlers began arriving over the OREGON TRAIL in 1842–43. The region, which had

been controlled jointly by the U.S. and Great Britain, became the center of the "Oregon controversy," which was resolved (1846) with the fixing of the Canadian-U.S. boundary at the 49th parallel. The arrival of the railroads (1880s) facilitated marketing of the state's lumber and wheat. Post–World War II industrial expansion has been closely tied to the construction of huge power projects, such as Bonneville Dam (completed 1943), on the Columbia, which provide abundant hydroelectricity. Because of Oregon's heavy reliance on lumbering, its economy has been severely affected by cyclical downturns in the nation's building industry. Oregon has been a leader in programs to protect the state's environment, but some environmental issues have divided its citizens, as in the 1980s and early 90s when protection of the endangered spotted owl caused a halt to some logging activities. High-technology firms migrated from California to Oregon during the late 1980s and early 90s.

Oregon Trail, route used (1840s to 70s) by Western settlers in the U.S. to reach the Oregon Territory. Their wagon trains generally started at Independence or Westport, Mo., traveled NW along the Platte and N Platte rivers to Fort Laramie, Wyo., and crossed the Rocky Mts. by the South Pass to the Colorado R. basin. The Oregon Trail continued SW to Fort Bridger, where the Mormon Trail diverged to the southwest, and then ran NW, via the Snake R., Blue Mts., and Columbia R., to the Willamette valley. It totaled c.2,000 mi (3,200 km) in length and required about six months for the average wagon train to traverse it. In 1978 it was made a national historical trail.

Orestes, in Greek mythology, son of AGAMEMNON and CLYTEMNESTRA, brother of ELECTRA and IPHIGENIA. The young Orestes was exiled after the slaying of Agamemnon by Clytemnestra and AEGISTHUS. Later he returned and, helped by Electra, killed his mother and her lover. He was pursued by the FURIES until he reached Athens, where he was tried and acquitted by the prime council, the Areopagus. To complete his purification, he took the image of ARTEMIS from Taurus (where he was reunited with Iphigenia) to Greece. His vengeance and expiation are dramatized in AESCHYLUS' *Oresteia.* SOPHOCLES and EURIPIDES also used the story.

Orff, Carl, 1895–1982, German composer and educator. His best-known work is *Carmina Burana* (1937), a secular ORATORIO derived from medieval German and Latin poems. His system for teaching music to children, based on rhythmic and verbal patterns and the pentatonic scale, is widely used.

organ, musical wind instrument in which sound is produced by one or more sets of pipes, each producing a single pitch by means of a mechanically or electrically controlled wind supply. Several keyboards (manuals) are played with the hands. Projecting knobs (stops) to the sides of the keyboard operate wooden sliders that pass under the mouths of a rank of pipes to "stop" a particular rank. The pedals of the organ are like another keyboard, played with the feet. The prevailing organ for several centuries from the 3d cent. B.C. was the Greek *hydraulos.* Organs in the Middle Ages already had several ranks of *diapason* pipes, their timbre characteristic only of the organ. The 15th cent. added stops, including those imitative of other instruments, e.g., flute. Organ building reached a peak in the German BAROQUE, then declined. The 19th cent. obscured diapason tone by adding stops imitative of orchestral sound and by the use of crescendo. While the early 20th cent. developed electrification of the mechanical parts of the organ, Albert SCHWEITZER and others led a movement back to baroque ideals.

organic chemistry, branch of CHEMISTRY dealing with CARBON compounds. Of all the elements, carbon forms the greatest number of different compounds; moreover, compounds that contain carbon are about 100 times more numerous than those that do not. Compounds containing only carbon and HYDROGEN are called HYDROCARBONS. Organic compounds containing NITROGEN are of great importance to BIOCHEMISTRY. Organic chemistry is of importance to the petrochemical, pharmaceutical, and textile industries; in textiles a prime concern is the synthesis of new organic molecules and POLYMERS.

organic farming, farming practices that exclude or avoid synthetic PESTICIDES, FERTILIZERS, growth regulators, and feed additives. Organic farmers prefer biological pest control, manure, and practices such as rotation of crops to supply plant nutrients and control pests. Interest in organic farming has been fostered by awareness of the dangers caused by INSECTICIDES and the excessive use of chemical fertilizers. See also ENVIRONMENTALISM.

Organization for Economic Cooperation and Development (OECD), international organization, formed in 1961, superseding the Organization for European Economic Cooperation. The organization has 24 full members, including Australia, Britain, Canada, France, Germany, Japan, and the U.S. Members pledge to work to promote economic growth, aid developing nations, and expand world trade. The headquarters are in Paris.

Organization of African Unity (OAU), organization (est. 1963) to promote unity, development, and defense of African states; eradicate colonialism; and coordinate economic, health, and other policies. There are 52 members.

Organization of American States (OAS), regional agency (est. 1948) to promote peace and development in the Americas. It succeeded the Pan-American Union, which became the secretariat of the OAS. The inter-American program of economic assistance called the Alliance for Progress, proposed by Pres. John KENNEDY, was created within the OAS framework in 1961. The OAS has sought to settle disputes between member nations and has discouraged foreign intervention in their internal affairs, but in the early 1990s it began to actively oppose the overthrow of democratic governments, calling for an embargo on trade with HAITI after an army coup. The OAS has 35 members, but Cuba has been excluded from participation since 1962.

Organization of Petroleum Exporting Countries (OPEC), organization (est. 1960) coordinating petroleum policies of most of the major THIRD WORLD oil-producing nations. Its members are Algeria, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, United Arab Emirates, and Venezuela. During the 1970s its members, acting as a cartel, raised oil prices sharply, causing shortages, inflation, and other problems in the oil-importing nations. Since then, however, OPEC's ability to affect oil prices has diminished.

organized crime, nationally (sometimes internationally) coordinated criminal activities. In the U.S., the term was first applied during PROHIBITION to the operations of local gang leaders, such as Al CAPONE in Chicago, who built criminal organizations on the profits of bootlegging. Organized crime has since moved into gambling, narcotics trafficking, labor racketeering, and many other activities. Under Lucky Luciano, an interstate "Syndicate" with strong political connections was put together in the 1930s. Murder, Inc., a band of professional killers, served as its enforcement arm until a legal crackdown occurred (1940–41). Despite Sen. Estes KEFAUVER's investigations (1950–51) and later law-enforcement efforts, organized crime continues to flourish, often hiding or supplementing its profits through legal "front" operations. The MAFIA, of Sicilian origin, has played an important role in the evolution of U.S. organized crime. Criminal organizations have also flourished in other countries, e.g., the yakuza of Japan and the cocaine "cartels" of Colombia.

organometallic chemistry, branch of CHEMISTRY concerned with substances that contain an organic compound or fragment bound to a metal atom or ion by a metal-carbon bond; by tradition compounds containing a metal-hydrogen bond are also included. Because organometallic compounds exhibit unique properties, organometallic chemistry is differentiated from both ORGANIC CHEMISTRY and INORGANIC CHEMISTRY. Organometallic chemistry, especially that employing organomagnesium compounds, is used to synthesize many organic compounds and has been important in the development of silicone polymers, polyvinyl chloride, and polyethylene. Many organometallic compounds, such as tetraethyl lead, formerly used in GASOLINE, and the alkyls produced by fish that have consumed mercury, are highly toxic, primarily because of the metal they contain.

Origen (Origines Adamantius), 185?–254?, Christian philosopher; b. Egypt. Origen taught in Alexandria for 28 years and became famed for his profound interpretations of the Scriptures. He attempted to synthesize the principles of Greek philosophy, particularly NEOPLATONISM and STOICISM, with those of Christianity. The most influential theologian of the early church, he is said to have written 800

works, of which few survive. His system of philosophy is contained in *On First Principles.*

Orinoco, river, Venezuela, flowing south c.1,600 mi (2,600 km) from Mt. Délgado Chalbaud, in the Guiana Highlands, to a very large, marshy delta in the northeast. The volume of flow varies markedly with the seasons. Ciudad Bolívar is the principal city on the river, which is connected to the AMAZON R. system by the Casiquiare, a natural canal.

oriole, name for various perching BIRDS of the Old World (family Oriolidae) and New World (family Icteridae). The European oriole is allied to the CROW, while the small American oriole is related to the BLACKBIRD and MEADOWLARK. Swift fliers with clear calls, orioles feed on fruit, mainly berries, or insects. Both Old World and New World orioles have orange and black (or brown) markings.

Orion [ōrī'ən], in Greek mythology, Boeotian hunter. While drunk he raped his betrothed, Merope, and was then blinded by her father. His vision was restored by the rays of the sun. At his death ARTEMIS turned him into a constellation.

Oriya [ôrē'yə], language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See LANGUAGE (table).

Orizaba: see CITLALTÉPETL.

Orkney Islands (1991 pop. 19,450), 376 sq mi (974 sq km), N Scotland, an archipelago of about 70 islands in the Atlantic Ocean and the North Sea. Less than half of the islands are inhabited. Fishing, farming, and the exploitation and processing of nearby North Sea oil deposits are the principal industries. Ruled by Viking, then Scottish, earls, the Orkneys passed to the Scottish crown in 1472.

Orlando, Vittorio Emanuele, 1860–1952, Italian statesman. As Italian premier (1917–19), he was one of the "Big Four" leaders at the Paris Peace Conference (1919), where he demanded territorial compensation for Italy in Dalmatia. Meeting stiff opposition from U.S. Pres. WILSON, he temporarily left the conference. When his demand was still not met, he resigned as premier. Opposed to Fascism, he gave up (1925) his seat in the Italian parliament. After World War II he served as a senator (1948–52).

Orlando, city (1990 pop. 164,693; met. area 1,072,748), seat of Orange co., central Fla.; inc. 1875. It is a resort city, and the trade and shipping center for a citrus fruit and farm area. Aerospace and electronic industries and naval facilities provide employment. The Universal Studios theme park is in Orlando; Sea World and Walt Disney World, including Epcot (Experimental Prototype Community Of Tomorrow) Center and Disney-MGM Studios Theme Park, are a short distance SW of the city.

Orléans, family name of two branches of the French royal line. The house of Valois-Orléans was founded by **Louis, duc d'Orléans,** 1372–1407, brother of CHARLES VI of France. Louis's assassination, ordered by JOHN THE FEARLESS, duke of Burgundy, caused a civil war between the Orléanists, or Armagnacs, and the Burgundians. Louis's son **Charles, duc d'Orléans,** 1391–1465, became the titular head of the Armagnacs. He was captured (1415) by the English at Agincourt and remained a captive until 1440. Charles's son ascended the French throne (1498) as LOUIS XII, but he died without a male heir. The modern house of Bourbon-Orléans (see BOURBON) was founded by **Philippe I, duc d'Orléans,** 1640–1701, a brother of LOUIS XIV. A notorious libertine, he was excluded from state affairs. His son, **Philippe II, duc d'Orléans,** 1674–1723, regent of France (1715–23) in the minority of LOUIS XV, distinguished himself in the wars of the GRAND ALLIANCE and the SPANISH SUCCESSION. To solve the financial crisis, Orléans called on John LAW, but Law's schemes collapsed in 1720. Social life during his regency reached an apex of licentiousness. The ambitions of the regent and of his descendants brought the house of Orléans into open opposition to the ruling house. The regent's great-grandson, **Louis Philippe Joseph, duc d'Orléans,** 1747–93, known as **Philippe Égalité,** supported the FRENCH REVOLUTION, voted to execute Louis XVI, and was himself guillotined during the REIGN OF TERROR. His adherents, the Orleanists, who sought a compromise between monarchical and revolutionary principles, came to power in the JULY REVOLUTION of 1830 and put Philippe Égalité's son LOUIS PHILIPPE on the French throne. After his fall (1848), they continued to support the claims of his descendants, the Orleanist pretenders. Their prospects, high under the presidency of Marshal MACMAHON, dwindled steadily, especially after the Third Republic exiled all pretenders in 1886. Louis Philippe's grandson **Louis Philippe Albert d'Orléans, comte de Paris,** 1838–94, fought on the Union side in the U.S. Civil War. He relinquished his claims to the legitimist pretender, Henri de Chambord (1873), but on Chambord's death (1883) he became head of the entire house of Bourbon. His son **Louis Philippe Robert, duc d'Orléans,** 1869–1926, succeeded his father as pretender in 1894. Born in England, he served briefly in the Indian army and traveled widely. He died childless, and his pretensions to the French throne passed to a cousin and his heirs.

Orléans, city (1990 pop. 105,111), capital of Loiret dept., N central France, an industrial and transportation center. First inhabited by the Celtic Carnutes, the city revolted against Julius CAESAR (52 B.C.) and was burned. It repelled (451) Attila but fell (498) to CLOVIS I. In the 10th cent. it became an important part of the royal domain. In 1429, during the HUNDRED YEARS WAR, JOAN OF ARC lifted the English siege of Orléans. Many historic buildings were destroyed in World War II, and the city has been extensively rebuilt, utilizing traditional architectural styles.

Orlon: see SYNTHETIC TEXTILE FIBERS.

Ormandy, Eugene, 1899–1985, American conductor; b. Hungary. He came to the U.S. in 1921, joined the Philadelphia Orchestra in 1936, and became its music director (1938–80). Ormandy is noted for his romantic interpretations.

Oromo or **Galla,** Hamitic pastoral people of W and S Ethiopia and Kenya, numbering about 20 million. They are largely Muslim. They have inhabited the Ethiopian highlands since the 16th cent., having come there from Somalia. The Oromo have historically maintained small-group autonomy from the Ethiopian government.

Orozco, José Clemente [ōrō'skō], 1883–1949, Mexican painter, one of the leaders of the Mexican renaissance. His boldly painted works often deal with social themes. He was noted for his FRESCOES, e.g., the mural *Mankind's Struggle* (1930; New School for Social Research, N.Y.C.).

orphan drug, drug developed under the U.S. Orphan Drug Act (1983) to treat a disease that affects a relatively small number of people. The terms of the orphan drug law offer tax breaks and a seven-year monopoly on drug sales to induce companies to undertake development and manufacturing of such drugs, which otherwise might not be profitable. The law has led to the introduction of valuable new drugs for the treatment of rare diseases, but some drug companies have been accused of abusing the law's provisions by making inordinately high profits on orphan drugs under monopoly.

Orpheus [ôr'fēəs, ôr'fyōōs], in Greek mythology, Thracian musician; son of the MUSE Calliope by APOLLO or by Oeagrus, a king of Thrace. He is said to have played the lyre so beautifully that he charmed the beasts, trees, and rivers. He married the nymph Eurydice, and when she died he descended to HADES to search for her. He was allowed to return with her on condition that he not look back at her, but he disobeyed and lost her forever. Grief-stricken, he wandered for years. In one legend, he worshiped Apollo above DIONYSUS, who caused the Thracians to tear him to pieces. Orpheus was celebrated in the ORPHIC MYSTERIES.

Orphic Mysteries or **Orphism,** religious cult of ancient Greece, ascribed to Orpheus. The Orphics affirmed the divine origin of the soul, but also the dual aspect of human nature as good and evil. They believed that through initiation into the Orphic MYSTERIES and through the process of transmigration, the soul could be liberated from its inheritance of evil and achieve eternal blessedness. Orphism followed a strict ethical and moral code and adopted practices such as VEGETARIANISM for purification.

Orr, Bobby (Robert Orr), 1948–, Canadian hockey player. He ranked as the National Hockey League's finest defenseman while with the Boston Bruins (1967–76). Three times the league's most valuable player, he was the first defenseman to score 100 points in a season, and his 102 assists (1970–71) set a record. Orr played for the Chicago Blackhawks from 1976 to 1979.

Ørsted, Hans Christian: see OERSTED, HANS CHRISTIAN.

Ortega y Gasset, José [ôrtä'gä ē gäsĕt'], 1883–1955, Spanish essayist and philosopher. A professor of metaphysics at the Univ. of Madrid, he sought to establish the ultimate reality in which all else was rooted. He gained world fame with *The Revolt of the Masses*

Bobby Orr

(1929), which contends that the masses must be directed by an intellectual minority, or chaos will result.

orthodontics: see DENTISTRY.

Orthodox Eastern Church, community of Christian churches, independent but mutually recognized, originating in E Europe and SW Asia through a split with the Western church. They agree in accepting the decrees of the first seven ecumenical councils and in rejecting the jurisdiction of the pope. Orthodox and Roman Catholics view each other as schismatic, but consider the Nestorian, Coptic, and Jacobite churches heretical. The split between East and West began in the 5th cent. and became definite only with the condemnation of the patriarch of Constantinople by Pope LEO IX (1054). The CRUSADES embittered feelings, and many attempts at reunion since have failed. Eastern church liturgy is always sung and is not usually celebrated daily as in the West, and communion is given in a spoon. Parish priests may marry; bishops and monks may not. The term *Greek Church* may be used very loosely and is best confined to the patriarchate of Constantinople, the Church of Greece, and churches using the Byzantine rite (liturgy in Greek). Among the national churches, the most ancient is the Church of Cyprus, and the most important is the Russian Orthodox Church. The latter was first under Constantinople, but a patriarchate was set up in Moscow in 1589. The rite is in Old Church Slavonic. After the Russian Revolution the church suffered greatly and went into an eclipse, but a new patriarch was elected in 1943. After World War II, Communist influence greatly weakened the Orthodox churches in Bulgaria, Yugoslavia, Romania, and Poland. With the collapse of Communist rule in the countries of E Europe during the late 1980s and early 1990s, many Orthodox churches revived and gained new members. The U.S. has several Orthodox churches with ties to Old World churches. Several observers from Orthodox churches attended the Second VATICAN COUNCIL in 1962, and afterward most agreed to open a dialogue with Rome as equals.

Orthodox Judaism: see JUDAISM.

orthopedics, medical specialty concerned with deformities, injuries, and diseases of the BONES, joints, ligaments tendons, and MUSCLES. It includes surgical treatment for fractures bone grafting, joint and limb replacement, and the fitting of braces or other appliances.

Orton, Joe, 1933–67, British playwright. His plays, which are often farces, are characterized by violence, decadence, and attacks on establishment values, but are written in a smooth, sophisticated, powerful prose. They include *Entertaining Mr. Sloane* (1964), *Loot* (1966), and *What the Butler Saw* (1969). He was killed during a lover's quarrel.

Orwell, George, pseud. of **Eric Arthur Blair,** 1903–50, English writer. Many of his works, like *Down and Out in Paris and London* (1933), *The Road to Wigan Pier* (1937), and *Homage to Catalonia* (1938), are autobiographical and sociopolitical. *Animal Farm* (1946) is a fable about the failure of communism, and his prophetic novel *Nineteen Eighty-Four* (1949) depicts a totalitarian world. His literary essays are highly regarded.

oryx: see ANTELOPE.

Os, chemical symbol of the element OSMIUM.

Osage, indigenous people of North America (see NORTH AMERICA, INDIGENOUS PEOPLES OF) with a Siouan language of the Hokan-Siouan stock (see NATIVE AMERICAN LANGUAGES). They migrated from their prehistoric home in the Ohio valley to the Osage R. region in Missouri, where they had a typical Plains culture except that half the tribe were vegetarians. In 1810 the 5,500 Osage began to cede their lands to the U.S. and moved to a reservation in Oklahoma. They now own land individually, and the discovery of oil on the reservation has made them one of the wealthiest tribes in the U.S. In 1990 there were 9,527 Osage in the U.S.

Osaka, city (1990 pop. 2,623,831), capital of Osaka prefecture, S Honshu, Japan. The third largest city in Japan and a major port, Osaka is the focal point of a chain of industrial cities (called the *Hanshin* or *Kinki*), with machinery, electrical equipment, metals, textiles, and chemicals among the chief industries. Osaka is known for its puppet and other theaters and for its universities. Landmarks include the Buddhist temple of Shitennoji, founded 593; Temmangu, a Shinto shrine founded in 949; and HIDEYOSHI's castle (reconstructed 1931).

Osborne, John (James), 1929–, English dramatist. His *Look Back in Anger* (1956), about a restless young working-class man at war with himself and society, became the seminal work of the so-called angry young men, a group of rebellious English writers of the 1950s. Later plays include *The Entertainer* (1957), *Inadmissable Evidence* (1964), *Time Present* (1968), *Watch It Come Down* (1976), and *Déjà vu* (1991). He has also written screenplays, e.g., *Tom Jones* (1963; Academy award).

Oscan [ŏs'kən], extinct language belonging to the Italic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Osceola, c.1800–1838, leader of the SEMINOLE who denounced 1832 and 1833 treaties requiring Native Americans to move west. After his warriors killed (1835) an Indian agent, Wiley Thompson, U.S. troops under Gen. Jesup drove Osceola's band southward to the Everglades. In response to peace overtures he went (1837) under a flag of truce to meet Jesup, who had him seized and imprisoned at Fort Moultrie, S.C., where he died.

oscilloscope, device based on a CATHODE-RAY TUBE used to produce a visual display of electrical signals. Typically the horizontal position of the illuminated point is controlled by the value of the independent variable (often time), while the vertical position is controlled by the dependent variable. A third signal is often used to control the brightness of the point.

Osee: see HOSEA.

Oshawa [ŏsh'əwə], city (1991 pop. 129,344), SE Ontario, on Lake Ontario, part of the regional municipality of Durham (1991 pop. 409,070). The production of automobiles, begun by the McLaughlin family in 1907 and taken over by General Motors in 1918, dominates the local economy. Oshawa was founded (1795) at the site of a French fur-trading post.

Osiris, in EGYPTIAN RELIGION, legendary ruler of predynastic Egypt and god of the underworld. Osiris symbolized the creative forces of nature and the imperishability of life. Called the great benefactor of humanity, he brought to the people knowledge of agriculture and

civilization. In a famous myth he was slain by his evil brother Set, but his death was avenged by his son HORUS. The worship of Osiris, one of the great cults of ancient Egypt, gradually spread throughout the Mediterranean world and, with that of ISIS and Horus, was especially vital during the Roman Empire.

Oslo, city (1990 pop. 458,456), capital of Norway, SE Norway, at the head of a fjord of the Skagerrak. It is Norway's largest city; main port; and chief commercial, industrial, and transportation center. Founded c.1050 by HAROLD III, it became the national capital in 1299. It was rebuilt after being razed by fire in 1624. It came under HANSEATIC LEAGUE domination in the 14th cent. Oslo's modern growth dates from the 19th cent. During WORLD WAR II it was occupied (1940–45) by Germany. In the modern city, government-sponsored modern art shares attention with the medieval Akerskirke and Akershus fortress and the royal palace (1848). The city was the site of the 1952 Olympic winter games.

osmium (Os), metallic element, discovered by Smithson Tennant in 1804. It is a very hard and dense, brittle, lustrous, bluish-white metal found in platinum ores. Its tetroxide is used as a stain in microscopy, in fingerprint detection, and as a catalyst. Osmium alloys are used in fountain-pen points and instrument bearings. See ELEMENT (table); PERIODIC TABLE.

osmosis, spontaneous transfer of a liquid solvent through a semipermeable membrane that does not allow dissolved solids (solutes) to pass. Osmosis refers only to the transfer of solvent; transfer of solute is called DIALYSIS. In either case, the direction of transfer is from the area of higher CONCENTRATION of the material transferred to the area of lower concentration. If a vessel is separated into two compartments by a semipermeable membrane, if both compartments are filled to the same level with a solvent, and if solute is added to one side, then osmosis will occur, and the level of the liquid on the side containing the solute will rise. If an external pressure is exerted on the side containing the solute, the transfer of solvent can be stopped. The minimum pressure to stop solvent transfer is called the osmotic pressure. Osmosis plays an important role in the control of the flow of liquids in and out of a living CELL.

osprey, BIRD of prey related to the HAWK and the New World VULTURE, found near water in much of the world. The American osprey, or fish hawk (*Pandion haliaetus*) has a wingspan of 5 to 6 ft (152 to 183 cm) and feeds solely on live fish.

Ossian [ŏsh'ən] or **Oisin** [əshēn'], legendary Gaelic poet, supposed son of FINN MAC CUMHAIL. One cycle of Ossianic poetry treats Finn and his 3d-cent. exploits, a second tells of the hero Cuchulain. In the 1760s the Scottish poet James MACPHERSON represented his own work as Ossian's.

Ossietzky, Carl von, 1889–1938, German pacifist. Arrested (1932) for exposing the secret rearmament of Germany in his antimilitarist weekly, *Weltbühne,* he was moved to a concentration camp after Hitler's rise to power in 1933. When he was awarded the 1935 Nobel Peace Prize, the German government protested and barred all Germans from future acceptance of any Nobel Prize. Ossietzky died in prison.

Ostade, Adriaen van [vän ô'städə], 1610–85, Dutch genre painter. Trained in Frans HALS's studio, he created good-humored depictions of village and peasant life. Later, influenced by REMBRANDT, he used a warmer palette and deeper high contrast effects. Among his many works is *The Old Fiddler* (Metropolitan Mus.). He did over 1,000 oils, and about 50 graphic works. His brother and pupil, **Isaak van Ostade,** 1621–49, created many fine winter landscapes and pastoral scenes.

Ostend Manifesto, document drawn up (1854) by three U.S. ministers at Ostend, Belgium, suggesting that the U.S. should take Cuba by force if Spain refused to sell it. The three Americans—James BUCHANAN, John Y. Mason, and Pierre SOULÉ—were proslavery Democrats acting at the behest of Secy. of State William L. Marcy. When the secret manifesto was made public and denounced in the press as a plot to extend slavery, Marcy repudiated it for the U.S. government.

osteomyelitis, acute or chronic infection of the bone and bone marrow characterized by pain, high fever, and an ABSCESS at the site of infection. The infection, which may be caused by a variety of microorganisms, reaches the bone through an open wound or fracture or through the bloodstream. Treatment includes ANTIBIOTICS and sometimes surgery.

osteopathy, practice of therapy based on manipulation of bones and muscles. Osteopaths maintain that the normal body produces forces necessary to fight disease and that most ailments are due to the misalignment of bones and other faulty conditions of the muscle tissue and cartilage. Osteopathy was founded in the U.S. in 1874 by Andrew Taylor Still.

osteoporosis, disorder in which the normal replenishment of old bone tissue is disrupted, as it usually is throughout life, resulting in weakened bones and increased risk of fracture. It is most common in white women after MENOPAUSE, although it can also occur in younger women and men. It is aggravated by a variety of factors, including smoking, excessive alcohol consumption, and a sedentary lifestyle. Lost bone cannot be replaced, but treatment, including calcium supplements, exercise, and (after MENOPAUSE) ESTROGEN replacement, can prevent further bone loss.

Ostia, ancient city of Italy, at the mouth of the Tiber. Founded (4th cent. B.C.) as a protection for Rome, it became a Roman port. From the 3d cent. A.D. it declined.

Ostrava, city (1990 est. pop. 331,000), NE Czech Republic, near the junction of the Oder and Ostravice rivers. In the heart of the Czech Republic's major industrial area, Ostrava produces coal, iron, steel, railroad cars, and automobiles. It is the site of several hydroelectric stations.

ostrich, large, flightless BIRD (*Struthio camelus*) of Africa and parts of SW Asia, related to the RHEA and EMU; the largest living bird. Some males reach 8 ft (244 cm) in height and weigh from 200 to 300 lb (90 to 135 kg). The male is black, with long white plumes on wings and tail; the female is grayish brown. Ostriches can run at great speeds. They are raised commercially for skins, meat, and feathers.

Ostrogoths or **East Goths,** a division of the Goths, one of the chief groups of ancient GERMANS. In the 3d cent. the Goths split into VISIGOTHS, or West Goths, and Ostrogoths, who were subjects of the HUNS until 453. The Ostrogoths then settled in Pannonia (modern Hungary) as allies of the Byzantine Empire. Their ruler, Theodoric the Great, defeated ODOACER (493) and set up the Ostrogothic kingdom of Italy. After the murder (535) of Theodoric's daughter, Amalasuntha, who as regent for her son was under Byzantine protection, JUSTINIAN I reconquered Italy through his generals BELISARIUS and NARSES. When Narses defeated (552) an Ostrogothic revolt under TOTILA, the Ostrogothic kingdom was crushed.

Ostrovsky, Aleksandr Nikolayevich [əstrôf'skē], 1823–86, Russian dramatist. Most of his plays depict patriarchal family life; all but eight are in blank verse. His masterpiece is the tragedy *The Storm* (1860). The composers JANÁČEK, RIMSKY-KORSAKOV, and TCHAIKOVSKY drew upon his work.

Ostwald, Wilhelm [ôst'vält], 1853–1932, German physical chemist and natural philosopher; b. Latvia. He won the 1909 Nobel Prize in chemistry for his work on catalysis, equilibrium, and rates of reaction. He also studied color and originated the **Ostwald process** for preparing nitric acid. In this process, ammonia mixed with air is heated and led over a catalyst (platinum). It reacts with oxygen to form nitric oxide, which is then oxidized to nitrogen dioxide; this in turn reacts with water to form nitric acid.

Otis, Elisha Graves, 1811–61, American inventor; b. Halifax, Vt. From his invention (1852) of an automatic safety device to prevent the fall of hoisting machinery he developed the first passenger ELEVATOR (1857), a basic step in the development of the SKYSCRAPER.

Otis, James, 1725–83, American colonial political leader; b. Barnstable co., Mass. As leader of the radical wing of the American opposition to Britain, he defended colonial rights. Otis helped Samuel ADAMS draft the circular letter to other colonies denouncing the TOWNSHEND ACTS (1767).

Otomí [ōtōmē'], a Macro-Otomanguean language spoken by an indigenous people of Mexico. See NATIVE AMERICAN LANGUAGES (table).

Ottawa, indigenous people of the Eastern Woodlands (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). From their traditional home N of the Great Lakes they migrated to

the Georgian Bay region, and in the 17th cent. controlled trade with the French on the Ottawa R. Driven away by the Iroquois and SIOUX (see IROQUOIS CONFEDERACY), they dispersed over a wide area. Under PONTIAC they rebelled with other peoples (1763–66) against British rule. The Ottawas remain scattered today. In 1990 there were 7,522 Ottawas in the U.S.

Ottawa, city (1991 pop. 313,987), capital of Canada, SE Ontario, part of the regional municipality of Ottawa-Carleton (1991 pop. 678,147), at the confluence of the Ottawa and Rideau rivers. It functions primarily as a government center but has some industry. Of special interest are the Parliament Buildings, on Parliament Hill; the National Gallery; and the National Arts Center. Ottawa was founded as Bytown in 1825 and acquired its present name in 1854. The city was selected by Queen Victoria in 1858 as the capital of the newly formed United Provinces of Canada, and began to function as such in 1865. It became the capital of modern Canada in 1867.

otter, several aquatic, carnivorous MAMMALS of the WEASEL family, found on all continents except Australia. Common river otters of Eurasia and the Americas (genus *Lutra*) are slender, streamlined, and agile, with thick, brown fur. Otters are social and playful, sliding down mudbanks and snowbanks. The South American giant otter and the sea otter of the Pacific, hunted to near extinction, are now protected.

Otto, rulers of the HOLY ROMAN EMPIRE. **Otto I** or **Otto the Great,** 912–73, emperor (962–73) and German king (936–73), son and successor of Henry I of Germany, is often regarded as the founder of the Holy Roman Empire. He brought Italy, BURGUNDY, and LOTHARINGIA under German control and broke the independence of the duchies. He married Adelaide, the widowed Italian queen, and crowned himself king of the LOMBARDS. Pope JOHN XII, who crowned Otto emperor in 962, soon found Otto too powerful and allied himself with Otto's enemies; he was unsuccessful but established the long tradition of enmity between pope and emperor. **Otto II,** 955–83, emperor (973–83) and German king (961–83), was forced to defend the great empire left him by his father. He put down a revolt by his cousin, the duke of Bavaria; repulsed Danish attacks from the north; and resisted French efforts to annex Lorraine. He was defeated by the Arabs in S Italy, and his failure to expel them greatly diminished the prestige of his empire. His son, **Otto III,** 980–1002, emperor (996–1002) and German king (983–1002), was elected king shortly before his father's death; his mother and then his grandmother acted as regent for him. He installed (996) his cousin as Pope Gregory V, and later made his tutor pope (999) as SYLVESTER II. He attempted to establish his imperial headquarters in Rome, but a Roman mob forced him to flee (1001). He died while trying to regain the city. **Otto IV,** 1175?–1218, emperor (1209–15) and German king, was the son of HENRY THE LION, duke of Saxony. His uncle, RICHARD I of England, had him named antiking to Philip of Swabia in 1178. Philip's murder (1208) was not of Otto's doing, but it revived his cause. He won over the princes and was elected emperor. He had made important concessions to the papacy regarding its Italian territories, but he quickly reverted to the HOHENSTAUFEN policy of dominance. He seized church lands and invaded Sicily, whereupon Pope INNOCENT III excommunicated him (1210). With the help of France and some German nobles, the pope succeeded in deposing him in 1215.

Otto, German kings: see OTTO, rulers of the Holy Roman Empire.

Otto I, 1815–67, first king (1833–62) of the Hellenes (Greece). The second son of Louis I of Bavaria, he was chosen by the European powers to rule over newly independent Greece. Highly unpopular, he was finally forced (1862) to abdicate.

Otto, Nikolaus August, 1832–91, German engineer. Coinventor (1867) of an INTERNAL-COMBUSTION ENGINE, he developed (1876) the four-stroke Otto cycle, widely used for automobile, airplane, and other motors.

Ottoman Empire, vast state founded in the 13th cent. by the Ottoman or Osmani TURKS and ruled by the descendants of Osman I, the empire's first sultan, until its dissolution after world War I. It was the largest of the modern states, extending into Asia, Europe, and Africa; modern TURKEY formed only a part of the empire, but the terms "Turkey" and "Ottoman Empire" are often used interchangeably. The Ottoman state began as one of the many small Turkish states that emerged in Asia Minor as the power of the Seljuk Turks declined. The Ottomans began absorbing those small states as later (14th cent.) they absorbed territory belonging to the BYZANTINE EMPIRE. The great Balkan conquests of the late 14th cent. awoke Europe to the Ottoman threat. In spite of opposition from TIMUR, the Turks, under MUHAMMAD II, conquered Constantinople in 1453 and established it as the Ottoman capital. The Ottoman Empire reached its height in the 16th cent. under SELIM I, who assumed the CALIPHATE after his victories in Syria and Egypt (1516–17), and under SULAYMAN I (the Magnificent), who brought much of the Balkan peninsula, Hungary, Persia, and Arabia under Turkish rule. The Turkish fleet, under BARBAROSSA, became the scourge of the Mediterranean. Despite Sulayman's reforms, Turkey remained a medieval state, and decline set in at his death. The Turkish fleet was destroyed (1571) at Lepanto, and other military defeats followed. Succession to the throne was a continuing problem; fratricide was common within the royal family, and later heirs were protected in luxurious isolation until they assumed the throne. Actual rule fell to the grand viziers, often hereditary, like the KÖPRÜLÜ family, and to the elite JANISSARIES. Corruption and bribery were rampant. Serious disintegration began in the 18th cent. with the RUSSO-TURKISH WARS and continued with the loss of Greece and Egypt in the early 19th cent., when Turkey became known as the Sick Man of Europe. The Western powers feared Russian expansion (see EASTERN QUESTION) and loss of their commercial arrangements. Those arrangements had, in fact, gradually caused the Ottoman Empire to lose its economic independence and to rely almost wholly on foreign capital and loans. An attempt to reform the Turkish government was made with a new constitution in 1876, but this failed when the sultan abolished the constitution. After 1908 the Young Turks, a reformist and nationalist group, were increasingly important. Turkey lost most of its remaining European territories in the BALKAN WARS (1912–13), and World War I confirmed its disintegration. Turkey sided with the losing Central Powers, and in 1918 the peace treaties ending the war formally dissolved the Ottoman Empire. In 1922 Kemal ATATÜRK overthrew the last sultan, and the history of modern Turkey began.

Otto the Great: see Otto I under OTTO, rulers of the Holy Roman Empire.

Ouagadougou or **Wagadugu** [both: wägədōō'gōō], city (1985 pop. 442,223), capital of Burkina Faso. It is a communications and economic center, as well as the market for an agricultural region. The city has rail connections with Côte d'Ivoire and road links with Niger. Founded in the late 11th cent. as the capital of the Mossi empire, it was a center of Mossi power until captured (1896) by the French.

Oudh, historic region of India: see INDIAN MUTINY.

Ouida [wē'də], pseud. of **Louise de la Ramée,** 1839–1908, English novelist. Her many sentimental romances include *Under Two Flags* (1867) and, for children, *A Dog of Flanders* (1872).

Ouwe, Hartmann von: see HARTMANN VON AUE.

ovary: see REPRODUCTIVE SYSTEM.

Overland Park, city (1990 pop. 111,790), Johnson co., NE Kansas, a residential suburb of Kansas City; inc. 1960. A rapidly growing city, it has profited from the regional growth and development in the Kansas City metropolitan area.

over-the-counter, method of buying and selling securities outside the standard STOCK EXCHANGE. The over-the-counter (OTC) market is composed of thousands of far-flung stock and bond dealers and brokers who negotiate most transactions by computer or telephone. For the most part, dealers purchase securities for their own accounts and sell them at a markup. Prices of many U.S. OTC issues are quoted on NASDAQ (National Association of Securities Dealers Automated Quotations), a computerized system.

over-the-counter drugs: see PATENT MEDICINE.

overture, instrumental musical composition written as an introduction to an OPERA, BALLET, ORATORIO, MUSICAL, or play. Early examples were simply symphonic pieces, but by C.W. von GLUCK's time it began to foreshadow what was to come in the opera. In many 19th-cent. operas and 20th-cent. musicals, the overture is a potpourri of the work's music. The concert overture is a composition in one movement.

Ovid (Publius Ovidius Naso) [ŏv'ĭd], 43 B.C.–A.D. 18, Latin poet. His highly perfected elegiacs fall into three groups—erotic poems, mythological poems, and, after he was banished to the Black Sea for unknown reasons in A.D. 8, poems of exile. The love poems include *Amores*, *Letters from Heroines*, and *The Art of Love*. His masterpiece *Metamorphoses*, in hexameters, is his major mythological work. *Fasti* is on myths connected with days of the year; *Tristia* is on the sorrows of exile. Ovid was a major source of inspiration for the RENAISSANCE.

ovum, in biology, specialized female plant or animal sex cell, also called the egg. In higher animals the ovum differs from the SPERM (male sex cell) in that it is larger and nonmotile. Its nucleus contains the CHROMOSOMES, which bear the hereditary material of the parent. Ova are produced in the ovary of the female; they undergo a maturation process that includes MEIOSIS, by which the number of their chromosomes is reduced by half. The union of mature sperm and ovum (see FERTILIZATION), with each bearing half the normal number of chromosomes, results in a single cell (the zygote) with a full number of chromosomes. The zygote eventually becomes a mature individual. The pattern is similar in plants that reproduce sexually. The term *egg* also refers to a complex structure, such as a bird's egg, in which the ovum is swollen with yolk (food material) and the rest of the egg is secreted around the ovum. Development from an unfertilized ovum is called PARTHENOGENESIS. See also REPRODUCTION; REPRODUCTIVE SYSTEM.

Owen, Robert, 1771–1858, British social reformer, a pioneer in the cooperative movement. In 1800 he began to convert old mills in New Lanark, Scotland, into a model industrial town, instigating reforms later reflected in the Factory Act of 1819. Believing that individual character is molded by environment and can be improved in a society based on cooperation, he founded several self-sufficient cooperative agricultural-industrial communities, including, in the U.S., NEW HARMONY, Ind. (1825). His son, **Robert Dale Owen,** 1801–77, b. Scotland, became an American social reformer, the first who publicly advocated BIRTH CONTROL (1830). He was a member of Congress (1843–47) and, in Indiana, secured (1850) extension of property rights for married women and state provision for public schools. After serving (1853–58) as U.S. minister to Naples, he became an active ABOLITIONIST.

Owen, Wilfred, 1893–1918, English poet. Owen, who died on the French front in World War I, wrote of the horror and pity of war in verse that transfigured traditional meter and diction. Siegfried SASSOON published 24 of Owen's poems posthumously (1920).

Owen Glendower, 1359?–1416?, Welsh leader. In 1400 he revolted against HENRY IV of England. Allying himself with the Percy family and with France, he had some military success and summoned (1405) his own parliament, but by 1409 the English had rendered him powerless.

Owens, Jesse, 1913–81, African-American track star; b. Alabama. While at Ohio State Univ. he broke (1935–36) several world records. At the 1936 Olympics in Berlin, Owens upset Hitler's "Aryan" theories by setting world records in the broad jump and the 200-meter race and equaling the record in the 100-meter race. His fourth gold medal came in the 400-meter relays.

owl, nocturnal BIRD of prey found worldwide, belonging to the families Tytonidae and Strigidae. Owls resemble short-necked HAWKS, except that their eyes are directed forward and surrounded by disks of radiating feathers. Their eyes are specially adapted to seeing in partial darkness, and most sleep during the day. Owls' soft, fluffy plumage makes them almost noiseless in flight. They feed on rodents, frogs, insects and small birds. Many usurp the deserted nests of other birds; others live in burrows.

ox: see CATTLE.

oxalis or **wood sorrel,** plant (genus *Oxalis*), usually with cloverlike leaves that respond to darkness by folding back their leaflets. Most cultivated forms are tropical herbs. Wild North American species include the white wood sorrel (*O. acetosella*), a plant identified as the SHAMROCK. True sorrel is a plant of the BUCKWHEAT family.

Oxenstierna, Count Axel Gustaffson, 1583–1654, Swedish statesman. Named chancellor in 1612, he was Sweden's real administrator because GUSTAVUS II was occupied with foreign wars. Oxenstierna tried to keep Sweden out of the THIRTY YEARS WAR. After Gustavus II died in battle (1632) he unified the German Protestant princes and secured France's entry into the war. As leader of the council of regency (1632–44) in the minority of CHRISTINA, Gustavus's daughter, he was virtual ruler of Sweden. He wrote the constitution of 1634, centralizing administration, and directed the war with Denmark (1643–45), in which Sweden gained several Danish provinces. Clashes with Christina diminished his power. After her abdication (1654), which he had opposed, he served her successor, CHARLES X.

Oxford, Edward de Vere, 17th earl of, 1550–1604, English poet. An actor, producer, and court writer, he is believed by some to have written SHAKESPEARE'S plays.

Oxford, city (1991 pop. 110,103), Oxfordshire, S central England. It is famous as the seat of Oxford Univ. (est. 12th cent.). In its suburbs automobiles and steel products are manufactured. During the civil wars (17th cent.) Oxford was the royalist headquarters. It has many historic buildings, including the Ashmolean Museum and the Bodleian Library (see LIBRARY, table).

Oxford, Provisions of: see PROVISIONS OF OXFORD.

Oxford and Asquith, Herbert Henry Asquith, 1st earl of, 1852–1928, British statesman. Entering Parliament as a Liberal in 1886, he supported (1899) the South African War and became prime minister (1908–16). His government put through a social welfare program, including old age pensions (1908) and unemployment insurance (1911), and began a naval buildup. Asquith also secured passage of the Parliamentary Reform Act of 1911, which stripped the House of Lords of its veto power. Dissatisfaction with his leadership in World War I led to his resignation. His second wife, **Margot (Tennant) Asquith,** 1864–1945, was a prominent socialite whose frank autobiography (1920–22) created a sensation.

Oxford Group: see BUCHMAN, FRANK NATHAN DANIEL.

Oxford movement, religious movement begun in 1833 by Anglican clergy at Oxford Univ. to revitalize the Church of England by reviving certain Roman Catholic doctrines and rituals. Among its leaders were J.H. NEWMAN, John KEBLE, and R.H. Froude. Under Newman a series of pamphlets, *Tracts for the Times* (1833–41), were issued that preached Anglicanism as a via media between Catholicism and evangelicalism. The group then became known as Tractarians. Newman's *Tract 90* on the Thirty-nine Articles aroused a storm of controversy and brought the series to an end. The movement began to lose valuable supporters to Roman Catholicism, including Newman and H.E. MANNING. Its leadership passed to E.B. PUSEY, and opponents dubbed the movement "Puseyism." Its clergy, known as Anglo-Catholics, adopted innovations, such as chanting prayers, wearing vestments, and using elaborate ritual within the services. For these actions they were often labeled ritualists. This revival of ceremonial customs caused much public agitation, but the movement exerted a great influence on doctrine, spirituality, and liturgy in the ANGLICAN COMMUNION. It was responsible for the revival of Anglican religious communities and, through an emphasis on social concern, was an antecedent of CHRISTIAN SOCIALISM.

Oxford University, at Oxford, England. One of the world's most prestigious universities, it had its beginnings in the early 12th cent. Its system of residential colleges dates from the mid-13th cent., when University, Balliol, and Merton colleges were founded. Oxford was a leading center of learning in the Middle Ages. There are 35 colleges. Its Ashmolean Museum and Bodleian Library (see LIBRARY, table) are renowned. Oxford's Rhodes scholarships for foreign students were initially financed by a gift from Cecil RHODES.

oxidation and reduction, complementary chemical reactions characterized by the loss or gain, respectively, of one or more electrons by an atom or molecule. When an atom or a molecule combines, or forms a chemical bond, with oxygen, it tends to give up electrons to the oxygen. Similarly, when it loses oxygen, it tends to gain electrons. Oxidation is defined as any reaction involving a loss of electrons, and reduction as any reaction involving the gain of electrons. The two processes, oxidation and reduction, occur simultaneously and in chemically equivalent quantities; the number of electrons lost by one substance is equaled by the number of electrons gained by another substance. The substance losing electrons

(undergoing oxidation) is said to be an electron donor, or a reductant. Conversely, the substance gaining electrons (undergoing reduction) is said to be an electron acceptor, or an oxidant. Common reductants (substances readily oxidized) are the active METALS, CARBON, CARBON MONOXIDE, HYDROGEN, hydrogen sulfide, and sulfurous acid. Common oxidants (substances readily reduced) include the HALOGENS, NITRIC ACID, OXYGEN, OZONE, potassium permanganate, potassium dichromate, and concentrated SULFURIC ACID. See also ANTIOXIDANT.

Oxnard, city (1990 pop. 142,216), S Calif., on the Pacific coast; inc. 1903. Its economy, formerly based on agriculture, mining, and military bases, is growing increasingly industrial and commercial. A navy missile range is nearby. Oxnard is the gateway to an island and forest resort area.

oxygen (O), gaseous element, first isolated (c.1773–74) independently by Joseph PRIESTLEY and Karl SCHEELE. A colorless, odorless, tasteless gas, it is the most abundant element on earth, constituting about half of the surface material. It makes up about 90% of water, two-thirds of the human body, and 20% by volume of air. Normal atmospheric oxygen is a diatomic gas (O_2). OZONE is a highly reactive triatomic (O_3) allotrope of oxygen (see ALLOTROPY). Oxygen forms compounds with almost all of the elements except the inert gases. The common reaction in which it unites with another substance is called oxidation (see OXIDATION AND REDUCTION). The burning of substances in air is rapid oxidation, or combustion. The RESPIRATION of plants and animals is a form of oxidation essential to the liberation of the energy stored in such food materials as carbohydrates and fats. Chief industrial uses are in STEEL production (e.g., in the BESSEMER PROCESS) and the oxyacetylene torch (see ACETYLENE); in medicine it is used to treat respiratory diseases. Liquid oxygen is used in rocket fuel systems. See ELEMENT (table); PERIODIC TABLE.

Oxyrhyncus, excavation site in Upper Egypt, now Behnesa. Important papyrus finds there (1896–97, 1906–7) retrieved lost Greek literary classics, chiefly in Roman and Byzantine scrolls dating from the 1st cent. B.C. to the 10th cent. A.D.

oyster, BIVALVE mollusk found in beds in the shallow, warm waters of all oceans. Except in the free-swimming larval stage, oysters spend their lives attached to substrates of rocks, shells, or roots by means of a cementlike secretion. The pearl oyster, from which the PEARL is obtained, is a large (12-in./30.5-cm) tropical species. The edible American, or common, oyster is harvested commercially in artificial beds on the U.S. coast.

Oz, Amos, 1939–, Israeli novelist. Richly atmospheric and often incorporating elements of fantasy, his novels usually treat the conflicts and tensions in Israeli life. They include *Elsewhere Perhaps* (1966), *My Michael* (1968), *Touch the Water, Touch the Wind* (1973), *A Perfect Peace* (1985), *Black Box* (1988), and *To Know a Woman* (1989).

Ozarks, the, or **Ozark Plateau,** forested upland region, c.50,000 sq mi (129,500 sq km), mostly in Missouri and Arkansas. Referred to locally as mountains, the Ozarks rise prominently from surrounding plains to more than 2,000 ft (600 m) in the rugged Boston Mts. The economy is based on agriculture, lead and zinc mining, and tourism, with subsistence farming and household crafts remaining as features of life in the more isolated areas.

Ozawa, Seiji, 1935–, Japanese conductor, the first prominent in the West. He led the Toronto Symphony (1965–70) and the San Francisco Symphony (1970–76), and was named music director of the Boston Symphony in 1973.

ozone, triatomic OXYGEN (O_3). Pure ozone is an unstable, faintly bluish gas with a characteristic fresh, penetrating odor. It is the most chemically active form of oxygen. Ozone is formed in the OZONE LAYER of the stratosphere (see ATMOSPHERE) by the action of solar ultraviolet light on oxygen; this layer plays an important role in preventing most ultraviolet and other high-energy radiation, which is harmful to life, from penetrating to the earth's surface. Ozone in the lower atmosphere is a pollutant that can damage lung tissue. It is produced by chemical or electrical processes, as when an electric discharge, such as lightning or from electric motors, passes through the air. Commercially, ozone is used as a disinfectant and decontaminant for air and water, as a bleaching agent, and in the production of azelaic acid (used in making plastics). Ozone is manufactured by passing dry air between two electrodes connected to an alternating high voltage.

ozone layer or **ozonosphere,** region of the stratosphere (see ATMOSPHERE) containing relatively high concentrations of OZONE, located at altitudes of 12–30 mi (19–48 km) above the earth's surface. The ozone layer prevents most ultraviolet (UV) and other high-energy radiation from penetrating to the earth's surface but allows sufficient UV to support the activation of vitamin D in humans to reach the earth. The full radiation, if unhindered by this filtering effect, would destroy animal tissue. Ozone in the ozone layer is formed by the action of solar ultraviolet light on oxygen. In 1974 scientists warned that certain industrial chemicals, e.g., CHLOROFLUOROCARBONS (CFCs), HALONS, and carbon tetrachloride, could migrate to the stratosphere where sunlight could free their chlorine atoms to form chlorine monoxide, which would deplete upper-atmospheric ozone. A seasonal decrease, or "hole," discovered in 1985 in the ozone layer above Antarctica was the first confirmation of a thinning of the layer; by 1993 the region of diminished ozone was nearly the size of North America and reached to S South America and S Australia. Less dramatic decreases have been found above other areas of the world, including the U.S. In 1987 an international agreement was reached on reducing the production of ozone-depleting compounds. Revisions in 1992 called for an end to the production of most of such compounds by 1996, and CFC emissions had dropped dramatically by 1993. Recovery of the ozone layer, however, is expected to take 50 to 100 years. Damage to the ozone layer can also be caused by sulfuric acid droplets produced by volcanic eruptions.

The key to pronunciation appears on page xiii.

P

P, chemical symbol of the element PHOSPHORUS.

Pa, chemical symbol of the element PROTACTINIUM.

Pabst, G(eorg) W(ilhelm), 1885–1967, German film director; b. Austria. He used MONTAGE in such works of social realism as *The Joyless Street* (1925), *Pandora's Box* (1929), *Westfront 1918* (1930), and *The Threepenny Opera* (1931).

PAC: see POLITICAL ACTION COMMITTEE.

pacemaker, artificial, device used to stimulate a rhythmic heartbeat by means of electrical impulses. Implanted in the body when the heart's own electrical conduction system does not function normally, the battery-powered device emits impulses that trigger heart-muscle contraction at a rate preset or controlled by an external remote switch.

Pacific, War of the, 1879–84, fought between CHILE and the allied nations of PERU and BOLIVIA. It began when Bolivia rescinded (1879) a contract with a Chilean company to mine nitrates in its territory and Chile, in reprisal, seized the Bolivian port of Antofagasta. Peru was drawn into the war by a defensive alliance with Bolivia. Chilean forces conquered (1879) a Peruvian border province, gained control of the sea, and entered (1881) Lima in triumph. The treaty of Ancón (1883) assigned Bolivia's only coastal territory, Atacama (now Antofagasta), to Chile. By the truce at VALPARAISO (1884) Peru ceded Tarapacá and control of Tacna and Arica provinces to Chile; eventually, Chile returned (1929) Tacna to Peru.

Pacific Islands, Trust Territory of the, former trust territory administered by the U.S., consisting of c.2,180 islands and islets spread out over the W Pacific Ocean in the area generally known as MICRONESIA. The islands were seized by Japan from Germany in 1914, occupied by the U.S. in 1944 during WORLD WAR II, and made a trusteeship in 1947. As the result of negotiations for termination of the trusteeship, the NORTHERN MARIANAS gained U.S. commonwealth status in 1978, and three other self-governing units, under the military protection of the U.S., were established: PALAU, the Federated States of MICRONESIA, and the MARSHALL ISLANDS. The trusteeship was dissolved in 1990, but Palau remained a trust territory pending resolution of a disagreement with the U.S. over a nuclear-free provision in its proposed constitution.

Pacific Ocean, world's largest ocean, c.70,000,000 sq mi (181,300,000 sq km), occupying about one third of the earth's surface between the west coasts of North and South America and the east coasts of Australia and Asia. It has a maximum length of c.9,000 mi (14,500 km), a maximum width of c.11,000 mi (17,700 km), and a maximum depth of 36,198 ft (11,033 m) in the Challenger Deep, in the Marianas Trench c.250 mi (400 km) SW of Guam. A series of volcanoes, the so-called Ring of Fire, rims the ocean. Along the eastern shore there is a narrow continental shelf, and high mountains rise abruptly from a deep sea floor. The Asian coast is low and fringed with islands rising from a wide continental shelf.

Pacific Rim, nations bordering the Pacific Ocean, and the island countries situated in it. Asian Pacific Rim countries grew significantly in economic and political importance during the 1980s and 90s. Many Pacific Rim nations, including the U.S., are members of the Asia-Pacific Economic Cooperation (est. 1989).

Pacific scandal, 1873, charges that Canadian Prime Min. John MACDONALD had received campaign funds by promising a railroad contract to Sir Hugh Allan's syndicate. Although MacDonald denied the charges, his government resigned, and the Conservative party lost the 1873 election.

pacifism, opposition to war through individual or collective action. Motivated by religious or humanitarian impulses, pacifism is often connected with international cooperation toward the goal of disarmament. Local peace societies were founded in the U.S. (1815) and Britain (1816), and the first international peace congress met (1843) in London. The movement was advanced during the late 1800s by the work of the Frenchman Frédéric PASSY and others and was publicized through the establishment (1901) of the NOBEL PRIZE for peace. The horrors of World War I gave it new vigor after 1920, when it was influenced by both the LEAGUE OF NATIONS and GANDHI's effective practice of nonviolent (or passive) resistance. The number of British and American CONSCIENTIOUS OBJECTORS grew in World War II. In the 1960s and 70s, U.S. pacifists were in the forefront of the opposition to the VIETNAM WAR.

Paderewski, Ignace Jan [păd″ərĕf′skē], 1860–1941, Polish pianist, composer, and statesman. His playing won him a reputation exceeding that of any performer since LISZT. An ardent patriot, he headed Polish governments in 1919 and 1940–41 (in exile). He died in the U.S. pleading Poland's cause. The Minuet in G for piano is his best-known work.

Padua, city (1990 pop. 220,358), in Venetia, NE Italy. A major Roman city, it was an important free commune (12th–14th cent.), then passed to the Carrara family (1318) and to Venice (1405). Its Capella degli Scrovegni has magnificent frescoes (1304–6) by GIOTTO. Among its other treasures are sculptures by DONATELLO and paintings by MANTEGNA, who was born there.

Páez, José Antonio [pä′ās], 1790–1873, first president of VENEZUELA (1831–35, 1839–43). He led (1810–19) a guerrilla band and drove the Spanish from their Venezuelan stronghold. A leader of separatism from Colombia, he headed the new state of Venezuela, but he was exiled (1850–58), served as dictator (1861–63), and was exiled again.

Paganini, Niccolò, 1782–1840, Italian violin virtuoso. He extended the violin's compass by employing harmonics, perfected the use of double and triple stops, and revived *scordatura,* diverse tuning of strings. His 24 caprices for violin were adapted for piano by SCHUMANN and LISZT.

Page, Thomas Nelson, 1853–1922, American author; b. Hanover co., Va. His fictional idealizations of the Old South include the stories in *In Ole Virginia* (1887) and the novel *Red Rock* (1898). Page was ambassador to Italy (1913–19).

Pagnol, Marcel [pänyôl′], 1895–1974, French dramatist and film director. His is best known for his popular trilogy about Marseilles, *Marius* (1929), *Fanny* (1931), and *César* (1936). He wrote the screenplays for all three and directed *César.*

pagoda, name given in the East to a variety of buildings in tower form, usually part of a temple or monastery, and serving as shrines. The Indian masonry STUPA, chiefly pyramidal, is elaborately decorated with carvings or sculpture. The Chinese pagoda, of Indian origin, is hexagonal, octagonal, or square in plan. It is built in as many as 15 superimposed stories. From each story an upward-curving tile roof projects. Brick, faced with tiles, is the most common material. Japanese pagodas, usually square and five-storied, are made of wood and exhibit superb carpentry craftsmanship. See also CHINESE ARCHITECTURE; JAPANESE ARCHITECTURE.

Pago Pago town, (1990 pop. 10,640), capital of AMERICAN SAMOA.

Pahari [pəhä′rē], languages or dialects of the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See LANGUAGE (table).

Pahlavi language [pä′ləvē″] or **Pehlevi language** [pā′–], member of the Iranian group of the Indo-Iranian subfamily of the Indo-European family of languages. It is also called Middle Persian. See LANGUAGE (table).

Paige, (Leroy) "Satchel," 1906?–1982, African-American baseball player; b. Mobile, Ala. Celebrated for his wit and extraordinary pitching ability, he became legendary while barnstorming in the Negro baseball leagues prior to the integration (1947) of the major

leagues, playing in as many as 2,500 games and being credited with more than 50 no-hitters. In 1948, when he was over 40, he joined the Cleveland Indians of the American League. He pitched for six seasons in the majors and was the first star of the Negro leagues to be inducted (1971) into the Baseball Hall of Fame.

Paine, Thomas, 1737–1809, Anglo-American political theorist and writer; b. England. In 1774 he emigrated to America, where he wrote (1776) the successful pamphlet *Common Sense.* During the AMERICAN REVOLUTION he began a series of 16 pamphlets (1776–83), *The Crisis.* In *The Rights of Man* (two parts, 1791, 1792), written in England, he defended the French Revolution in reply to Edmund BURKE, arguing that only democratic institutions can guarantee natural rights. To escape prosecution for treason in England, he fled to Paris, where he became a member of the National Convention and was imprisoned (1793–94) during the Reign of Terror. He wrote his deistic work *The Age of Reason* (2 parts, 1794, 1795) at this time. He returned to the U.S. in 1802.

Paiute, indigenous people of the Plateau (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with a Uto-Aztecan language of the Aztec-Tanoan stock (see NATIVE AMERICAN LANGUAGES). The warlike Northern Paiute ranged over parts of California, Nevada, and Oregon; they fought miners and settlers in the 1860s. To the south lived the Southern Paiute, sometimes called Digger Indians because they lived on roots. In general, the Paiute subsisted by hunting, fishing, and root digging, and lived in wickiups (see TEPEE). The GHOST DANCE originated (c.1870) with them, and the prophet WOVOKA was a Paiute. Today many northern and southern Paiutes remain on reservations, living chiefly on agriculture and the sale of crafts. In 1990 there were 11,142 Paiutes in the U.S.

Pakistan, officially Islamic Republic of Pakistan, republic (1993 est. pop. 120,800,000), 310,403 sq mi (803,944 sq km), S Asia, on the NW corner of the Indian subcontinent, bordered by India (E), the Arabian Sea (S), Iran (SW), and Afghanistan (W and N). The capital is ISLAMABAD; other important cities are KARACHI, LAHORE, and RAWALPINDI. Pakistan may be divided into four geographic regions: an arid plateau in the west; alluvial plains in the east; hills and fertile valleys in the northwest; and high mountains of the HINDU KUSH, HIMALAYA, and Karakorum ranges in the north. The INDUS R. runs

The key to pronunciation appears on page xiii.

the length of the country. Agriculture is the mainstay of the economy, with wheat, rice, cotton, and sugarcane the principal crops. Vast irrigation projects and the use of fertilizers have increased output, and the country is now self-sufficient agriculturally. The production of textiles, consumer goods, cement, and fertilizers, as well as oil refining and metal processing, are important components of Pakistan's expanding industrial base. The people are a mixture of many ethnic groups, with the Punjabis the most numerous; Pathan tribes in the northwest and Baluchis in the west have pressed for autonomous states. Islam is by far the dominant religion. Urdu is the official language, but English and Punjab, Pashto, Baluchi, and other ethnic languages are spoken.

History. The area that is now Pakistan was the site of the INDUS VALLEY CIVILIZATION, the earliest known culture on the Indian subcontinent. The territory's location placed it on the historic route from central Asia to India, and for thousands of years invaders, including Aryans, Persians, Alexander the Great, Seleucids, and Parthians, swept down on the settlements there. Muslim Arabs established themselves in S. India in A.D. 712. They were followed by Turks, who gained control of N India in the 12th and 13th cent. What is now Pakistan was part of the MOGUL empire, but at the end of the 18th cent., the Punjab region came under control of the SIKHS. The region was under British control from 1830 to 1850. The MUSLIM LEAGUE, founded in 1906 and led by Muhammad Ali JINNAH from 1916, demanded establishment of a separate Muslim state. Finally, in 1947, under the provisions of the Indian Independence Act, Pakistan—consisting of East Bengal (renamed East Pakistan in 1955) and West Pakistan, separated by 1,000 mi of Indian territory—became a separate, independent dominion, with Jinnah as governor-general. The new state faced precarious economic conditions. In addition, dissension with India, particularly over KASHMIR, was immediate and violent (see INDIA-PAKISTAN WARS), and strife between Hindus and Muslims was widespread. In 1956 Pakistan formally became a republic, but in 1958 the constitution was abrogated and martial law imposed under Gen. Muhammad AYUB KHAN, who was elected president in 1960. Under his dictatorship, a vigorous land reform and economic development program was begun, but after disastrous riots in 1968 and 1969 he resigned in favor of Gen. Agha Muhammad YAHYA KHAN. Almost from its inception, Pakistan was plagued by tension between East Pakistan, which had the majority of the population, and West Pakistan, which dominated the army and federal government. In May 1971, after the government's refusal to recognize the election victory of Sheikh Mujibur Rahman's Awami League, which advocated autonomy for East Pakistan, East Pakistan declared independence as BANGLADESH. In the ensuing civil war, West Pakistan was quickly defeated with the aid of Indian troops. Political turmoil continued in Pakistan (the former West Pakistan), and opposition to Zulfikar Ali BHUTTO, who had become president after the war, became intense. In 1977 an army coup placed Gen. Muhammad ZIA UL-HAQ in the office of president; Bhutto was arrested and later (1979) hanged. Zia died in a suspicious plane crash in 1988. A few months later the opposition Pakistan People's party won a parliamentary majority, and its leader, Benazir BHUTTO, daughter of Zulfikar Ali Bhutto, became prime minister and the first female leader of a Muslim country. In 1990 Pres. Ghulam Ishaq Khan dismissed Bhutto, charging corruption and mismanagement. In new elections her party lost its majority, and Nawaz Sharif became head of a coalition government. When he moved to reduce presidential power, he was dismissed (1993) by Ishaq Khan, precipitating a crisis that led to the resignations of both Sharif and Ishaq Khan. Bhutto's party won the most seats in new elections, and she became prime minister of a coalition government. Farooq Leghari, a Bhutto ally, was elected president.

palaeo-. For words beginning thus, see also PALEO-.

Palaeologus, ruling Greek dynasty of the Byzantine Empire, 1261–1453. Its emperors included MICHAEL VIII, Andronicus II, JOHN V, JOHN VII, JOHN VIII, and CONSTANTINE XI. Noted for learning, the family helped the Greeks to retain their culture under Turkish rule.

Palatinate [pəlăt'ĭnāt"], two regions of Germany. The Rhenish or Lower Palatinate is a district of the state of Rhineland-Palatinate. The Upper Palatinate is a district in NE Bavaria. Holy Roman Emperor FREDERICK I bestowed (1156) the title count palatine on his half-brother Conrad, who held lands E and W of the Rhine. In 1214 the Palatine passed to the Bavarian WITTELSBACH dynasty, whose holdings near Bohemia were constituted as the Upper Palatinate. In 1356 the counts palatine were confirmed as electors. The Rhenish Palatine became a center of the German REFORMATION, and the choice of Elector Frederick V (see FREDERICK THE WINTER KING) as king of Bohemia precipitated the THIRTY YEARS WAR. Both the Rhenish Palatinate and the Upper Palatinate eventually became parts of Bavaria. In 1946 the Rhenish Palatinate became part of the new state of Rhineland-Palatinate.

Palau or **Belau,** officially Republic of Belau, self-governing Micronesian island group (1992 est. pop. 15,800), c.192 sq mi (497 sq km), in the W Pacific Ocean at the extreme western end of the Caroline Islands, until 1990 part of the U.S. Trust Territory of the PACIFIC ISLANDS. It consists of c.200 small islands (8 are inhabited), of which Babelthuap (the largest and future site of the capital) and Koror (the capital) are the most important. Subsistence farming is the basis of the economy; there is some commercial fishing. Most of the population is Micronesian. Palauan is the official language, but English is also spoken. Roman Catholicism and Protestantism are the predominant religions.

History. Spain held the islands for about 300 years and sold them to Germany in 1899. Japan seized them in WORLD WAR I, administered them as a mandate for the League of Nations, and in WORLD WAR II used them as a major naval base. U.S. forces captured the islands in 1944, and in 1947 they became part of the trust territory. Voters approved (1979) a local constitution, and the islands became (1981) self-governing. Palau is the last UN trust territory because voters had not approved a compact of free association with the U.S. by the necessary 75% majority, but in a new plebiscite (1993) that required only a majority vote, the compact was approved. Kuniwo Nakamura became president of Palau in 1993. See PACIFIC OCEAN map.

Palembang, city (1990 pop. 1,141,036), capital of South Sumatra prov., on SE Sumatra, Indonesia. A deepwater port, it is one of the island's largest cities, and the trade and shipping center for the S SUMATRA oil fields. There are large oil refineries, textile mills, fertilizer factories, and food-processing plants. The Dutch began trading there in 1617, and abolished its sultanate in 1825.

Paleocene epoch: see GEOLOGIC ERA (table).

Paleolithic art, art of the most recent ice age. Knowledge of this art is largely confined to works discovered at 150 sites in W Europe, particularly to the magnificent cave paintings in N Spain and the Dordogne R. valley of SW France. Most of these works were produced during two overlapping periods. The Aurignacio-Perigordian (c.14,000–c.13,500 B.C.) includes the Lascaux cave paintings, the outdoor sculpture at Laussel, and several small, abnormally voluptuous female figures called Venuses, e.g., the Venus of Willendorf, Austria. The Solutreo-Magdalenian (c.14,000–c.9500 B.C.) includes the murals at Rouffignac and Niaux, and the ceiling of the

cave at Altamira, Spain. The painting styles ascribed to CRO-MAGNON MAN embrace a variety of techniques, which include painting with fingers, sticks, pads of fur or moss; daubing; dotting; sketching with colored material and charcoal; and spray-painting through a hollow bone or by mouth. In most paleolithic caves animal figures predominate, suggesting ritual significance. Drawn with the vitality and elegance of great simplicity, they are the masterpieces of prehistoric art. See also ROCK CARVINGS AND PAINTINGS.

Paleolithic period: see under STONE AGE.

paleontology: see FOSSIL.

Paleozoic era: see GEOLOGIC ERA (table).

Palermo, city (1990 pop. 731,418), capital, largest city, and chief port of Sicily, Italy. Manufactures include textiles, processed food, and ships. A Phoenician town founded between the 8th and 6th cent. B.C., and a Carthaginian base, it was taken by Rome (153 B.C.). Later rulers included Byzantines (535–831), Arabs (831–1072), and Normans (1072–1194), whose legacies are visible in its art and architecture.

Palestine, historic region on the eastern shore of the Mediterranean Sea, comprising parts of modern Israel, Jordan, and Egypt; also known as the Holy Land. This article discusses the physical geography and history of Palestine until the UN took up the Palestine problem in 1947; for the economy and later history, see GAZA STRIP, ISRAEL, JORDAN, and WEST BANK. Palestine is the Holy Land of the Jews, promised to them by God according to the Bible; of the Christians because it was the scene of Jesus' life; and of the Muslims because Jerusalem is the traditional site of Muhammad's ascent to heaven. Palestine comprises three geographic zones: a part of the GREAT RIFT VALLEY, a ridge, and a coastal plain. The earliest known settlements in Palestine, e.g., JERICHO, may date from c.8000 B.C. An independent Hebrew kingdom was established c.1000 B.C. After c.950 B.C. this kingdom broke up into two states, Israel and Judah. Assyrians, Babylonians, Persians, Greeks, and Romans in turn conquered Palestine, which fell to the Muslim Arabs by A.D. 640. The area was the focus of the CRUSADES and was conquered by the Ottoman Turks in 1516. By the late 19th cent., ZIONISM arose with the aim of establishing a Jewish homeland in Palestine, and during World War I the British, who captured the area, appeared to support this goal. After the League of Nations approved (1922) the British mandate of Palestine, Jews immigrated there in large numbers despite Arab opposition. There was tension and violence between Jews and Arabs, and the British, unable to resolve the problem, turned (1947) the Palestine question over to the UN. See also ARAB-ISRAELI WARS; PALESTINE LIBERATION ORGANIZATION.

Palestine Liberation Organization (PLO), coordinating council for PALESTINE refugee groups, recognized (1974) by the UN and the Arab states as the government of the Palestinians. Founded in 1964, it has been dominated by the Al Fatah guerrilla group of Yasir ARAFAT. The PLO regarded ISRAEL as an illegal country and committed itself to establishing a Palestinian state, using guerrilla and terrorist attacks to achieve its goal. In 1982 the PLO was weakened when, after the Israeli siege of BEIRUT, Lebanon (see ARAB-ISRAELI WARS), PLO guerrillas in West Beirut were dispersed to other Arab countries. In 1988 the PLO responded to the Palestinian uprising, or *intifada*, in the WEST BANK and GAZA STRIP by proclaiming the establishment of an independent Palestinian state. The PLO also equivocally recognized Israel's right to exist and renounced terrorism. After Iraq's invasion of Kuwait in 1990, the PLO sided with Iraq, alienating the Saudis and Persian Gulf states that had long funded it. In 1991, with PLO agreement, Palestinians participated in peace talks with Israel. Secret negotiations between the PLO and Israel led (1993) to mutual recognition and an accord that called for limited Palestinian self-rule in Jericho and the Gaza Strip.

Palestrina, Giovanni Pierluigi da, c.1525–1594, Italian composer. He was undisputed master of the MASS, of which he wrote 105, for four, five, six, and eight parts. His other works included MOTETS, MADRIGALS, magnificats, offertories, litanies, and settings of the Song of Songs.

Pali [pä'lē], language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See LANGUAGE (table).

Palissy, Bernard [pälēsē'], c.1510–c.1589, French potter. Palissy created a widely imitated pottery, admired for smooth glazes in richly colored enamels. He is noted for pieces reproducing scriptural and mythological subjects and for rustic pieces with forms copied from nature.

Palladio, Andrea [päl-lä'dēō], 1508–80, Italian Renaissance architect. His measured drawings of ROMAN ARCHITECTURE, with plans of his own and a treatise based on Vitruvius, the Roman writer, were published in *The Four Books of Architecture* (1570). Palladio's formally classic buildings were mainly palaces and villas in or near Vicenza. The country houses displayed a classic temple front, and the ground plan had a central hall surrounded by rooms in absolute symmetry. Noted examples (1550s–60s) are the Villa Rotunda, Chiericati Palace, and Villa Barbaro. At Venice, Palladio adapted the classical motif to three famous church facades—San Francesco della Vigna, San Giorgio Maggiore, and Il Redentore. Palladio's works greatly influenced English architecture, through Inigo JONES and others. In the U.S., this influence can be seen in the manor houses of southern plantations, e.g., Thomas Jefferson's MONTICELLO.

palladium (Pd), metallic element, discovered in 1803 by William WOLLASTON. It is a lustrous, corrosion-resistant, silver-white metal with a great ability to absorb hydrogen. Major uses are in alloys used in low-current electrical contacts, jewelry, and dentistry and in automobile catalytic converters. See ELEMENT (table); PERIODIC TABLE.

palm, common name for the Palmae, or the Arecaceae, a large family of chiefly tropical trees, shrubs, and vines. Most species are trees, typified by a crown of compound leaves (fronds) terminating a tall, woody, unbranched stem. The fruits, covered with a tough, fleshy, fibrous, or leathery outer layer, usually contain a large amount of stored food. Important economically, especially in the tropics, palms, e.g., COCONUT and DATE palms, provide food and other products. Important palm fibers are raffia and RATTAN. **Palm oil** is fat pressed from the fruit, principally that of the coconut palm, African oil palm (genus *Elaeis*), and some other species. The oils are widely used in soap, candles, lubricants, margarine, fuel, and other products.

Palma: see MAJORCA.

Palme, Olof [päl'mə], 1927–86, Swedish political leader, prime minister (1969–76, 1982–1986). Head of the Social Democratic party, he led Sweden's rejection (1971) of European Community membership and was critical of U.S. policy in Vietnam. In 1982 Palme again became prime minister after his party won the parliamentary elections. Four years later he was assassinated by an unknown gunman.

Palmer, Arnold, 1929–, American golfer; b. Latrobe, Pa. Winner of seven major championships, he popularized golf with his victories in the 1960s. Cheered on by "Arnie's army," as his fans were known, he was the first golfer to win four Masters titles (1958, 1960, 1962, 1964). He also captured the U.S. Open (1960) and British Open (1961–62) and became the first golfer to reach $1 million in earnings.

Palmerston, Henry John Temple, 3d Viscount, 1784–1865, British statesman. As foreign secretary (1830–34, 1835–41, 1846–51), he supported liberal constitutionalism at home and abroad. Twice prime minister (1855–58, 1859–65), he vigorously prosecuted the CRIMEAN WAR, facilitated the unification of Italy, and suppressed the INDIAN MUTINY. His diplomacy, though reckless, advanced British prestige.

Palm Springs, city (1990 pop. 40,181), S Calif.; founded 1876, inc. 1938. It is a desert oasis and fashionable resort. The Spanish knew it as Agua Caliente (because of its hot springs) as early as 1774.

Palm Sunday: see LENT.

Palmyra, ancient city of central Syria, NE of Damascus, traditionally founded by SOLOMON. A trade center, it gradually expanded and became a powerful state after the Romans established control (A.D. c.30). Its ambitious queen, Zenobia, provoked a Roman expedition (A.D. 272), which partly destroyed Palmyra. The city declined, and after being sacked by TIMUR, it fell into ruins.

Palomar Observatory, astronomical observatory located at an altitude of 5,500 ft (1,680 m) on Palomar Mt., NE of San Diego, Calif., and operated by the California Institute of Technology. Its primary instrument is the 200-in. (500-cm) Hale reflector, which was the

largest in the world at the time of its completion (1948). Its 48-in. (120-cm) Schmidt camera telescope was used to prepare a monumental photographic atlas of about three fourths of the entire sky.

pampas, c.300,000 sq mi (777,000 sq km), grassy plains of temperate S South America, extending from the **Pampa** (c.250,000 sq mi/647,500 sq km) of central and N Argentina into Uruguay. Livestock and wheat are produced in the drier west, while corn and more intensive forms of agriculture predominate in the more populous and humid east. BUENOS AIRES is the main shipping point. The Pampa is associated with the gaucho, the Argentine cowboy.

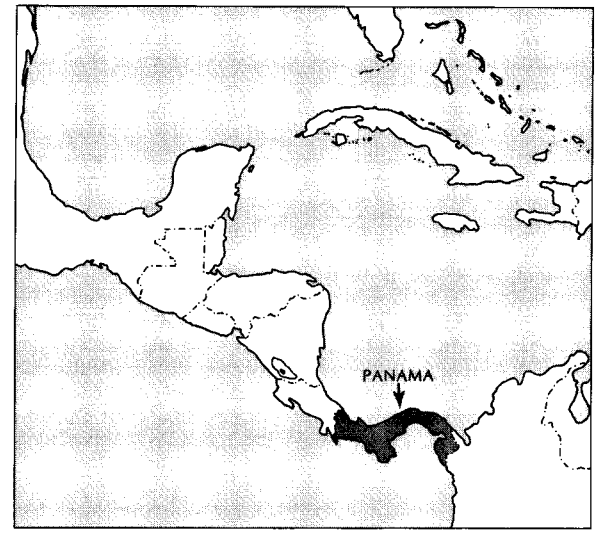
Pan, in Greek mythology, pastoral god of fertility; worshiped principally in ARCADIA. He was depicted as a merry, ugly man with a goat's horns, ears, and legs. All his myths deal with his amorous affairs. He came to be associated with the Greek DIONYSUS and the Roman FAUNUS, both fertility gods.

Panama, Span. *Panamá,* officially Republic of Panama, republic (1992 est. pop. 2,530,000), 29,209 sq mi (75,650 sq km), on the Isthmus of Panama, which connects Central and South America; bordered by Costa Rica (E), the Caribbean Sea (N), Colombia (W), and the Pacific Ocean (S). The capital is PANAMA City; other large cities are Colón and David. There are mountains in the east and west, and lowlands along both coasts. The PANAMA CANAL, which cuts through low hills in the central area, bisects the country. The nation has varied industries and promising mineral deposits, but its exports (bananas, shrimp and fish products, sugar, and coffee) lag far behind its imports. The canal provides 25% of national income and much employment. The country has become a link in the illegal Colombian drug trade and a center for drug-related financial transactions. Panama is a Spanish-speaking, Roman Catholic country; the population is of diverse descent, with a mestizo majority.

History. Spaniards founded settlements on the north coast before 1513, when Vasco Núñez de BALBOA crossed the isthmus and discovered the Pacific. This discovery—the short distance from sea to sea—has dominated Panama's history ever since. Soon the isthmus became the route by which gold from PERU reached the Atlantic in colonial times; later it was crossed by U.S. gold prospectors traveling to California after 1849. Long a part of COLOMBIA, in 1903 Panama—supported by the U.S., which wanted to build a canal across the isthmus—revolted and became a separate republic. The Panama Canal was completed in 1914. Internal politics have been stormy, with many changes of administration. In 1969 a left-leaning regime was established, dominated until his death in 1981 by Gen. Omar TORRIJOS HERRERA. After much agitation and prolonged negotiations, the U.S. turned over the Canal Zone to Panama in 1979 and agreed to eventual (1999) Panamanian control of the canal itself. When U.S. grand juries indicted Gen. Manuel NORIEGA, the de facto ruler of Panama, for narcotics smuggling, tensions increased between the two nations. The U.S. invaded Panama in Dec. 1989, captured Noriega, and brought him to Florida for trial. Guillermo Endara Galimany, who had been defrauded of victory (May 1989) in the presidential election, became president with U.S. support.

Panama, city (1990 pop. 411,549), central Panama, capital of Panama, on the Gulf of Panama, at the Pacific entrance to the PANAMA CANAL. Panama's largest city, a financial center, and industrial hub, in Spanish colonial days it was the Pacific port for transshipment of Andean gold. The city prospered with the building of the canal (1904–14) and grew rapidly after World War II.

Panama Canal, waterway across the Isthmus of Panama, connecting the Atlantic (by way of the CARIBBEAN SEA) and Pacific oceans. It was built by U.S. military engineers in 1904–14 across land leased from the Republic of PANAMA. The eradication of malaria and yellow fever in the area was a vital accomplishment. The canal is 51 mi (82 km) long, has six locks, and traverses two natural lakes, one of which is 85 ft (26 m) above sea level. With the development after 1950 of supertankers and other ships too large to navigate the canal, it lost some of its earlier strategic importance. The **Panama Canal Zone** (553 sq mi/1,432 sq km) extended 5 mi (8 km) on either side of the canal and was administered by the U.S. until 1979, when it was turned over to Panama under the terms of two U.S.-Panamanian treaties narrowly ratified (1978) by the U.S. Senate. At the end of 1999 control of the canal itself is to pass to Panama, with that nation guaranteeing the neutral operation of the canal.



Pan-American Union: see ORGANIZATION OF AMERICAN STATES.

Panathenaea: see ATHENA.

Panchatantra, anonymous collection of Sanskrit animal fables, probably compiled before A.D. 500. Derived from Buddhist sources and intended for the instruction of sons of royalty, the prose fables are interspersed with aphoristic verse.

pancreas, glandular organ of the DIGESTIVE SYSTEM that secretes digestive ENZYMES and HORMONES. In humans, the pancreas is a yellowish organ that lies crosswise beneath the stomach and is connected to the small intestine at the duodenum. It produces trypsin, amylase, and lipase—enzymes essential to the digestion of proteins, carbohydrates, and fats, respectively. Small groups of cells in the pancreas, called islets of Langerhans, contain several types of specialized cells: alpha-2 cells, which produce the hormone GLUCAGON; beta cells, which produce the hormone INSULIN; and alpha-1 cells, which produce somatostatin, all of which regulate blood-sugar levels.

panda, two nocturnal Asian MAMMALS, the red panda (*Ailurus fulgens*) and giant panda (*Ailuropoda melanoleuca*). The red panda, or lesser panda, resembles a RACCOON and is found in the Himalayas and the mountains of W China and N Myanmar. The giant panda resembles a BEAR, although it is anatomically more like a raccoon; it lives in the high bamboo forests of central China. Its body is mostly white, with black limbs, ears, and eye patches; adults weight from 200 to 300 lb (90 to 140 kg). Low reproduction rates and human encroachment on its habitat have seriously endangered the giant panda.

Pandora, in Greek mythology, first woman on earth. ZEUS ordered her creation as vengeance on man and his benefactor, PROMETHEUS, to whose brother Epimetheus he sent her. Zeus gave her a box that he forbade her to open. She disobeyed and let out all the world's evils. Only hope remained in the box.

Pangaea: see CONTINENTAL DRIFT; PLATE TECTONICS.

panic, financial and economic crisis, marked by public loss of confidence in the financial structure. Panics are characterized by runs on banks and a rapid fall of the securities market, and bank failures and bankruptcies typically ensue. Perhaps the earliest panic of modern capitalism occurred in France and England in 1720, touched off by wild speculation in the stock of John LAW's colonizing company. The first real panic in the U.S. came in 1819. Others were to occur in 1837, 1857, 1869 (see BLACK FRIDAY), 1873, 1907, 1929 (when the stock-market crash precipitated a worldwide financial crisis and led to the GREAT DEPRESSION), and 1987 (see BLACK MONDAY). Banking instability, historically a major contributor to panics, became less of a threat in the U.S. with the founding of the FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC) in 1933.

Panizzi, Sir Anthony [pänēt'sē], 1797–1879, English librarian; b.

Italy. He was chief librarian at the BRITISH MUSEUM (1856–67). His 91 rules (1839) became the basis of the museum's catalog. Panizzi enforced the act requiring deposition at the museum of all books copyrighted in Great Britain.

Pankhurst, Emmeline Goulden, 1858–1928, English woman suffragist. She founded (1903) the Women's Social and Political Union and urged extreme militancy in the furtherance of women's rights. In 1912–13 she was repeatedly arrested and imprisoned. During World War I she turned her energies from the women's movement to the war effort. She was nationally revered at the time of her death.

Panmunjom, village, in the demilitarized zone between North and South Korea. In the KOREAN WAR negotiations were moved to Panmunjom in Oct. 1951 and the truce was signed on July 27, 1953.

Panofsky, Erwin, 1892–1968, one of the most important American art historians of the 20th cent.; b. Germany. Particularly interested in iconography, he wrote classic studies of medieval, Renaissance, mannerist, and baroque art. His many books include *Studies in Iconology* (1939), *Albrecht Dürer* (1943), and *Early Netherlandish Painting* (1953).

pansy: see VIOLET.

Pantanal, lowland region of SW Brazil. The world's largest wetland, the Pantanal is part of the floodplain of the Paraguay R. and its tributaries. Swampy during the rainy season, it has lush grasslands during the six months it is dry.

pantheism [Gr. *pan* = all, *theos* = God], any system of belief or speculation that identifies the universe with GOD. Some pantheists view God as primary and the universe as a finite and temporal emanation from God; others see nature as the great, inclusive unity. The various types of pantheism have religious, philosophical, scientific, and poetic bases. HINDUISM is a noteworthy form of religious pantheism; philosophical pantheism is most completely represented in the monistic system of SPINOZA.

pantheon, term applied originally to a temple to all the gods. The **Pantheon,** Rome (built 27 B.C., destroyed, and rebuilt in the 2d cent. A.D. by HADRIAN), is of brick with a great hemispherical dome. In 609 it became a Christian church. The term is now applied to a monument in which the illustrious dead are buried. The Panthéon, Paris, designed by J.G. Soufflot, was built between 1764 and 1781. Several times secularized and reconsecrated, it became a national mausoleum.

panther, name commonly applied to black LEOPARDS, a color variant of the leopard, not a distinct species. The generic name *Panthera* refers to all big roaring cats.

pantomime or **mime,** silent drama using movement, gesture, and facial expression to develop a story. Although pantomime dates from ancient times, its traditional characters (e.g., Columbine and Harlequin) have their origin in the 16th-cent. Italian COMMEDIA DELL'ARTE. Popular modern pantomimists include Charlie CHAPLIN and Marcel MARCEAU.

Paoli, Pasquale [pä'ōlē], 1725–1807. Corsican patriot. In 1755 he led a revolt against Genoese rule and was chosen president of CORSICA under a republican constitution. Genoa sold its rights to Corsica to the French, who defeated Paoli in 1769. He then fled to England. During the FRENCH REVOLUTION he was named (1791) governor of Corsica, but he opposed the radical turn of the revolution and with British aid drove (1794) the French from the island. A British protectorate was proclaimed, but Paoli was disappointed in his hope of becoming viceroy. In 1795 he went to England, where he died. The Corsicans, with help from the French, expelled the British in 1796.

papacy, office of the pope, head of the ROMAN CATHOLIC CHURCH. The pope is bishop of Rome and thus, according to Roman Catholic belief, the successor of St. PETER, the first bishop of the see of Rome (the Holy See). The pope claims to be head of all Christianity and the representative of Jesus Christ, a claim not accepted by the ORTHODOX EASTERN CHURCH and Protestant churches. Roman Catholics believe in papal INFALLIBILITY. On the death of a pope, a new pope is elected by the college of CARDINALS in a secret conclave. Election requires a two-thirds vote plus one. Early popes, such as CLEMENT I, asserted their right to guide the church, and with the decline of the Roman Empire in the West, the pope became an important political leader. With the founding (756) of the Papal States, the pope became a secular ruler as well. The papacy was surrounded by corruption in the 10th cent., but after the reforms of GREGORY VII in the 11th cent., the popes had great prestige. By the end of the 12th cent. INNOCENT III attempted with some success to assert his claims as arbiter of all lay affairs. In the 14th cent. the papal see was moved by CLEMENT V to Avignon and came under French control (the Babylonian captivity) from 1309 to 1378. The papacy's return to Rome was followed by the Great SCHISM (1378–1417), in which there were two or three rival popes at one time, a contest ended by the Council of CONSTANCE. In the 15th cent. the popes were characterized by worldly rule in Italy, patronizing Renaissance art, and forwarding family fortunes. This spiritual apathy led to the Protestant REFORMATION. Reform within the church followed the election of PAUL III (see REFORMATION, CATHOLIC). The loss (1870) of the Papal States proved in the end to be a boon (see LATERAN TREATY) since it made the pope perforce a purely ecclesiastic ruler with great spiritual and moral influence. He now governs only the tiny state of VATICAN CITY. The election of JOHN PAUL II of Poland in 1978 broke the long line of Italian popes that dated from the 16th cent.

Papadopoulos, George, 1919–, Greek colonel and political leader. He headed the military junta that overthrew the government in 1967. He became premier and ruled over an authoritarian government. In 1973 he abolished the monarchy and became president. He was overthrown by another military junta later that year.

Papago: see TOHONO O'ODHAM.

Papal States, from 754 to 1870 the territory under temporal rule of the popes. In 1859 the area included c.16,000 sq mi (41,440 sq km). In 754 the papacy received extensive lands in central Italy, including RAVENNA, from PEPIN THE SHORT. Papal rule in these areas was often negligible, but in the 16th cent. Pope JULIUS II consolidated papal power. NAPOLEON I conquered the Papal States in 1796, but they were restored to the pope in 1815. During the RISORGIMENTO most of the Papal States joined (1860) Sardinia and became part of the new kingdom of Italy. The rest of the area came under French protection. The fall of NAPOLEON III in France allowed Italy to seize (1870) the remaining territory, including Rome. The status of Rome was not settled until the LATERAN TREATY (1929) created VATICAN CITY.

Papandreou, George, 1888–1968, Greek political leader, premier (1964–65). In 1961 he formed the Center Union party and in 1964 he became premier. The next year he was removed from office by King CONSTANTINE II, thereby setting off the chain of events that resulted in the so-called colonels' coup (1967) and the abolition (1973) of the monarchy. His son, **Andreas Papandreou,** 1919–, held U.S. citizenship for a time (1944–64) but gave it up to serve in the Greek parliament and as an aide to his father. He was imprisoned after the 1967 coup and later exiled. In exile he formed what later became the Panhellenic Socialist Movement (Pasok). He returned to Greece after the fall (1974) of the junta and later served as Greece's first socialist premier (1981–89). After leaving office he was tried and acquitted on charges of instigating the loss of government funds and accepting bribes. He became premier again in 1993.

Papen, Franz von, 1879–1969, German diplomat and politician. In 1932 he was named chancellor, but he was unable to assemble enough support, and Kurt von Schleicher quickly succeeded him. His manipulations behind the scenes brought HITLER to power (1933). He served briefly as vice chancellor in Hitler's cabinet and as his ambassador to Turkey (1939–44). In 1946 the Nuremberg tribunal acquitted him of war crimes; he was convicted (1947) by a German "denazification court," although the sentence was later rescinded.

paper, thin, flat sheet usually made from plant fiber. It was probably invented c.105 in China, where it was made from a mixture of bark and hemp. The Moors introduced the papermaking process into Spain c.1150, and by the 15th cent., when PRINTING developed in Europe, paper mills had spread throughout the Continent. The basic papermaking process exploits the ability of plant cell fibers to bond together when a pulp made from the fibers is spread on a screen and dried. Today, paper is made principally from wood pulp combined with pulps from waste paper or, for fine grades of paper, with fibers from cotton rags. For newsprint, tissue, and

CHRONOLOGY OF POPES

In the following list the date of election, rather than of consecration, is given. Before St. Victor I (189), dates may err by one year. Antipopes—i.e., those whose elections have been declared uncanonical—are indicated.

St. Peter, d. 64? or 67?
St. Linus, 67?-76?
St. Cletus, or Anacletus, 76?-88?
St. Clement I, 88?-97?
St. Evaristus, 97?-105?
St. Alexander I, 105?-115?
St. Sixtus I, 115?-125?
St. Telesphorus, 125?-136?
St. Hyginus, 136?-140?
St. Pius I, 140?-155?
St. Anicetus, 155?-166?
St. Soter, 166?-175?
St. Eleutherius, 175?-189?
St. Victor I, 189-99
St. Zephyrinus, 199-217
St. Calixtus I, 217-22
antipope: St. Hippolytus, 217-35
St. Urban I, 222-30
St. Pontian, 230-35
St. Anterus, 235-36
St. Fabian, 236-50
St. Cornelius, 251-53
antipope: Novatian, 251
St. Lucius I, 253-54
St. Stephen I, 254-57
St. Sixtus II, 257-58
St. Dionysius, 259-68
St. Felix I, 269-74
St. Eutychian, 275-83
St. Caius, 283-96
St. Marcellinus, 296-304
St. Marcellus I, c.308-309
St. Eusebius, 309-c.310
St. Miltiades, or Melchiades, 311-14
St. Sylvester I, 314-35
St. Marcus, 336
St. Julius I, 337-52
Liberius, 352-66
antipope: Felix, 355-65
St. Damasus I, 366-84
antipope: Ursinus, 366-67
St. Siricius, 384-99
St. Anastasius I, 399-401
St. Innocent I, 401-17
St. Zosimus, 417-18
St. Boniface I, 418-22
antipope: Eulalius, 418-19
St. Celestine I, 422-32
St. Sixtus III, 432-40
St. Leo I, 440-61
St. Hilary, 461-68
St. Simplicius, 468-83
St. Felix III (or II), 483-92
St. Gelasius I, 492-96
Anastasius II, 496-98
St. Symmachus, 498-514
antipope: Lawrence, 498-505
St. Hormisdas, 514-23
St. John I, 523-26
St. Felix IV (or III), 526-30
Boniface II, 530-32
pope or antipope: Dioscurus, 530
John II, 533-35
St. Agapetus I, 535-36
St. Silverius. 536-37
Vigilius, 537-55
Pelagius I, 556-61
John III, 561-74
Benedict I, 575-79
Pelagius II, 579-90
St. Gregory I, 590-604
Sabinian, 604-6
Boniface III, 607
St. Boniface IV, 608-15
St. Deusdedit, or Adeodatus I, 615-18
Boniface V, 619-25
Honorius I, 625-38
Severinus, 640
John IV, 640-42
Theodore I, 642-49
St. Martin I, 649-55
St. Eugene I, 654-57
St. Vitalian, 657-72
Adeodatus II, 672-76
Donus, 676-78
St. Agatho, 678-81
St. Leo II, 682-83
St. Benedict II, 684-85
John V, 685-86
Conon, 686-87
antipope: Theodore, 687
antipope: Paschal, 687
St. Sergius I, 687-701
John VI, 701-5
John VII, 705-7
Sisinnius, 708
Constantine, 708-15
St. Gregory II, 715-31
St. Gregory III, 731-41
St. Zacharias, 741 -52
Stephen II, 752 (never consecrated)
Stephen II (or III), 752-57
St. Paul I, 757-67
antipope: Constantine, 767-69
antipope: Philip, 768
Stephen III (or IV), 768-72
Adrian I, 772-95
St. Leo III, 795-816
Stephen IV (or V), 816-17
St. Paschal I, 812-24
Eugene II, 824-27
Valentine, 827
Gregory IV, 827-44
antipope: John, 844
Sergius II, 844-47
St. Leo IV, 847-55
Benedict III, 855-58
antipope: Anastasius, 855
St. Nicholas I, 858-67
Adrian II, 867-72
John VIII, 872-82
Marinus I, 882-84
St. Adrian III, 884-85
Stephen V (or VI), 885-91
Formosus, 891-96
Boniface VI, 896
Stephen VI (or VII), 896-97
Romanus, 897
Theodore II, 897
John IX, 898-900
Benedict IV, 900-903
Leo V, 903
antipope: Christopher 903-4
Sergius III, 904-11
Anastasius III, 911-13
Lando, 913-14
John X, 914-28
Leo VI, 928
Stephen VII (or VIII), 928-31
John XI, 931-35
Leo VII, 936-39
Stephen VIII (or IX), 939-42
Marinus II, 942-46
Agapetus II, 946-55
John XII, 955-64
Leo VIII, 963-65, or Benedict V, 964-66, (*one of these was an antipope*)
John XIII, 965-72
Benedict VI, 973-74
antipope: Boniface VII, 974, 984-85
Benedict VII, 974-83
John XIV, 983-84
John XV, 985-96
Gregory V, 996-99
antipope: John XVI, 997-98
Sylvester II, 999-1003
John XVII, 1003
John XVIII, 1004-9
Sergius IV, 1009-12
Benedict VIII, 1012-24
antipope: Gregory, 1012

other inexpensive papers, the pulp is prepared mechanically, by grinding the wood. Chemical pulp is made by boiling a mixture of wood chips with either soda, sulfite, or sulfate, a process that removes lignin. The pulp is poured onto a wire screen, where the water drains away and the fibers begin to mat. The paper layer then passes through a series of rollers that dry, press, and smooth it, and add various finishes. Writing papers contain a water-resistant substance such as rosin to prevent the spreading of ink. Kraft paper, made chemically with sulfate, is used for bags and wrapping papers because of its strength.

paper nautilus, mollusk, closely related to the octopus, with a rounded body, eight tentacles, and no fins. It is named for the delicate, papery shell, actually an egg case, that surrounds the egg-brooding female. A CEPHALOPOD found in most warm waters, it is not a true NAUTILUS.

Papineau, Louis Joseph [päpēnō'], 1786–1871, French Canadian insurgent leader. As speaker (1815–37) of Lower CANADA's assembly, he headed the Reform party. Although he was not active in the revolt of 1837, he fled to the U.S. after the rebellion was put down. He later returned (1845) to Canada and served again (1848–54) in the assembly.

Papinian (Aemilius Papinianus) [pəpĭn'ēən], d. 212, Roman jurist. A stern moralist, he became known through his writings, chiefly *Quaestiones* (37 books) and *Responsa* (19 books), as the preeminent figure in ROMAN LAW.

Papp, Joseph, 1921–91, American director and producer; b. Brooklyn, N.Y., as Yosl Papirofsky. A theatrical innovator, he made fine plays available to large and varied audiences through his New York Shakespeare Festival and the Public Theater (since 1992, Joseph Papp Public Theater) in New York City, using income from commercial successes, such as *A Chorus Line* (1975; Tony Award), to support the production of works by lesser-known playwrights. Other major productions included *Hair* (1967), *Sticks and Bones* (1971; Tony Award), and *The Pirates of Penzance* (1980; Tony Award).

paprika: see PEPPER.

Papua New Guinea, officially Independent State of Papua New Guinea, independent Commonwealth nation (1992 est. pop. 4,007,000), 183,540 sq mi (475,369 sq km), SW Pacific Ocean, north of Australia. It includes the eastern half of the mountainous island of NEW GUINEA; the Bismarck Archipelago, including New Britain and New Ireland; Bougainville and Buka, which are part of the Solomon Islands group; and other adjacent islands. PORT MORESBY is the capital and chief port. The climate is monsoonal. Mainstays of Papua New Guinea's developing economy include copper, silver, and gold mining; timber and plywood; and the cultivation of cocoa, coffee, and copra. There is also petroleum; production began in 1992. The native population is largely Melanesian and Papuan but is divided into many distinct cultures. Some 700 languages are spoken, but pidgin English is the *lingua franca.* About half the population is Christian, with Roman Catholics and Lutherans the largest sects; the rest follow traditional beliefs. The nation has a parliamentary government with a governor general, representing the British crown; a prime minister and cabinet; and a unicameral, popularly elected parliament.

History. Papua, the southern region of the country, became a British protectorate in 1884 and in 1905 passed to Australian control as the Territory of Papua. In 1884 Germany took possession of the northern region as Kaiser-Wilhelmsland; the area fell to Australia in World War I and was mandated to that nation in 1920 as the Territory of New Guinea. The two territories were combined in 1949 as the Territory of Papua and New Guinea, and became self-governing in 1973 and independent in 1975. Since 1989 Bougainville has been the scene of fighting between government and secessionist forces. Paias Wingti has been prime minister since 1992.

papyrus, plant (*Cyperus papyrus*) of the SEDGE family, now almost

The key to pronunciation appears on page xiii.

extinct in Egypt but universally used there in antiquity. The roots were used as fuel; the pith was eaten. The stem was used for sandals, boats, twine, mats, and cloth, and, most notably, in a paperlike writing material.

parable, in the BIBLE, term used in the GOSPELS for short illustrative narratives and figurative statements. OLD TESTAMENT parables include the unproductive vineyard (Isa. 5.1–7). Among well-known parables of JESUS are the Good Samaritan (Luke 10.29–37); the hidden treasure (Mat. 13.44); the prodigal son (Luke 15.11–32); the rich man and LAZARUS (Luke 16.19–31); the tares (Mat. 13.24–30, 36–43); and the laborers in the vineyard (Mat. 20.1–16). Parables are also common in the TALMUD.

parabola: see CONIC SECTION.

Paracas, ancient culture of Peru, probably influenced by the earlier culture of CHAVÍN DE HUÁNTAR. The Paracas are known for resin-painted pottery and textiles.

Paracel Islands, S China, group of low coral islands and reefs in the potentially oil-rich SOUTH CHINA SEA, c.175 mi (280 km) SE of Hainan Island. Also claimed by Vietnam and Taiwan, the islands were part of French INDOCHINA prior to WORLD WAR II, when they were occupied by the Japanese. They passed to China in 1945 and are the site of a Chinese airfield.

Paracelsus, Philippus Aureolus, 1493?–1541, Swiss physician and alchemist, originally named Theophrastus Bombastus von Hohenheim. Learned in alchemy, chemistry, and metallurgy, he gained wide popularity, although his contemporaries often opposed him. His work was colored by the fantastic philosophies of the time, but he rejected GALEN's humoral theory of disease; advocated the use of specific remedies for specific diseases (introducing many chemicals, e.g., laudanum, mercury, sulfur, iron, and arsenic); and noted relationships such as the hereditary pattern in syphilis, and the association of cretinism with endemic goiter and of paralysis with head injuries.

parachute, device designed to retard the descent of a falling body by creating drag as it passes through air. A parachute is usually constructed from a flexible material, such as silk, nylon, or Kevlar. A traditional parachute, when extended, has an umbrellalike form, with a series of cords converging down to a harness strapped to the user. A modern parachute is wing-shaped and has control cords that the parachutist can use to turn or even hover. Both can be folded into a small package and thus can be easily carried aboard an aircraft or strapped onto a person's body. The rate of descent for a human-carrying parachute is about 18 ft/sec (5.5 m/sec). The first successful parachute descent from a great height was made in 1797 by the French aeronaut Jacques Garnerin, who dropped 3,000 ft (920 m) from a balloon. Parachutes are used as escape systems for persons aboard aircraft unable to land safely, as braking devices for rockets, space vehicles, airplanes, and high speed surface vehicles, and as a means to land airborne military units and their equipment from transport planes. Parachute jumping for sport is known as skydiving.

paraffin, white, semitranslucent, odorless, tasteless, water insoluble, waxy solid. Though relatively inert, it burns readily in air. A mixture of HYDROCARBONS obtained from PETROLEUM during refining, paraffin is used in candles and for coating paper.

Paraguay [pâr'əgwā, -gwī], officially Republic of Paraguay, republic (1992 est. pop. 4,929,000), 157,047 sq mi (406,752 sq km), S central South America, one of two landlocked nations on the continent, enclosed by Bolivia (N, E), Brazil (W), and Argentina (S, E). The most populous region, between the Paraguay and PARANÁ rivers, is a lowland, rising to a plateau region in the east and north. To the west is a dry plain, part of the GRAN CHACO. Important cities include ASUNCIÓN (the capital), Villarrica, and Concepción. Agriculture and forestry occupy more than half of the labor force. Meatpacking, processing forest products, textile manufacturing, and brewing are the main industries. The population is largely mestizo, a mixture of Spanish and GUARANÍ strains. Spanish is the official language, but Guaraní is widely spoken. Roman Catholicism is the established religion.

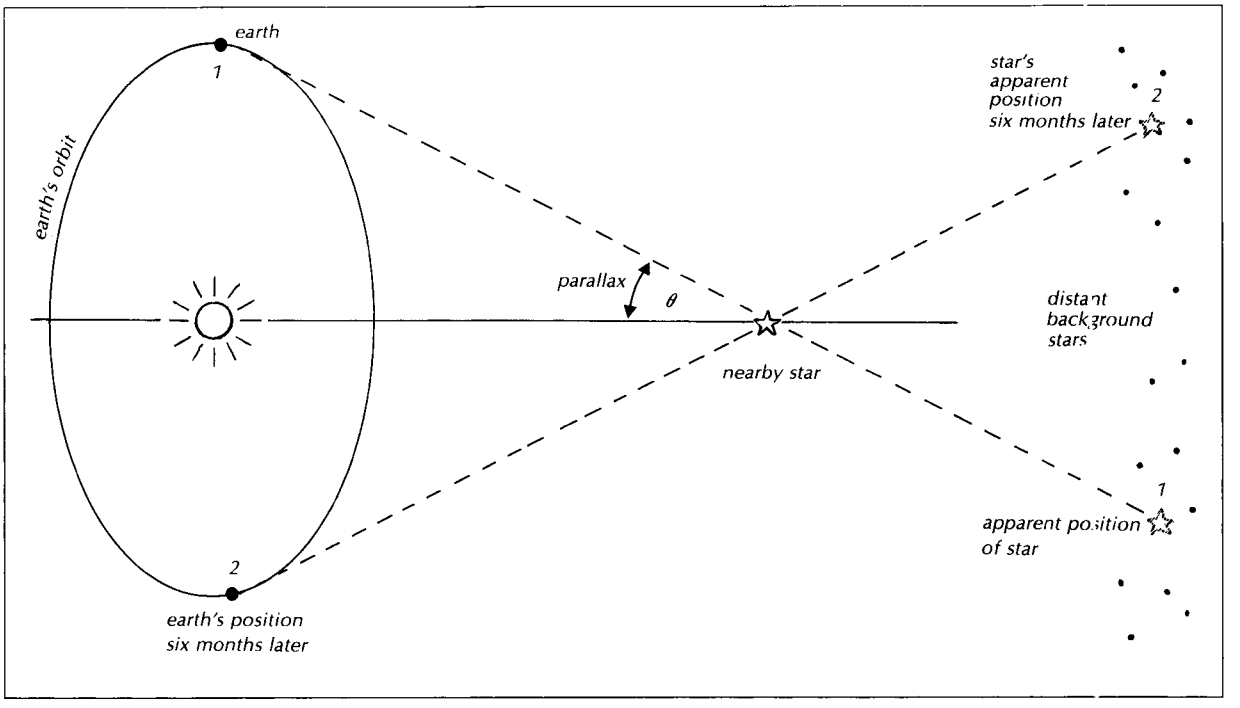
History. European influence in Paraguay was introduced with the early explorations of the Río de la PLATA, beginning with Juan Diaz de Solís (1516). A colony founded at Asunción (1536 or 1537) became the center of the La Plata region. The strong rule of Hernando Arias de Saavedra, in the early 1600s, established Paraguay's virtual independence from Spanish administrators in Buenos Aires and Peru; it was also during his tenure that the Jesuit missions, so important in 16th- to 18th-cent. Paraguayan culture, were founded. Full independence from Spain came in 1811, when Paraguay's colonial officials were quietly overthrown. Then followed three great dictators who molded the future of the country: José Gaspar Rodriguez Francia, incorruptible, harsh, autocratic, known as *El Supremo,* kept Paraguay in the palm of his hand from 1814 to 1840; Carlos Antonio López held absolute power from 1844 to 1862; and his son, Francisco Solano LÓPEZ, who ruled from 1862 to 1870, involved Paraguay in a disastrous war (1865–70) with Brazil, Argentina, and Uruguay (see TRIPLE ALLIANCE, WAR OF THE) that cost the nation more than half its population. Recovery was slow, and just as conditions were beginning to improve, Paraguay was plunged into another major war—the Chaco War (1932–35) with Bolivia—from which it emerged victorious but exhausted. A rapid succession of governments followed, ending with the oppressive dictatorship (1940–48) of Higinio Morínigo, finally overthrown in 1948. After another round of short-lived regimes, Gen. Alfredo STROESSNER came to power in 1954. By suppressing opposition, he ruled until 1989, when he was overthrown by a military coup, and Gen. Andrés Rodríguez became president. Rodríguez has slowly permitted the country to move away from its authoritarian past. A promised free presidential election (1993), which Juan Carlos Wasmosy won, was marred by fraud and sabotage.

Paraguay, river, South America, chief tributary of the PARANÁ R. It flows generally south c.1,300 mi (2,090 km) from central Brazil along parts of the Brazil, Paraguay, and Argentine borders. It is a major artery in the Río de la PLATA system and is navigable for most of its length. ASUNCIÓN, Paraguay, is the chief port.

parakeet or **parrakeet,** name for a widespread group of small PARROTS, with generally green plumage, native to the Indo-Malayan region and popular as cage birds. The budgerigar, also called the shell, zebra, or grass, parakeet (*Melopsittacus undulatus*), is the best known of the true parakeets. The extinct Carolina parakeet was the only parrot native to the U.S.

Paralipomenon: see CHRONICLES.

parallax, any alteration in the relative apparent positions of objects produced by a shift in the position of the observer. Stellar parallax is the apparent displacement of a nearby star against the background of more distant stars resulting from the motion of the earth



Parallax: A star's trigonometric parallax is a measure of its apparent motion against the background of more distant stars, a motion resulting from the earth's orbit around the sun. To obtain the maximum apparent motion of the star, measurements are made at two points six months apart.

in its orbit around the sun; formally, the parallax of a star is the angle at the star that is subtended by the mean distance (1 ASTRONOMICAL UNIT) between the earth and the sun. A star's distance d in PARSECS is thus the reciprocal of its parallax p in seconds of arc (or $d = 1/p$). Friedrich BESSEL measured (1838) the first stellar parallax (0.3 seconds of arc for the star 61 Cygni). Geocentric parallax, used to determine the distances of solar system objects, is measured similarly; the diameter of the earth, rather than that of its orbit, however, is used as the baseline.

parallel processing, the concurrent or simultaneous execution of two or more parts of a single COMPUTER PROGRAM, at speeds far exceeding those of a conventional COMPUTER. Parallel processing requires two or more interconnected processors, each of which executes a portion of the task; some supercomputer parallel-processing systems have as many as 256,000 MICROPROCESSORS. The processors access data through shared memory. The efficiency of parallel processing is dependent upon the development of COMPUTER LANGUAGES that optimize the division of the tasks among the processors.

Paramaribo, city (1988 est. pop. 241,000), capital of Suriname, on the Suriname R., 17 mi (27 km) from the Atlantic Ocean. It exports bauxite and agricultural products and produces cement, paint, and beer. Settled in the 1630s by British from Barbados, Paramaribo came under Dutch rule in 1815. Canals give the modern city a Dutch aspect.

paramecium, microscopic, one-celled, slipper-shaped PROTOZOAN. Paramecia are among the most complex single-celled organisms. Found in fresh water, they swim rapidly, usually in a corkscrew fashion, by means of coordinated, wavelike beats of their many short, hairlike projections, called cilia. Paramecia feed on smaller organisms, such as bacteria.

Paraná, river, SE South America. Formed by the confluence of the Paranaíba and Rio Grande rivers in SE Brazil, it flows generally south-southwest c.2,000 mi (3,200 km) to meet the Uruguay R. at the head of the Río de la PLATA estuary, in Argentina. Its major tributary is the PARAGUAY R. It is a major transport artery and has the continent's second largest drainage system.

paranoia, term denoting persistent and logically reasoned false beliefs, or delusions, often of persecution or grandeur (e.g., the belief that one has an important mission). A person with *paranoid disorder,* often known as delusional disorder, may lead a relatively normal life, since most aspects of general behavior are unaffected by the delusional beliefs. In paranoid SCHIZOPHRENIA delusions are sometimes bizarre and are accompanied by hallucinations in the form of voices that make continual remarks on a single theme. Paranoid features also figure in the nondelusional *paranoid personality disorder,* which is marked by unwarranted jealousy, mistrust, and the misconstruing of innocent remarks and gestures as demeaning or threatening.

parapsychology, study of paranormal or psychic phenomena not explainable by accepted principles of science. Scientific methodology in this field dates from the foundation (1882) in London of the Society for Psychical Research, which sought to distinguish psychic phenomena from SPIRITISM and to investigate mediums and their activities. The society studied automatic writing, levitation, and reports of ectoplasmic and poltergeist activity. Modern experiments, notably at Duke Univ. under Joseph Banks Rhine and in Britain and the USSR, have concentrated principally on EXTRASENSORY PERCEPTION (ESP) and psychokinesis (mental influence on physical objects). Scientists differ as to the validity of the results.

Pará rubber tree, large tree (*Hevea brasiliensis*) of the SPURGE family, native to tropical South America and the source of the greatest amount and finest quality of natural RUBBER. The yellow or white latex from which rubber is made occurs in vessels in the bark layers. Trees, which may grow over 100 ft (30 m) high, are tapped for the latex.

parasite, organism that obtains nourishment from another living organism (the host). The host, which may or may not be harmed, never benefits from the parasite. Many parasites have more than one host and most cannot survive apart from their host. Parasites include bacteria (e.g., those causing TUBERCULOSIS), invertebrates such as worms (e.g., TAPEWORM), and vertebrates (e.g. the CUCKOO, which lays its eggs in the nests of other birds).

parathyroid glands, four small endocrine bodies (see ENDOCRINE SYSTEM) behind the THYROID GLAND that govern calcium and phosphorus metabolism. A low calcium ion concentration in the blood causes these glands to produce parathyroid hormone, which increases calcium absorption in the intestines and kidneys and takes

The key to pronunciation appears on page xiii.

calcium salts from the bones. The hormone also decreases the concentration of phosphate ions, which form a relatively insoluble salt with calcium. High parathyroid hormone levels can lead to bone degeneration; low levels lead to calcium deficiency (typified by muscle spasms and, eventually, by convulsions and psychiatric symptoms).

Parcae: see FATES.

parchment, untanned animal skins, especially of sheep, calf, or goat, prepared for use as a writing material. The skins were soaked, scraped, and stretched, then rubbed with chalk and pumice. More durable than the PAPYRUS used in ancient times, parchment was the chief writing material in Europe until the advent of printing brought PAPER into wide use. Vellum is a fine grade of parchment.

Pardo Bazán, Emilia, condesa de [pär'thō bäthän'], 1852–1921, Spanish novelist and critic. In such novels as *The Mayor of Ulloa* (1886) and *Mother Nature* (1887) she introduced NATURALISM into Spanish literature.

Paris, Matthew: see MATTHEW OF PARIS.

Paris, city (1990 pop. 2,152,423; met. area 9,060,257), N central France, the French capital. It is the commercial, financial, and industrial focus of France, a major transportation hub, and a cultural and intellectual center of international renown. A beautiful city in which tourism is the main industry, Paris is cut by the Seine River. On its stately, formal right (northern) bank are many of the most fashionable streets and shops, and such landmarks as the ARC DE TRIOMPHE, Place de la Concorde, LOUVRE, and Sacré Coeur. The left bank houses governmental offices and is the site of much of the city's intellectual life. It is known for its old Latin Quarter and for such landmarks as the Sorbonne, the Luxembourg Palace, the Panthéon, and the modern Pompidou Center. The historic core of Paris is the Île de la Cité, a small island occupied in part by the Palais de Justice and the Cathedral of NOTRE DAME DE PARIS. Above the city rises the EIFFEL TOWER. Paris is divided into 20 *arrondissements* (boroughs) and governed by a mayor. A fishing village when it was conquered (52 B.C.) by CAESAR, it became an important Roman town. It was a Merovingian capital in the 5th cent. and became the national capital with the accession (987) of Hugh Capet, count of Paris. It flowered as the center of medieval commerce and SCHOLASTICISM but suffered severely during the HUNDRED YEARS WAR. Paris consistently displayed a rebellious and independent spirit, as in its resistance to Henry IV (1589–93); the first FRONDE (1648–49); the revolutions of 1789, 1830, and 1848; and the COMMUNE OF PARIS (1871). During WORLD WAR II it was occupied (1940–44) by the Germans, but was relatively undamaged.

Paris or **Alexander,** in Greek mythology, son of Priam and HECUBA. Because of a prophecy that he would destroy Troy, he was abandoned on Mt. Ida, but shepherds rescued him. Later he returned to Troy and was chosen as judge in a dispute among HERA, ATHENA, and APHRODITE. Spurning Hera, who offered him greatness, and Athena, who promised success in war, he awarded the golden apple of discord to Aphrodite, who offered the most beautiful woman in the world. His abduction of that woman, HELEN, caused the TROJAN WAR.

Paris, Congress of, 1856, conference held by Great Britain, France, the Ottoman Empire (Turkey), Sardinia, Russia, Austria, and Prussia to negotiate the peace after the CRIMEAN WAR. In the Treaty of Paris that resulted, Russia was forced back to its prewar borders and was made to accept the neutralization of the Black Sea and the placing of the lower Danube R. under international control. Moldavia and Walachia (later Romania) were given quasi-independence under the suzerainty of Turkey. Turkish integrity was guaranteed, and in return the sultan promised to improve the status of his Christian subjects. The congress also adopted the **Declaration of Paris,** which was the first major effort to codify the international law of the sea. Privateering was banned, contraband was defined and codified, and a blockade was to be legal only when it prevented access to the enemy's coastline. The U.S., which at first rejected the provisions of the declaration, finally accepted them during the Civil War. Technological advances in the 20th cent. (e.g., submarine warfare) made many of the provisions inapplicable.

Paris, Treaty of, any of several important treaties signed at or near Paris, France. **1** The Treaty of 1763 was signed by Great Britain, France, and Spain. Together with the Treaty of Hubertusburg it ended the SEVEN YEARS WAR. France lost Canada to Britain, Cuba and the Philippines were restored to Spain, and India in effect passed to Britain. From this treaty dated the colonial and maritime supremacy of Britain. **2** In the Treaty of 1783 Great Britain formally acknowledged the independence of the Thirteen Colonies as the U.S. The treaty also fixed the boundaries of the new nation. In addition, the warring European powers—Britain against France and Spain, with the Dutch as armed neutrals—effected a large-scale peace settlement. Spain reacquired the Floridas and Minorca from Britain, and Britain relinquished its restrictions on the French port of DUNKIRK. Otherwise, the territorial dispositions of the 1763 Treaty of Paris were reaffirmed. **3** The Treaty of 1814 was concluded between France on the one hand and Britain, Russia, Austria, and Prussia on the other after the first abdication of NAPOLEON I. Its provisions never went into effect owing to the return of Napoleon from Elba and the resumption of the war. **4** The Treaty of 1815 was signed after Napoleon's final surrender. Many provisions of the treaty of 1814 and the Final Act of the Congress of VIENNA remained binding. France was reduced to its 1790 borders and was forced to pay 700 million francs in reparations plus the costs of an army of occupation for five years. **5** For the Treaty of 1856, see PARIS, CONGRESS OF. **6** For the Treaty of 1898, see SPANISH-AMERICAN WAR. After WORLD WAR I several treaties were signed (1919–20) in or near Paris, the most important of which was the Treaty of VERSAILLES. After WORLD WAR II separate treaties were signed (1947) by the Allies at or near Paris with Italy, Romania, Hungary, Bulgaria, and Finland.

Paris, University of, at Paris, France; founded 12th cent. Its first endowed college, opened in 1253 and later called the **Sorbonne,** gained academic and theological distinction during the late Middle Ages and early modern times, the name Sorbonne often being used to designate the university itself. The university was suppressed during the French Revolution and replaced (1808) by a school of the centralized Univ. of France. Reestablished as the Univ. of Paris in 1890, it was divided (1970) into 13 separate, state-supported universities, each with academic autonomy.

Paris Pacts, 1954, four international agreements that recognized the full sovereignty of the Federal Republic of GERMANY (West Germany) and brought to an official end the post-WORLD WAR II occupation of that country. Participants were the former Western Allies. West Germany was permitted to rearm within certain limitations and was accepted into the NORTH ATLANTIC TREATY ORGANIZATION; it also became a member of the newly created WESTERN EUROPEAN UNION. A bilateral agreement between France and West Germany giving "European status" to the SAARLAND was later rejected by the Saarlanders.

Paris Peace Conference, 1919: see VERSAILLES, TREATY OF.

Park Chung Hee, 1917–79, president (1963–79) of South KOREA. Park took part in the military coup of 1961 and was three times elected president. His rule became increasingly dictatorial, and in 1972 he declared martial law. He was assassinated (1979) by Kim Jae Kyu, head of the Korean Central Intelligence Agency.

Parker, Charlie "Bird" (Charles Christopher Parker, Jr.), 1920–55, African-American musician and composer; b. Kansas City, Kans. A brilliant improvising saxophonist, he was, with Dizzy GILLESPIE, a leader of the bop movement in JAZZ.

Parker, Dorothy (Rothschild), 1893–1967, American writer and wit; b. West End, N.J. Her light, ironic verse is contained in such volumes as *Enough Rope* (1926) and *Death and Taxes* (1931). She also wrote satirical, often poignant short stories, e.g., "Big Blonde," collected in *Laments for the Living* (1930) and *Here Lies* (1939).

Parker, Matthew, 1504–75, English prelate, archbishop of Canterbury (1559–75). He was called by Elizabeth I to the see of Canterbury and maintained a distinctly Anglican position between Roman Catholicism and extreme Protestantism. In 1562 he revised the Thirty-nine Articles and later supervised (1563–68) the preparation of the Bishops' Bible.

Parkinson's disease or **Parkinsonism,** degenerative brain disorder initially characterized by trembling lips and hands and muscular rigidity, later producing body tremors, a shuffling gait, and eventually possible incapacity. Emotions may be affected and men-

tal capacity impaired, but assessment of these is difficult because depression often accompanies the disease. The disease occurs when the brain cells that produce dopamine die. In cases where there is no known cause (the majority), it usually appears after age 40 and is referred to as Parkinson's disease. Parkinsonism usually refers to similar symptoms resulting from certain antipsychotic drugs, reserpine (a blood pressure drug), carbon monoxide or manganese poisoning, or MPTP (a heroin byproduct). Symptoms are treated with the drugs deprenyl (selegiline), L-DOPA (given with carbidopa to reduce side effects) and amantadine. Parkinsonism is named for English surgeon James Parkinson, who first described it in 1817.

Parkman, Francis, 1823–93, American historian; b. Boston. He overcame nervous affliction and near-blindness to become a great historian. His *Oregon Trail* (1849) is a popular account of his journey west in 1846. Parkman's many works on the history of Canada and the Northwest are marked by historical accuracy and felicity of expression. They include *Pioneers of France in the New World* (1865), *The Old Régime in Canada* (1874), and *A Half-Century of Conflict* (1892). Parkman was also an accomplished horticulturalist.

Parks, Rosa Lee 1913–, American civil-rights activist; b. Tuskegee, Ala. Her refusal to give up her seat to a white man on a bus in Montgomery, Ala., in 1955, led to a local bus boycott that inspired CIVIL-RIGHTS activists nationwide.

parlement, chief judicial body in France until 1789. The Parlement of Paris grew out of the Curia Regis king's court in the reign (1226–70) of LOUIS IX, and provincial parlements were established from the 15th cent. onward. At first strictly judicial, the parlement gradually gained political power by its function of registering royal edicts before they became law. The parlements joined in the FRONDE (1648–53), an abortive aristocratic revolt against Cardinal MAZARIN. LOUIS XV abolished (1771) them to centralize his political control, but after his death (1774) LOUIS XVI restored the parlements to pacify the privileged classes. In 1787–88 they successfully opposed fiscal reforms and forced Louis XVI to summon the STATES-GENERAL to consider the reforms. As bastions of reaction and privilege, the parlements were abolished early in the FRENCH REVOLUTION.

Parliament, legislative assembly of GREAT BRITAIN. It has evolved into the nation's sovereign power, while the monarchy remains sovereign in name only. Technically, it consists of the monarch, the House of Commons, and the House of Lords, but the term usually refers only to Commons, a democratically elected body of 651 members. The House of Lords is composed of peers and Anglican prelates. Since 1911 its powers have been negligible. The House of Commons is presided over by a nonpartisan speaker elected by Commons, which also elects the PRIME MINISTER; the executive head of government, by modern tradition, must be a member of Commons. The rest of the government's ministers, the CABINET, may be selected from either house. Thus, the executive branch is, in effect, a committee of the legislature. Elections must be held every five years; the prime minister may call elections earlier, although no more frequently than once a year. If the party in power fails to obtain a parliamentary majority on an important issue, it must call a general election. The major parties in Parliament are Conservative, Labour, and the coalition of Social Democrats and Liberals. The origins of Parliament go back to the medieval Curia Regis, or great council, a body of noble and ecclesiastical advisers to the monarch that evolved into the House of Lords. Quasi-legislative, it was primarily a judicial and executive body. In the 13th cent. representatives of the knights and burgesses were also assembled to approve royal acts. Parliamentary power grew slowly in relation to that of the monarchy. During the ENGLISH CIVIL WAR (1642–48) and its aftermath Parliament gained legislative supremacy over taxation and expenditures. Parliamentary sovereignty was permanently affirmed by the GLORIOUS REVOLUTION (1688). Demands for representation by the new classes created by the INDUSTRIAL REVOLUTION led in the 19th cent. to passage of REFORM BILLS that greatly extended male suffrage; universal male and female suffrage was granted in the 20th cent. (see REPRESENTATION OF THE PEOPLE ACTS; WOMAN SUFFRAGE).

Parmenides, b. c.515 B.C., pre-Socratic Greek philosopher. The founder of the Eleatic school, he held that unchanging being is the material substance of which the universe is composed, and that generation, change, destruction, and motion are all illusions of the senses. His major contribution to philosophy was the method of reasoned proof for assertions.

Parmigiano [pärmējä'nō] or **Parmigianino** [-jänē'nō], 1503–40, Italian painter and etcher; b. Francesco Mazzola. A mannerist (see MANNERISM) he became noted for the grace and sensuality of his style and for his elongated figures. Representative paintings are the *Vision of St. Jerome* (National Gall., London) and *The Marriage of St. Catherine* (Parma Gall.). An unusual work is a self-portrait seen in a convex mirror (Vienna). He was among the first to use ETCHING.

Parnassians [pärnăs'ēənz], group of 19th-cent. French poets, named for their journal the *Parnasse contemporain* (1866–76). It included LECONTE DE LISLE, SULLY-PRUDHOMME, VERLAINE, and HEREDIA. Influenced by GAUTIER and reacting against ROMANTICISM, they strove for faultless workmanship, precise form, and emotional detachment.

Parnassós or **Parnassus,** mountain, c.8,060 ft (2,430 m) high, Phocis, central Greece. In ancient Greece it was believed sacred to APOLLO and DIONYSUS, and to the MUSES.

Parnell, Charles Stewart, 1846–91, Irish nationalist leader. The son of a Protestant landowner, he attached himself to the HOME RULE movement and in 1875 entered the British Parliament. He used filibusters to stress the gravity of Irish problems, and his agitation on the IRISH LAND QUESTION led to violence against landlords. Imprisoned (1881–82), he was released after he promised to help check the violence. In 1886 he formed an alliance with William GLADSTONE, who attempted unsuccessfully to pass the first Home Rule Bill. One of Ireland's most effective and popular leaders, Parnell lost his political influence after being named (1889) a corespondent in a divorce suit, and died a broken man.

Parr, Catherine, 1512–48, sixth queen consort of HENRY VIII of England. She married Henry in 1543 and had a beneficent influence on the aging king. After his death, she wed (1547) Thomas SEYMOUR, but died in childbirth.

Parrish, Maxfield, 1870–1966, American artist; b. Philadelphia. Using glowing colors, he created original and highly decorative posters, magazine covers, murals, and book illustrations, e.g., *Arabian Nights.*

parrot, common name for brilliantly colored BIRDS of the pantropical order Psittaciformes. Parrots have large heads, short necks, and strong feet with two front and two back toes (for climbing and grasping). Parrots range from the 3½-in. (8.7-cm) pygmy parrot of the South Pacific to the 40-in. (100-cm) Amazon parrot of South America. Species include the PARAKEETS, cockatoos, cockateels, and macaws. Parrots are long-lived, and many are popular as cage birds; some species can learn to mimic speech.

Parry, Sir William Edward, 1790–1855, British arctic explorer and rear admiral. In 1818 he accompanied Sir John ROSS on an expedition to find the NORTHWEST PASSAGE, and later he led other attempts (1819–20, 1821–23, 1824–25). The Parry Islands bear his name.

parsec, unit of length equal to the distance (206,265 ASTRONOMICAL UNITS; 3.26 LIGHT-YEARS; 1.917×10^{13} mi; or 3.086×10^{13} km) at which a hypothetical star's PARALLAX would be one second of arc. The distance in parsecs of an object from the earth is thus the reciprocal of the parallax in seconds of the object.

Parsifal or **Sir Percivale:** see ARTHURIAN LEGEND.

Parsis or **Parsees,** religious community of India, numbering over 200,000 followers of ZOROASTRIANISM, whose ancestors migrated from Iran in the 8th cent. to escape Muslim persecution. They revere fire and other aspects of nature as manifestations of Ahura Mazdah, the divinity. To avoid contaminating fire, earth, or water, they dispose of their dead by exposing the bodies in circular towers, where vultures devour them. The Parsis are a united community, well educated and, although small, economically important.

parsley, Mediterranean aromatic herb (*Petroselinum crispum*) of the CARROT family. It has been cultivated since Roman antiquity for its foliage, used as a seasoning and garnish.

parsnip, garden plant (*Pastinaca sativa*) of the CARROT family native

The key to pronunciation appears on page xiii.

to the Old World and cultivated since ancient times for its long, fleshy, edible root.

Parsons, Sir Charles Algernon, 1854–1931, English engineer and inventor of a revolutionary steam TURBINE. His first turbines drove electric generators. In 1897 he constructed the *Turbinia,* the first turbine-propelled vessel; its amazing speed led to the construction of many turbine-powered warships for the British navy.

Parsons, Talcott, 1902–79, American sociologist; b. Colorado Springs, Colo. A professor at Harvard Univ. (1927–74), he is noted for his structural-functional theory, an attempt to construct one framework for classifying general and specific characteristics of societies. Parsons's books include *The Social System* (1951) and *Politics and Social Structure* (1969).

Parsons, William: see ROSSE, WILLIAM PARSONS, 3D EARL OF.

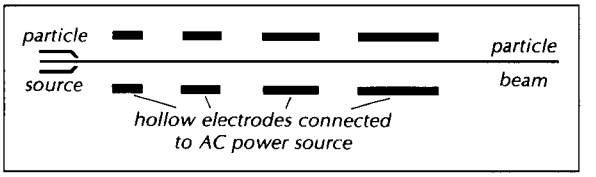
Partch, Harry, 1901–74, American composer; b. Oakland, Calif. He developed a theory of "corporeal" music based on "harmonized spoken words," writing pieces on verbal recollections and street cries. He also invented a 43-note scale.

parthenogenesis, in zoology, reproduction in which an unfertilized egg develops into a new individual. It is common in lower animals, especially insects, e.g., the APHID. In many social insects, e.g., the honeybee, unfertilized eggs produce male drones and fertilized eggs produce female workers and queens. Artificial parthenogenesis has been achieved by scientists for most major groups of animals, although it usually results in abnormal development. In plants, the phenomenon (called parthenocarpy) is rare.

Parthenon [Gr., = the virgin's place], temple to ATHENA on the Acropolis, Athens, built 447–432 B.C., the masterpiece of Greek architecture. ICTINUS and CALLICRATES were the architects; PHIDIAS supervised the sculpture. Surrounded by 46 Doric columns, the temple stands on a three-step stylobate. The body comprised a main hall, with an inner chamber (the Parthenon proper) behind it. Within the hall a Doric colonnade divided the space into a broad nave and side aisles. Toward the west end stood the colossal gold and ivory *Athena Parthenos* of Phidias, destroyed in antiquity. Sculpture groups on the east and west pediments depicted the birth of Athena and her contest with POSEIDON. Of 525 ft (160 m) of sculpture on the interior frieze, 335 ft (102 m) still exist, the western portion in place and most of the rest in the British Museum (see ELGIN MARBLES). In the 6th cent. the temple became a Christian church and later a MOSQUE (with the addition of a MINARET). Used for storing gunpowder in 1687, the center section was destroyed by an explosion, but has been reconstructed.

The Parthenon

Parthia, ancient country of Asia, SE of the Caspian Sea. It was included in the Assyrian and Persian empires, the Macedonian empire of Alexander the Great, and the Syrian empire. In 250 B.C. the Parthians, led by ARSACES, founded the Parthian empire. They defeated the Romans in 53 B.C. but were in turned vanquished by them in 39–38 B.C. The empire declined and in A.D. 226 was conquered by ARDASHIR I, the founder of the Persian Sassanid dynasty. The chief Parthian cities were Ecbatana, Seleucia, Ctesiphon, and Hecatompylos.



Particle accelerator: In a cyclotron, as the charged particles move faster, they spiral out of the edge of the D-shaped sections (Ds).

particle accelerator, device used to produce beams of energetic charged particles (see ELEMENTARY PARTICLES) and to direct them against various targets for studies of the structure and components of the atomic nucleus (see ATOM) and of the forces holding it together. Accelerators also have applications in medicine and industry, most notably in the production of radioisotopes. The first stage of any accelerator is an ION source to produce the charged particles from a neutral gas. The charged particles are accelerated by electric fields. In linear accelerators, which are the most powerful and efficient electron accelerators, the particle path is a straight line. The early linear accelerators used large static electric charges, which produced an electric field along the length of an evacuated tube to accelerate the particles. Present linear accelerators use electromagnetic waves to accomplish the acceleration. To reach high energies without prohibitively long paths, E.O. LAWRENCE designed the cyclotron, in which a cylindrical magnet bends the particle beam into a circular path in a hollow circular metal box that is split in half to form two *D*-shaped sections. A radio-frequency electric field is applied across the gap, accelerating the particle each time it crosses the gap. In the synchrocyclotron, used to accelerate protons, the frequency of the accelerating electric field steadily decreases to match the decreasing angular velocity of the proton caused by the increase of its mass at relativistic velocities, i.e., those close to the speed of light. In the synchrotron, a ring of magnets surrounding a doughnut-shaped vacuum tank produces a magnetic field that rises in step with the proton velocities, thus keeping the radius of their paths constant; this design eliminates the need for a center section of the magnet, allowing construction of rings with diameters measured in miles. The Superconducting Supercollider (SSC), which began construction in 1989, was to be the world's largest proton accelerator, encircling Waxahachie, Tex. (30 mi/48 km S of Dallas), with its 54-mi (87-km) oval main ring. The U.S. Congress killed the project in 1993. A smaller proton collider is under construction at CERN, outside Geneva, Switzerland.

particle detector, in physics, one of several devices for detecting, measuring, and analyzing particles and other forms of radiation entering it. For example, in the ionization chamber (consisting basically of a sealed chamber containing a gas and two electrodes between which a voltage is maintained by an external circuit) and the Geiger counter (consisting commonly of a gas-filled metal cylinder that acts as one electrode, and a needle or thin, taut wire along the axis of the cylinder that acts as the other electrode), the ionizing radiation is measured by changes in the external circuit; these changes are caused by a current resulting from the increase in charges. In other devices, ionization (see ION) is used to make visible the track of the charged particle causing the ionization: the bubble chamber is filled with liquid hydrogen or some other liquefied gas; the cloud chamber is filled with a supersaturated vapor; and the spark chamber contains a high-pressure gas that fills the gaps between a stack of metal plates or wire grids that are maintained with high voltage between alternate layers. In the scintillation counter, radiation is detected and measured by means of tiny, visible flashes produced by the radiation when it strikes a sensitive substance known as a phosphor (see PHOSPHORESCENCE).

particle physics: see ELEMENTARY PARTICLES; NUCLEAR PHYSICS.

Parti Québecois [pärtē kēbēkwä'], Canadian provincial political party that advocates the independence of Quebec. Founded in 1968, it was long led by René LÉVESQUE. It won control of the provincial assembly in 1976 and made French Quebec's official language and passed diverse social legislation. Weakened after a 1980 provincial referendum rejected further negotiation for Quebec's independence, the party lost to the Liberals in the 1985 elections.

partridge, name for henlike BIRDS of various families. The true partridges of the Old World belong to the PHEASANT family. The gray partridge (*Perdix perdix*) of Europe, about 1 ft (30 cm) long, has been successfully introduced in parts of the U.S. The name *partridge* is also applied to the ruffed GROUSE, the BOBWHITE, and the plumed QUAIL.

parvovirus any of several small DNA viruses that cause several diseases in animals, including humans. In humans, parvoviruses cause fifth disease, or erythema infectiosum, an acute disease usually affecting young children. Symptoms include a rash that spreads from the cheeks to the extremities, low fever, fatigue, and, in adults, mild to severe joint pain and swelling. Dogs, wolves and coyotes can become infected with canine parvovirus. Puppies are most susceptible to the virus, which causes diarrhea, vomiting, and fever. Feline distemper, an often fatal disease of cats, raccoons, and minks, is characterized by fever, dehydration, loss of appetite, and a reduction in white blood cells.

Pasadena. **1** City (1990 pop. 131,591), S Calif., at the base of the San Gabriel Mts.; inc. 1866. Its manufactures include electronic and aerospace components; the California Inst. of Technology, with its NASA Jet Propulsion Laboratory, is in the city. It is the scene of the annual Tournament of Roses parade and the postseason college football game in the Rose Bowl. **2** City (1990 pop. 119,363), S Tex., on the Houston ship channel, an industrial suburb of HOUSTON; inc. 1929. The port of Houston, and oil and related industries provide much employment. NASA's manned space center (on Clear Lake) and the San Jacinto battlefield (1836) are nearby.

Pascal, Blaise, 1623–62, French scientist and religious philosopher. A mathematical prodigy, Pascal founded the modern theory of probability, discovered the properties of the cycloid, and contributed to the advance of differential calculus. In physics his experiments in the equilibrium of fluids led to the invention of the hydraulic press (see HYDRAULIC MACHINERY). As a young man Pascal came under Jansenist influence (see under JANSEN, CORNELIS), and after a profound religious experience in 1654 he entered the convent at Port-Royal, thereafter devoting his attention primarily to religious writing. His best-known works are *Provincial Letters* (1656), a defense of the Jansenists; and the posthumously published *Pensées* (1670), which preach the necessity of mystic faith in understanding the universe.

PASCAL: see PROGRAMMING LANGUAGE.

Pascal's law: see HYDRAULIC MACHINERY.

Paschal II or **Pascal II,** d. 1118, pope (1099–1118), an Italian named Ranieri. A Cluniac monk, he succeeded URBAN II. During his reign, PHILIP I of France was reconciled with the church, St. ANSELM triumphed in England, and the first Crusade was successful. In 1110 Holy Roman Emperor HENRY V invaded Italy and forced Paschal to surrender the papal position on INVESTITURE. Paschal later repudiated this surrender.

Pashto: see PUSHTU.

Pasiphaë, in Greek mythology, wife of King MINOS.

Pasolini, Pier Paolo, 1922–75, Italian writer and film director. A Marxist, he brought to his novels, poetry, and films a combination of religious and social consciousness. His films include *The Gospel According to St. Matthew* (1964), *Medea* (1969), and *Salò or The 120 Days of Sodom* (1975).

Passion play, surviving genre of the medieval MIRACLE PLAY. First given in Latin, then evolving into German by the 15th cent., it has as its subject the suffering, death, and resurrection of JESUS. The Passion play given every 10 years at Oberammergau, Bavaria, dates from 1633.

Passover: see under JEWISH HOLIDAYS.

Passy, Frédéric [päsē'], 1822–1912, French economist who shared with J.H. DUNANT the first Nobel Peace Prize (1901). He founded the International League for Permanent Peace (1867) and, with Sir William R. Cremer, the Inter-Parliamentary Union of Arbitration (1889).

pasta or **macaroni,** shaped and dried dough prepared from semolina or farina wheat flour and water, associated especially with Italian cuisine. Often mixed with eggs or egg solids the dough is cut into many shapes. Long known in Asia, similar flour and rice pastes are believed to have been introduced into Europe during the 13th-cent. Mongol invasions.

pastel, artists' medium of chalk and pigment, tempered with gum water and usually molded into sticks; also, a work in the medium. Pastel has been very popular in France, where it was introduced in the 18th cent. It was used by such 19th-cent. masters as DEGAS, TOULOUSE-LAUTREC, WHISTLER, and CASSATT. In the 20th cent. MATISSE created superb pastels.

Pasternak, Boris Leonidovich [păs'tərnăk"], 1890–1960, Russian poet, novelist, and translator. His first book of poems was *The Twin in the Clouds* (1914). *Over the Barriers* (1916) and *My Sister, Life* (1922) established him as a major poet with a fresh, lyrical, passionate voice. In the repressive intellectual climate of the 1930s he ceased publishing his own work, devoting himself to translating works of SHAKESPEARE, GOETHE, and other major Western poets. Two World War II collections brought only censure. His masterpiece, the novel *Doctor Zhivago,* an epic treatment of the tragic upheavals of 20th-cent. Russia, was finished by 1955. Denied publication in the USSR, it was first published (1957) in Italy, and soon acclaimed worldwide. Though Pasternak was awarded the 1958 Nobel Prize in literature, official Soviet pressure compelled him to refuse it. He spent his last years at an artists' colony near Moscow, where he remained an international symbol of artistic incorruptibility.

Pasteur, Louis [păstür'], 1822–95, French chemist. Noted for his studies of fermentation and BACTERIA, he disproved the theory of spontaneous generation and advanced the germ theory of infection. Of great economic importance are the process of PASTEURIZATION, which he developed; his studies of silkworm disease and chicken cholera; and his discovery of ANTHRAX and RABIES vaccines. In 1888 the Pasteur Inst. was founded in Paris, with Pasteur as director, to provide a teaching and research center on virulent and contagious diseases.

pasteurization, treatment of food with heat to destroy disease-causing and other undesirable organisms. The process was developed by Louis PASTEUR in the 1860s. Modern pasteurization standards for milk require temperatures of about 145°F (63°C) for 30 min followed by rapid cooling. The harmless lactic acid bacteria that cause milk to sour survive pasteurization but are destroyed when milk is heated to ultrahigh temperatures, a process called ultrapasteurization.

pastoral, literary work based on a conventionalized portrait of shepherd or rural life, whose purity and simplicity are contrasted with the corruption and artificiality of court and city. The pastoral, found in poetry, drama, and fiction, may embrace love, death, religion, and politics as themes. The idylls of THEOCRITUS (3d cent. B.C.) introduced Daphnis, Amaryllis, and other figures who became standard fixtures of the genre. VERGIL's *Bucolics,* or eclogues, describe an imaginary Arcadia yet glorify Rome. *Daphnis and Chloë,* by LONGUS (3d cent. A.D.), was the first pastoral romance. The pastoral revived during the RENAISSANCE in the work of DANTE, PETRARCH, BOCCACCIO, and Angelo Poliziano, and it has enriched English literature from Edmund SPENSER, Sir Philip SIDNEY, and SHAKESPEARE to John MILTON's "Lycidas," P.B. SHELLEY's "onais," and Matthew ARNOLD's "Thyrsis." Its conventions had faded by the 20th cent.

Patagonia, semiarid, windswept plateau, c.300,000 sq mi (777,000 sq km), S Argentina. The sparsely populated plateau has large coal, oil, and iron ore deposits, and vast untapped mineral wealth. The origins of Patagonia's original inhabitants, such as the Tehuelches ("Patagonian giants"), and of its unusual wildlife have greatly interested paleontologists and zoologists.

Patchen, Kenneth, 1911–72, American author; b. Niles, Ohio. His poetry, diverse in genre and free in form, ranges from *Before the Brave* (1936) to *Hallelujah Anyway* (1967). His novels include *Memoirs of a Shy Pornographer* (1945).

Patenier, Joachim de: see PATINIR, JOACHIM DE.

patent, in law, governmental grant of the exclusive privilege of mak-

ing, using, and selling and authorizing others to make, use, and sell an invention. The term derives from the medieval letters patent, public letters granting monopolistic control of useful goods to an individual. The first U.S. patent legislation was enacted in 1790, and the U.S. Patent Office was created in 1836. U.S. law allows the patenting of any original and useful device or process; the patent is valid for 17 years. Although there have been many independent inventors in the U.S., most important patents today are the property of large corporations.

patent medicine or **proprietary medicine,** packaged DRUGS that can be obtained without a prescription; also called **over-the-counter drugs.** Sale of patent medicines is regulated by the FOOD AND DRUG ADMINISTRATION, which evaluates their safety and effectiveness. ANALGESICS, antiseptics, some sedatives, laxatives, antacids, some cough medicines, and some skin preparations are examples of patent medicines.

Pater, Walter Horatio, 1839–94, British essayist and critic. He believed that the ideal life consisted of cultivating an appreciation for the beautiful and profound. *Studies in the History of the Renaissance* (1873), *Marius the Epicurean* (1885), *Imaginary Portraits* (1887), and other works exhibit his precise, subtle, and refined style.

Paterson, city (1990 pop. 140,891), seat of Passaic co., NE N.J., at the falls of the Passaic R.; inc. 1851. Founded (1791) by Alexander HAMILTON and others to promote industry in the newly-formed U.S., it became known as the "Silk City of the World," and in the 19th cent. was noted also as a producer of COLT revolvers and locomotives. Modern Paterson is a leading producer of textiles, clothing, electronic equipment, and plastics. The city's Great Falls Historic District contains a remarkable display of American industrial history.

Pathé, Charles [pätā'], 1863–1957, French film mogul. Pathé Frères dominated (c.1901–14) world production, world distribution, and European manufacture of film stock and equipment. The *Pathé Gazette* newsreel was among the firm's many films.

pathology, study of the cause of disease and the changes in structure and function produced in any cell, organ, or part of the body by disease. A pathologist, in modern terms, is a physician with special training in examining body tissues and excretions (including sputum, BLOOD, URINE, tissue BIOPSIES, and excised organs) for visible and microscopic changes indicative of disease. Diagnostic techniques include laboratory tests, microscopic examination, and electron microscopy which allows examination on a molecular level.

Patinir, Patenier, or **Patiner, Joachim de** [all: də pätĭnĭr'], d. 1524, Flemish landscape and religious painter. He was the first Flemish painter to regard himself primarily as a landscape painter. The small figures in his vistas were sometimes painted by other artists. A characteristic painting is *Flight into Egypt* (Antwerp).

Paton, Alan, 1903–88, South African novelist. His fiction, written with simplicity and compassion, reflects the deep conflicts that exist in South Africa. Among his novels are *Cry, the Beloved Country* (1948), *Too Late the Phalarope* (1953), and *Ah, But Your Land Is Beautiful* (1982).

patriarchy: see MATRIARCHY.

patriation bill: see CONSTITUTION ACT, 1982.

patrician [Lat., = of the fathers], member of the privileged class of ancient Rome. From the 6th cent. B.C. the PLEBS struggled constantly for political equality with the patricians. The patricians wore a distinctive tunic and shoe. Later the term became a title of honor.

Patrick, Saint, c.385–461, Christian missionary, the Apostle of Ireland. His life is largely obscured by legend. He is said to have been born in Roman Britain and enslaved by the Irish until he escaped to Gaul. He studied at Auxerre and later returned as a missionary to Ireland, where he made many converts. In 444 or 445 he established his archiepiscopal see at Armagh with the approval of Pope LEO I. By his death, Ireland was Christianized. The prime source of his life is the *Confessions,* written during his last years. Feast: Mar. 17.

Patroclus, in Greek mythology, friend of ACHILLES.

Patrons of Husbandry: see GRANGER MOVEMENT.

Patterson, P(ercival) J(ames), 1935–, Jamaican political leader. A member of the People's National party, he held ministerial posts (1972–80, 1989–92) and was deputy prime minister (1989–92) under Michael MANLEY. He succeeded (1992) Manley as prime minister when the latter resigned.

Patti, Adelina, 1843–1919, coloratura soprano; b. Spain, of Italian parents. She made her debut in New York City in 1859 and became the most popular singer of her day.

Patton, George Smith, Jr., 1885–1945, American general; b. San Gabriel, Calif. During WORLD WAR II he commanded the 3d Army, which spearheaded the liberation of France (1944) and the defeat of Germany (1945). A notorious incident (1943) in which the hot-tempered general slapped a soldier suffering from battle fatigue detracted from his brilliant military record.

Paul, Saint, d. A.D. 64? or 67?, the apostle to the Gentiles; b. Saul of Tarsus, Asia Minor. A Jew, son of a Roman citizen, he was a tentmaker. Educated in Jerusalem, he became a zealous nationalist and probably a Pharisee. Sources for his life are the ACTS OF THE APOSTLES and the Pauline Epistles. Of the epistles, ROMANS, CORINTHIANS, GALATIANS, PHILIPPIANS, COLOSSIANS, First THESSALONIANS, and PHILEMON are undoubted as Paul's work. EPHESIANS and Second Thessalonians are generally accepted. First and Second TIMOTHY and TITUS are thought in their present form to be later; HEBREWS was not written by Paul himself. Paul apparently approved of the martyrdom of St. Stephen and shortly thereafter was commissioned by the chief priest to help suppress Christianity in Damascus (A.D. 33). On his way there a light blinded him, and he heard Jesus asking, "Why persecutest thou me?" In Damascus he was found by the disciple Ananias. On regaining his sight he was baptized and began preaching. He spent 13 years, some of them in the Arabian desert, learning the faith. In A.D. 47 Paul set out with St. BARNABAS and St. MARK on his first missionary journey, establishing churches in Cyprus and Asia Minor. About A.D. 50 he was at the council of the apostles in Jerusalem, opposing the Judaistic group's support for circumcision, which would have made Christianity a Jewish sect. On his second mission (A.D. 50–53) Paul was accompanied by Silas and visited Galatia, Troas, Philippi, Salonica, Athens, and Corinth, where he remained for some time. On his third journey (A.D. 53–57) he remained two and a half years in Ephesus. On what proved to be his last visit to the Holy Land (A.D. 57–59), he was arrested in Jerusalem for provoking a riot; after two years of imprisonment and hearings, he claimed his Roman citizen's right and was taken to Rome, where he was imprisoned (A.D. 60) but allowed to conduct his ministry among his visitors. His final fate is uncertain. His tomb and shrine are at the basilica of St. Paul's Without the Walls, Rome. St. Paul dominated the apostolic age. The first Christian theological writing is found in his epistles, and he became a fountainhead of Christian doctrine.

Paul III, 1468–1549, pope (1534–49), a Roman named Alessandro Farnese. An astute diplomat, he favored reform and began the Catholic Reformation (see REFORMATION, CATHOLIC). To achieve Catholic reform, he convened (1545) the Council of TRENT and supported the newly founded Jesuits (see JESUS, SOCIETY OF). A patron of the arts, he had Michelangelo continue to decorate the SISTINE CHAPEL, and he founded the Farnese Palace.

Paul VI, 1897–1978, pope (1963–78), an Italian named Giovanni Battista Montini. He reconvened the Second VATICAN COUNCIL, which had been called (1962) by his predecessor, JOHN XXIII, and carried out many of its reforms, such as vernacularization and reform of the liturgy. Rules of fasting and abstinence were relaxed, and some restrictions on intermarriage were lifted. In 1964, Paul undertook a pilgrimage to the Holy Land and became the first pope to leave Italy in over 150 years. That journey was followed by trips to India (1964), the U.S. (1965), Africa (1969), and Southeast Asia (1970). Paul brought a new ecumenism to the church; limited doctrinal agreements were reached with the Anglicans and the Lutherans. A strong defender of papal primacy and infallibility, Paul sparked dissent from liberal church factions with his encyclical *Humanae Vitae* (1968), which reaffirmed the church's long-standing ban on contraception. He also faced challenges from Catholic traditionalists, who wished to return to the old liturgy. Although criticized, Paul was universally respected for his intellect and spirituality, his humility and compassion.

Paul I, 1754–1801, czar of Russia (1796–1801); son of CATHERINE II. Reversing his mother's policies, he limited the power of the no-

bility and did not continue her expansionism. He briefly joined (1798) the second coalition against France and, with Denmark, Sweden, and Prussia, formed an armed league to counter English interference in neutral shipping. He prohibited foreign travel and importation of Western books and music. A conspiracy of nobles and officers led to Paul's murder and the accession of his son, ALEXANDER I.

Paul, 1901–64, king (1947–64) of the Hellenes (Greece), brother and successor of GEORGE II. His reign was pro-Western, and he was succeeded by his son, CONSTANTINE II.

Paul, Alice, 1885–1977, American feminist; b. Moorestown, N.J. She helped found the Congressional Union for Woman Suffrage (1913), which became the National Woman's party (1917). After the passage of the Nineteenth Amendment to the U.S. CONSTITUTION, she worked for passage of an equal rights amendment.

Paul, Jean: see RICHTER, JOHANN PAUL FRIEDRICH.

Paulding, James Kirke, 1778–1860, American author, secretary of the navy under Pres. Van Buren; b. near Millbrook, N.Y. He collaborated with Washington IRVING on the periodical *Salmagundi,* and wrote satires, tales, and novels.

Pauli, Wolfgang, 1900–1958, Austro-American physicist; b. Vienna. A professor at the Federal Institute of Technology, Zürich, and a member (1935–36, 1940–46) of the Institute for Advanced Study, Princeton, N.J., he won the 1945 Nobel Prize in physics for his exclusion principle, according to which no two electrons in an atom may be in the same quantum state (see QUANTUM MECHANICS). He also posited the existence of the NEUTRINO before it was observed.

Pauling, Linus Carl, 1901–, American chemist. One of the few recipients of two Nobel prizes, he won the chemistry award in 1954 and the peace prize in 1962. His long career at the California Inst. of Technology began in 1931. He wrote a classic study of the chemical bond, and did important work in molecular biology. He is noted as an active proponent of disarmament, and as a champion of the use of large doses of vitamin C for treating the common cold and of the use of chemotherapy for mental diseases.

Pavarotti, Luciano, 1935–, Italian tenor. He made his debut in Italy in 1961, in London in 1963, and in the U.S. in 1965. Since 1968 he has appeared regularly at the METROPOLITAN OPERA, New York City. A great popular favorite, Pavarotti is noted for his brilliance and style, notably in works by BELLINI, DONIZETTI, PUCCINI, and VERDI.

Pavese, Cesare [pävĕ'sā], 1908–50, Italian poet, novelist, and translator. He translated many American works into Italian and was himself influenced by MELVILLE. His major novels include *The Comrade* (1947), *The House on the Hill* (1949), and *The Moon and the Bonfire* (1950); they all treat man's search for stability and release from isolation.

Pavlov, Ivan Petrovich, 1849–1936, Russian physiologist and experimental psychologist. Using dogs as experimental animals, he obtained secretions of the salivary glands, pancreas, and liver without disturbing the nerve and blood supply; for this work on the physiology of the DIGESTIVE SYSTEM he received the 1904 Nobel Prize in physiology or medicine. He also experimented on nervous stimulation of gastric secretions and thus discovered the conditioned reflex, a physiological reaction to environmental stimuli, which influenced the development or BEHAVIORISM. His chief work was *Conditioned Reflexes* (1926).

Pavlova, Anna Matveyevna [pävlu'və, Rus. päv'ləvə], 1881–1931, Russian ballerina. She made her debut (1899) in St. Petersburg and danced with DIAGHILEV's Ballets Russes. She was considered the greatest ballerina of her time and was noted for her classical technique. Her most famous role was *The Dying Swan.*

Pawnee, indigenous people of North America with a Caddoan language of the Hokan-Siouan stock (see NATIVE AMERICAN LANGUAGES). Their material culture was typical of the Plains (see NORTH AMERICA, INDIGENOUS PEOPLES OF), but they had elaborate myths and rituals, including a supreme god and, until the 18th cent., the custom of human sacrifice to their god of vegetation. In 1541 the Pawnee were living in S Nebraska. By the early 18th cent. they numbered 10,000, but epidemics and wars with the SIOUX greatly reduced their numbers. Fierce fighters, they never warred against the U.S., but instead provided protection in the INDIAN WARS. In 1876 they moved to a reservation in Oklahoma. In 1990 they numbered 2,892, but few were still living on the reservation.

Payne-Aldrich Tariff Act (1909), a compromise law that lowered some tariffs but increased others, contrary to the anti-protectionist plank of the 1908 Republican platform. Sponsored by Rep. Sereno E. Payne and Sen. Nelson W. ALDRICH, it was the chief issue during Pres. William H. TAFT's term.

Payton, Walter (Jerry), 1954–, American football player; b. Columbia, Miss. Playing 13 seasons (1975–87) as a running back for the Chicago Bears of the National Football League, Payton set career records in rushing yards (16,726), in total yards (21,803), and in touchdowns scored rushing (110). He rushed for over 1,000 yards in a season ten times and set a single-game record of 275 yards in 1977.

Paz, Octavio [päs], 1914–, Mexican poet and critic, distinguished for his insight, elegance, and erudition. His poetry includes *The Violent Season* (1958) and *Configurations* (1971). Among his prose works are *The Labyrinth of Solitude* (1950), *The Bow and the Lyre* (1956), *Children of the Mire: Modern Poetry from Romanticism to the Avant-Garde* (1974), and *The Monkey Grammarian* (1981). He was awarded the 1990 Nobel Prize for literature.

Paz Estenssoro, Victor [päs ästänsō' rō], 1907–, president of BOLIVIA (1952–56, 1960–64, 1985–89). He founded (1941) and helped to bring the National Revolutionary Movement (NRM) to power (1943). Elected (1951) president while in exile, he took office by means of an NRM-led revolt and instituted social reforms. He amended the constitution to permit himself a third term, and though reelected, he was ousted (1964) by a military coup. After returning to Bolivia and serving as a governmental adviser (1971), he lost two more presidential elections before he was elected to the position by the Bolivian congress (1985). In last term he reduced the government's role in the economy and controlled inflation, but with enormous social costs.

Pb, chemical symbol of the element LEAD.

PBB or **polybrominated biphenyl,** compound used as a fire retardant. In 1973 several thousand pounds of PBB were accidentally mixed with livestock feed that was later distributed to farms in west-central Michigan. Some 1.5 million chickens, 30,000 cattle, 5,900 swine, and 1,470 sheep that became contaminated with PBB before the mistake was discovered had to be destroyed. Later studies indicated that PBB had spread through the food chain; in one test of a sample of Michigan's residents, 97% of those tested had traces of PBB in fat tissue. Affected cattle suffered loss of appetite and weight loss (often leading to death), decreased milk production, and increased miscarriages. Laboratory studies have linked PBB with liver cancer in rats and with low birth weight, liver damage, and weakened resistance to disease in human beings.

PCB or **polychlorinated biphenyl,** any of a group of organic compounds that were once widely used as liquid coolants and insulators in industrial equipment, e.g., power transformers. They were later found to be dangerous environmental pollutants, however, and U.S. manufacture of PCBs ended in 1977. Research indicates that the chemical is toxic to a wide variety of animals, especially fish, and may also affect animal reproduction. As the result of a PCB leak in Japan in 1968 that contaminated rice oil, 1,000 people developed a skin disease, and babies showed signs of poisoning.

Pd, chemical symbol of the element PALLADIUM.

pea, hardy, annual, climbing plant (*Pisum sativum*) of the PULSE family, long grown for food and no longer found in the wild form. The round seeds, borne in a pod, are highly nutritious, having a high PROTEIN content. Split peas are obtained from the field pea (var. *arvense*), grown also for forage and as a green manure. The pods of sugar, or snow, peas are also eaten. The CHICKPEA and SWEET PEA belong to different genera.

Peace, river, W central Canada, flowing 945 mi (1,521 km) N and E from the confluence of the Finlay and Parsnip rivers at Williston Lake to join the Slave R. at Lake Athabasca. Its fertile middle valley in N Alberta, settled since 1900, is an important Canadian agricultural region. Sir Alexander MACKENZIE explored (1792–93) the river.

Peace Corps, U.S. agency established (1961) to assist developing countries to train manpower for their needs. The program now also sends volunteers to the former Soviet bloc nations and tries to

The key to pronunciation appears on page xiii.

attract people with technical training or special skills, particularly in agriculture. Volunteers serve two-year tours in foreign countries.

peach, tree *(Prunus persica)* of the ROSE family having decorative pink blossoms and a juicy, sweet, drupe fruit. Peach fruits have a characteristically fuzzy skin; the NECTARINE is the smooth-skinned variety. The numerous kinds of peaches are generally distinguished as clingstone (in which the fruit's ripe flesh does not readily separate from the seed) and freestone (flesh readily separates from the seed). Purple-leaved and double-flowering peach trees are often cultivated as ornamentals.

Peacock, Thomas Love, 1785–1866, English novelist and poet. His satires on the intellectual modes of the day include *Headlong Hall* (1816) and *Crotchet Castle* (1831). His best poems are interspersed in the novels.

peacock or **peafowl,** large BIRD of the PHEASANT family, native to E Asia. During courtship, the crested male common peacock (*Pavo cristatus*) displays his magnificent green-and-gold upper tail coverts before the drabber peahen. When the term *peafowl* is used, *peacock* refers to the male and *peahen* to the female.

Peale, Charles Willson, 1741–1827, American painter, naturalist, and inventor; b. Queen Annes co., Md. Peale studied under J.S. COPLEY and Benjamin WEST and later served as a captain in the American Revolution. Succeeding Copley as the most popular U.S. portraitist, he painted such figures as Franklin, Jefferson, Hamilton, and John Adams. His many paintings of George Washington include the earliest-known portrait (1772; Washington and Lee Univ.). Peale's scientific pursuits included paleontology, taxidermy, and such inventions as a velocipede, false teeth, and (with Thomas Jefferson) the polygraph. His brother **James Peale,** 1749–1831, b. Chestertown, Md., painted portraits, particularly miniatures, e.g., a painting of Washington (N.Y. Historical Soc.). Of Charles Willson Peale's 17 children, 4 became painters—**Titian Peale,** 1799–1885, animal painter, b. Philadelphia; **Rubens Peale,** 1784–1865, still-life painter, b. Bucks co., Pa.; **Raphaelle Peale,** 1774–1825, still-life and portrait painter, b. Annapolis, Md.; and **Rembrandt Peale,** 1778–1860, portrait and historical painter, b. Bucks co., Pa. Rembrandt Peale was a student of Benjamin West. His portraits of Washington and other contemporary figures are in Independence Hall, Philadelphia; the Metropolitan Museum; and the Museum of Fine Arts, Boston.

peanut, low plant (*Arachis hypogaea*) of the PULSE family, and its protein-rich, edible seeds. Native to South America, it is now widely cultivated. The seeds (peanuts) are eaten fresh or roasted and used in cooking and confection. They are ground to make peanut butter and yield an oil used for margarine, cooking oil, soap manufacture, and industrial purposes. The peanut plant is unusual for its geocarpy: when the pod begins to form, it is pushed into the ground by elongation of the stalk and matures underground.

pear, name for a tree (genus *Pyrus*) of the ROSE family and for its fruit. Most of the pear strains grown for fruit are varieties of the common pear *(P. communis)* or of its hybrids. The sweet and juicy fruit, broad at the base, generally narrows toward the stem; common varieties include the Bartlett, Anjou, Bosc, Comice, and Seckel. Pears are sold fresh, canned, or dried. Several pear species are cultivated as ornamentals for their blossoms, particularly the Callery, or Bradford, pear *(P. calleryana)*, which is valued as a street tree, and pear wood is used in cabinetmaking. The pear is closely related to the APPLE.

pearl, hard, rounded gem formed by certain BIVALVE mollusks, particularly the pearl OYSTER and the freshwater pearl MUSSEL. In response to an irritation caused by a foreign object such as a parasite or a grain of sand within the shell, the mantle (specialized layer of tissue between the shell and body mass) secretes layers of calcium carbonate, identical in composition to MOTHER-OF-PEARL, around the object. In several years, a pearl is formed. Pearls vary in shape (from round to irregular) and color (white to black). Cultured pearls, mainly from Japan, are produced by placing a small bead in the mantle of an oyster.

Pearl, The, one of four Middle English alliterative poems, presumably by the same author, in a manuscript of c.1400. An allegorical vision of singular beauty, it is generally explained as an elegy for the poet's daughter. Two of the other poems are the homiletic *Cleanness* (or *Purity*) and *Patience.* The fourth, *Sir Gawain and the Green Knight,* is perhaps the most brilliantly conceived of all Arthurian romances (see ARTHURIAN LEGEND).

Pearl Harbor, nearly landlocked harbor on Oahu island, Hawaii, site of important U.S. military installations. It is best known as the scene of the devastating Japanese surprise air attack on Dec. 7, 1941, which catapulted the U.S. into WORLD WAR II. It is now a national historic landmark.

Pearson, Lester Bowles, 1897–1972, prime minister of CANADA (1963–68). He helped to found (1944) the UNITED NATIONS and became (1947) chairman of the UN political and security committee. As Liberal minister of Canada's external affairs (1948–57), he helped to form NATO and mediated the 1956 ARAB-ISRAELI WAR, for which he received the 1957 Nobel Peace Prize. He led the Liberal party to victory in the 1963 elections and took office as prime minister.

Peary, Robert Edwin, 1856–1920, American arctic explorer, traditionally acknowledged as the discoverer of the NORTH POLE; b. Cresson, Pa. He made several expeditions to the arctic, including GREENLAND and Peary Land, which bears his name. He claimed to reach the North Pole on April 6, 1909. Although challenged by the prior claim of Frederick Albert Cook, his accomplishment was recognized by the U.S. Congress in 1911. Recent scholarship has reopened the question.

peat, soil material consisting of partially decomposed organic matter, formed by the slow decay of aquatic and semiaquatic plants in SWAMPS and bogs. Principal types include moss peat, derived chiefly from SPHAGNUM and used as mulch and stable litter, and fuel peat, used where wood and coal are scarce. Peat is the first stage of transition from compressed plant growth to the formation of COAL.

peat moss: see SPHAGNUM.

pecan: see HICKORY.

pediatrics, branch of medicine specializing in the care of children and the treatment of childhood diseases. It includes treatment of such diseases as MEASLES, CHICKEN POX, and MUMPS; immunization against serious childhood infections such as DIPHTHERIA and WHOOPING COUGH; and recognition and treatment of disorders due to MALNUTRITION, poor hygiene, and child abuse. Other specialties include pediatric SURGERY and perinatology (the care of the fetus and newborn, and the study of diseases of infancy and SUDDEN INFANT DEATH SYNDROME).

Pedro: for Spanish and Portuguese rulers thus named, see PETER.

Pedro [pā'drō], emperors of BRAZIL. **Pedro I,** 1798–1834 (r.1822–31), fled as a child with the Portuguese royal family to Brazil and became regent of Brazil (1821) when his father, JOHN VI, returned to Portugal. Heeding his Brazilian advisers, he declared Brazil a separate empire (1822) and granted its first constitution (1824). Upon his father's death (1826), he conceded the Portuguese crown to his daughter, MARIA II. His inability to cope with Brazil's problems led him to abdicate (1831) in favor of his son, **Pedro II,** 1825–91 (r.1831–89). Pedro II was extremely popular, and his long reign was marked by internal peace and great material progress. Opposition to a law freeing the slaves brought about his downfall, however, and he was deposed in 1889.

Peel, Sir Robert, 1788–1850, British statesman, prime minister (1834–35, 1841–46). As home secretary in 1829, he secured passage of the CATHOLIC EMANCIPATION bill (which he had once opposed), and established the London police force, whose members were called Bobbies after him. Important in the emerging CONSERVATIVE PARTY, he hoped it would favor general reforms. The abandonment of custom duties and repeal (1846) of the CORN LAWS during his second prime ministry, however, split the party, forcing his resignation.

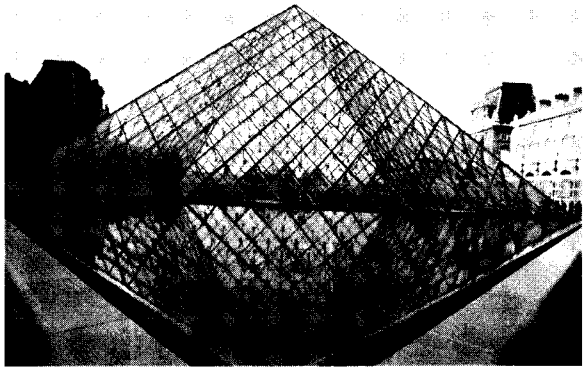
Pegasus, in Greek mythology, winged horse that sprang from the neck of the dying GORGON Medusa. Associated with the arts, he was captured by the hero BELLEROPHON, who rode him.

pegmatite: see GRANITE.

Pehlevi language: see PAHLAVI LANGUAGE.

Pei, I(eoh) M(ing) [pā], 1917–, Chinese-American architect; b. China. His designs integrate structure and environment. Among his works are Place Ville Marie, in Montreal; Government Center, in Boston; the East Wing of the National Gallery of Art, in Washington,

D.C. (1978); the West Wing of the Museum of Fine Arts, in Boston (1981); and a new, subterranean entrance complex for the Louvre, in Paris (1985), that is crowned by a glass pyramid.



Glass pyramid at the Louvre, designed by I.M. Pei

Peirce, Charles Sanders, 1838–1914, American philosopher; b. Cambridge, Mass. Viewing logic as the beginning of all philosophic study, he held that the meaning of an idea was to be found in an examination of the consequences to which the idea would lead; he coined the term PRAGMATISM to describe this principle. His followers included William JAMES and John DEWEY. Peirce was also a modern founder of SEMIOTICS. He was virtually unknown during his lifetime; his major essays appeared posthumously as *Chance, Love, and Logic* (1923), and his collected papers were published between 1931 and 1958.

Peisistratus: see PISISTRATUS.

Peking: see BEIJING.

Pekingese, TOY DOG; shoulder height, 6–9 in. (15.3–22.9 cm); weight, 6–14 lb (2.7–6.4 kg). Its long, soft coat, which may be any color, forms a ruff around the neck. As early as the 8th cent. it was kept by Chinese emperors. After a British raid on Beijing (then known as Peking) in 1860, it was brought to the West.

Peking man: see HOMO ERECTUS.

Pelé [pālā'], 1940–, Brazilian soccer player; b. Edson Arantes do Nascimento. Perhaps the greatest soccer player ever, he joined the Santos team at 16 and led Brazil's national team to world titles in 1958, 1962, and 1970. Pelé scored 1,281 career goals, and in international matches he averaged one goal per game. From 1975 to 1977 he played with the New York Cosmos, popularizing the sport in the U.S.

Pelée [pəlā'], volcano, 4,583 ft (1,397 m), on N Martinique, in the West Indies. Its great eruption of 1902 caused the death of more than 30,000 people and engulfed Saint-Pierre, the city at its base.

Peleus, in Greek mythology, father of ACHILLES.

pelican, large aquatic BIRD of warm regions, related to the CORMORANTS and gannets. Pelicans are long-necked birds with large, flat bills; they store fish in a deep, expandable pouch below the lower mandible. The white pelican (*Pelecanus onocrotalus*) of North America ranges from the NW U.S. to the Gulf and Florida coasts. It is about 5 ft (152.5 cm) long with a wingspread of 8 to 10 ft (244 to 300.5 cm).

pellagra, deficiency disease due to a lack of niacin, a component of vitamin B complex. See VITAMIN (table).

Peloponnesian League: see SPARTA.

Peloponnesian War [pĕl'əpənē'zhən], 431–404 B.C., a struggle in ancient GREECE between ATHENS and SPARTA, long-standing rivals. The war began after a contest between Athens and Corinth (Sparta's ally) over dependencies. The first important action was the invasion of Attica by a Spartan army in 431 B.C. The Athenians retired behind the walls of their city, and the Athenian fleet began raids, winning victories off Naupactus (429). A plague (430–428) wiped out a quarter of Athens' population. After PERICLES died, his successor, CLEON, won a great victory at Sphacteria (425) and rejected a Spartan bid for peace. The tide began to turn, and the Spartan leader Brasidas surprised Athens with a campaign in NE Greece that ended in a decisive Spartan victory at Amphipolas (422), in which both Brasidas and Cleon were killed. The new Athenian leader, NICIAS, arranged a peace (421), but his rival ALCIBIADES persuaded the Athenians to invade SYRACUSE. Alcibiades was accused of sacrilege, and the expedition, led by Nicias, ended in disaster (413). Alcibiades, who had fled to Sparta, sailed the Spartan fleet across the Aegean, inciting revolt in Athens' colonies. Recalled to Athens (410), he destroyed the Spartan fleet at Cyzicus, but Sparta, with a new fleet led by LYSANDER, defeated the Athenians at Notium (407), and Alcibiades was driven from Athens for good. After a last Athenian victory at Arginusae (406), Lysander crushed the Athenian navy at Aegospotamos (405) and sailed to Piraeus. Athens, besieged by land and sea, capitulated in 404. It never again regained its former importance, and for about 30 years afterward Sparta was the main power in Greece.

Peloponnesus or **Pelopónnisos,** formerly Morea, peninsula, S Greece, linked to the northern mainland by the Isthmus of Corinth. It is mainly mountainous, with fertile coastal strips in the north and west. Among its ancient Greek cities were SPARTA, CORINTH, Argos, and Megalopolis.

Pelops, in Greek mythology, son of TANTALUS. Murdered by his father, he was served at a banquet for the gods, who realized the trick, punished Tantalus, and restored Pelops, giving him an ivory shoulder for the one DEMETER had eaten. To win his wife, Hippodamia, he cheated in a chariot race and killed the charioteer Myrtilus, who cursed him before dying. Thus Pelops caused the many misfortunes visited upon his sons, ATREUS and Thyestes. The PELOPONNESUS was named for Pelops.

Pemba: see ZANZIBAR.

penance, SACRAMENT of the Roman Catholic and Orthodox Eastern churches in which a penitent confesses his or her SINS to a priest. A penance, usually of prayers, is then fixed by the priest. Roman Catholics are required to confess their serious sins before receiving communion and at least once a year. The penitent must have contrition for sin and make restitution for injuries to others.

pen-based computer, COMPUTER that uses pattern-recognition software to enable it to accept handwriting as a form of input. A stylus, which may contain special electronic circuitry, is used to write on the computer display or on a separate tablet. The earliest devices were limited to recognizing geometric shapes for COMPUTER GRAPHICS applications and neatly printed alphabetic characters. Pattern recognition has improved to the level where cursive input is now acceptable, especially in PERSONAL DIGITAL ASSISTANTS

Penderecki, Krzysztof [pändĕrĕts'kē], 1933–, Polish composer. He devised his own system of MUSICAL NOTATION to convey the effects of his unusual sonorities. His works include the *St. Luke Passion* (1963–66), a concerto for five-stringed violin (1967–68), symphonies, and several operas. He was rector (1972–87) of the Kraków conservatory.

Pendragon, Uther: see ARTHURIAN LEGEND.

pendulum, a mass suspended from a fixed point so that it can swing in an arc. The length of a pendulum is the distance from the point of suspension to the center of gravity of the mass. The period T, or time for one complete swing, depends on the length l of the pendulum and on the acceleration g of gravity at the pendulum's location, according to a formula derived by Christiaan HUYGENS: $T = 2\pi\sqrt{l/g}$. Huygens introduced (1673) the use of the pendulum to regulate the speed of clocks. See also HARMONIC MOTION.

Penelope, in Greek mythology, wife of ODYSSEUS, mother of Telemachus; in HOMER'S *Odyssey,* a model of fidelity. Pursued by suitors during Odysseus' absence, she agreed to marry after weaving her father-in-law's shroud but unraveled her work each night. She finally promised to marry the man who could bend Odysseus' bow, but none could. Odysseus returned disguised as a beggar, bent the bow, and slew the suitors.

penguin, originally the common name for the extinct great AUK and now used, starting in the 19th cent., for unrelated Antarctic diving birds. Penguins swim by means of their flipperlike wings, using their webbed feet as rudders; they waddle awkwardly on land. Species range from the largest, the emperor (3–4 ft/91.5–122 cm in height), to the smallest, the blue. Penguins are highly gregarious and nest in colonies of up to half a million birds in 500 acres.

The key to pronunciation appears on page xiii.

penicillin, any of a group of ANTIBIOTICS obtained from the molds of the genera *Aspergillis* and *Penicillium* and the first to be used successfully to treat bacterial infections in humans. Penicillin acts to inhibit cell wall formation in many gram-positive bacteria (see GRAM'S STAIN), including those that cause syphilis, pneumococcal pneumonia, and some staphylococcal and streptococcal infections. Although not active against most gram-negative bacteria, the tubercle bacillus, protozoans, fungi, or viruses, penicillin remains important in antibiotic therapy. Use of penicillin is limited by its tendency to induce allergic reactions (see ALLERGY) and because of the development of microorganisms that are resistant to its actions. Synthetic derivatives of penicillin include ampicillin, methicillin, and oxacillin. Erythromycin and other antibiotics have become important in treating infections that are resistant to penicillin.

Peninsular campaign, in the American CIVIL WAR, failed attempt (April–July 1862) by the Union army to capture RICHMOND by invading the Virginia peninsula between the York and James rivers. A Union force of 100,000 under Gen. George B. MCCLELLAN invaded the tip of the peninsula by sea and forced Confederate Gen. Joseph E. JOHNSTON to evacuate Yorktown and abandon Norfolk. The Union army drew near Richmond and beat off a Confederate attack at Fair Oaks, where Gen. Johnston was wounded. He was succeeded by Gen. Robert E. LEE, who withdrew the Confederate army to Richmond and subsequently forced McClellan to retreat from the peninsula by a brilliant counteroffensive in the SEVEN DAYS BATTLES.

Peninsular War, 1808–14, conflict between France and Great Britain on the Iberian Peninsula, growing out of the efforts of NAPOLEON I to control Spain and Portugal. When a palace revolt in Madrid (Mar. 1808) deposed the pro-French CHARLES IV, Napoleon invaded Spain and made his brother Joseph Bonaparte (see BONAPARTE, family) king of Spain (June). Both Spain and Portugal then revolted, and the British sent a force, under the future duke of WELLINGTON, to aid the rebels. Portugal was quickly won, but the fighting in Spain went on for years. By the time Napoleon abdicated, however, the British had won all of the peninsula and had penetrated France as far as Toulouse.

penis: see REPRODUCTIVE SYSTEM.

penitential psalms: see PSALMS.

Penn, William, 1644–1718, English Quaker leader and founder (1681) of PENNSYLVANIA colony as a religious and political haven for Quakers (see FRIENDS, RELIGIOUS SOCIETY OF). During his first visit there (1682–84), Penn drew up a liberal Frame of Government and established friendly relations with the indigenous tribes. He returned only once (1699–1701).

Pennell, Joseph, 1857–1926, American graphic artist and illustrator; b. Philadelphia. Influenced by WHISTLER, he is noted chiefly for his landscapes and architectural views, and his art is distinguished for its simplicity and technical perfection. Etchings, drawings, and lithographs of Pennell are in the Library of Congress (Wash., D.C.), Carnegie Institute (Pittsburgh), and Brooklyn Museum (N.Y.C.).

Pennsylvania, mid-Atlantic state of the U.S.; bordered by the Delaware River, across which lies New Jersey (E), Delaware and Maryland (S), West Virginia (SW), Ohio (W), and Lake Erie and New York (N).

Area, 45,333 sq mi (117,412 sq km). *Pop.* (1990) 11,881,643, a 0.1% increase over 1980 pop. *Capital,* Harrisburg. *Statehood,* Dec. 12, 1787 (second of original 13 states to ratify the Constitution). *Highest pt.,* Mt. Davis, 3,213 ft (980 m); *lowest pt.,* sea level. *Nickname,* Keystone State. *Motto,* Virtue, Liberty, and Independence. *State bird,* ruffed grouse. *State flower,* mountain laurel. *State tree,* hemlock. *Abbr.,* Pa.; PA.

Land and People. Coastal plains are found in the northwest and southeast. Most of Pennsylvania's terrain consists of mountains extending diagonally across the state. Ridges and valleys dominate the west; the Allegheny plateau covers the northern half of the state. Almost 70% of the population lives in metropolitan areas. PHILADELPHIA, the country's fifth largest city and a major port, is followed in size by PITTSBURGH, a major steel center; ERIE; and ALLENTOWN. In 1990 the state was 88% white and 9% African American.

Economy. Pennsylvania produces about 15% of the country's steel, and primary metals are the most profitable manufacture, followed by processed foods, fabricated metal products, and nonelectrical machinery. The state has extensive farmlands producing dairy items, cattle, corn, hay, eggs, mushrooms, and apples. Pennsylvania has long been one of the country's leading coal producers, and it is also an important source of cement, lime, and crushed stone.

Government. The constitution of 1873 provides for a governor elected to a four-year term. The general assembly consists of a senate of 50 members elected to four-year terms and a house of 203 members elected to two-year terms. Pennsylvania is represented in the U.S. Congress by 2 senators and 21 representatives and has 23 electoral votes.

History. Pennsylvania was inhabited by Native American tribes, including the DELAWARE, SHAWNEE, and Susquehanna, when the Swedes established a settlement in 1643. Control subsequently passed to the Dutch (1655) and the British (1664), who granted proprietary rights to the Quaker William PENN. He viewed his colony as a haven for persecuted religious groups; early settlers included the "Pennsylvania Dutch," who settled in the fertile Great Valley, where they are still heavily concentrated. The western frontier of Pennsylvania was the site of much fighting during the FRENCH AND INDIAN WARS. Pennsylvanians such as Benjamin FRANKLIN became leaders of the independence movement, often centered in Philadelphia, which was the premier city of the THIRTEEN COLONIES. As the geographical keystone of the colonies, Pennsylvania saw considerable fighting during the AMERICAN REVOLUTION. Iron-smelting began during the late 18th cent., and further economic growth was encouraged by the construction of canals (1820s) and railroads. Pennsylvania was the site of fighting during the CIVIL WAR, particularly in the GETTYSBURG CAMPAIGN of 1863. With the close of the war came the rapid emergence of the state as a mighty industrial commonwealth dominated by oil drilling, coal mining, and steel production. Huge industrial combines, including the U.S. Steel Co., emerged, and their plants were the scenes of violent strikes that produced a strengthened labor movement. Although Pennsylvania remains a major industrial state, its heavy industries were hurt by the national economic slowdown of the early 1980s, and the recession of the late 1980s and early 90s precipitated the loss of many manufacturing jobs. There was, however, increased demand for Pennsylvania coal, growth in the service sector, and expansion in the biotechnology and drug industries.

Pennsylvania, University of, in Philadelphia. Opened as an academy in 1751, largely through Benjamin FRANKLIN's efforts, it was chartered (1755) as a college. By establishing (1765) the first school of medicine in what is now the U.S., it became the country's first true university, acquiring that title in 1779. Its Wharton School of Finance and Commerce (est. 1881) was the first of its kind, and its Wistar Institute of Anatomy and Biology (1892) is notable.

Pensacola, city (1990 pop. 58,165), seat of Escambia co., NW Fla., on Pensacola Bay; inc. 1822. On the site of early Spanish settlements (1559–61, 1698), it belonged to several nations before becoming (1821) part of the U.S. purchase of Florida. Fishing, shipping, and manufacturing are important. Much of the city's economic and community life centers around military air bases.

pension, periodic payments to employees who retire because of age or disability. In the 19th cent., France and Great Britain provided government pensions to civil servants. In the U.S., government pensions have been given to all war veterans since the Revolution and to federal employees since 1920. Today private pension plans (organized by municipalities, labor unions, corporations, professional associations, and others) supplement SOCIAL SECURITY, which was instituted in 1935. The federal Pension Benefit Guaranty Corp. insures the pension plans of participating U.S. companies.

Pentagon, the, structure housing the U.S. Dept. of DEFENSE, in Arlington, Va. Completed in 1943, it comprises five concentric buildings, connected by corridors, and covers an area of 34 acres (13.8 hectares).

Pentagon Papers, government study of U.S. involvement in Southeast Asia from World War II to May 1968. Commissioned by Secretary of Defense Robert S. MCNAMARA, the top secret study, completed in Jan. 1969, revealed a considerable degree of miscalculation, bureaucratic arrogance, and deception by U.S. policymakers. In particular, it found that the U.S. government had continually resisted full disclosure of its military involvement in

Southeast Asia. On June 13, 1971, the New York *Times* began a series of articles based on the study. The Justice Department obtained a court injunction against further publication on national security grounds, but the Supreme Court ruled (June 30) that constitutional guarantees of a free press overrode other considerations, and allowed further publication. The government indicted (1971) Daniel Ellsberg, a former government employee who made the Pentagon Papers available to the New York *Times*, on charges of espionage, theft, and conspiracy. On May 11, 1973, a Federal judge dismissed all charges due to improper government conduct.

pentameter [Gr., = measure of five feet], in versification, a line to be scanned in five feet, as in Thomas NASHE's "Cold doth/not sting,/ the pret/ty birds/do sing." Iambic pentameter, with short-long feet, is the most common English meter, appearing first in CHAUCER's poetry. In the *Canterbury Tales* he used rhymed pentameter couplets; since he pronounced a final *e*, the lines often had eleven syllables. Later, with the final *e* dropped, this form became the heroic couplet, used notably by John DRYDEN and Alexander POPE. Blank verse, a succession of unrhymed iambic pentameters, is primarily an English form; it has been used in the loftiest epic and dramatic verse from SHAKESPEARE and John MILTON to the present. The SONNET is one of the most successful uses of iambic pentameter in English poetry.

Pentateuch [pĕn'tətyo͞ok] [Gr., = five books], first five books of the OLD TESTAMENT, the TORAH of MOSES.

pentathlon, composite athletic event. In ancient Greece it comprised leaping, foot racing, wrestling, discus, and javelin. The modern pentathlon, an Olympic event since 1912, involves a cross-country horseback ride, a cross-country run, swimming, épée fencing, and pistol shooting.

Pentecost [Gr., = fiftieth], important Jewish and Christian feasts. In Judaism it is called *Shavuot* and marks the end of the Palestinian spring grain harvest (see JEWISH HOLIDAYS). In Christianity it commemorates the coming of the HOLY GHOST to the disciples of Jesus, 50 days after the Passover in which Jesus died. In England it is called Whitsunday.

Pentecostalism, fundamentalist Protestant religious movement that grew out of the holiness movement in the U.S. in the early 20th cent. Pentecostalists believe in baptism with the Holy Ghost, "Speaking in tongues," faith healing, and the impending second coming of Jesus. Of the many Pentecostalist churches, the Church of God in Christ and the Assemblies of God are the largest.

penumbra: see ECLIPSE; SUNSPOTS.

Penutian [pənō͞o'shən], linguistic family of indigenous peoples of North and Central America. See NATIVE AMERICAN LANGUAGES (table).

Penzias, Arno Allan, 1933–, American astrophysicist, b. Munich. He and Robert Wilson won a Nobel Prize in physics in 1978 for their study of cosmic microwave radiation. They analyzed radio emissions from a ring of gas encircling the MILKY WAY. Their work lent support to the big bang theory (see COSMOLOGY) of creation. In 1981 Penzias became vice president of research at Bell Laboratories.

peony, popular flowering plant (genus *Paeonia*) of the buttercup family. Herbaceous peonies (most varieties of *P. lactiflora*) are hardy, bushy perennials that die back each year. The large, usually spring-blooming, single or double flowers are generally shades of red, pink, or white. Tree peonies (*P. suffroticosa*) have a somewhat woody base and are usually taller, with more abundant and larger blossoms.

People's party: see POPULIST PARTY.

Peoria, city (1990 pop. 113,504), seat of Peoria co., central Ill., on the Illinois R.; inc. as a city 1845. A busy port, it is the trade and transportation hub for a region producing grain, livestock, and coal. Although it has distilleries and factories producing heavy and light industrial goods, Peoria is known for its scenic beauty. La Salle established a fort in the region in 1680. The first permanent American settlement was in 1819.

Pepin [pĕ'pĭn], rulers of the FRANKS. **Pepin of Landan** (Pepin I), d. 639?, mayor of the palace of the Frankish kingdom of Austrasia, forced the succession (629) of Dagobert I as king and established the foundation for the CAROLINGIAN dynasty. His grandson, **Pepin of Heristal** (Pepin II), d. 714, mayor of the palace (680–714) of Austrasia and Neustria, established Carolingian power over the MEROVINGIAN kings by making himself the actual ruler of the Franks. He was the father of CHARLES MARTEL and the grandfather of **Pepin the Short** (Pepin III), c.714–768, the first Carolingian king of the Franks (751–68). He overthrew the Merovingian dynasty and had himself crowned king with the support of Pope Zacharias. Pepin defended papal interests and in 754 turned over to the pope what became the foundation of the PAPAL STATES. He was the father of CHARLEMAGNE.

pepper, name for the fruits of several plants used as condiments or in medicine. **Black pepper** (*Piper nigrum*), the true pepper, is economically the most important species of the pantropical pepper family (Piperaceae). A perennial climbing shrub native to Java, it bears pea-sized berries, the "peppercorns" of commerce. Black pepper, sold whole or ground, is the whole fruit; white pepper, made by removing the dark, outer hull, has a milder, less pungent flavor. Other *Piper* species of value include the betel pepper (*P. betle*), whose leaves are a principal ingredient in BETEL. The **red peppers,** native to warm temperate and tropical regions of the Americas, are various species of *Capsicum* (of the NIGHTSHADE family). The hot varieties include cayenne pepper, whose dried, ground fruit is sold as a spice, and chili pepper, sold similarly as a powder or in a chili sauce. Paprika (the Hungarian word for red pepper) is a ground spice from a less pungent variety. The pimiento, or Spanish pepper, is a mild type; its small fruit is used as a condiment and for stuffing olives. The common garden, or bell, pepper has larger, also mild fruits; they are used as vegetables and in salads. Bell peppers are also known as green peppers because they are most often marketed while still unripe.

peppermint: see MINT.

pepsin, digestive enzyme in the STOMACH that degrades protein. Most active in the acidic medium normally present in the stomach, pepsin breaks down proteins into their readily absorbed components, i.e., PEPTIDES and AMINO ACIDS.

peptic ulcer: see under ULCER.

peptide or **polypeptide,** biochemical formed by the linkage of up to about 50 AMINO ACIDS to form an unbranched chain. Longer chains are called PROTEINS. The amino acids are coupled by a peptide bond, a special linkage in which the amide group of one amino acid binds to the carboxyl group of another. Many peptides, such as the hormones vasopressin and ACTH, have physiological or antibacterial activity.

Pepys, Samuel [pēps], 1633–1703, English public official and author of the most famous English DIARY. He was an admiralty official, sat in Parliament (1679), and in 1684 was named president of the ROYAL SOCIETY. Forced into retirement on the accession of William III, he wrote *Memoirs . . . of the Royal Navy* (1690). Pepys's diary, in cipher, was partially deciphered and published in 1825, and almost all the text appeared from 1893 to 1899. An intimate record of his private life from Jan. 1, 1660, to May 31, 1669, the diary gives a vivid picture of social life and conditions in the early RESTORATION period.

Pequot, indigenous people of the Eastern Woodlands (see NORTH AMERICA, INDIGENOUS PEOPLES OF), with an Algonquian language of the Algonquian-Wakashan stock (see NATIVE AMERICAN LANGUAGES). By 1630 their territory extended to the Connecticut R., where they fought the Pequot War (1637) against settlers. Most were killed or enslaved. Today a few hundred live on two reservations in Ledyard, Connecticut, where the Mashantucket Pequot have established one of the largest gambling casinos in the world.

perch, symmetrical freshwater FISHES of the family Percidae, related to sunfishes and sea BASSES. The yellow perch, *Perca flavescens*, is a popular game and food fish, abundant in lakes and streams, where it feeds on insects, CRAYFISH, and small fish, and grows to an average length of 1 ft (30 cm) and weight of 1 lb (.5 kg). The family includes the walleye or walleyed pike (*Stizostedion vitreum*), the sauger or sand pike (*S. canadense*), and the brilliantly colored American darters, found E of the Rockies.

percussion instrument, any instrument that produces a musical sound when struck with an implement such as a mallet, a stick, a disk, or with the hand. They are used in ORCHESTRAS and bands most often to emphasize rhythm. The most common type is the DRUM, technically known as a membranophone, which consists of a membrane stretched over a frame to be struck with sticks or with

The key to pronunciation appears on page xiii.

the hand. Idiophones are percussion instruments in which the vibrating agent is the solid substance of the instrument itself. These include the triangle, a steel rod bent into an angle and struck with a straight rod; sticks clicked against each other; castanets, commonly consisting of two joined pieces of wood or ivory snapped together between the palm and the fingers; cymbals, a pair of concave metal plates that are struck together; the gong, a disk struck with a mallet or drumstick; the celesta, a high-pitched instrument consisting of steel bars fastened over wood resonators and struck by hammers operated from a keyboard; the glockenspiel, a curved frame enclosing metal bars that are struck with a hammer; the xylophone, an instrument with gradated wooden slats that are struck with small mallets, and sometimes equipped with tubular resonators (in which case it is called a marimba); and the bell.

Percy, Sir Henry, 1366–1403, English nobleman, called Hotspur; son of Henry Percy, 1st earl of Northumberland. He fought against the Scots at Otterburn (1388) and Homildon (1402). Although he had earlier supported the Lancastrian cause, in 1403 Hotspur and his father planned with Thomas Percy, OWEN GLENDOWER, and Sir Edmund de Mortimer to dethrone HENRY IV. Henry triumphed at Shrewsbury, and Hotspur was slain.

Percy, Walker, 1916–90, American novelist; b. Birmingham, Ala. In such novels as *The Moviegoer* (1961), *Love in the Ruins* (1971), and *The Second Coming* (1980), Percy dealt with alienation and redemption as they impinge on Southern Christian gentlemen coping with change.

Pereira, I(rene) Rice [pərā'rə], 1907–71, American painter; b. Chelsea, Mass. Her paintings are characterized by open, framelike forms juxtaposed against bands in mazelike patterns, e.g., *Oblique Progression* (Whitney Mus., N.Y.C.).

Perelman, S(idney) J(oseph), 1904–79, American comic writer; b. Brooklyn, N.Y. The titles of some of his best-known books suggest his screwball type of humor—*Strictly from Hunger* (1937), *The Road to Miltown; or, Under the Spreading Atrophy* (1957), and *The Rising Gorge* (1961). Perelman wrote the scripts for several MARX BROTHERS films.

S.J. Perelman

Peres, Shimon, 1923–, Israeli politician. Born in Poland, he emigrated (1934) to Palestine. He held (1948–65) various posts in Israel's defense ministry and was minister of defense (1974–77). A member of the Labor party from 1968, he became its leader in 1977. He was prime minister (1984–86) and vice premier and foreign minister (1986–90) in a national unity government. Unseated (1992) as party leader by Yitzhak RABIN, Peres became foreign minister under Rabin later that year.

perestroika: see GORBACHEV, MIKHAIL SERGEYEVICH; UNION OF SOVIET SOCIALIST REPUBLICS.

Peretz or **Perez, Isaac Loeb,** 1852–1915, Polish Jewish poet, novelist, playwright, and lawyer. A voice of the renaissance of progressive culture among the Jews (*Haskalah*), he wrote in Hebrew and Yiddish of the material poverty and spiritual riches of European Jews. His finest work is contained in his Hasidic sketches, e.g., *Stories and Pictures* (1900–1901).

Pérez de Ayala, Ramón [pā'räth dā äyä'lä], 1880?–1962 Spanish writer. His work includes such novels of ideas as *Belarmino and Apolonio* (1921), *Tiger Juan* (1926), and *The Healer of His Honor* (1926); essays; and poetry.

Pérez de Cuéllar, Javier, 1920–, Peruvian diplomat, secretary general of the UNITED NATIONS (1982–91). He entered the Peruvian foreign service in 1940 and served in several posts, including ambassador to the USSR (1969–71) and to the UN (1971–75). He represented the UN on the CYPRUS problem (1975–78) and in 1982 succeeded Kurt Waldheim as secretary general. Serving two terms, he restored the prestige of the UN and, aided in part by the end of the COLD WAR, helped to end the IRAN-IRAQ WAR and the Cambodian civil war and secure the withdrawal of Soviet troops from Afghanistan. Under his leadership UN negotiators obtained the release of the Americans held hostage by Shiites in Lebanon, and he personally negotiated a peace pact between the government and rebels in El Salvador.

Pérez Galdós, Benito [pā'rĕth gäldōs'], 1843–1920, Spanish novelist and dramatist. For his panoramic and psychologically acute treatment of Spanish society he has been called the greatest Spanish novelist since CERVANTES. His works include a cycle of 46 historical novels, *Episodios nacionales,* covering 1805 to 1874; 21 *novelas españolas contemporáneas,* including *Fortunata and Jacinta* (1886–87); and 6 *novelas españolas de la primera época,* notably *Doña Perfecta* (1876) and *La familia de Léon Roch* (1878). His plays include dramatizations of some of his novels.

performance art, art form in which live performance is the essential feature of the artwork. With roots in DADA, it originated in the "happenings" of the 1960s. Performance art incorporates elements from the visual arts, dance, music, pantomime, drama, and other forms; stresses spontaneity, evanescence, and originality; and often exhibits a keen sense of absurdity, humor, or pathos. Performance artists are varied in background and style, and include such figures as Laurie Anderson, Eric Bogosian, Bill Irwin, Reno, the Blue Man Group, and John Kelly.

perfume, aroma produced by essential oils of plants and by synthetic aromatics. The burning of incense in religious rites of ancient China, Palestine, and Egypt led gradually to the personal use of perfume, widespread in ancient Greece and Rome. During the Middle Ages Crusaders brought knowledge of perfumery to Europe from the East. After 1500 Paris was the major center of perfume-making. Since the early 19th cent. chemists have produced thousands of synthetic scents. In the 20th cent. perfumes for men and women, most a blend of natural and synthetic scents, were produced by prominent fashion designers (see FASHION, table).

Pergamum, ancient city of Asia Minor on the Caicus R., now in Turkey. An independent kingdom, it flourished as a brilliant center of Hellenistic culture in the 3d and 2d cent. B.C. It was particularly notable for its sculptures and for a large library of books on PARCHMENT (which takes its name from the city). King Attalus III (d. 133 B.C.) bequeathed Pergamum to Rome.

Pergolesi, Giovanni Battista, 1710–36, Italian composer. He wrote two masterpieces, the short comic opera *The Maid as Mistress* (1733) and a *Stabat Mater* for treble voices and strings, as well as two operas.

Pericles, c.495–429 B.C., Athenian statesman. In 461 B.C. he secured the exile of Cimon, whom he replaced as leader of ATHENS. Under his tutelage Athens reached its zenith. The DELIAN LEAGUE was powerful, a truce was arranged (445) with Sparta that brought 14 years of peace, and democratic reforms were introduced. Pericles became a great patron of the arts, encouraging music and drama, and was responsible for the building of such great monuments as the PARTHENON and Propylaea on the Acropolis. In 430

‡Also called kurchatovium and unnilquadium (104); unnilpentium (105); unnilseptium (107); unniloctium (108); unnilennium (109).

B.C., during the PELOPONNESIAN WAR, he made a strong appeal to the pride and patriotism of the Athenians but was driven from office. Reinstated (429), he died six months later.

perigee and **perihelion:** see APSIS.

perinatology: see PEDIATRICS.

period, in physics: see HARMONIC MOTION; WAVE.

periodic table, chart that reflects the periodic recurrence of chemical and physical properties of the ELEMENTS when the elements are arranged in order of increasing ATOMIC NUMBER. The periodic table was devised by Dmitri MENDELEEV and revised by Henry MOSELEY. It is divided into vertical columns, or groups, numbered from I to VIII, with a final column numbered 0. Each group is divided into two categories, or families, one called the a series (the representative, or main group, elements) the other the b series (the TRANSITION ELEMENTS, or subgroup elements). All the elements in a group have the same number of VALENCE electrons and have similar chemical properties. The horizontal rows of the table are called periods. The elements of a particular period have the same number of electron shells; the number of electrons in these shells, which equals the element's atomic number, increases from left to right within each period. In each period the lighter METALS appear on the left, the heavier metals in the center, and the nonmetals on the right. Elements on the borderline between metals and nonmetals are called metalloids. Elements in group Ia are called the ALKALI METALS; in group IIa, the ALKALINE-EARTH METALS; in group VIIa, the HALOGENS; and in group 0, the INERT GASES.

periodontitis or **pyorrhea,** inflammation and degeneration of the gums and other tissues surrounding the teeth. Symptoms are bleeding gums, followed by the receding of gums from the TEETH, loosening of the teeth, and resorption of the bone supporting the teeth. Causes include poor nutrition, plaque, and poor oral hygiene.

peritoneum: see ABDOMEN.

peritonitis, acute or chronic inflammation of the peritoneum, the membrane lining the abdomen and surrounding internal organs. It is caused by invasion of bacteria or foreign matter following rupture of an internal organ, by infection from elsewhere in the body, by penetrating injury to the abdominal wall, or by accidental contamination during surgery. Treatment includes ANTIBIOTIC therapy.

periwinkle, mollusk with a conical spiral shell, a variety of SNAIL. Periwinkles are marine GASTROPODS that feed on algae and seaweed and are found at the water's edge.

Perkins, Frances, 1882–1965, U.S. secretary of labor (1933–45); b. Boston. The first woman appointed to the cabinet, she promoted and administered liberal labor legislation during Pres. F.D. ROOSEVELT'S NEW DEAL administration.

Perlman, Itzhak, 1945–, Israeli violinist. Although a victim of polio at age four, he gave a solo violin recital at ten and appeared on American television in 1958. He studied at the Juilliard School, in New York City, and has since the early 1960s appeared widely in concert. He is noted for his warmth and brilliant technique.

Perm [pyĕrm], city (1990 est. pop. 1,090,000), E European Russia, on the Kama R. A transfer center for rail and river cargo, it is a major producer of machinery in the Urals industrial and mining region and has oil refineries and chemical plants. Founded in 1780, it was named Molotov from 1940 to 1958.

Permian period: see GEOLOGIC ERA (table).

permutations and combinations, the study of techniques for counting arrangements and choices of objects; such techniques are often used in PROBABILITY problems. A permutation of a set is a way in which the elements of the set can be arranged or ordered. In general, the number of permutations of n things taken r at a time is given by $P(n,r) = n!/(n - r)!$, where the symbol $n!$, denoting the product of the integers from 1 to n, is called the n factorial. A combination is a choice of different elements from a larger set, without regard to order. In general, the number of combinations of n things taken r at a time is $C(n,r) = n!/r!(n - r)!$

Perón, Juan Domingo [pĕrōn'], 1895–1974, president of Argentina (1946–55, 1973–74). An army officer, he rose to prominence when Ramón Castillo was overthrown in 1943. He developed a following among workers, churchmen, landowners, and industrialists. In 1946 he was elected president by a huge majority. He set up a dictatorship and instituted a program of revolutionary, nationalistic

measures (known as *peronismo*) which were supposed to lead to economic self-sufficiency. By the early 1950s, however, the economy had deteriorated and Perón had broken with the church. After the death in 1952 of his enormously popular wife, Eva, his support weakened, and in 1955 he was overthrown by a military coup. *Peronismo* nevertheless remained a potent political force and contributed to governmental chaos. In 1971 Perón returned to Argentina, and in 1973 he was elected president. His wife, María Estela (Isabel) Martínez de Perón (see below), was elected vice president, and she succeeded to the presidency when he died in 1974. Perón's second wife, **Eva Duarte de Perón** [dōōär'tā], 1919–52, was a minor actress before her marriage to Perón in 1945. After he became president, she virtually ran the ministries of health and labor, and she commanded a huge political following. She died of cancer at the age of 33. Perón's third wife, **María Estela (Isabel) Martínez de Perón,** 1931–, was a dancer before she married the exiled Perón in 1961. Upon her husband's death in 1974 she became president of Argentina, but in 1976 she was deposed in a military coup and placed under house arrest. Freed in 1981, she went into exile in Spain.

Perot, H(enry) Ross, 1930–, American business executive; b. Texarkana, Tex. After working for IBM, he founded (1962) Electronic Data Systems (EDS), a computer services company. During the Iranian hostage crisis (1979), he funded a successful operation to rescue two of his employees from an Iranian prison. He sold EDS to General Motors in 1984, diversified into real estate, gas, and oil, and later started a new computer services company. He ran unsuccessfully for U.S. president as an independent in 1992 and fought U.S. ratification of the NORTH AMERICAN FREE TRADE AGREEMENT.

peroxide, chemical compound containing two oxygen atoms, each of which is bonded to the other and to a radical or some element other than oxygen; e.g., in hydrogen peroxide (H_2O_2) the atoms are joined together in the chainlike structure H—O—O—H. Peroxides are unstable, releasing oxygen when heated, and are powerful oxidizing agents. Peroxides may be formed directly by the reaction of an element or compound with oxygen.

perpetual-motion machine, a machine, considered impossible to build, that would be able to operate continuously and supply useful work without needing a continuous supply of heat or fuel. A perpetual-motion machine of the first kind, which would produce more ENERGY in the form of work than is supplied to it in the form of heat, violates the first law of THERMODYNAMICS. A perpetual-motion machine of the second kind, which would continuously supply work without a flow of heat from a warmer body to a cooler body, violates the second law of thermodynamics.

Perrault, Charles [pĕrō'], 1628–1703, French poet famed for his *Mother Goose Tales* (1697) for children. One of his poems (1687) set off the celebrated "quarrel of the ancients and the moderns"; BOILEAU-DESPRÉAUX, the chief defender of the ancients, bandied insults with Perrault until 1694.

Perret, Auguste [pĕrā'], 1874–1954, French architect. He was a pioneer in the use of reinforced concrete, notably in the church of Le Raincy, near Paris (1922–23). He built warehouses, factories, residences, and theaters in this material.

Perrot, Jules, 1810–92, French dancer and choreographer. He worked (1848–59) at the Imperial Theatre in St. Petersburg. His ballets include *Esmeralda, Ondine,* and part of the original *Giselle* (1841).

Perry, Matthew Calbraith, 1794–1858, U.S. naval officer; b. South Kingstown, R.I. Commodore Perry opened up isolationist JAPAN to Western trade and influence. In 1853 he anchored his squadron of four U.S. navy ships in lower Tokyo Bay. A skilled diplomat, Perry negotiated a treaty (1854) with Tokugawa shogunate officials that permitted American ships to use two Japanese ports. His brother, **Oliver Hazard Perry,** 1785–1819, was also a U.S. naval officer. He commanded the U.S. fleet that defeated a British force in the Battle of Lake Erie (1813) during the WAR OF 1812. His report of the battle—"We have met the enemy and they are ours"—has become famous.

Perry, William James, 1927–, U.S. government official; b. Vandergrift, Pa. A former engineering professor and founder of a military electronics firm, he served as a defense undersecretary (1977–81) in the Carter administration. Appointed deputy defense secretary by Pres. Clinton in 1993, he became defense secretary in 1994.

Perse, Saint-John, pseud. of **Alexis Saint-Léger Léger,** 1887–1975, French poet and diplomat; b. Guadeloupe. He was the permanent head of the foreign affairs ministry from 1933 to 1940. His reputation as a poet of great lyric power grew after his self-imposed exile to the U.S. in 1940. His works include *Éloges* (1911), *Anabasis* (1924), *Exile* (1942), and *Seamarks* (1957). He received the 1960 Nobel Prize in literature.

Persephone [pərsĕf'ənē] or **Proserpine** [prōsûr'pənē], in Greek and Roman mythology, goddess of fertility, queen of the underworld; daughter of ZEUS and DEMETER. She was abducted by PLUTO, who held her captive in HADES. Demeter persuaded the gods to let her return to earth for eight months a year. Her story, celebrated in the ELEUSINIAN MYSTERIES, symbolized the vegetative cycle. When she left the earth, life withered; when she returned, it blossomed anew.

Persepolis [pərsĕp'əlĭs], ancient city of Persia, NE of present-day Shiraz. It was the ceremonial (but not administrative) capital of the Persian empire under DARIUS I and his successors. The ruins contain several palaces as well as a citadel.

Perseus, c.212–166 B.C., last king of MACEDON (179–168 B.C.), son and successor of PHILIP V. His anti-Roman policy caused the Third Macedonian War (171–168); he was defeated (168) by the Romans at Pydna and died in captivity.

Perseus, in Greek mythology, son of ZEUS and Danaë. Told by an oracle that Perseus would kill him, his grandfather Acrisius set him and Danaë afloat in a chest, from which they were rescued by King Polydectes. Later, seeing Perseus as an obstacle to his love for Danaë, the king sent him to fetch the head of the GORGON Medusa. The gods aided Perseus, and he slew Medusa. Fleeing from the other Gorgons, Perseus was refused aid by ATLAS, who was turned into a stone mountain by Medusa's head. On his way home, Perseus rescued ANDROMEDA and married her. Later, while competing in a discus contest, Perseus accidentally killed Acrisius, thus fulfilling the prophecy. Benvenuto CELLINI's famous statue of Perseus is in FLORENCE, Italy.

Pershing, John Joseph, 1860–1948, U.S. army officer; b. Linn co., Mo. After commanding army units during the SPANISH-AMERICAN WAR (1898) and in the Philippines (1906–13), Gen. Pershing commanded the American Expeditionary Force (1917–18) in WORLD WAR I. He was expert at molding hastily trained American troops into skilled combat units.

Persia, old name for the Asian country of IRAN, in which the ancient Persian empire had its core. The early Persians were presumably a nomadic tribe that filtered through the Caucasus to the Iranian plateau. By the 7th cent. B.C. they were established in the present region of Fars, which then belonged to the Assyrian empire. Persian rulers were early associated with the Medes, who created a strong state in the 7th cent. B.C. CYRUS THE GREAT, the first of the ACHAEMENIDS, made himself ruler of MEDIA in the mid-6th cent. B.C. and by rapid conquest established the great Persian empire. From the beginning the Persians built on the foundations of earlier states, borrowing the political structure of Assyria and the arts of Babylonia and Egypt. The country was beset by dynastic troubles, concerning first the claims of Cambyses and later those of DARIUS I. Darius organized a highly efficient centralized system of administration and extended Persian rule east into modern Afghanistan and NW India and as far north as the Danube. The Greeks revolted successfully in the PERSIAN WARS, and after the mid-5th cent. B.C. Persia was weakened by dynastic troubles, e.g., the rebellion of CYRUS THE YOUNGER against ARTAXERXES II and the successful revolt of Egypt. Finally, ALEXANDER THE GREAT destroyed the Achaemenid empire. After Alexander's death most of Persia fell to the Seleucids, who, though they introduced a fruitful Hellenistic culture, were unable to maintain control. PARTHIA, which broke away in the mid-3d cent. B.C., became a kind of successor to the old Persian empire and came to rival Rome. Its decline was followed by the establishment of a new Persian empire in A.D. c.226 under the Sassanids. This state flourished until A.D. 637, when invading Arabs took the capital, Ctesiphon. Islam replaced ZOROASTRIANISM, and the caliphate made Persia part of a larger pattern, from which modern Iran eventually emerged.

The key to pronunciation appears on page xiii.

Persian art and architecture. The first finds of artistic importance are the superb ceramics of Susa and Persepolis (c.3500 B.C.). On goblets and bowls are stylized abstractions of birds and animals. Much Iranian art of the 4th, 3d, and 2d millennia is strongly influenced by that of MESOPOTAMIA. The treasure of Ziwiye (Sakiz), a hoard containing ivory, gold, and silver objects, also contained controversial Luristan bronze objects that provide a definite link with the art of the Scythians. The Ziwiye Treasure (700 B.C.) is divided into four styles: Assyrian, Scythian, proto-Achaemenid (with Greek influence), and native, or provincial. A unified style emerges in the Achaemenid period (c.550–330 B.C.) using monumental relief sculpture as an adjunct to massive architectural complexes, such as the famous *Frieze of the Archers,* from the palace of DARIUS I at Susa (Louvre). After the death of ALEXANDER THE GREAT (323 B.C.) there was internal turmoil until the rise of the Parthians (c.250 B.C.), whose art synthesized Hellenistic motifs with Iranian forms. Of greater artistic importance was the work of the SASSANIDS (A.D. 226–7th cent.). Their architecture is decorated with carved stone and stucco reliefs, and makes use of colorful stone MOSAICS. Beautiful gold and silver dishes are decorated with hunting scenes and animals in high relief. Little remains of the early centuries of Islam in Iran, but a significant innovation by the Persians was the raising of a DOME over a square hall by means of squinches. During this early period ceramics became an art form. Under the Seljuk Turks in the 11th and 12th cent., luster and "minai" ceramics with intricate scenes of court life were produced. The most famous work of the Mongol school of the 14th cent. is an illustrated book, the Demotte *Shah Namah* (The History of Kings), which is free and lively in execution. Chinese influence is seen in 15th-cent. Timurid painting. Under the Safavids illustration became decoratively patterned, as in the 16th-cent. *Shah Namah* of Shah Tamasp, which incorporates the great developments in painting of the period; it was published in facsimile as *The King's Book of Kings* in 1972. In the 17th cent. Persian art fell under the influence of Europe and India, and it rapidly degenerated.

Persian cat: see under CAT.

Persian Gulf, called the Arabian Gulf by Arabs, arm of the ARABIAN SEA, extending c.600 mi (970 km) from the mouth of the SHATT AL ARAB (N) to the Strait of HORMUZ (S), through which it connects with the Gulf of Oman. It is of great strategic importance as the chief maritime outlet for the bordering oil-rich states of Saudi Arabia, Bahrain, the United Arab Emirates, Kuwait, Iran, and Iraq. During the IRAN-IRAQ WAR the gulf was heavily mined by both sides and suffered ecologically from massive oil spills, which also occurred during the PERSIAN GULF WAR.

Persian Gulf War or **Gulf War,** Jan.–Feb. 1991, armed conflict resulting from IRAQ's invasion of KUWAIT. In Aug. 1990 Iraq invaded and annexed Kuwait, which it had long claimed. The UN Security Council called for Iraq to withdraw and subsequently embargoed most trade with Iraq. On Jan. 17, 1991, a U.S.-led coalition that included Britain, Egypt, France, Saudi Arabia, and other nations began a massive air war to destroy Iraq's forces and military and civil infrastructure. Iraq called for terrorist attacks against the coalition and launched missiles at Israel (in an unsuccessful attempt to widen the war and break up the coalition) and at Saudi Arabia. The main coalition forces invaded Kuwait and S Iraq on Feb. 24 and, over the next four days, encircled and defeated the Iraqis and liberated Kuwait. Kuwait and Iraq suffered enormous property damage, and the war led to unrest among Kurds and Shiites in Iraq. Iraq agreed to coalition peace terms but subsequently sought to frustrate the carrying out of the terms, particularly UN weapons inspections. In 1993 the U.S., France, and Britain launched several air strikes and a cruise missile strike at Iraq in response to provocations, including a planned assassination attempt on former U.S. Pres. Bush. See also IRAN-IRAQ WAR.

Persian language, member of the Iranian group of the Indo-Iranian subfamily of the Indo–European family of languages. See LANGUAGE (table).

Persian literature. The oldest extant Persian writing is found in ancient inscriptions, but it is only of historical interest. The first major literary works are the scriptures of ZOROASTRIANISM and the Pahlavi writing of SASSANID Persia. The Arab invasion (7th cent. A.D.) made Arabic the literary language and ISLAM the dominant literary theme. Many notable works of Arabic literature are by Persians. Persian reemerged as the literary language in the 9th cent., and in the following centuries classical Persian literature flowered. The great poet FIRDAUSI (10th cent.) wrote the *Book of Kings,* the national epic, and OMAR KHAYYAM (11th cent.) crafted his well-known *Rubaiyat.* Also among the great writers are the poets of SUFISM. FARID AD-DIN ATTAR, Jalal ed-Din RUMI, and SADI (12th–13th cent.) all wrote mystical poetry of the highest order, full of finely wrought symbols. In the 14th cent. HAFIZ was the author of a number of exquisite lyrics. Prose—tales, fables, allegories, and philosophical and scientific works—also flourished. The most outstanding prose works were the histories; many of these surpassed their Arabic models. After the 15th cent. Persian literature went into a decline that lasted until the rise of BABISM and BAHA'ISM in the 19th cent. brought about a religious literary revival. In the 20th cent. Western influence and the struggle for independence and social justice in Iran made political and social themes paramount, and literary language became simple and direct. Modern poets include Iradj, Abid e-Pishawari, Parwin, and Nima; S. Hedayet and M.M. Hejazi are celebrated novelists.

Persian Wars, 500–449 B.C., conflict between the Greek city-states and the Persian Empire. It began in 500 B.C., when the Ionian Greek cities, aided by ATHENS and Eretria, revolted against the despotic rule of DARIUS I. They were subdued by the Persians (494), and Darius decided to punish Athens and Eretria, and annex all of Greece. His first expedition (492) ended when his fleet was crippled by a storm. A second expedition destroyed (490) Eretria and then proceeded against Athens, which, under MILTIADES, expelled the invaders at MARATHON. (The Spartans, whose aid had been sought, arrived the day after the battle.) A third expedition, under preparation when Darius died (486), was completed by his son Xerxes I, who reached Greece in 480. His huge land force was delayed at the narrow pass of THERMOPYLAE by a small but gallant force of Spartans, who fought until they all had died. The Athenians, under THEMISTOCLES, put trust in their navy and made little effort to defend their city, which was taken (480) by the Persians. Shortly afterward the Persian fleet was crushed off Salamis by the Greeks. Xerxes returned to Persia, leaving behind a military force, which was defeated (479) at Plataea by a Greek force under the Spartan Pausanius. The Greeks also won a naval victory at Mycale. Although the wars dragged on for many years, these two victories marked the end of the Persian threat to Europe and the beginning of the period of Greek greatness.

persimmon: see EBONY.

Persius or **Aulus Persius Flaccus,** A.D. 34–62, Roman satirical poet. He wrote in the manner of HORACE and Lucilius, preaching Stoic moral doctrine (see STOICISM). He was harsh in exposing the corruption and folly of contemporary Rome.

personal computer (PC), small but powerful COMPUTER primarily used in an office or home without the need to be connected to a larger computer. PCs evolved after the development of the MICROPROCESSOR made possible the hobby-computer movement of the late 1970s, when some computers were built from components or kits. In the early 1980s the first low-cost, fully assembled units were mass-marketed. The typical configuration consists of a video display, keyboard, mouse, logic unit and memory, storage device and, often, a MODEM. Further decreases in component size have made it possible to build portable PCs, or laptops, the size of a ream of paper and smaller. Most current PCs have more computing power, memory, and storage than the large mainframe computers of the 1950s and early 60s. PCs equipped with networking and communications hardware are often used as COMPUTER TERMINALS. See also NETWORK; PERSONAL DIGITAL ASSISTANT.

personal digital assistant (PDA), lightweight, hand-held COMPUTER designed for use as a personal organizer with communications capabilities. A typical PDA has no keyboard, relying instead on recognition of handwritten input, through the use of special hardware and PEN-BASED COMPUTER software, on the surface of LIQUID CRYSTAL display screen. In addition to including such applications as a word processor, spreadsheet, calendar, and address book, PDAs are envisioned as notepads, appointment schedulers, and wireless communicators for sending and receiving data, faxes, and electronic-mail messages.

Perth, city (1991 pop. 1,143,265), capital of Western Australia, SW Australia, on the Swan R. The suburbs of Kwinana, Welshpool, and Fremantle, a port, have heavy industry. Perth is a very isolated city; ADELAIDE, the nearest large city, is c.1,400 mi (2,250 km) away. Settled in 1829, Perth received about 10,000 convict laborers in the 1850s. The Coolgardie gold rush of the 1890s brought an influx of settlers. The Univ. of Western Australia and Murdoch Univ., as well as the Art Gallery of Western Australia, are in the city, and the Kings Park botanical gardens are nearby.

Perth, town (1981 pop. 41,998), Tayside, central Scotland, on the Tay R. It is famous for its dye works and cattle markets, and has textile factories and distilleries. The capital of Scotland (11th–15th cent.), it played a role in the civil wars and in the JACOBITE rebellions.

perturbation: see CELESTIAL MECHANICS.

pertussis: see WHOOPING COUGH.

Peru [pəroo'], Span. *Perú,* officially Republic of Peru, republic (1993 pop. 22,128,466), 496,220 sq mi (1,285,210 sq km), W South America, bordered by the Pacific Ocean (W), Ecuador and Colombia (N), Brazil and Bolivia (E), and Chile (S). Major cities include LIMA (the capital), AREQUIPA, CALLAO, and Trujillo. Peru has three main geographical regions. A narrow strip along the coast is mostly desert, but fertile where irrigated by streams flowing from the mountains; Peru's leading ports, as well as the centers of its commercial agriculture, are located here. A central region, with 60% of the population, consists of three ranges of the ANDES Mts., with Huascarán as the highest peak (22,205 ft/6,768 m). The largest region, in the east, is composed of forested mountains and low-lying tropical plains drained by the AMAZON R. system. The coast and mountain regions are frequently shaken by severe earthquakes; the last major earthquake, in 1970, killed 50,000 people. Peru ranks among the world leaders in copper and silver production, and it became a petroleum exporter in 1985. Chief commercial crops are sugarcane and cotton; illegally cultivated coca, from which cocaine is made, is also important. Fishing is important. Manufactures include textiles, consumer goods, processed food, cement, refined minerals, fish meal, and fertilizer. The population is chiefly indigenous (50%), mestizo (37%), and white (13%). Spanish and Quechua are the official languages, and most of the whites and mestizos are Roman Catholic.

History. Inhabited since at least the 9th millennium B.C., Peru was later the center of several advanced indigenous cultures. The Spanish conquest of the area began in 1532, when Francisco PIZARRO and a small band of adventurers overthrew the great INCA empire, capturing and treacherously executing its ruler, Atahualpa. Lima (founded 1535) became the center of Spanish rule in South America, and the viceroyalty of Peru eventually included all Spanish-ruled lands on the continent except Venezuela. Independence, proclaimed in 1821, was achieved through the efforts of José de SAN MARTÍN and Simón BOLÍVAR and assured by the defeat (1824) of Spain at the battles of Junín and AYACUCHO. Following independence, Peruvian society remained sharply divided between the wealthy oligarchy (mostly Creoles) and the poverty-ridden majority (mostly of indigenous descent). Political life alternated between revolts and dictatorships. A disastrous war with Chile (see PACIFIC, WAR OF THE) in 1879 further slowed progress. The early 20th cent. was dominated by Pres. Augusto B. LECUÍA (1908–12, 1919–30), a virtual dictator who promoted economic development in the interest of the wealthy minority. A radical reform party, founded in 1924 and dedicated to improving the conditions of the indigenous peoples, gained influence in the 1940s. Fernando BELAÚNDE TERRY, a moderate reformer, won election as president in 1963, but was deposed (1968) by a military junta which assumed dictatorial powers, instituted a program of social reform, and seized U.S.-owned companies. Constitutional government resumed in 1980 with elections that returned Belaúnde to the presidency. He was succeeded in 1985 by Alan García Perez. The 1980s was a decade of economic collapse, with inflation nearly 8000% in 1990. SHINING PATH guerrillas became increasingly powerful in rural and urban areas, and fighting continued into the 1990s. Alberto K. Fujimori was elected president in 1990. He reduced inflation and moved to free the economy from government control, but Peru's economic recession deepened. In 1992 Fujimori suspended the constitution, saying emergency action was needed to fight the guerrillas, drug traffickers, and corruption. His supporters won (1992) a majority in legislative elections that were boycotted by major opposition parties. Peru began to privatize most state-owned businesses in 1993, and voters narrowly approved a new constitution the same year.

Perugino [pārōjē'nō], c.1445–1523?, Umbrian painter; b. near Perugia as Pietro di Cristoforo Vannucci. A student, with LEONARDO DA VINCI, of VERROCCHIO, and later the teacher of RAPHAEL, he helped decorate the SISTINE CHAPEL. Some of his work there was later destroyed, but the remaining *Christ Giving the Keys to St. Peter* is famous. Thereafter he worked mainly in Florence and Perugia. His tender color and simple style later became sentimental, e.g., in his *Triumph of Chastity* (Louvre) and *The Adoration of the Shepherds* (National Gall., London), his last work.

Pescadores, group of 64 small islands, c.50 sq mi (130 sq km), in Taiwan Strait, part of TAIWAN. The islands, which were ceded to Japan by China in 1895 and returned after WORLD WAR II, came under Chinese Nationalist rule after the Communist takeover of mainland China in 1949.

Pessoa, Fernando, 1888–1935, Portuguese poet. The four distinct poetic personas he claimed for himself, the messianic, the rationalist, the stoic, and the Nietzschean, reflect his disbelief in the idea of an integrated personality. His highly original verse collections include *Sonnets* (1918), *Mensagem* (1934), and *English Poems* (1922).

Pestalozzi, Johann Heinrich [pĕ"stälôt'sē], 1746–1827, Swiss educational reformer. His theories laid the foundation of modern elementary education. He was director (from 1805) of an experimental institute established at Yverdon on his principle that choice of pedagogical method should be based on the individual's development and concrete experience. He opposed memorization learning and strict discipline, and pioneered in the use of tactile objects in the teaching of natural science. He also promoted broad liberal education followed by professional training for teachers. His works include *Leonard and Gertrude* (1781–87) and *How Gertrude Teaches Her Children* (1801).

pesticide, biological, physical, or chemical agent used to kill plants or animals considered harmful to human beings; see FUNGICIDE; HERBICIDE; INSECTICIDE.

Pétain, Henri Philippe [pātăN'], 1856–1951, marshal of France,

The key to pronunciation appears on page xiii.

head of the VICHY government (1940–44). In WORLD WAR I he halted the Germans at Verdun (1916) and became (1917) French commander in chief. Named ambassador to Spain (1939), he succeeded (June 1940) Paul Reynaud as premier when France was on the brink of collapse in WORLD WAR II. He soon arranged an armistice with Germany. On July 10 the French constitution was suspended, and Pétain became "chief of state" at Vichy. Pétain's fascistic government collaborated with Nazi Germany and grew unpopular as it yielded to harsh German demands. In 1942 Pierre LAVAL took power, and Pétain remained chiefly a figurehead. After the Allied victory, he was convicted of treason (1945) and was sentenced to death; the sentence was commuted by Charles DE GAULLE to life imprisonment.

Peter, Saint, d. A.D. 64?, most prominent of the Twelve APOSTLES, traditionally the first bishop of Rome. His name was Simon, but Jesus called him Cephas [Aramaic, = rock], or, in Greek, Petros. A native of Bethsaida in Galilee, he was the brother of St. ANDREW. Fishermen, they were called by Jesus at the same time as James (James the Greater) and John. Peter appears in the gospels as leader and spokesman of the disciples, and Jesus most often addressed him when speaking to them. When Peter confessed Jesus to be the Christ, he was told, "Upon this rock I will build my church." With James and John, he was chosen to see the Transfiguration and after the Last Supper witnessed the agony at Gethsemane. When Jesus was betrayed, Peter denied him, as Jesus had predicted he would. After the Resurrection Jesus appeared and charged Peter to "feed my sheep." The ACTS OF THE APOSTLES describes Peter's role as leader in the early apostolic period. According to 2d-cent. sources, he apparently left Antioch for Rome A.D. c.55 and there died as head of the local church—a martyr under NERO—traditionally crucified on the Vatican Hill. Over his supposed burial place stands ST. PETER'S CHURCH, the principal shrine of Europe. Peter is said to have helped St. MARK write his gospel, but the epistles of PETER are regarded as mistakenly attributed. His successors as bishop of Rome came to be leaders of the church (see PAPACY).

Peter, czars of Russia. **Peter I** or **Peter the Great,** 1672–1725 (r.1682–1725), was the youngest child of Czar Alexis by his second wife, Natalya Naryshkin. Alexis was succeeded by Feodor III, a son by his first wife, Maria Miloslavsky. On Feodor's death a bloody struggle erupted between the Naryshkins and Miloslavskys. Peter was made joint czar with IVAN V, Feodor's feebleminded brother, under the regency of Sophia Alekseyevna, Feodor's sister. In 1689 Sophia Alekseyevna attempted a coup against Peter; she was overthrown, and for some years the Naryshkins ruled, until Peter took personal control. In 1697–98 he toured Europe, where he tried but failed to form an alliance against Turkey; laid the basis for a coalition against Sweden; studied industrial techniques; and hired craftsmen to work in Russia. He returned on news of an attempt to restore Sophia Alekseyevna; he forced her into a nunnery and took brutal revenge on her followers. The ruthless reforms that marked his reign began on the day after his return, when he personally cut off the beards of his nobles and ordered them to wear Western dress henceforth. To pursue his almost continuous wars, particularly the NORTHERN WAR (1700–1721) with Sweden under CHARLES XII, he introduced territorial conscription, enlarged and modernized the army, founded a navy, and set up military-technical schools. Financing was provided by state monopolies, poll taxes, and levies on many items. Private industry was subsidized, and state mines and factories were established to supply war materials. Peter increased the number of nobles owing service to the state; forced nobles' sons to attend military-technical schools; and created a bureaucratic hierarchy in which promotion depended on merit rather than birth. The serfs, who paid the bulk of taxes and comprised most of the soldiery, were bound more securely to their masters and to the land. The Academy of Sciences was founded, the calendar reformed, and the alphabet simplified. On the swamps of Ingermanland (ceded by Sweden in 1721) Peter had St. Petersburg built to replace the capital at Moscow. The discontented looked to his son, Alexis, who was tried for treason and tortured to death in 1718. Peter proclaimed himself "emperor of all Russia" in 1721. His second wife, crowned as CATHERINE I in 1724, succeeded him. **Peter II,** 1715–30 (r.1727–30), was the grandson of Peter I. He succeeded Catherine I under a regency. During his reign his grandfather's great minister MENSHIKOV fell from power. He was succeeded by his cousin ANNA. **Peter III,** 1728–62 (r.1762), was the son of Charles Frederick, dispossessed duke of Holstein-Gottorp, and of Anna Petrovna, daughter of Peter the Great. He succeeded his aunt, Czarina ELIZABETH. One of his first acts was to withdraw Russia from the SEVEN YEARS WAR and make an alliance with FREDERICK II of Prussia. His domestic policy included the abolition of the secret police and the extension of religious freedom. Forced to abdicate in favor of his wife, CATHERINE II, he was later murdered.

Peter, kings of ARAGÓN. **Peter III** (the Great), 1239?–85 (r.1276–85), was also king of Sicily (1282–85). He obtained from his marriage (1262) to Constance, daughter of MANFRED OF SICILY, claims to the island, which he seized in 1282. Pope Martin IV excommunicated him and organized with the French a crusade against Catalonia, but Peter repulsed the French invasion. He left Aragón to his eldest son, ALFONSO III, and Sicily to his second son, James II. **Peter IV** (the Ceremonious), 1319?–87 (r.1336–87), recovered Majorca for Aragón and fought an indecisive naval war against Genoa and Pisa over SARDINIA. Although he was forced to confirm privileges granted earlier to the nobles, he defeated (1348) them in battle and withdrew their charter. He was succeeded by his son, John I.

Peter, kings of Portugal. **Peter I,** 1320–67 (r.1357–67), was the son of ALFONSO IV. Although married (1336) to Constance Manuel, he fell in love with Inés de CASTRO. When his father allowed Inés to be murdered (1355), Peter led a rebellion against him. Although peace was made and Peter formally pardoned the murderers, he had two of them executed after he became king. This act and his concern for legal reform earned him the names Peter the Severe and Peter the Justiciar. **Peter II,** 1648–1706 (r.1683–1706), ruled Portugal from 1667 as regent for his incompetent brother, ALFONSO VI. His reign was one of prosperity and peace until 1703, when he was reluctantly drawn into the War of the SPANISH SUCCESSION. **Peter III,** 1717–86, married his niece, MARIA I and was joint ruler with her from 1777 until his death.

Peter, rulers of Serbia and Yugoslavia. **Peter I,** 1844–1921, king of Serbia (1903–18) and king of the Serbs, Croats, and Slovenes (1918–21), was a member of the KARADJORDJEVIĆ dynasty and in exile while the OBRENOVIĆS were in power. The assassination (1903) of King ALEXANDER of Serbia brought him to the throne. He proved a forward-looking ruler and succeeded in unifying what later became Yugoslavia. **Peter II,** 1923–70, king of Yugoslavia (1934–45), served under a regency until 1941. His personal rule coincided with the German occupation of Yugoslavia, and he spent World War II in exile in England. In 1945 the Communist government of Marshal TITO forced his abdication.

Peter, two EPISTLES of the NEW TESTAMENT, the 21st and 22d books in the usual order, among the Catholic, or General, Epistles. Both state that they are by the apostle St. PETER. First Peter, addressed from Rome to the Christians of Asia Minor, stresses the duties of Christians and offers them consolation under persecution. Second Peter, one of the last books accepted in the New Testament canon, urges virtue and warns against false teachers.

Peter Damian, Saint, 1007?–1072, Italian reformer, Doctor of the Church. A Camaldolese monk, he was strong in the reform party of Hildebrand (later Pope GREGORY VII). In 1057 he was made cardinal. His *Gomorrhianus* is a violent denunciation of clerical abuses. Feast: Feb. 21.

Peter Lombard, c.1100–c.1160, Italian theologian, archbishop of Paris. His *Sentences,* a compilation of the often conflicting opinions of theologians, is among the most celebrated of theological works. His doctrine of the SACRAMENTS was made official by the Council of TRENT.

Petersburg, city (1990 pop. 38,386), SE Va., on the Appomattox R.; inc. as a city 1850. Located on the site of a Native American village and Fort Henry (1646), it is a port of entry and a tobacco market, and produces cigarettes, luggage, and other manufactures. The city was the object of fighting during the AMERICAN REVOLUTION and at the end of the CIVIL WAR, when it was (1864–65) the site of fierce struggles between the armies of R.E. LEE and U.S. GRANT that ended in Lee's surrender at APPOMATTOX. Its national battlefield (est. 1926) is much visited.

Peter the Cruel, 1334–69. Spanish king of CASTILE and LEÓN (1350–69). His desertion of his wife, Blanche of Bourbon, for María Padilla and his favors to the Padilla family offended the nobles and caused rebellions fomented by his half brother, later Henry II. With the help of ARAGÓN and France, Henry conquered Castile and was crowned king in 1366. Peter retaliated by defeating Henry's army with the help of England in 1367. But Henry raised a new army, which was victorious at Montiel (1369), and he killed Peter in a duel after the battle. Despite his reputation for cruelty, Peter is regarded by many historians as a defender of the rights of the commoners against the nobles.

Peter the Great: see Peter I under PETER, czars of Russia.

Pétion, Alexandre [pātyôN'], 1770–1818, Haitian revolutionary leader. After fighting to liberate HAITI from the English and French, he established (1806) a mulatto-controlled republic in S Haiti. As its president, he instituted land reform and political freedom.

Petipa, Marius, 1822?–1910, French dancer and choreographer. He was the principal creator of modern classical ballet. He brought European technique to the Imperial Theater, St. Petersburg, and expanded the male role in dance. His major works include *La Bayadère* (1875) and *Sleeping Beauty* (1890).

Petit, Roland, 1924–, French dancer and choreographer. He founded (1948) the Ballets de Paris de Roland Petit. His best known work is *Carmen* (1949), set to music from Georges BIZET's opera. He has been director of the Ballets de Marseilles since 1972.

Petition of Right, 1628, statement sent by the English PARLIAMENT to CHARLES I. It laid down four principles: no taxes without the consent of Parliament; no imprisonment without cause; no quartering of soldiers on the citizenry; and no martial law in peacetime. Charles soon violated its spirit.

őofi, sándor

Petőfi, Sándor [pĕ'töfē], 1822–49, Hungarian poet. His epic *Janos the Hero* (1845) relates the fantastic adventures of a peasant-soldier. "Rise, Magyar" (1848) voices the ideals of the Hungarian revolution, in which Petőfi died.

Petra, ancient city, in SW Jordan. The capital of the Nabataeans from the 4th cent. B.C. to the Roman occupation in A.D. 106, it remained a religious center of Arabia. An early seat of Christianity, the Muslims (see ISLAM) conquered it in the 7th cent. and the Crusaders (see CRUSADES) built a citadel there in the 12th cent.

Petrarch [pē'trärk] or **Francesco Petrarca,** 1304–74, Italian poet and humanist, a RENAISSANCE literary figure of extreme influence. At Avignon in 1327 he first saw Laura, who was to inspire his great vernacular love lyrics. He was crowned laureate at Rome in 1341, and from 1348 he worked for Italian reunification. Among the first to realize that Platonic thought and Greek studies provided a new cultural framework, he helped spread HUMANISM through his criticism of SCHOLASTICISM. Petrarch's poetry, ignoring medieval conventions, defined true emotions. His perfection of the SONNET form makes him perhaps the first modern poet. Though he valued his Latin works above those in Italian, he reached heights in both tongues.

Petrie, Sir William Matthew Flinders, 1853–1942, English archaeologist and Egyptologist. He is best known for excavations at Memphis and Thebes. He also founded (1894) the British School of Archaeology in Egypt and discovered ruins of 10 cities at Tel-el-Hesy (S of Jerusalem). His works include *Methods and Aims in Archaeology* (1904) and *Seventy Years in Archaeology* (1931).

Petrified Forest National Park: see NATIONAL PARKS (table).

petrol: see GASOLINE.

petroleum or **crude oil,** oily, flammable liquid that occurs naturally in deposits, usually beneath the surface of the earth. The exact composition varies according to locality, but it is chiefly a mixture of HYDROCARBONS. Petroleum is a fossil fuel thought to have been formed over millions of years from incompletely decayed plant and animal remains buried under thick layers of rock. Drilling for oil is a complex, often risky process. Scientific methods are used to locate promising sites for wells, some of which must be dug several miles deep to reach the deposit. Many wells are now drilled offshore from platforms standing on the ocean bed. Usually the crude oil in a new well comes to the surface under its own pressure. Later it has to be pumped or forced up with injected water, gas, or air. Pipelines or tankers transport it to refineries, where it is separated into fractions, i.e., the portions of the crude oil that vaporize between certain defined limits of temperature. Fractions are obtained by a refining process called fractional DISTILLATION, in which crude oil is heated and sent into a tower. The vapors of the different fractions condense on collectors at different heights in the tower. The separated fractions are then drawn from the collectors and further processed into various petroleum products. Generally the fractions are vaporized in the following order: dissolved NATURAL GAS, GASOLINE, naphtha, KEROSENE, diesel fuel, heating oils, and finally tars (see TAR AND PITCH). Lighter fractions, especially gasoline, are in greatest demand and their yield can be increased by breaking down heavier hydrocarbons in a process called cracking. The leading producers of petroleum are Russia, the U.S., Saudi Arabia, Iran, Iraq, China, Mexico, the United Arab Emirates, Venezuela, Nigeria, Kuwait, and Norway. The largest reserves are in the Middle East. Modern industrial civilization depends heavily on petroleum for motive power, fuel, lubrication, and a variety of synthetic products, e.g., DYES, drugs, and PLASTICS. The widespread burning of petroleum products as fuels has resulted in serious problems of air POLLUTION, and oil spilled from tankers and offshore wells has damaged ocean and coastline environments. The environmentally disruptive effects of oil wells have sometimes led to strong opposition to new drilling, as in wilderness areas of N Alaska. See also ENERGY, SOURCES OF.

petrology, branch of GEOLOGY concerned with the origin, composition, structure, and properties of ROCKS, as well as the laboratory simulation of rock-forming processes.

Petronius, d. A.D. c.66, Roman satirist, known as Petronius Arbiter because he is identified with Gaius Petronius, whom TACITUS calls the *arbiter elegantiae* in NERO's court. He is remembered as a profligate lover of luxury. Arrested in an intrigue, he slashed his veins and died in a leisurely fashion, attended by his friends. He is credited with the *Petronii arbitri satyricon,* a prose and verse romance that preserves, in colloquial language, a study of the life and manners of his time.

Petrov, Yevgeny Petrovich, pseud. of **Yevgeny Petrovich Katayev,** 1903–42, Russian writer. With Ilya Arnoldovich ILF he wrote satirical novels. After Ilf's death, Petrov became a war correspondent and was killed in battle. He was the brother of Valentin KATAYEV.

PET scan or **positron emission tomography,** medical imaging technique that measures cellular activity in the brain and other organs by tracking the movement and concentration of a radioactive tracer. The technique requires special computerized imaging equipment and uses rings of detectors around the patient to record the GAMMA RADIATION produced when the positrons emitted by the injected or inhaled tracer are annihilated in collisions with electrons. The tracer is taken up by living tissue and enables a PET scanner to measure blood flow, metabolic reaction rate, and biochemical synthesis. PET scans are being studied to determine their usefulness in detecting brain tumors and for investigating such psychological disorders as SCHIZOPHRENIA and MANIC-DEPRESSION.

Petty, Richard, 1937–, American auto racing driver; b. Level Cross, N.C. In his 35-year career (1958–92) in stock-car racing Petty won a record 200 National Association for Stock Car Auto Racing (NASCAR) races, including a record seven Daytona 500 races. He also won a record seven NASCAR championships.

petunia, annual or perennial herb (genus *Petunia*) of the NIGHTSHADE family, native to the Americas. Valued as garden ornamentals, petunias have a straggling habit and produce an abundance of large, colorful, funnel-shaped blossoms.

Pevsner, Antoine, 1886–1962, Russian sculptor and painter. He and his brother Naum GABO worked together in 1920 on the manifesto of CONSTRUCTIVISM. Pevsner created constructivist works in bronze and other materials, e.g., his portrait of Marcel DUCHAMP (1926; Yale Univ., New Haven, Conn.).

pewter, ductile, silver-white alloy consisting mainly of tin. The addition of lead imparts a bluish tinge and increased malleability. Other metals such as antimony, copper, bismuth, and zinc may also be added. Pewter is shaped by casting, hammering, or lathe spinning on a mold. Ornamentation is usually simple. Pewter was early used in E Asia, and Roman pieces are extant. In England during the Middle Ages, pewter was the chief tableware, later being

supplanted by china. It was made in America from c.1700. The craft had virtually died out by 1850 but was revived in the 20th cent. in reproductions and pieces of modern design.

peyote, spineless cactus (*Lophophora williamsii*) indigenous to the SW U.S. and Mexico. Peyote produces a drug, also called peyote, whose active substance is mescaline, a nonaddictive HALLUCINOGENIC DRUG that produces visions and changes in perception, time sense, and mood. Peyote-eating rituals are important in the NATIVE AMERICAN CHURCH.

peyotism: see NATIVE AMERICAN CHURCH.

***p*H,** range of numbers expressing the relative acidity or alkalinity of a solution. The *p*H value is the negative common LOGARITHM of the hydrogen-ion CONCENTRATION in a solution, expressed in MOLES per liter of solution. A neutral solution, i.e., one that is neither acidic nor alkaline, such as pure water, has a concentration of 10^{-7} moles per liter; its *p*H is thus 7. Acidic solutions have *p*H values ranging with decreasing acidity from 0 to nearly 7; alkaline or basic solutions have a *p*H ranging with increasing alkalinity from just beyond 7 to 14. See also ACIDS AND BASES.

Phaedra [fē'drə], in Greek mythology, daughter of MINOS and Pasiphaë, wife of THESEUS. When her stepson, Hippolytus, rejected her love, she accused him of rape, then hanged herself. The legend was dramatized by EURIPIDES, SENECA, and RACINE.

phaeophyte, member of a division (Phaeophyta) of the PLANT kingdom consisting of brown ALGAE; almost all are SEAWEEDS growing in colder parts of the world. They get their color from *a* and *c* chlorophylls and xanthophylls in the cell chloropasts. Brown algae are now usually considered PROTISTS.

Phaëthon [fā'əthən] or **Phaëton** [fā'ətən], in Greek myth, son of HELIOS. He lost control of his father's golden chariot, which in falling dried the Libyan Desert. ZEUS avoided the universe's destruction only by killing Phaëthon.

pharaoh [fâr'ō], title of the kings of ancient EGYPT. Many scholars believe that Seti I oppressed the Jews, and that his son RAMSES II was pharaoh during the Hebrew Exodus.

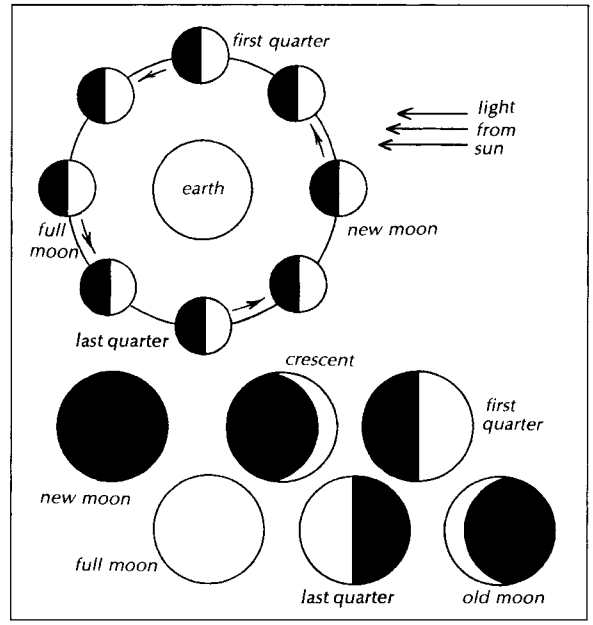
pharmacology, study of the changes produced in living animals by DRUGS, chemical substances used to treat and diagnose disease. It is closely related to other scientific disciplines, particularly BIOCHEMISTRY and PHYSIOLOGY. Areas of pharmacologic research include mechanisms of drug action, the use of drugs in treating disease, and drug-induced side effects. See also PHARMACY.

pharmacy, science of compounding and dispensing medication; also, an establishment used for such purposes. Modern pharmaceutical practice includes the dispensing, identification, selection, and analysis of DRUGS. Pharmacy began to develop as a profession separate from medicine in the 18th cent., and in 1821 the first U.S. school of pharmacy was established in Philadelphia. See also PHARMACOLOGY.

pharming, the use of genetically altered livestock, such as cows, goats, and pigs, to produce pharmaceutical drugs. Researchers employing GENETIC ENGINEERING techniques have introduced hybrid genes into animal embryos, creating "transgenic" animals that secrete human hormones or proteins in their milk or blood. The secreted substance is extracted from the milk or blood and purified. Still in the experimental stage as a manufacturing process, pharming is regarded as a more efficient alternative to the "bioreactor" technique of using genetically altered bacteria or specially cultured animal cells to produce drugs (see BIOTECHNOLOGY). Transgenic animals are also being studied as possible source of organs for medical TRANSPLANTATION.

pharynx, section of the DIGESTIVE SYSTEM between the mouth and esophagus. In humans the pharynx is a cone-shaped tube, continuous with both the mouth and nasal passages at its upper end and esophagus at its lower end. It connects with the EARS via the eustachian tubes and with the LARYNX by an opening covered by the epiglottis during swallowing.

phase, in astronomy, the measure of how much of the illuminated surface of a planet or natural satellite can be seen from a point at a distance from that body. The phase depends on the overlap of the half of the surface that is seen by the observer and the half that is illuminated by the sun. An inferior planet, whose orbit lies inside the earth's, shows all the phases that the moon shows; a superior planet, whose orbit lies outside earth's, is always gibbous or full.



Phases of the moon as seen from the earth

phases of matter: see STATES OF MATTER.

pheasant, name for some henlike birds of the family Phasianidae, related to the GROUSE and including the Old World PARTRIDGES, the PEACOCK, some domestic and jungle fowl, and the true pheasants (genus *Phasianus*). Pheasants are typified by wattled heads and long tails, and by the brilliant plumage and elaborate courtship displays of the male. All are indigenous to Asia. The hybrid ring-necked pheasant, *P. colchicus,* is a common game bird in the U.S., where the ruffed grouse is also called *pheasant.*

Pheidias: see PHIDIAS.

phenomenology, modern school of philosophy founded by Edmund HUSSERL, who attempted to develop a philosophical method devoid of presuppositions by focusing purely on phenomena and elucidating their meaning through intuition. Anything that cannot be perceived, and thus is not immediately given to the consciousness, is excluded. The influence of phenomenology was strong, especially on EXISTENTIALISM.

pheresis: see APHERESIS; PLASMAPHERESIS.

pheromone, any chemical substance secreted by members of an animal species that alters the behavior of other members of the same species. Sex-attractant pheromones are widespread, particularly among insects. Other pheromones act as signals for alarm and defense, territory and trail-marking, and social regulation and recognition. Pheromones are now being used in insect control, e.g., as bait to attract males to field traps or, in very high concentrations, to disorient insects and prevent mating.

Phi Beta Kappa: see under FRATERNITY AND SORORITY.

Phidias or **Pheidias** [both: fĭd'ēəs], c.500–c.432 B.C., one of the greatest ancient Greek sculptors. Though numerous Roman copies of his works exist, no originals can be definitely attributed to him. His fame rests on the descriptions and estimates of ancient writers. His greatest works were the colossal chryselephantine (ivory and gold) *Athena Parthenos* at Athens (destroyed in ancient times) and *Zeus,* one of the SEVEN WONDERS OF THE WORLD. He is said to have been in charge of the PARTHENON and ACROPOLIS sculptures.

Philadelphia, name of several ancient cities. One was in Lydia, W Asia Minor, near modern Alasehir, Turkey. It was founded in the 2d cent. B.C. by Attalus II Philadelphus of Pergamum. AMMAN (capital of present-day Jordan) was renamed Philadelphia by PTOLEMY II in the 3d cent. B.C.

Philadelphia, city (1990 pop. 1,585,577; met. area 4,856,881), SE Pa., on the Delaware and Schuylkill rivers; chartered 1701.

Founded in 1681 on the site of earlier settlements by William PENN as a Quaker colony, the city has played a prominent role in American history. By 1774 it was second only to London as the largest English-speaking city in the world. The CONTINENTAL CONGRESS met there, and it was the national capital during most of the period 1777–1800. The DECLARATION OF INDEPENDENCE was signed in Independence Hall. Benjamin FRANKLIN is one of the most famous of Philadelphia residents. A commercial, banking, insurance, and transportation center, Philadelphia is the fifth largest U.S. city. It has one of the world's largest freshwater ports and is a major oil-refining center. Leading manufactures include chemicals, electrical appliances and machinery, and scientific instruments. A cultural nucleus since colonial times, the city is home to many artistic, dramatic, musical, and scientific societies, and has over 30 universities and institutions of higher learning, including the Univ. of Pennsylvania, Temple Univ., and Drexel Univ. Cultural institutions include the Pennsylvania Academy of the Fine Arts, the Philadelphia Museum of Art, and an outstanding symphony orchestra. Veterans' Stadium and Fairmount Park are major sports and recreation centers. Among the city's sights are the Liberty Bell, INDEPENDENCE HALL, Carpenters' Hall, the Betsy ROSS House, and the redeveloped Society Hill and Penn's Landing sections.

Philadelphia Museum of Art, est. 1875; present building opened 1928; owned by the city. Its outstanding collection is the John G. Johnson Collection of European old masters. Its holdings also include other European art, modern art, and works from Persia and China. The museum houses particularly fine groups of paintings by EAKINS and works by Marcel DUCHAMP.

Philemon, epistle of the NEW TESTAMENT, 18th book in the usual order, written by St. PAUL (probably A.D. c.60) to a Colossian named Philemon, asking him to forgive his fugitive slave Onesimus, who was carrying the epistle to him.

Philip, Saint, one of the Twelve APOSTLES, from Bethsaida in Galilee. He is said to have been martyred in Phrygia.

Philip, kings of France. **Philip I,** 1052–1108 (r.1060–1108), enlarged his small royal domain and quarreled with the papacy over his marriages. He was succeeded by his son, LOUIS VI. **Philip II** or **Philip Augustus,** 1165–1223 (r.1180–1223), succeeded his father, LOUIS VII. During his reign the royal domains were more than doubled, and royal power was consolidated. He seized territory from the count of Flanders and from HENRY I of England. In 1190 he left on the Third CRUSADE with Henry's successor, RICHARD I of England, but they soon quarreled, and Philip returned (1191) to France. He forced Richard's successor, King JOHN of England, to cede (1204) Normandy, Brittany, Anjou, Maine, and Touraine. In 1214, at Bouvines, he defeated the combined forces of John, Holy Roman Emperor Otto IV, and the count of Flanders. Philip condoned the crusade against the ALBIGENSES, which paved the way to the eventual annexation of S France by King LOUIS IX. The latter's son, **Philip III** (the Bold), 1245–85 (r.1270–85), took peaceful possession of Poitou, Auvergne, and Toulouse by a small cession (1279) to England. He died during an unsuccessful invasion of Aragón. His son, **Philip IV** (the Fair), 1268–1314 (r.1285–1314), arrested (1301) Bishop Saisset and caused a quarrel with Pope BONIFACE VIII, who denounced the king. Philip retaliated by convoking the first STATES-GENERAL (1302–3) to hear a justification of his actions. Threatened with excommunication, Philip had Boniface seized and later gained control of the PAPACY with the election of CLEMENT V, who transferred (1309) the papacy to Avignon. Beginning in 1294, Philip tried to conquer Guienne from EDWARD I of England, but was forced to concede (1303) the duchy to Edward. His attempts to subdue the Flemish led to the disastrous French defeat (1302) at Courtrai. His son, LOUIS X, succeeded him. **Philip V** (the Tall), c.1294–1322 (r.1317–22), was regent for his infant nephew, JOHN I. When John died (1316), Philip had himself crowned despite the claims of John's sister. This helped to establish the Salic Law in France, which excluded females from the royal succession. Philip made notable administrative, judiciary, and military reforms and was succeeded by his brother CHARLES IV. Charles IV's successor, **Philip VI,** 1293–1350 (r.1328–50), grandson of Philip III, invoked the Salic Law to set aside the claims of Charles's daughter and Charles's nephew, Edward III of England. He was the first VALOIS king of France. After 1337 his reign was dominated by the HUNDRED YEARS WAR. In 1340 the French fleet was destroyed at Sluis, and in 1346 Edward III defeated Philip at Crécy. Philip was succeeded by his son, JOHN II.

Philip, kings of Macedon. **Philip II,** 382–336 B.C. (r.359–336), was the son of Amyntas II. He seized the throne while serving as regent for his nephew Amyntas. He reorganized the army and followed a policy of expansion, annexing Amphipolis (357), the gold mines of THRACE (356), and the Chalcidice (348). When his continued threats roused ATHENS and THEBES to war against him, he crushed them at Chaeronea (338) and became master of GREECE. He was preparing an attack on Persia when he was killed. His wife, OLYMPIAS, was accused, probably falsely, of the murder Philip's consolidation of his kingdom and creation of a powerful army paved the way for the campaigns of his son, ALEXANDER THE GREAT. **Philip V,** 238–179 B.C. (r.221–179), was the son of Demetrius II. Successful in a war in Greece (220–217), he tried to take the Roman holdings in Illyria, precipitating the First Macedonian War with Rome (215–205). It ended favorably for Philip, but in the Second Macedonian War he was decisively defeated at Cynoscephalae (197). He was succeeded by his son PERSEUS.

Philip, Spanish kings. **Philip I** (the Handsome), 1478–1506, king of CASTILE (1506), was the son of Holy Roman Emperor MAXIMILIAN I and MARY OF BURGUNDY. He inherited Burgundy and the Low Countries from his mother and was titular joint ruler of Castile with his wife, JOANNA. But her father ruled these lands as his regent, so he contested (1504) Ferdinand's regency and assumed (1506) joint rule of Castile with his wife. Philip's early death, however, and his wife's deteriorating mental condition allowed Ferdinand to resume joint control of Castile. The Low Countries passed to Philip's son, who later became Holy Roman Emperor CHARLES V. **Philip II,** 1527–98, king of Spain (1556–98), king of NAPLES and SICILY (1554–98) and, as Philip I, king of Portugal (1580–98), centralized authority under his absolute monarchy and extended Spanish colonization to the present S United States and the Philippines (which were named after him). From his father, Holy Roman Emperor Charles V, he inherited NAPLES, SICILY, the Low Countries, and other territories. After the death of his first wife, Maria of Portugal, he married (1554) Queen MARY I of England and drew that nation into his father's war with France. Following Mary's death (1558), he married Elizabeth of Valois and concluded the war with France in 1559. Philip used the INQUISITION to repress the MORISCOS and assure Spanish religious unity. He dealt with the Dutch revolt in his Low Countries domain by reconquering the southern half of the country. English support of the rebels and their persistent attacks on Spanish ships led him to plan an invasion of England by the Spanish ARMADA (1588), which was ignominiously defeated. Earlier, he succeeded in conquering Portugal (1580). Despite his conquests and the influx of gold from America, the cumulative effects of depopulation, colonial overexpansion, and burdensome taxation debilitated Spain by the end of his reign (1598). Philip was a hardworking bureaucrat with a capacity for infinite detail, and though his administration was generally just, his bureaucratic absolutism inevitably created discontent. His court was at the ESCORIAL. **Philip III,** 1578–1621, king of Spain, Naples, and Sicily, and, as Philip II, king of Portugal (1598–1621), lacked the intelligence and capacity for work of his father, Philip II, and left the actual government to the duque de Lerma. Shortly before his reign began, Spain had ended the war with France (1598) and then made peace with England (1604) and the Netherlands (1609). But the nation fought in Italy (1615–17) and entered the THIRTY YEARS WAR. Although the church prospered and the grandees accumulated vast estates, the Spanish economy declined, partly as a result of Philip's expulsion (1609–14) of the Moriscos. During Philip's reign, Spanish culture flourished and gave to the world great artists such as the author CERVANTES and the painter EL GRECO. **Philip IV,** 1605–65, king of Spain, Naples, and Sicily (1621–65) and, as Philip III, king of Portugal (1621–40), intelligent but lacking energy, was unable to prevent Spain's political and economic decline. The Thirty Years War continued until 1648, and the war with France (1621–59) ended with Spain's humiliation. Portugal revolted (1640), Catalonia was occupied by the French, and Spain had to recognize the independence of the Netherlands (1648). Philip was a patron of the arts and, thanks to VELÁZQUEZ, was perhaps the most frequently

The key to pronunciation appears on page xiii.

portrayed king in history. The accession of **Philip V,** 1683–1746, the first Bourbon king of Spain (1700–46), precipitated the War of the SPANISH SUCCESSION (1701–14) because his grandfather, LOUIS XIV of France, had accepted the Spanish throne for Philip. By the Peace of Utrecht, Spain lost much territory, including the Spanish Netherlands, Naples, and Sicily. Philip was forced to introduce the Salic law of succession, which forbade female monarchs and thus precluded the crown's personal union with France. The indolent and melancholy Philip was dominated by women, particularly after his marriage (1714) to Elizabeth Farnese (see FARNESE, family). Under her influence, he attempted to reconquer the Italian territories, causing the formation of the QUADRUPLE ALLIANCE of 1718, to which Spain had to submit. The latter years of his reign were plagued by wars. Under Philip, however, Spain began to recover from economic stagnation.

Philip, Prince: see EDINBURGH, PHILIP MOUNTBATTEN, DUKE OF.

Philip Augustus: see Philip II under PHILIP, kings of France.

Philip of Hesse, 1504–67, German ruler, landgrave of Hesse (1509–67), champion of the REFORMATION. He was converted to Lutheranism in 1524 and founded (1531) the Schmalkaldic League to uphold Protestantism against Holy Roman Emperor CHARLES V. In 1547 Charles crushed the league and imprisoned Philip. At his death his lands were divided among his four sons (see HESSE).

Philip of Swabia, 1176?–1208, German king (1198–1208), son of Holy Roman Emperor FREDERICK I and brother of Emperor Henry VI. When he was elected king in 1198, a minority faction chose OTTO IV as antiking. The resulting war ended in 1206 in Philip's favor, but his murder by a personal enemy eventually placed Otto on the throne. Philip's role in diverting the Fourth CRUSADE (1202–4) to Constantinople for dynastic reasons has long been disputed.

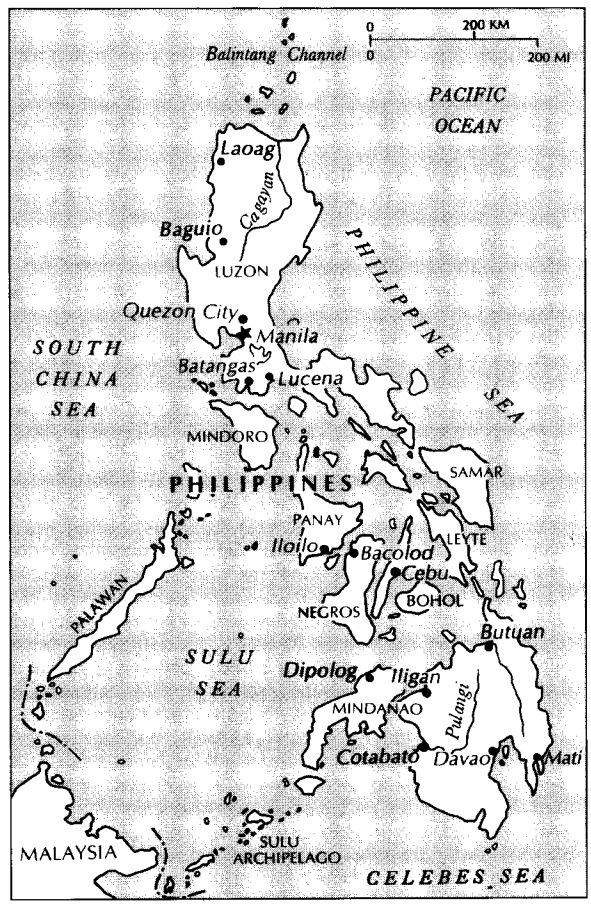
Philippe Égalité: see Louis Philippe Joseph, duc D'Orléans, under ORLÉANS, family.

Philippians, EPISTLE of the NEW TESTAMENT, 11th book in the usual order, written (A.D. c.60) by St. PAUL to the Christians of Philippi (MACEDONIA), the first European city he evangelized. The book is noted for its intimate tone and its eloquence.

Philippics, series of three denunciations of PHILIP II of Macedon by DEMOSTHENES. CICERO's polemics against Marc ANTONY are also called philippics.

Philippines, the, officially Republic of the Philippines, republic (1992 est. pop. 67,114,000), 115,830 sq mi (300,000 sq km), SW Pacific Ocean, off the mainland of Southeast Asia, comprising over 7,000 tropical islands; the two largest are LUZON and MINDANAO. The capital is MANILA, on Luzon. The islands are mountainous and volcanic; earthquakes are common. Half of the working population is engaged in agriculture; rice, corn, and coconuts are the principal crops. Among the mineral resources are nickel, zinc, copper, cobalt, gold, silver, iron, and chromite. Manufactures include processed foods, clothing and textiles, electronic equipment, chemicals, refined metals, and electronics. The islands have one of the world's greatest stands of commercial timber, a major export. The great majority of the population are ethnic Malays (known as Filipinos), but there are groups of Negritos (negroid PYGMIES), Dumagats (similar to the Papuans of New Guinea), and Chinese. Roman Catholicism is the predominant religion, with Aglipayan (a Catholic offshoot), Protestant, and, in the south, Muslim minorities. Pilipino, based on Tagalog, is the national language, but English, Spanish, and some 70 native tongues are also spoken.

History. Europeans, led by Ferdinand MAGELLAN, first visited the islands, which were named for the future Philip II of Spain, in 1521. Manila, founded in 1571, became a leading commercial center of E Asia. Spanish control of the region remained secure until the 19th cent., when resentment against Spanish injustices brought about a movement for independence, which was inspired by the writings of José RIZAL and led by Emilio AGUINALDO. The SPANISH-AMERICAN WAR (1898) ended Spanish rule, but, to the nationalists' bitter disappointment, control of the islands was transferred to the U.S. An armed revolt (1899–1901) against U.S. rule was effectively crushed, but the question of Philippine independence remained a burning issue until 1934, when the internally self-governing Commonwealth of the Philippines was established. Preparations for full independence, led by the first president, Manuel L. QUEZON, were interrupted by WORLD WAR II, in which, after bitter fighting, the Philippines were occupied by Japan. Liberated (1944–45) by U.S. forces under Gen. Douglas MACARTHUR, the Philippines gained full independence in 1946. The combined tasks of reconstructing the war-torn country and building the new republic were complicated by the activities of Communist-led Hukbalahap (Huk) guerrillas, tensions over U.S. military installations, inflation, the need for land reform, and government corruption. A succession of presidents did little to help the peasant majority or to curb political violence. Ferdinand E. MARCOS, elected president (1965, 1969), reacted to increasing civil disorder by declaring martial law in 1972; a new constitution (1973) gave Marcos near-dictatorial powers. Although martial law was nominally lifted in 1981, critics accused Marcos, who was again elected president under a revised constitution, of retaining most of his former powers. Marcos fled the Philippines in 1986 after massive protests against alleged election frauds, and his opponent, Corazon AQUINO, became president. Despite great inital popularity, a new constitution, and promised land reforms, Aquino disappointed the hopes she had raised. Inherited debt, a continuing communist insurgency, natural disasters, and a number of attempted coups kept her from fulfilling many economic promises, and the country entered a prolonged recession in 1989. Fidel RAMOS succeeded (1992) her as president, winning election with less than 24% of the vote.



Philip the Bold, king of France: see Philip III under PHILIP, kings of France.

Philip the Bold, 1342–1404, duke of Burgundy (1363–1404); a younger son of JOHN II of France. In 1382 he helped defeat Flemish rebels, and he inherited Flanders in 1384. During the minority (1380–88) of CHARLES VI, Philip was virtual ruler of France. When the king became insane (1392), Philip fought with the king's brother, Louis d'ORLÉANS, for power. His son, JOHN THE FEARLESS, carried on the quarrel.

Philip the Fair: see Philip IV under PHILIP, kings of France.

Philip the Good, 1396–1467, duke of Burgundy (1419–67), son of JOHN THE FEARLESS. By the Treaty of Troyes (1420) he supported the English cause in France until he made peace with CHARLES VII by the Treaty of Arras (1435). He later supported (1440) the Pragurie, a revolt against Charles, and gave asylum to the rebellious DAUPHIN (later LOUIS XI). By various means, Philip acquired Hainaut, Holland, Zeeland, and other possessions. He was succeeded by his son, CHARLES THE BOLD.

Philip the Tall: see Philip V under PHILIP, kings of France.

Phillips, Wendell, 1811–84, American reformer; b. Boston. Ranked with Edward Everett and Daniel Webster as an orator, Phillips was a delegate to the World Anti-Slavery Convention in London (1840), opposed the Mexican War and annexation of Texas, advocated dissolution of the Union, and vehemently denounced slaveholding. He held that the government owed African-American slaves not only freedom but land, education, and full civil rights. After the 15th amendment to the U.S. CONSTITUTION enfranchised African Americans, Phillips continued his agitation for social reforms, including PROHIBITION, WOMAN SUFFRAGE, abolition of capital punishment, currency reform, and labor rights.

Philo Judaeus, c.20 B.C.–C.A.D. 50, Greek philosopher. A Hellenistic Jew, he attempted to synthesize revealed Greek philosophical reason and Jewish faith, often by interpreting the Bible in an allegorical way. His efforts set a precedent for future Jewish and Christian theologians.

philosophy [Gk., = love of wisdom], study of the ultimate reality, causes, and principles underlying being and thinking. Western philosophy, dating from c.600 B.C., when the Greeks established inquiry independent of theological creeds, is traditionally divided into five major branches. METAPHYSICS inquires into the nature and ultimate significance of the universe, holding reality to subsist in thought (IDEALISM), in matter (MATERIALISM), or in both (DUALISM). LOGIC is concerned with the laws of valid reasoning. EPISTEMOLOGY investigates the nature of knowledge and the process of knowing. ETHICS deals with the problems of right conduct. AESTHETICS attempts to determine the nature of beauty and the criteria of artistic judgment. Historically, philosophy falls into three major periods. Classical (Greek and Roman) philosophy emphasized a concern with the ultimate nature of reality and the problem of virtue in a political context; in fact, virtually all of the problems of philosophy were defined by the Greeks. SOCRATES, PLATO, and ARISTOTLE were the towering figures of classical philosophy. Medieval philosophy in the West was virtually inseparable from Christian thought. SCHOLASTICISM, the high achievement of medieval philosophy, was based on Aristotelian principles as preserved by Arab philosophers, notably AVICENNA and AVERROËS. St. THOMAS AQUINAS was the most prominent of the scholastics. The main concern of modern philosophy, beginning with the Renaissance, has been epistemology. DESCARTES, SPINOZA, LEIBNIZ, and other great rationalists of the 17th cent. attempted to give the new science a philosophical basis and thus paved the way for EMPIRICISM. (See articles on HOBBES; HUME; LOCKE.) KANT, representing a bridge between empirical and rationalist views, influenced the idealism of FICHTE, SCHELLING, and HEGEL. MARX, drawing from Hegel's system, developed DIALECTICAL MATERIALISM. Late in the 19th cent. philosophy and religious thinking diverged. In Europe PHENOMENOLOGY and EXISTENTIALISM, and later STRUCTURALISM and DECONSTRUCTION, developed, while Britain and the U.S. focused on the philosophy of science, epistemology, and logic, and more recently on ethics and political philosophy, as in John RAWLS' theory of justice. The many rigorous systems of Eastern philosophy are founded in religion (see BUDDHISM; CONFUCIANISM; HINDUISM; ISLAM; JAINISM; SHINTO; TAOISM; VEDANTA). See also names of individual philosophers, e.g., NIETZSCHE, Friedrich; SCHOPENHAUER, Arthur; TEILHARD DE CHARDIN, Pierre.

phlebitis, inflammation of a vein, often accompanied by a blood clot, or THROMBUS, in the affected vein. When a blood clot is present, the condition is known as **thrombophlebitis.** Blood clot formation may follow injury, surgery, childbirth, or prolonged bedrest, or may be associated with infection. The chief danger is that the clot may dislodge and travel to a vital organ, causing serious damage. Phlebitis is treated with ANTICOAGULANTS.

phloem: see BARK; STEM.

phlogiston theory, hypothesis regarding combustion. The theory, advanced by Johann Becher late in the 17th cent., postulates the presence in all flammable material of phlogiston, a substance that is without color, odor, taste, or weight and that is given off in burning. The ash of the burned material is held to be the true material. The theory was popular until the late 18th cent., when it was refuted by the work of Antoine LAVOISIER.

phlogopite: see MICA.

phlox, name for plants (genus *Phlox*) and the family Polemoniaceae, consisting of herbs, shrubs, and vines. Found chiefly in the W U.S., the family includes many popular wild and garden flowers, especially the genera *Phlox, Polemonium* (called Jacob's ladder), and *Gilia.* Most phlox are perennial, but some common garden varieties are annual hybrids.

Phnom Penh, capital of Cambodia (1990 est. pop. 800,000), at the confluence of the MEKONG and Tônlé Sap rivers, S Cambodia. The country's chief port and commercial center, it became (c.1432) the capital of the KHMER EMPIRE and (1867) of Cambodia. The city was captured (1975) when Cambodia fell to the Communist KHMER ROUGE, and most of its population (then estimated at over 700,000) was evacuated to work in the countryside. Since 1979, when the Khmer Rouge were ousted by Vietnamese forces, the city has gradually revived.

phobia, persistent, illogical, or intense fear of a specific thing or situation, recognized by the phobic person as irrational. There are many types, e.g., fear of enclosed spaces (claustrophobia), of public places from which escape might be difficult (agoraphobia), of water (hydrophobia), and of public humiliation (social phobia). Phobias are usually treated through psychotherapy, especially BEHAVIOR THERAPY.

Phobos, in astronomy, natural satellite of MARS.

Phoebe, in astronomy, natural satellite of SATURN.

Phoebus or **Phoebus Apollo:** see APOLLO.

Phoenicia [fĭnē'shə], ancient territory occupied by Phoenicians. The name Phoenicia usually refers to the heart of the territory where the great Phoenician cities, notably TYRE and SIDON, stood (corresponding roughly to the coast of present-day Lebanon). By 1250 B.C. the Phoenicians, a Semitic people, were well established as navigators and traders. Organized into city-states, they later established outposts, notably UTICA and CARTHAGE, and traveled to the edges of the known world. The Phoenicians were also fine artisans, but their greatest contribution was the ALPHABET, an idea adopted by the Greeks; the use of symbols for sounds in place of clumsier CUNEIFORM and HIEROGLYPHIC was a tremendous advance. The rise of the Greeks in the 5th cent. B.C. challenged Phoenician maritime power, and Hellenistic culture gradually absorbed the last traces of Phoenician civilization.

Phoenician art. The Phoenician region was a major trade center of the ancient world, and its art reflects the influences of Egypt, Syria, and Greece. Phoenician metalcraft and ivory work were copied in many neighboring regions, and Phoenician works in glass, jewelry, clay, alabaster, faience, and wood are found in all Mediterranean countries and Asia Minor. A well-known example of Phoenician art is a glass- and gem-inlaid ivory from Nimrud showing a lion attacking a man (British Mus.).

Phoenix, city (1990 pop. 983,403; met. area 2,122,101), state capital and seat of Maricopa co., S Ariz, on the Salt R.; inc. 1881. The largest city in Arizona and the ninth largest in the U.S., it produces electronic, computer, and aerospace equipment, as well as citrus and other food products. Phoenix boomed after World War II. The dry, sunny climate makes it a popular resort center. In the area are Native American and pioneer remains, and numerous parks.

phoenix, fabulous bird of ancient legend. When it reached 500 years of age it burned itself on a pyre from whose ashes another phoenix arose. It commonly appears in literature as a symbol of death and resurrection.

phonograph: see RECORD PLAYER.

phosphorescence, LUMINESCENCE produced by certain substances after absorbing radiant energy or other types of energy. Phosphorescence is distinguished from FLUORESCENCE in that it continues even after the radiation causing it has ceased. The luminescence is caused by electrons that are excited by the radiation and trapped in potential energy troughs, from which they are freed by the ther-

mal motion within the crystal. As they fall back to a lower energy level, they emit energy in the form of light.

phosphorus (P), nonmetallic element, discovered c.1674 by Hennig Brand. It is an extremely poisonous, yellow to white, waxy, solid substance. Because phosphorus ignites spontaneously when exposed to air, it is stored underwater. Its major source is the mineral APATITE, found in phosphate rocks. The principal use of phosphorus is in compounds in fertilizers, detergents, insecticides, soft drinks, toxic nerve gases, pharmaceuticals, and dentifrices. Phosphorus compounds are essential in the diet. Phosphorus is a component of ADENOSINE TRIPHOSPHATE (ATP), a fundamental energy source in living things, and of calcium phosphate, the principal material in bones and teeth. See ELEMENT (table); PERIODIC TABLE.

Photius, c.820–892?, Greek churchman and theologian, patriarch of CONSTANTINOPLE. In favor of treating repentant iconoclasts leniently (see ICONOCLASM), he replaced (858) St. Ignatius of Constantinople as patriarch, but Pope St. NICHOLAS I refused to recognize him. When Photius called (867) a synod that challenged the pope, he was replaced as patriarch and condemned. Photius was again patriarch (877–86) and was recognized by Pope JOHN VIII, but he died in exile. The schism of Photius pointed out the growing differences between East and West.

photocell: see PHOTOELECTRIC CELL.

photocopying, processes that use chemical, electrical, or photographic techniques to copy printed or pictorial matter. Most familiar is *xerography,* an electrostatic process that utilizes the attractive force of electric charges to transfer an image to a charged plate. Light, reflecting off the white areas of the object to be copied, erases the charge on the corresponding areas of the plate. A plastic ink powder, called toner, sticks to the charged areas of the plate and transfers an image of the original to paper. *Thermography* uses infrared rays on heat-sensitive paper to transfer an image. Several processes use cameras to make copies of an original. The *photostat* can reduce or enlarge copied material photographically. *Microfilming* generates copies from 1/12 to 1/100 the size of the original, and advances in microphotography allow even greater miniaturization in the *microfiche,* where extremely small microphotographs are printed side by side on a card made of film. In the *transfer process,* chemically coated paper is placed in contact with the original, exposed to light, and developed. The blueprint and the whiteprint, used to reproduce the drawings of architects and engineers, are examples of transfer processes.

photoelectric cell or **photocell,** device whose electrical characteristics (e.g., current, voltage, or resistance) vary when light is incident upon it. Common photoelectric cells consist of two electrodes separated by a light-sensitive SEMICONDUCTOR material. A battery or other voltage source connected to the two electrodes sets up a current even in the absence of light; when light strikes the semiconductor section of the photocell, the current increases in proportion to the light intensity. Photocells can be used to operate switches, RELAYS, door openers, and intrusion alarms. See also PHOTOVOLTAIC CELL.

photoelectric effect, the emission of electrons by substances, especially metals, when light falls on their surfaces. The effect was discovered by Heinrich HERTZ in 1887 and explained by Albert EINSTEIN in 1905. According to Einstein's theory, light is composed of discrete particles of energy, or quanta, called PHOTONS. When the photons with enough energy strike the material, they liberate electrons that have a maximal kinetic energy equal to the energy of the photons less the work function (the energy required to free the electrons from a particular material). See also PHOTOELECTRIC CELL; QUANTUM MECHANICS.

photography, still, science and art of making permanent images on light-sensitive materials. Photography's basic principles, processes, and materials were discovered independently and virtually simultaneously by a diverse group of individuals early in the 19th cent. Johann Heinrich Schulze had discovered in 1727 that silver nitrate darkens upon exposure to light. Using Schulze's research, Thomas Wedgwood and Sir Humphry DAVY created the first photogram. The French physicist Joseph Nicéphore Niépce made the first paper negative (1816) and the first known photograph, on metal (1827). He formed a partnership with a painter, Louis Jacques DAGUERRE, who in 1839 announced his method for making a direct positive image on a silver plate—the daguerreotype. The English scientist William Henry Fox TALBOT developed a paper negative (the calotype) from which an infinite number of paper positives could be printed. Sir John Herschel (see HERSCHEL, family) discovered (1819) a suitable photographic fixing agent for paper images and is credited with giving the new medium its name. In 1851 Frederick Scott Archer developed the collodion process, or "set plate" technique, which resulted in a negative image with the fine detail of the daguerreotype and was infinitely reproducible. Soon the photograph was considered incontestable proof of an event, experience, or state of being. Among the chief photographers of the 19th cent. were the explorer W.H. JACKSON; Roger Fenton, who documented the Crimean War; Mathew B. BRADY and his photographic corps, who photographed the American Civil War; the painter Thomas EAKINS; and Eadweard MUYBRIDGE, who devised a means of making stop-action photographs. As accessory lenses were perfected, the moon and the microcosm became accessible. The development of the halftone process (see PRINTING) in 1881 made photographic reproduction possible in books and newspapers. In 1888 George EASTMAN introduced roll film and the simple Kodak box CAMERA, and photography became available to all. The medium's legitimacy as an art form was challenged by artists and critics and upheld by Alfred STIEGLITZ, founder of the Photo-Secession movement. Initially photography imitated painting, but soon a "straight" aesthetic was widely adopted whereby the image was left free of manipulation. In the early 20th cent. the documentary power of photography was exemplified in the works of Jacob RIIS. Paul STRAND combined documentary concerns with a lean, modernist vision. Eugène ATGET and Henri CARTIER-BRESSON developed intensely personal styles. Technical advances, including smaller cameras, faster films, and portable lighting, granted photojournalists unprecedented versatility, and the popular picture magazines (e.g., *Life*) provided a vast audience for documentary work. The Great Depression and World War II were major sources of important documentary photography, as evidenced in the work of Margaret BOURKE-WHITE, Walker EVANS, Dorothea LANGE, and W. Eugene SMITH. Color photography also emerged as an important force, as in the nature photographs of Eliot Porter and the microphotographs of Roman VISHNIAC. Also significant was the development of the one-step Polaroid camera, first demonstrated (1947) in black and white by Edwin LAND and later (1963) available for color images. Although many photographers have adhered to the straight aesthetic, e.g., Ansel ADAMS, Diane Arbus, and Edward WESTON, younger photographers have felt little inhibition against manipulation of the image. As photography has become a more dominant artistic medium, many painters and printmakers, e.g., Andy WARHOL, Robert RAUSCHENBERG, and David HOCKNEY, have blended photography with a variety of other techniques such as handwork, collage, and multiple images. The late 20th cent. has seen the development of a number of important technologies, among them the three-dimensional images of HOLOGRAPHY, photography from space and sensitive astronomical photography that can register even a single PHOTON, and digital imaging and processing and other COMPUTER-based techniques for recording and editing photographic images. See also HOLOGRAPHY.

photolithography: see LITHOGRAPHY.

photometry, branch of physics dealing with the measurement of the intensity of light sources. Instruments used for such measurements are called photometers; most types are based on the comparison of the light source to be measured with a light source of known intensity. The modern unit, adopted in 1948, for the measurement of light intensity is the candela (cd); it is equal to 1/60 of the intensity of one square centimeter of a BLACKBODY radiator at the temperature at which platinum solidifies (2046K).

photon or **light quantum,** the particle composing light and other forms of electromagnetic radiation. The PHOTOELECTRIC EFFECT and BLACKBODY radiation can be explained only by assuming that light energy is transferred in discrete packets, or photons, and that the energy of each photon is equal to the frequency of the light multiplied by Planck's constant *h.* Light imparts energy to a charged particle when one of its photons collides with the particle. See also QUANTUM MECHANICS.

photonics, the science and technology based on and concerned

with the controlled flow of PHOTONS, or light particles. It is the optical equivalent of ELECTRONICS, and the two technologies coexist in such innovations as optoelectronic integrated circuits. Photonic applications include data storage (using OPTICAL DISKS and holograms), data transmission (see FIBER OPTICS), experimental optical computers, optical switches and light modulators (for signal processing and interconnection), and a photonic gyroscope used in commercial aircraft that has no moving parts.

photorealism, international art movement of the late 1960s and 70s that stressed the precise rendering of subject matter, often taken from actual photographs or painted with the aid of slides. Also known as superrealism, the style stressed objectivity and technical proficiency in producing images of photographic clarity, often street scenes or portraits. Well-known American photorealists include the painters Chuck CLOSE and Richard ESTES and the sculptor Duane HANSON.

photosphere: see SUN.

photosynthesis, process in which green plants use the energy of sunlight to manufacture carbohydrates from carbon dioxide and water in the presence of CHLOROPHYLL. The chlorophyll molecule is uniquely capable of converting active light energy into a latent form (glucose) that is stored in food. The initial phase of the process requires direct light; water (H_2O) is broken down into oxygen (which is released as a gas) and hydrogen. Hydrogen and the carbon and oxygen of carbon dioxide (CO_2) are then converted into a series of increasingly complex compounds that result finally in a stable organic compound, glucose ($C_6H_{12}O_6$), and water. The simplified equation for the overall reaction is $6CO_2 + 12H_2O + \text{energy} \rightarrow C_6H_{12}O_6 + 6O_2 + 6H_2O$. The oxygen released as a by-product is atmospheric oxygen, vital to respiration in plants and animals. Photosynthesis, in general, is the reverse of RESPIRATION, in which carbohydrates are broken down to release energy.

photovoltaic cell or **solar cell,** SEMICONDUCTOR diode that converts light to electric current. When light strikes the exposed active surface, it knocks electrons loose from their sites in the crystal. Some of the electrons have sufficient energy to cross the DIODE junction and pass through an external circuit. Because the current and voltage obtained from these devices are small, they are usually connected in large series-parallel arrays. Practical photovoltaic cells are currently about 10 to 15% efficient. Although cells constructed from indium phosphide and gallium arsenide are, in principle, more efficient, silicon-based cells are generally less costly. Solar cells have long been used to provide electric power for spacecraft. As costs have decreased, they have seen greater use as energy sources for irrigation pumps in remote areas, oil drilling platforms, and mountaintop microwave relay stations, and for small devices such as hand-held CALCULATORS.

Phrygia, ancient region, central Asia Minor (now central Turkey). The Phrygians, apparently Indo-Europeans, entered (c.1200 B.C.) the area from the Balkans. The kingdom of Phrygia (fl. 8th–6th cent. B.C.) is associated in Greek legend with MIDAS and GORDIUS. Phrygia was later dominated in turn by Lydia, the Gauls, Pergamum, and Rome.

Phrynichus [frĭn'ĭkəs], c.512–476 B.C., Athenian tragedian. Called by PLATO the founder of TRAGEDY, he was noted for his choreography and for introducing female characters. His *Taking of Miletus* moved the audience to tears.

Phyfe, Duncan, c.1768–1854, American cabinetmaker; b. Scotland. In the early 1790s in his New York City shop he made chairs, settees, tables, and sideboards of mahogany, satinwood, maple, and rosewood. After 1820 the excellent proportions, graceful curves, and simple decoration of his work gave way to heaviness and overornamentation.

physical chemistry, branch of science that combines the principles and methods of PHYSICS and CHEMISTRY. It provides a fundamental theoretical and experimental basis for all of chemistry, including organic, inorganic, and analytical chemistry. Important topics are chemical equilibrium, ELECTROCHEMISTRY, molecular structure, MOLECULAR WEIGHTS, reaction rates, SOLUTIONS, and STATES OF MATTER.

physical therapy or **physiotherapy,** treatment of disorders of the MUSCLES, BONES, or JOINTS resulting from injury or disease of the muscles or nerves. Treatment, by a trained physiotherapist, includes the use of such agents as water (e.g., whirlpool baths), manual and electrically-stimulated massage, heat, and exercise to stimulate nerves, prevent muscular atrophy, and train other muscles to compensate for damaged ones. See also SPORTS MEDICINE.

physician's assistant (PA), health care professional who provides patient services ranging from physical examinations to surgical procedures, under the supervision of a physician. PAs receive two years of post-college training and are licensed by the states.

physics, branch of science traditionally defined as the study of MATTER, ENERGY, and the relation between them. Physics today may be loosely divided into classical physics and modern physics. Classical physics includes the traditional branches that were recognized and fairly well developed before the beginning of the 20th cent.: MECHANICS (the study of MOTION and the FORCES that cause it), ACOUSTICS (the study of SOUND), OPTICS (the study of LIGHT), THERMODYNAMICS (the study of the relationships between HEAT and other forms of energy), and ELECTRICITY and MAGNETISM. Most of classical physics is concerned with matter and energy on the normal scale of observation. By contrast, much of modern physics is concerned with the behavior of matter and energy under extreme conditions (see, e.g., LOW-TEMPERATURE PHYSICS) or on the very small scale (see ATOM; ELEMENTARY PARTICLES; NUCLEAR PHYSICS; PARTICLE ACCELERATOR). On the very small scale, and for rapidly-moving objects, ordinary, commonsense notions of space, time, matter, and energy are no longer valid, and two chief theories of modern physics present a different picture of these concepts from that presented by classical physics. QUANTUM MECHANICS is concerned with the discrete, rather than the continuous, nature of many phenomena at the atomic and subatomic level, and with the complementary aspects of particles and waves in the description of such phenomena. The theory of RELATIVITY is concerned with the description of phenomena that take place in a frame of reference that is in motion with respect to an observer. See also ASTRONOMY; SOLID-STATE PHYSICS.

physiocrats, school of 18th-cent. French thinkers who evolved the first complete system of ECONOMICS. Physiocracy's founder, François QUESNAY, argued that the source of all wealth was the land and that only the abundance and high prices of agricultural goods could create prosperity. His followers stressed that absolute freedom of trade was essential to guarantee the most beneficial operation of "economic law," which they considered immutable. The physiocrats influenced later advocates of LAISSEZ FAIRE and contributed to the economic thinking of Adam SMITH.

physiology, study of the normal functioning of animals and plants, and of activities that maintain and transmit life. It is usually accompanied by the study of structure (see ANATOMY), the two being intimately related. Physiology considers basic activities such as METABOLISM and special functions within cells, tissues, and organs.

pi, in mathematics, the ratio of the circumference of a CIRCLE to its diameter; its symbol is π. The ratio is the same for all circles and is approximately 3.1416. The NUMBER π is irrational and transcendental. An early value was the Greek approximation 3⅐; by the mid-20th cent. a computer had calculated π to 100,000 decimal places.

Piaf, Edith, 1915–63, French cabaret singer; b. Edith Giovanna Gassion. She began singing in cafes and in the streets at 15, and went on to fame in cabaret, concert, and movie appearances with her powerful, emotional style.

Piaget, Jean [pyä'jā], 1896–1980, Swiss psychologist. He is known for his contributions to child psychology, especially for his theory of cognitive and intellectual development, according to which development proceeds in genetically determined stages that always follow the same sequential order. Piaget showed that young children reason differently from adults and are often incapable of understanding logical reasoning. He wrote on the applications of dialectics and STRUCTURALISM in the behavioral sciences and attempted a synthesis of physics, biology, psychology, and epistemology. His writings include *The Child's Conception of the World* (tr. 1929) and *Genetic Epistemology* (tr. 1970).

piano or **pianoforte,** musical STRINGED INSTRUMENT whose sound is produced by vibrating strings struck by felt hammers that are controlled from a keyboard. Its earliest predecessor was the medieval dulcimer. The 14th to 16th cent. saw the rise of the harpsichord, a

The key to pronunciation appears on page xiii.

keyboard instrument whose strings were plucked by quills or jacks. The square harpsichord, often called the spinet, was common by the 16th cent. In c.1709 Bartolomeo Cristofori (1655–1731), a Florentine maker of harpsichords, constructed the first piano. It differed from the harpsichord in that by varying the touch one could vary the volume and duration of tone. This expressive quality was shared to some extent by the clavichord, a delicate instrument important in the 16th to 18th cent., but musical taste gradually favored the piano's greater volume and expressiveness, and it largely supplanted both the harpsichord and clavichord by 1800. C.P.E. BACH, MOZART, and HAYDN were the first major composers to write for the piano. The main body of its literature is from the 19th cent., including the works of BEETHOVEN, SCHUBERT, CHOPIN, Robert SCHUMANN, MENDELSSOHN, BRAHMS, FRANCK, LISZT, DEBUSSY, and RAVEL. The piano was originally built in the shape of a harpsichord, and this style (the grand piano) has always been the standard form. Innovations in the 19th cent. included an iron framework, a double-action striking mechanism permitting rapid repetition of tone, the upright piano (in which the strings are perpendicular to, rather than parallel to, the keys), and the player piano, which incorporates a mechanical system that automatically plays the encoded contents of a perforated paper strip. An electric piano has also been developed.

Piast, 1st dynasty of Polish dukes and kings. Duke Mieszko I (r.962–92) founded the dynasty and introduced Christianity to Poland. His son, BOLESLAUS I, was crowned king in 1025; not all of his successors, however, styled themselves king. During the reign (1079–1102) of BOLESLAUS III, four hereditary duchies were created for his four sons; a fifth son, CASIMIR II (probably a posthumous child), carved out a fifth duchy for himself and secured the hereditary right to the kingship for his descendants. Dynastic struggles continued, however, until the dynasty ended with the death (1370) of CASIMIR III. The Jagiello dynasty followed.

Picabia, Francis, 1878–1953, French painter. He was associated with IMPRESSIONISM, CUBISM, and SURREALISM, and was one of the first exponents of DADA in Europe. His works include *Physical Culture* (1913; Philadelphia Mus. Art).

Picard, Jean, 1620–82, French astronomer. His measurements led to a much improved determination of the length of a degree of meridian and consequently of the circumference of the earth. Sir Isaac NEWTON used Picard's figures to verify the accuracy of his principle of gravitation.

Picasso, Pablo (Pablo Ruiz y Picasso), 1881–1973, Spanish painter, sculptor, graphic artist, and ceramicist who worked in France; the foremost figure in 20th-cent. art. Leader of the SCHOOL OF PARIS, he was remarkable for his technical virtuosity, incredible originality, and prolificacy. Admitted to the Royal Academy of Barcelona at 15, he later moved to Paris, where he remained until 1947, then moving to the South of France. His early works, e.g., *Old Woman* (1901; Philadelphia Mus. Art), show the influence of TOULOUSE-LAUTREC. His production is usually described in series of overlapping periods. In his melancholy "blue period" such works as *The Old Guitarist* (1903; Art Inst., Chicago) depicted, in blue tones, the world of the poor. His "rose period" is characterized by a lighter palette and subjects from the circus. In 1907, Picasso painted *Les Demoiselles d'Avignon* (Mus. Mod. Art, N.Y.C.), the most significant work in the development of CUBISM and abstraction, and a herald of analytic cubism. In the synthetic phase of cubism (after 1912), his forms became larger and more representational, e.g., *The Three Musicians* (1921; Mus. Mod. Art, N.Y.C.). In the 1920s he also introduced COLLAGE. His second landmark work was *Guernica* (Reina Sofía, Madrid), an impassioned condemnation of war and fascism. In his later years, Picasso turned to creations of fantasy and comic invention. Working consistently in sculpture, ceramics, and the graphic arts, he continued to explore his personal vision until his death at 91.

Piccard, Auguste [pēkär'], 1884–1962, Belgian physicist, known for his balloon ascents into the stratosphere; b. Switzerland. In 1932 he reached an altitude of 55,500 ft (16,900 m). After 1946 he made ocean dives in a bathyscaphe of his own design. In 1960 his son, **Jacques Piccard,** 1922–, and Lt. Don Walsh of the U.S. Navy reached a depth of 35,800 ft (10,920 m) in the MARIANAS TRENCH.

piccolo: see WIND INSTRUMENT.

Piccolomini, Enea Silvio de': see PIUS II.

pickerel: see PIKE.

Pickett, George Edward, 1825–75, Confederate general in the American CIVIL WAR. He is best remembered for "Pickett's charge," the unsuccessful assault (1863) on the Union center during the GETTYSBURG CAMPAIGN that virtually annihilated his division.

Pickford, Mary, 1893–1979, American film actress; b. Canada as Gladys Smith. Called "America's Sweetheart," she played plucky heroines in such films as *The Poor Little Rich Girl* (1917) and *Tess of the Storm Country* (1922).

Mary Pickford

Picts, ancient inhabitants of N and central SCOTLAND. First mentioned in A.D. 297, the Picts formed a unified kingdom by the 7th cent. The union (c.843) of the Picts and the Scottish kingdom of Dalriada became the kingdom of Scotland.

pidgin, a lingua franca that is not the mother tongue of anyone using it and that has a simplified grammar and restricted, often polyglot, vocabulary. An example is the pidgin English used in E Asian ports, principally for trading between the English and Chinese. The majority of the vocabulary and grammar are of English origin, but there are also Malay, Chinese, and Portuguese elements. Pidgins are important national languages in Papua New Guinea and some Pacific island countries.

Piedmont, region (1990 pop. 4,357,559), 9,807 sq mi (25,400 sq km), NW Italy. The Piedmont is mostly mountainous, with the ALPS in the north and west, and the APENNINES in the south. TURIN, the capital, is a major industrial center. Wheat, corn, rice, and grapes are grown in the upper Po valley. From the 11th cent. the counts (later dukes) of SAVOY were powerful in the area. They became kings of SARDINIA in 1720 and had acquired all of modern Piedmont by 1748. France greatly influenced Piedmontese culture and ruled the area from 1798 to 1814. The region was the center of the RISORGIMENTO, and Turin was the first capital of the kingdom of Italy.

Pied Piper of Hamelin, legendary 13th-cent. figure who rid Hamelin, Germany, of its rats by charming them away with his flute playing. When he was refused payment, he charmed away the town's children in revenge. Among those who retold the tale are GOETHE and Robert BROWNING.

Pierce, Franklin, 1804–69, 14th president of the U.S. (1853–57); b. Hillsboro, N.H. He served in the New Hampshire legislature (1829–33) and in the U.S. Congress (1833–42), resigning from the Senate to practice law in Concord, N.H. In 1852, as the compromise "dark horse" presidential candidate of the badly divided Democratic party, he defeated the Whig candidate, Gen. Winfield SCOTT. Pierce's failures to unite the Democrats and to implement his ex-

pansionist foreign policy made him appear a weak, vacillating president. His one solid achievement in foreign affairs was the GADSDEN PURCHASE from Spain. Although he had favored the COMPROMISE OF 1850 on the slavery issue, he backed the KANSAS-NEBRASKA ACT of 1850 that precipitated virtual civil war between the pro- and antislavery forces in Kansas. The act enraged many Northerners and caused Pierce to be so unpopular that the Democrats passed him over for renomination; James BUCHANAN succeeded him as president. Pierce's opposition to the CIVIL WAR made him more than ever disliked in the North, where he died in obscurity.

Piero della Francesca or **Piero de' Franceschi,** c.1420–1492, major Italian RENAISSANCE painter. Early contact with the art of Florence gave him the basics of perspective, to which he added his own acute perception of nature, e.g., in the *Baptism of Christ* (National Gall., London). He delighted in the play of mathematical ratios and painted *The Flagellation of Christ* (Urbino) in a perfect, geometric framework. His most famous cycle, *The Story of the True Cross* (1452–66; Church of San Francesco, Arezzo), depicts scenes from the *Golden Legend.* He also painted court portraits, e.g., of the Duke and Duchess of Urbino (Uffizi).

Pierre, city (1990 pop. 12,906), state capital (since 1889) and seat of Hughes co., central S.Dak., on the Missouri R.; inc. 1883. Its economy is centered on agriculture (grains and cattle), tourism, and state government. Located on the site of an Arikara settlement, it was a river trade center from c.1822. The huge Oahe Dam and Lake Oahe are nearby.

Piers Plowman: see LANGLAND, WILLIAM.

piezoelectric effect, voltage (see POTENTIAL, ELECTRIC) produced between surfaces of a solid DIELECTRIC when a mechanical stress is applied to it. This effect is exhibited by certain crystals, e.g., quartz and Rochelle salt, and ceramic materials. When a voltage is applied across certain surfaces of a solid exhibiting the piezoelectric effect, the solid undergoes a mechanical distortion. Piezoelectric materials are used in TRANSDUCERS, e.g., phonograph cartridges, microphones, and strain gauges, which produce an electrical output from a mechanical input, and in earphones and ultrasonic radiators, which produce a mechanical output from an electrical input.

pig: see SWINE.

pigeon, land BIRD of the family Columbidae, cosmopolitan in temperate and tropical regions, characterized by a stout body, small head, and thick plumage. The names *dove* and *pigeon* are interchangeable, although the former generally refers to smaller birds. The rock dove (*Columba livia*) of temperate W Eurasia is the wild progenitor of the common street and domestic pigeons. The most common American wild pigeon is the small, brown mourning dove, or turtledove (*Zenaidura carolinensis*), similar to the once-abundant passenger pigeon, which became extinct in 1914.

pigeon English: see PIDGIN.

pig iron, IRON refined in a blast furnace, containing about 4% carbon and small amounts of manganese, silicon, phosphorus, and sulfur. About 95% of it is processed to make STEEL, and the balance is cast in sand molds into blocks called pigs and further processed in foundries (see CASTING).

Pike, Zebulon Montgomery, 1779–1813, American explorer; b. Lamberton, N.J. As an army lieutenant he led an expedition (1806–7) to Spanish NEW MEXICO, discovering the Colorado peak that is named after him. Promoted to brigadier general during the WAR OF 1812, he was killed in the successful assault on York (now Toronto).

pike, freshwater FISHES of the family Esocidae, found in Europe, Asia, and North America. The pike, muskellunge, and pickerel are long, thin fishes with spineless dorsal fins, large anal fins, and long, narrow jaws with formidable teeth. The muskellunge is the largest of the genus *Esox,* from 2 to 7 ft long (61 to 213.5 cm) and weighing 10 to 20 lb (4.5 to 9 kg). Carnivorous and solitary except while spawning, it eats fish, frogs, snakes, young aquatic mammals, and water fowl. The great northern pike (*E. lucius*), called jackfish in Canada, is thought to consume one fifth its weight (10–35 lb/4.5–16 kg) daily. The pickerels are smaller members of the family. Pikes are strong fighters and valued as game and food. The walleyed pike is a PERCH.

Pikes Peak, mountain, 14,110 ft (4,301 m) high, central Colo. in the Front Range of the ROCKY MOUNTAINS, at the end of the GREAT PLAINS. Colorado Springs is at its eastern base. The mountain was discovered (1806) by U.S. explorer Zebulon Pike. Its summit is accessible by highway or cog railroad.

Pilate: see PONTIUS PILATE.

Pilgrims, the 102 English Puritan separatists and others who founded the PLYMOUTH COLONY. While crossing the Atlantic Ocean on the *Mayflower,* they signed the MAYFLOWER COMPACT providing for majority rule. The Pilgrims landed at Plymouth in Dec. 1620.

pill, the: see ORAL CONTRACEPTIVE.

Pilnyak, Boris [pēlnyäk'], pseud. of **Boris Andreyevich Vogau,** 1894–1941, Russian novelist and short-story writer. He first attracted attention with his novel *The Naked Year* (1921), depicting the chaos of the revolutionary period. *The Volga Falls to the Caspian Sea* (1930) was denounced by the Soviet regime. Arrested in 1937, Pilnyak either died in prison or was executed

Pilobolus Dance Theater, innovative dance company founded (1971) at Dartmouth College by Moses Pendleton, Jonathan Wolken, Alison Chase, and others. Its dances, which are developed collectively, typically involve gymnastics, group "structures," and overt and implied humor. Later dances have often echoed literary works. In 1980 Pendleton and Chase established Momix, an offshoot group.

pilot fish: see POMPANO.

Piłsudski, Joseph, 1867–1935, Polish general and politician. Originally a Socialist, he was repeatedly exiled and imprisoned by Russian authorities in the early part of the century. He commanded the Polish Legions that fought for the Central Powers in WORLD WAR I. In 1918 he proclaimed an independent Polish republic, with himself as chief of state and (after 1919) PADEREWSKI as premier. In 1921 he extended Poland's eastern boundary with the Treaty of Riga. He surrendered his powers and retired in 1922 but in 1926 he reassumed power by a coup. Thereafter he headed a military dictatorship with fascist overtones.

Piltdown man, name given to fossil remains found (1908) at Piltdown, England, thought to be human and 200,000 to 1 million years old. In 1950, fluorine tests and X-ray analysis proved that Piltdown man was a forgery.

Pima or **Akimel O'Odham,** indigenous North American people of the Southwest, with a Uto-Aztecan language of the Aztec-Tanoan stock (see NATIVE AMERICAN LANGUAGES). They are closely related to the TOHONO O'ODHAM. Descendants of the Hohokam, who built a network of irrigation canals, the Pima were sedentary farmers, noted for fine basketry. Warlike toward the APACHES, they befriended both Spaniards and American pioneers. The Maricopa joined them in the 19th cent. Today, in central Arizona, they live on income from agriculture, crafts, and leasing land for mineral development. In 1990 there were 14,431 Pimas in the U.S.

pimento or **allspice,** tree (*Pimenta officinalis*) of the MYRTLE family. Its dried, unripe berries are used medicinally and as a spice. The spice supposedly combines the flavors of several other spices; it is used in pickles and relishes. Pimento (more correctly, *pimiento*) is also the name of a large, sweet Spanish PEPPER.

pimpernel: see PRIMROSE.

Pinatubo, Mount, active volcano, 5771 ft (1699 m), central Luzon island, the Philippines, c.55 mi (90 km) NW of Manila. Dormant for 600 years, it began erupting on Apr. 2, 1991. Most residents had evacuated nearby areas when Pinatubo erupted catastrophically (June 15, 1991), killing over 500 people and burying over 310 sq mi (800 sq km) under volcanic ash. Landslides of rain-soaked volcanic ash caused further destruction in 1991 and 1992.

Pinchot, Gifford [pĭn'shō], 1865–1946, U.S. conservationist; b. Simsbury, Conn. He served in the U.S. Forest Service (1898–1910) until dismissed by Pres. TAFT and later joined (1912) Theodore ROOSEVELT in forming the PROGRESSIVE PARTY. A founder of the Yale school of forestry, he was professor there (1903–36). He was twice governor of Pennsylvania (1923–29, 1931–35).

Pinckney, Charles, 1757–1824, American statesman; b. Charleston, S.C. A delegate to the FEDERAL CONSTITUTIONAL CONVENTION of 1787, he was also a U.S. senator (1798–1801), minister to Spain (1801–5), and governor of SOUTH CAROLINA (1789–91, 1796–98, 1806–8). His cousin **Charles Cotesworth Pinckney,** 1746–1825 also a del

egate to the Constitutional Convention, served as an envoy to France (1797) and refused to pay bribes to French officials in the XYZ AFFAIR. His brother, **Thomas Pinckney,** 1750–1828, was governor of South Carolina (1787–89) and as envoy to Spain negotiated the treaty (1795) establishing U.S. commercial relations with Spain.

Pindar, 518?–c.438 B.C., generally regarded as the greatest Greek LYRIC poet. He wrote choral lyrics and established a standard for the triumphal or epinician ode. Celebrating an athletic victory, each ode contains a narrative myth, connected with the winner, that sets an elevated moral and religious tone. Pindar's diction and complex word order do not translate easily. The 17th–18th cent. **Pindaric ode** of Abraham COWLEY, John DRYDEN, and Thomas GRAY is based loosely on Pindar's form.

Pindling, Sir Lynden O(scar), 1930–, prime minister of the Bahamas (1967–92). Leader of the Progressive Liberal party, he was (1967) the first person of African descent to become prime minister of the Bahamas, and in 1973 he led the country to independence. Pindling spurred the development of international banking and investment management as a major industry. In the 1980s he was accused of corruption and accepting bribes from drug traffickers. Those charges and a depressed economy contributed to his party's defeat in 1992.

pine, common name for the family Pinaceae, resinous woody trees chiefly of north temperate regions, with needlelike, usually evergreen leaves. The Pinaceae reproduce by means of cones rather than flowers, and have winged seeds suitable for wind distribution. The family is the largest and most important of the CONIFERS, providing naval stores (pitch, turpentine, and rosin), paper pulp, and more lumber than any other family. The family's genera include the FIR, LARCH, SPRUCE, HEMLOCK, CEDAR, DOUGLAS FIR, and true pines. True pines (genus *Pinus*) can be identified by the leaf arrangement: in each species a specific number of needles (one to five) is contained in a sheath. The ponderosa, or Western yellow, pine (*P. ponderosa*) is second only to the Douglas fir as a commercial timber tree in North America; the Scotch pine (*P. sylvestris*), ranging from Scotland to Siberia, is one of the most valuable European timber trees. The white pine (*P. strobus*) of E North America has straight-grained softwood with little resin; it is used for interior trim and cabinetwork. A major source of naval stores is the longleaf, or Southern yellow, pine (*P. palustris*); its highly resinous wood is also used for heavy construction and paper pulp. Several Mediterranean and American pines yield edible seeds, called pine nuts.

pineal body or **pineal gland,** pea-sized organ situated in the BRAIN. Generally regarded as an endocrine gland (see ENDOCRINE SYSTEM) even though no pineal HORMONE has been isolated in humans, it may exert some influence on sexual development by secreting a substance called melatonin.

pineapple, fruit of a spiny herbaceous plant (*Ananas comosus*) of the BROMELIAD family. Native to South America, the pineapple plant is widely cultivated in tropical regions; Thailand supplies the major portion of the world's canned pineapple. The fruit, whose spiny skin is yellowish brown when ripe, is sweet and juicy; it is topped by a distinctive rosette of green leaves.

Pine Bluff, city (1990 pop. 57,140), seat of Jefferson co., S central Ark., on the Arkansas R.; inc. 1839. A port and the trade center for a lumber and farm area, it has industries making electrical goods and wood and paper products. The huge Pine Bluff Arsenal, north of the city, is the U.S. Army's chief chemical and biological research center.

Pinero, Sir Arthur Wing, 1855–1934, English dramatist. His early successes were farces and sentimental comedies, but plays like *The Profligate* (1889) and *The Second Mrs. Tanqueray* (1893) brought him fame as a serious social dramatist.

Pines, Isle of: see YOUTH, ISLE OF.

Ping-Pong: see TABLE TENNIS.

pink, common name for some members of Caryophyllaceae, a family of small herbs chiefly of north temperate zones, typified by swollen stem nodes and notched, or "pinked," petals ranging in color from white to red and purple. The family includes several ornamentals and many wildflowers and weeds. Ornamental pinks include the fragrant flowers of the genus *Dianthus,* among which are the many varieties of carnation and sweet William. Baby's breath (*Gypsophila paniculata*) is an unusual pink in being a bushy plant; it is often used by florists as a bouquet filler.

Pinkerton, Allan, 1819–84, American detective; b. Scotland. In Chicago he founded (1850) what became the Pinkerton National Detective Agency. During the Civil War he directed an espionage system behind the Confederate lines. His agency, which solved numerous railroad robberies, also gathered the evidence that broke up the MOLLY MAGUIRES in the 1870s. It subsequently became notorious as a private police force for hire to management as strikebreakers.

pinkeye: see CONJUNCTIVITIS.

Pinochet Ugarte, Augusto [pēnōchā′ ōōgär′ tā], 1915–, president of Chile (1973–90). An army general, he led the coup that overthrew Pres. Salvador ALLENDE. He instituted conservative economic measures and harshly suppressed political dissent. His bid to remain president for another eight years was rejected in a national plebiscite in 1988, and the following year Patricio Aylwin was elected president. Pinochet, however, remained commander of the army.

pinochle, card game played by two to four players, with a deck of 48 cards made up of two each of nine through ace in all four suits, developed in the U.S. in the 19th cent. Auction pinochle, probably the most popular form of the game, is based on a complicated system of bidding. Four-hand, or partnership, pinochle, and bottom card–trump opening pinochle are popular. In all of these, an arbitrary point goal, not simply game, is often set.

pinophyte, member of a division (Pinophyta) of the plant kingdom consisting of the GYMNOSPERMS. In some classifications, the term refers only to the CONIFERS.

Pinter, Harold, 1930–, English dramatist. In his "comedies of menace," the commonplace is invested with tension and mystery, often through the use of silence. *The Dumbwaiter* (1957), *The Birthday Party* (1958), *The Caretaker* (1960), *The Homecoming* (1965), *Betrayal* (1978), and *Moonlight* (1993) are among his best-known plays. His screenplays include *The Servant* (1963) and *The French Lieutenant's Woman* (1981).

pinyin [Chin. *pinyin zimu* = phonetic alphabet], system of romanization of Chinese written characters, approved in 1958 by the government of the People's Republic and officially adopted by it in 1979. Its use replaces that of the more complex Wade-Giles system (1859; modified 1912), among others. Objectives of pinyin include promoting a national language, establishing a means for writing non-Chinese (minority) languages in China, and encouraging foreigners to learn Chinese. Pinyin is not used in Taiwan or in Hong Kong.

Pinza, Ezio, 1895–1957, Italian-American basso; b. Italy. He achieved success at the METROPOLITAN OPERA (N.Y.C.) and appeared on Broadway in *South Pacific* (1949).

Pinzón, Martín Alonzo [pēnthōn′], d. 1493, Spanish navigator. Commander of the *Pinta* on COLUMBUS's first voyage (1492), he deserted Columbus in the Antilles for six weeks and upon his return was censured for treasonable conduct. His younger brother, **Francisco Martín Pinzón,** fl. 1492, was master of the *Pinta.* Another brother, **Vicente Yáñez Pinzón,** fl. 1492–1509, commanded the *Niña.* When the *Santa María* was wrecked, he took Columbus aboard. He explored the mouth of the AMAZON (1500), was governor of PUERTO RICO from 1505, and explored the coasts of YUCATÁN, HONDURAS, and VENEZUELA (1508–9).

pion: see ELEMENTARY PARTICLES.

Pioneer, in space exploration: see SPACE PROBE, table.

Pippin: for Frankish rulers thus named, see PEPIN.

Piraiévs or **Piraeus,** city (1981 pop. 196,389), E central Greece, on the Saronic Gulf. Part of Greater Athens, it is the chief port of Greece and a commercial center. It was built in 450 B.C. and was connected to Athens by the famed Long Walls, which were destroyed (404 B.C.) by Sparta.

Pirandello, Luigi, 1867–1936, Italian author; b. Sicily. A major figure in 20th-cent. theater, he was awarded the 1934 Nobel Prize in literature. In the 1890s he began to write poetry and short stories, then produced seven novels, including *The Late Mattia Pascal* (1904). His fame, however, rests on his grimly humorous plays dealing with illusion and reality, which he began writing during World War I. They include *Right You Are If You Think You Are*

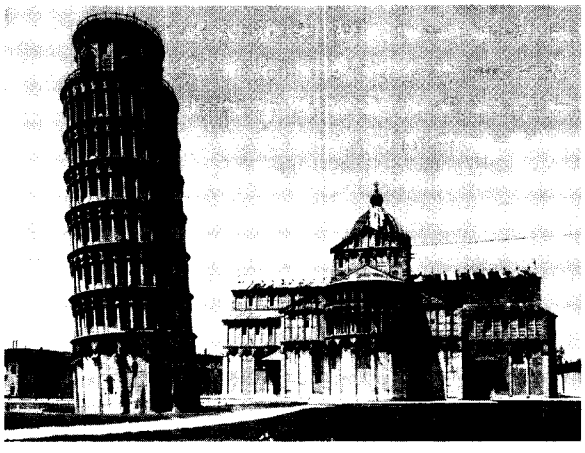
(1917), *Six Characters in Search of an Author* (1921), *Henry IV* (1922), and *Tonight We Improvise* (1930).

Piranesi, Giovanni Battista, 1720–78, Italian engraver and architect. In Rome he made engravings, notable for their accuracy and grandeur, of the city's buildings and monuments. Some digressed from documentary into fanciful reconstruction.

piranha or **caribe,** predatory freshwater FISH of the family Characidae, found in E and central South America, especially in the AMAZON. The piranha (genus *Serrasalmus*) has powerful jaws and razor-sharp triangular teeth and is capable of killing cattle and human beings. The largest piranha is c.2 ft (60 cm) long.

Pirenne, Henri [pērĕn'], 1862–1935, Belgian historian. In *Mohammed and Charlemagne* (1935), he attributed the collapse of Western civilization to the spread of Islam, a thesis that aroused much controversy. He also wrote a *History of Belgium* (7 vol., 1899–1932) and *Medieval Cities* (1927).

Pisa, city (1990 pop. 102,150), in TUSCANY, N central Italy, on the Arno R. It is a center of commerce and industry, producing vehicle parts, glass, and drugs. An Etruscan town, it prospered under Rome. It was a strong maritime republic from the 9th to 11th cent. A Ghibelline center (13th–14th cent.), Pisa fell to FLORENCE in 1406. GALILEO was born and taught there. The school of sculpture founded by Nicola PISANO flourished in the city. Its Romanesque cathedral and Leaning Tower are famous.



Cathedral and Leaning Tower at Pisa

Pisa, Council of: see SCHISM, GREAT.

Pisanello [pēzänĕl'lō], c.1395–1455?, Italian RENAISSANCE medalist, painter, and draftsman; b. Antonio Pisano, called Vittore Pisano. His only surviving FRESCOES are the *Annunciation* (San Fermo, Verona) and *St. George and the Princess* (Sant' Anastasia, Verona). He was the first Renaissance artist to revive the antique medal form of portraiture, and his medals, valued for their historic as well as their artistic merit, include a portrait of Francesco Sforza (Victoria and Albert Mus., London). He was also a superb draftsman.

Pisano, Andrea [pēzä'nō], c.1290–c.1348, Italian sculptor, also called Andrea da Pontedera. His most important work is the first bronze doors for the baptistery in Florence, depicting the life of John the Baptist. He was influenced by GIOTTO, whom he succeeded as head of the work on the Florence cathedral.

Pisano, Nicola, b. c.1220, d. between 1278 and 1284, major Italian sculptor. He founded a new school of sculpture in Italy, imbued with the classical spirit. His first great work was the hexagonal pulpit consisting of scenes from the life of Jesus for the baptistery in Pisa. He later concentrated on the human figure, recreating a style of monumental dignity. For the fountain at Perugia he and his son designed 24 statues and twice that many reliefs (1278). His son, **Giovanni Pisano,** b. 1250, d. after 1314, was a sculptor and architect. He helped his father and also did independent works, e.g., the pulpit for the cathedral at Pisa.

Pisano, Vittore: see PISANELLO.

Piscator, Erwin, 1893–1966, German theatrical director and producer. With Bertolt BRECHT he was the chief exponent of epic theater, in which narrative, montage, self-contained scenes, and rational argument were used to create a shock of recognition in the spectator. His experimental productions in Berlin and New York City greatly influenced Western theater methods.

Pisistratus or **Peisistratus** [pīsĭs'trətəs], 605?–527 B.C., tyrant of ATHENS. Having achieved popularity with liberal land laws, he seized power c.560 B.C. Under his rule Athens won SALAMIS and established hegemony in the Dardanelles. Exiled twice by his rivals, he nevertheless ruled until his death, and was succeeded by his sons Hippias and Hipparchus.

Pissarro, Camille [pēsärō'], 1830–1903, French impressionist painter; b. Virgin Islands. Allied with the impressionists (see IMPRESSIONISM), he experimented with SEURAT's color theories before developing a freer, more vital interpretation of nature, as seen in *Bather in the Woods* (Metropolitan Mus.). He was the teacher and friend of GAUGUIN, CÉZANNE, and CASSATT.

pistachio, tree or shrub (genus *Pistacia*) of the SUMAC family. The pistachio nut of commerce is obtained from *P. vera,* native to Turkey, Syria, and Palestine; the trade supply comes primarily from Iran, Syria, Turkey, Greece, Italy, and, in the U.S., California. The nut is a greenish seed that is eaten salted or used in confections.

pistil: see FLOWER.

pistol: see SMALL ARMS.

Piston, Walter, 1894–1976, American composer and teacher; b. Rockland, Me. A neoclassicist, he composed in traditional forms, e.g., SYMPHONIES, CONCERTOS, and string quartets, and wrote studies of HARMONY, COUNTERPOINT, and orchestration.

Pitcairn Island, volcanic island (1992 pop. 52), 2.5 sq mi (6.5 sq km), South Pacific, near the Tropic of Capricorn. The only inhabited island in the Pitcairn Islands group, it was discovered (1767) by the British and colonized (1790) by mutineers from the British naval vessel BOUNTY and Tahitian women. Their descendents, who speak a dialect of English, still inhabit the island; they are all Seventh-Day Adventists. It has been a British possession since 1839.

pitch, in music, the position of a tone in the musical scale, today designated by a letter name and determined by the frequency of vibration of the source of the tone. An international conference held in 1939 set a standard for A above middle C of 440 cycles per second.

pitch: see TAR AND PITCH.

pitchblende, dark, lustrous, massive variety (largely UO_2) of the mineral uraninite, a source of RADIUM and URANIUM. Pitchblende and uraninite occur as primary constituents of quartz veins and with other metals, chiefly in the Great Lakes region in Canada, the Colorado Plateau in the U.S., Australia, the Czech Republic, South Africa, and Zaïre.

Pitcher, Molly (Mary Ludwig Hays or Heis), 1744–1832, American Revolutionary heroine; b. near Trenton, N.J. She earned her nickname by carrying water for her husband, John, and other soldiers in the battle of MONMOUTH (1778).

pitcher plant, any of several insectivorous plants with leaves adapted as "pitchers" for trapping insects. Lured by nectar and the plant's coloration, the insects drown in the rainwater solution contained in the pitcher and are digested by plant ENZYMES and, perhaps, BACTERIA. There are three families: the American family, Sarraceniaceae, including the common pitcher plant (*Sarracenia purpurea*), found in the bogs of E North America; the Old World tropical family, consisting of the genus *Nepenthes,* found chiefly in BORNEO; and the Australian pitcher plant (*Cephalotus follicularis*), the only species in its family.

Pithecanthropus: see HOMO ERECTUS.

Pitt, William, 1st **earl of Chatham,** 1708–78, British statesman. His criticism of the War of the AUSTRIAN SUCCESSION led to the downfall (1742) of Robert WALPOLE. By denouncing government policy in the SEVEN YEARS WAR, Pitt became head of a coalition government in 1757; his shrewd policy led to the defeat of the French in India and Canada. He formed another ministry in 1766, but mental illness forced him to retire (1768). During the AMERICAN REVOLUTION he urged conciliation, and then, breaking with the WHIGS, favored any settlement short of independence. He was known as the Great Commoner for his insistence on constitutional

rights. His son, **William Pitt,** 1759–1806, entered Parliament in 1781 and became prime minister in 1783 at age 24. He pursued liberal policies, including new taxes to cut the national debt, reforms in India and Canada, and parliamentary reform. His liberal policies ended with the FRENCH REVOLUTIONARY WARS. His military coalitions against France failed to achieve victory on land, and financial support for Britain's allies caused a monetary crisis. Pitt obtained (1800) the union of Great Britain and Ireland by bribery, but failed to win CATHOLIC EMANCIPATION and resigned in 1801. Recalled to office in 1804, he died soon after hearing of Napoleon's victory at AUSTERLITZ.

Pittsburgh, city (1990 pop. 369,879; met. area 2,056,705), seat of Allegheny co., SW Pa., at the meeting of the Allegheny and Monongahela rivers, which there form the Ohio R.; settled 1760, inc. 1816. One of the world's largest inland ports, it is a center for corporate headquarters, research, and commerce. Steel manufacturing is its major heavy industry; glass, machinery, chemicals, and petroleum products are also produced. Located on the site of the 18th-cent. Fort Duquesne (later Fort Pitt), the city is hilly, with diverse industrial and residential neighborhoods. Pittsburgh's huge and innovative urban renewal program, which produced the Gateway Center and other projects, began in 1950 and produced a construction boom in the 1980s. The city's educational and cultural institutions include the Univ. of Pittsburgh and the Carnegie Institute.

pituitary gland, small, oval endocrine gland (see ENDOCRINE SYSTEM) that lies at the base of the BRAIN. It is called the master gland because the other endocrine glands depend on its secretions for stimulation. The pituitary has two distinct lobes, anterior and posterior. The anterior lobe secretes at least six hormones: HUMAN GROWTH HORMONE, which stimulates overall body growth; ACTH (adrenocorticotropic hormone), which controls steroid hormone secretion by the adrenal cortex (see ADRENAL GLAND); thyrotropic hormone, which stimulates the activity of the THYROID GLAND; and three gonadotropic hormones, which control growth and reproductive activity of the gonads (ovaries and testes). The posterior lobe secretes antidiuretic hormone, which causes water retention by the kidneys, and oxytocin, which stimulates the MAMMARY GLANDS to release milk and also causes uterine contractions. An overactive pituitary during childhood can cause gigantism; during adulthood, it can cause acromegaly. DWARFISM results from pituitary deficiency in childhood.

pit viper, poisonous SNAKE of the family Crotalidae. Like the Old World true VIPERS, pit vipers have long, hollow, erectile fangs. In addition, they have special heat-receiving organs, or pits, that help them sense warm-blooded animals, an ability especially useful at night, when many of them hunt. Pit vipers include the RATTLESNAKE, COPPERHEAD, and WATER MOCCASIN.

Pius II, 1405–64, pope (1458–64), an Italian named Enea Silvio de' Piccolomini. He became (1439) secretary to Antipope Felix V (Amadeus VII of Savoy) and gained a reputation as a humanist scholar. He became a priest in 1446. As pope he issued (1460) a bull condemning the doctrine that ultimate authority in the church rested in the general councils rather than with the pope. He tried in vain to unite Christian rulers in Europe against the Turks and quarreled with LOUIS XI of France and the Bohemian king George of Podebrad. Among his literary works is an autobiography.

Pius V, Saint, 1504–72, pope (1566–72), an Italian named Michele Ghislieri, a Dominican. A leading figure in the Catholic Reformation (see REFORMATION, CATHOLIC), he put the decrees of the Council of TRENT into vigorous effect. He excommunicated Elizabeth I of England and united Spain and Venice against the Turks, thus helping to bring about the Christian victory at the battle of LEPANTO. Feast: Apr. 30.

Pius VII, 1740–1823, pope (1800–23), an Italian named Barnaba Chiaramonti. He and NAPOLEON I signed the CONCORDAT of 1801, but much of it was vitiated by Napoleon's Organic Articles, which Pius would not accept. In 1804, Napoleon made Pius come to Paris to consecrate him as emperor, and the French took Rome (1808) and the Papal States (1809). When Pius excommunicated the assailants of the Holy See, he was taken to France as a prisoner and forced to sign a new concordat. This humiliation Pius bore with stolid dignity. After Napoleon's downfall, Pius disavowed the enforced contract, recovered the Papal States at the Congress of VIENNA, and set about restoring the church. He reconstituted the JESUITS in 1814.

Pius IX, 1792–1878, pope (1846–78), an Italian named Giovanni M. Mastai-Ferretti. Driven from Rome by revolution in 1848, he returned (1850) and ruled with the aid of NAPOLEON III's troops. Opposed to the unification of Italy, he refused to deal with the Italians after they seized (1870) Rome. The resulting Roman Question was not resolved until the LATERAN TREATY of 1929. Pius also had difficulties in Germany with the Kulturkampf. In 1869 he convened the first VATICAN COUNCIL, which enunciated the doctrine of papal infallibility. His pontificate of 32 years was the longest in history.

Pius X, Saint, 1835–1914, pope (1903–14), an Italian named Guiseppe Sarto. In the decree *Lamentabili* (1907) and the encyclical *Pascendi* (1907), Pius condemned religious MODERNISM. He opposed anticlerical laws in France, set up commissions to recodify canon law and translate the Bible anew, and encouraged the use of PLAINSONG. Concerned with the poor, he was widely venerated during his life and afterward (1954) was canonized by Pius XII. Feast: Aug. 21.

Pius XI, 1857–1939, pope (1922–39), an Italian named Achille Ratti. Before his election he was a papal nuncio to Poland and archbishop of Milan. His papacy was marked by great diplomatic activity and many important statements. The LATERAN TREATY (1929) ended the quarrel between the church and the Italian state, but Pius expressed his strong disapproval of Fascist methods in a letter, *Non abbiamo bisogno* (1931). A concordat with Germany (1933) was flouted by the Nazis, and the pope in a powerful encyclical (*Mit brennender Sorge,* 1937) denounced the Nazi government. He also issued the statement *On Atheistic Communism.* He opposed nationalism, racism, and anti-Semitism. He criticized laissez-faire capitalism in the encyclical *Quadragesimo anno* (1931) and renewed the plea for social reform made 40 years before by Leo XIII. Pius called for greater lay participation in all things religious—this he called Catholic Action. He was also concerned with the rights of Eastern Catholics and native cultures. One of his chief assistants was Eugenio Pacelli (later PIUS XII).

Pius XII, 1876–1958, pope (1939–58), an Italian named Eugenio Pacelli. Appointed papal secretary of state in 1930 by PIUS XI, he gained great diplomatic experience and negotiated (1933) the concordat with Nazi Germany. As pope during World War II, he believed that the Vatican could best work to achieve peace by maintaining formal relations with all the belligerents. He tried to alleviate the suffering of prisoners of war and displaced persons, but was later much criticized for not speaking out against Nazi persecution of the Jews and for not doing enough to protect them in Italy. After the war, Pius asked Catholics to oppose communism and excommunicated (1949) Italian Catholics who joined the Communist party. In the papal bull *Munificentissimus Deus* (1950), he defined the dogma of the Assumption of the Virgin Mary. He also reformed (1956) the Holy Week liturgy, relaxed the rules for fasting, permitted evening Mass, and favored the appointment of native hierarchies in overseas dioceses.

Pizarro, Francisco, c.1476–1541, Spanish CONQUISTADOR, conqueror of PERU. The illegitimate son of a gentleman, he accompanied Ojeda to COLOMBIA in 1510 and was with BALBOA when he discovered the PACIFIC. In 1524, with Diego de Almagro, he began searching the coasts of Ecuador and Peru for the fabled INCA empire. In 1532 he met the Inca emperor Atahualpa. Professing friendship, he took the emperor prisoner, exacted ransom, and executed him. The conquest of Peru was complete with the capture of CUZCO, later successfully defended in a counterattack by MANCO CAPAC, the new Inca emperor. Pizarro founded Lima as Peru's capital. He sent Almagro to conquer CHILE, but cheated him of promised territory. Almagro rebelled, seized Cuzco, but was defeated and executed. Pizarro was later assassinated by Almagro's followers. Francisco's greed and ambition, extreme even in a conquistador, had offset his resourcefulness, courage, and cunning. His brother **Gonzalo Pizarro,** 1506–1548, was a lieutenant in the conquest. He aided in the defense of Cuzco (1536–37), conquered Bolivia, and fought against Almagro. Governor of Quito from 1539, he led a revolt against the liberalized laws of the Spanish viceroy and was executed. A half-brother, **Hernando Pizarro,** fl. 1530–60, fought in the conquest and defended Cuzco. He defeated and ex-

ecuted Almagro in 1538. Because of his standing at the Spanish court, he was sent to Spain to argue the Pizarros' cause, but was lightly imprisoned for 20 years. Another brother, **Juan Pizarro,** d. 1536, aided Francisco in the conquest of Peru. He fought in the defense of Cuzco against the forces of Manco Capac in 1536 and was killed leading an attack against the Inca fortress Sacsahuamán.

placebo, inert chemical substance used instead of a DRUG. Placebos contain no medicine, but many patients show medical improvement when given a placebo or an ineffective treatment, a result known as the *placebo effect.* Because of this, placebos are used as controls in drug testing to assure unbiased, reliable results. In double-blind studies, both patient and doctor do not know whether a placebo or drug is administered. A traditional placebo's lack of side effects, however, often identifies it, so an older drug is sometimes used in drug tests instead of or in addition to a placebo.

plague, a general term used for any contagious epidemic disease, but usually used to refer specifically to bubonic plague, or the Black Death, an acute infectious disease caused by the bacterium *Pasteurella pestis* (*Yersinia pestis*), transmitted to humans by fleas from infected rats. Symptoms include high fever; chills; prostration; enlarged, painful lymph nodes (buboes), particularly in the groin; and, in its black form, hemorrhages that turn black. Invasion of the lungs by the bacterium causes a rapidly fatal form of the disease (pneumonic plague), which can be transmitted from one person to another via droplets. Epidemics have occurred throughout history, the best known being the Black Death that swept Europe and parts of Asia in the 14th cent., killing as much as three quarters of the population in less than 20 years. The disease is still prevalent in some areas of the world, but such ANTIBIOTICS as tetracycline and streptomycin have greatly reduced the mortality rate.

Plain, the, in the FRENCH REVOLUTION, the independent members of the National Convention. The name was applied because they sat on the lower benches in contrast to the raised seats of the radical MOUNTAIN. The Plain was a leaderless mass, but it aided in the overthrow (1794) of Maximilien ROBESPIERRE.

Plains Indians: see NORTH AMERICA, INDIGENOUS PEOPLES OF.

plainsong or **plainchant,** all early unharmonized melody in free rhythm, but usually synonymous with Gregorian chant, the liturgical music of the ROMAN CATHOLIC CHURCH. Texts are taken from the MASS, the BIBLE, and hymns. Four main dialects of plainsong developed in the Western church: Ambrosian, Roman, Mozarabic, and Gallican. Gregorian chant derives originally from Jewish and Greek music, but is named after Pope GREGORY I, under whose reign church music was codified. In the Middle Ages polyphony largely supplanted plainsong, and distortions crept into its performance. In the 19th cent., the Benedictine monks of Solesmes, France, through years of research established the original form and rhythm of the chant. The tonality of Gregorian chant is based on the system of eight MODES; the system of neumes developed for chant notation (see MUSICAL NOTATION) is still used.

planarian, any of several groups of turbellarians—free-living, primarily carnivorous FLATWORMS—with a three-branched digestive cavity. Most are freshwater forms, but marine and terrestrial planarians exist. White, gray, brown, black, or sometimes transparent, planarians range in size from ⅛ to 1 in. (0.32 to 2.54 cm), although some tropical forms are as big as 2 ft (60 cm). Some species can regenerate severed parts of the body, in some cases even producing entire individuals from small pieces.

Planck, Max, 1858–1947, German physicist. From his hypothesis (1900) that atoms emit and absorb energy only in discrete bundles (quanta) instead of continuously, as assumed in classical physics, QUANTUM MECHANICS was developed. Planck received the 1918 Nobel Prize in physics for his work on BLACKBODY radiation. He was professor (1889–1928) at the Univ. of Berlin and president (1930–35) of the Kaiser Wilhelm Society for the Advancement of Science, Berlin. Planck's constant (see QUANTUM MECHANICS) is named for him.

plane, in mathematics, flat surface of infinite extent but no thickness. A plane is determined by (1) three points not in a straight line; (2) a straight line and a point not on the line; (3) two intersecting lines; or (4) two parallel lines.

planet, any of the nine relatively large, nonluminous bodies—MERCURY, VENUS, EARTH, MARS, JUPITER, SATURN, URANUS, NEPTUNE, and PLUTO—that revolve around the sun (see SOLAR SYSTEM). By extension, any similar body discovered revolving around another star would also be called a planet. The ASTEROIDS are sometimes called minor planets. The major planets are classified either as inferior, with an orbit between the sun and the orbit of the earth (Mercury and Venus), or as superior, with an orbit beyond that of the earth (Mars, Jupiter, Saturn, Uranus, Neptune, and Pluto). The terrestrial planets—Mercury, Venus, Earth, and Mars—resemble the earth in size, chemical composition, and density. The Jovian planets—Jupiter, Saturn, Uranus, and Neptune—are much larger in size and have thick, gaseous atmospheres (much thicker in the cases of Jupiter and Saturn) and lower densities. Pluto is unclassified. The rapid rotation of the latter planets results in polar flattening of 2–10%, giving them an elliptical appearance. In 1992 radio astronomers reported evidence that strongly suggested the existence of two to three planets orbiting a PULSAR in the Milky Way about 1300 light-years from earth.

planetarium, optical device used to project a representation of the heavens onto a domed ceiling; the term also designates the building that houses such a device. As the axis of the device moves, beams of light are emitted through lenses and travel in predetermined paths on the ceiling. The juxtaposition of lights reproduces a panorama of the sky at a particular time as it might be seen under optimum conditions. The motions of the celestial bodies—typically the fixed stars, the sun, moon, and planets, and various nebulae—are accurately represented, although they can be compressed into much shorter time periods.

planetoid: see ASTEROID.

plane tree, sycamore, or **buttonwood,** deciduous tree (genus *Platanus*) indigenous to northern temperate regions. The dry, seedlike fruits are compressed into a hard, brown ball, which, when ripe, separates into windborne, downy tufts. The genus includes the American sycamore (*P. occidentalis*) and the Oriental plane (*P. orientalis*), both used for their wood. The London plane (*P. acerifolia*) is much used as an ornamental shade tree in cities.

plankton, very small to microscopic plants and animals that have little or no power of locomotion and drift or float in surface waters. Plankton is found worldwide in fresh and salt water. The plant forms include DIATOMS and dinoflagellates (see PYRROPHYTE); planktonic animals include PROTOZOANS, small CRUSTACEANS, JELLYFISH, COMB JELLIES, and FISH eggs and larvae. In the ocean, plankton is the source of food, either directly or indirectly through the food chain, for all marine animals.

Plano, city (1990 pop. 128,713), Collin co., N Texas, c.20 mi (32 km) NE of Dallas; inc. 1873. Spurred by the burgeoning Dallas–Fort Worth area, it is a booming financial and commercial center with many office complexes and housing developments. Manufactures include compact discs, plastics, metal products, and satellite communications equipment.

plant, an organism of the plant kingdom (Plantae). Plants comprise the three divisions of bryophytes (mosses, liverworts, and hornworts) and nine divisions of vascular plants (horsetails, ferns, conifers, flowering plants, etc.). All plants are multicellular and have cells with cell walls, nuclei, and vacuoles. They are usually anchored in one place and grow continually, having no maximum size. They manufacture their own food and give off oxygen in the process of PHOTOSYNTHESIS, thus representing the primary source of food for animals and providing oxygen for the earth's atmosphere. Although traditionally contrasted with animals, plants are now usually considered to be one of at least five kingdoms of living things (see CLASSIFICATION).The scientific study of plants is BOTANY.

plantain, annual or perennial weed (genus *Plantago*), of wide distribution. Many species are lawn pests, and the pollen is often a hay fever irritant. *P. psyllium,* or fleawort, is cultivated in Spain and France for its mucilaginous seed coats, which are used as a laxative. A tropical plant related to the BANANA is also called plantain.

plant louse: see APHID.

Planudes Maximus or **Maximus Planudes,** c.1260–c.1330, Byzantine monk and classical scholar whose edition of the GREEK ANTHOLOGY was standard until the 17th cent. His prose version of AESOP's fables is outstanding.

plasma, in physics, a fully ionized gas containing approximately equal numbers of positive and negative IONS. A plasma is an elec-

The key to pronunciation appears on page xiii.

MAJOR PLANETS OF THE SOLAR SYSTEM

Planet	*Distance from the sun (AU)**	*Period of revolution*	*Period of rotation*	*Mass (earth = 1)*	*Diameter (earth = 1)*	*Known satellite*
Mercury	0.39	88 days	59 days	0.06	0.38	0
Venus	0.72	225 days	243 days	0.82	0.95	0
Earth	1	365 days	24 hours	1	1	1
Mars	1.52	687 days	25 hours	0.11	0.53	2
Jupiter	5.20	12 years	10 hours	317.89	11.19	16
Saturn	9.54	29 years	10 hours	95.15	9.44	18
Uranus	19.18	84 years	16 hours	14.54	4.10	15
Neptune	30.06	165 years	18 hours	17.23	3.88	8
Pluto	39.44	248 years	6.4 days	0.002?	0.18	1

* AU = Astronomical Unit (Earth = 1)

tric conductor and is affected by magnetic fields. The study of plasmas, called plasma physics, is important in efforts to produce a controlled fusion reaction (see NUCLEAR ENERGY; NUCLEAR REACTOR). In nature, plasmas are thought to occur in the interior of stars and in interstellar gas, making plasma a form of matter in the universe (see STATES OF MATTER).

plasmapheresis, procedure in which plasma (the liquid portion of the blood) is separated from donated blood, the blood cells being returned to the donor. In some diseases, such as MYASTHENIA GRAVIS, plasmapheresis is used to attempt to remove the disease-causing substances from the blood.

plaster of Paris: see GYPSUM.

plastic, any synthetic organic material that can be molded under heat and pressure into a shape that is retained after the heat and pressures are removed. There are two basic types of plastic: THERMOSET, which cannot be resoftened after being subjected to heat and pressures; and THERMOPLASTIC, which can be repeatedly softened and reshaped by heat and pressure. Plastics are made up chiefly of a binder consisting of long chainlike molecules called POLYMERS. Binders can be natural materials, e.g., CELLULOSE, or (more commonly) synthetic RESINS, e.g., BAKELITE. The permanence of thermosetting plastics is due to the heat- and pressure-induced cross-linking reactions the polymers undergo. Thermoplastics can be reshaped because their linear or branched polymers can slide past one another when heat and pressure are applied. Adding plasticizers and fillers to the binder improves a wide range of properties, e.g., hardness, elasticity, and resistance to heat, cold, or acid. Adding pigments imparts color. Plastic products are commonly made from plastic powders. In compression molding, heat and pressure are applied directly to the powder in the mold cavity. Alternatively, the powder can be plasticized by outside heating and then poured into molds to harden (transfer molding); be dissolved in a heating chamber and then forced by a plunger into cold molds to set (injection molding); or be extruded through a die in continuous form to be cut into lengths or coiled (extrusion molding). The first important plastic, CELLULOID, has been largely replaced by a wide variety of plastics known by such trade names as Plexiglas, Lucite, Polaroid, and CELLOPHANE. New uses continue to be found and include contact lenses, machine gears, nonmoving engine parts, and artificial body parts. The widespread use of plastics has led to environmental problems. Because plastic products do not decay, large amounts accumulate as waste. Disposal is difficult because they melt when burned, clogging incinerators and often emitting harmful fumes, e.g., the hydrogen chloride gas given off by POLYVINYL CHLORIDE, and because many products into which they are made, such as plastic bottles, do not compact as readily in landfills. However, recycling is increasingly emerging as an alternative to disposal, particularly in communities with limited landfill capacity. See also POLYPROPYLENE; POLYURETHANES; TEFLON.

plastic surgery, surgical repair of congenital or acquired deformities and reconstruction of tissue disfigured by accidents such as severe burns or by removal of extensive cancers. It is also used to restore vital movement and function of destroyed tissues. The technique was first developed after World War I and is now also used for cosmetic purposes, e.g., to reshape a nose or remove sagging skin from around the eyes. Techniques include skin grafts, transplantation of bone or ligament from other parts of the body, and implants of various kinds. Modern plastic surgeons often employ CAT SCANS to produce computer-generated images that are used to plan or simulate complex reconstructive surgeries.

Plata, Río de la, estuary, c.170 mi (270 km) long and up to 120 mi (190 km) wide, in SE South America, between Uruguay and Argentina. It is formed by the PARANÁ and Uruguay rivers and is part of a major system of inland navigation. Two national capitals, BUENOS AIRES and MONTEVIDEO, are on the estuary.

plateau, elevated, more or less level portion of the earth's surface bounded on at least one side by steep slopes. Plateaus are formed by successive lava flows, upward-folding earth movements, or the erosion of adjacent lands. Notable plateaus include the COLORADO and COLUMBIA PLATEAUS in the U.S. and the DECCAN in India.

Plateau Indians: see NORTH AMERICA, INDIGENOUS PEOPLES OF.

plate tectonics, modern theory of CONTINENTAL DRIFT that has revolutionized geologists' understanding of EARTH history. It holds that the earth's crust is divided into contiguous, moving plates that carry the embedded CONTINENTS. Plate boundaries are marked by lines of EARTHQUAKE and volcanic activity (see VOLCANO). One kind of boundary is at the mid-ocean ridges, where tensional forces open rifts, allowing new crustal material to well up from the earth's mantle and become welded to the trailing edges of the plates (see OCEAN). When a continent straddles such a rift it is split apart, forming a new ocean area (e.g., the RED SEA and the Gulf of California). The ocean trenches mark subduction zones, where plate edges dive steeply into the mantle and are reabsorbed. A third boundary type occurs where two plates slide past each other in a shearing manner along great transform FAULTS (e.g., the SAN ANDREAS FAULT in California). MOUNTAIN ranges form where two plates carrying continents collide (e.g., the HIMALAYAS), or where ocean crust is subducted along a continental margin (e.g., the ANDES). Geologists believe that c.200 million years ago there was a supercontinent, Pangaea, which subsequent plate movements have split and resplit into the continents and islands we recognize today.

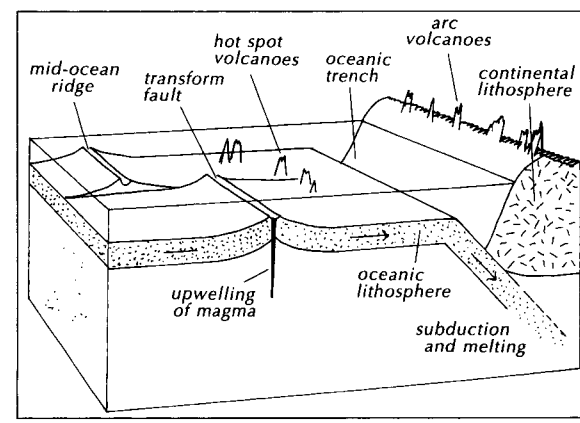


Plate tectonics: Schematic model of the oceanic crust, showing the three types of plat boundaries

Cross-references are indicated by SMALL CAPS.

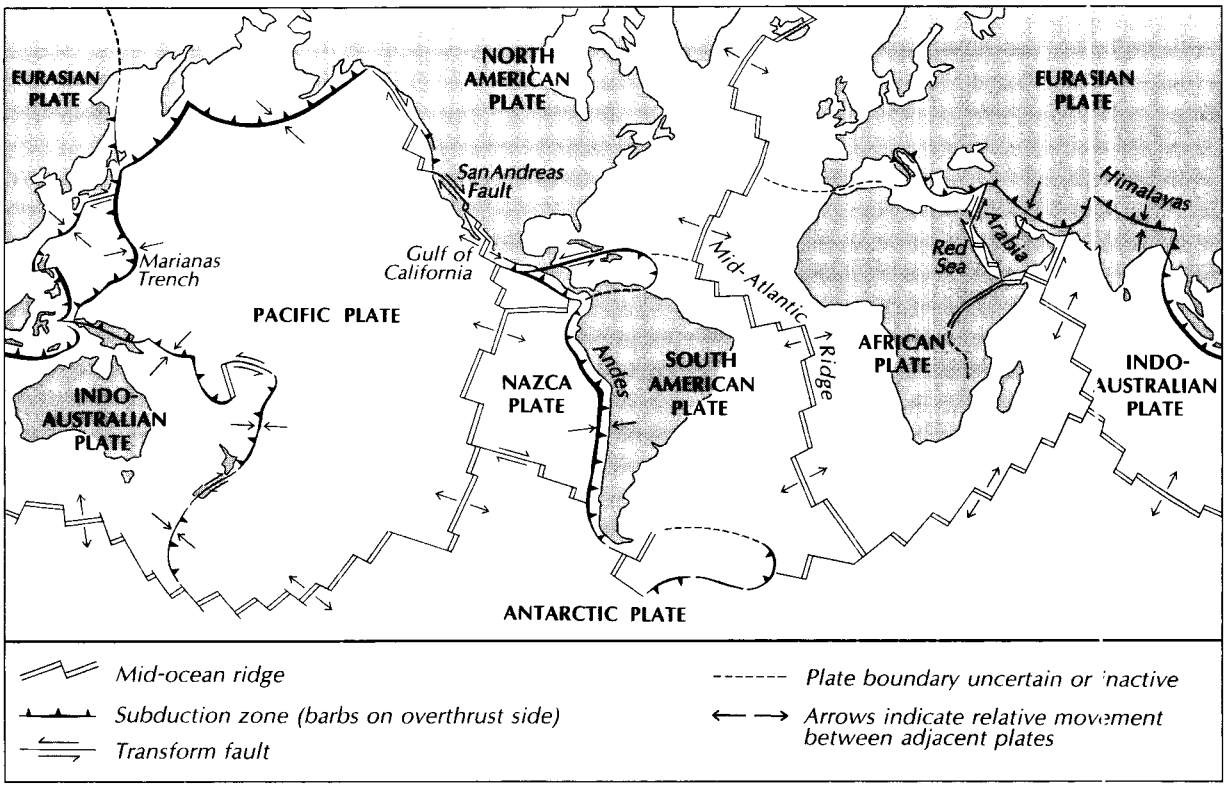

Plate tectonics: Map of the world showing major plates and plate boundaries

Radar mapping of Venus has revealed some apparent effects of subduction on that planet's surface.

Plath, Sylvia, 1932–63, American poet; b. Boston. Her finely crafted, intensely personal poems, known for their sharp, often violent imagery, appear in such volumes as *The Colossus* (1960), *Ariel* (1965), and *Collected Poems* (1981). She also wrote an autobiographical novel, *The Bell Jar* (1962, England; 1971, U.S.). Plath committed suicide in London.

platinum (Pt), metallic element, known in natural alloy form since antiquity. It is a malleable, ductile, lustrous, silver-white, chemically inactive metal. Platinum and its alloys are used in surgical tools, laboratory utensils, electrical-resistance wires, contact points, standard masses, jewelry, dentistry, and very powerful magnets. Platinum is used as a CATALYST in automobile catalytic converters and in many commercial processes. See ELEMENT (table); PERIODIC TABLE.

Plato, 427?–347 B.C., Greek philosopher. In 407 B.C. he became a pupil and friend of SOCRATES. After living for a time at the Syracuse court, Plato founded (c.387 B.C.) near Athens the most influential school of the ancient world, the Academy, where he taught until his death. His most famous pupil there was ARISTOTLE. Plato's extant work is in the form of epistles and dialogues, divided according to the probable order of composition. The early, or Socratic, dialogues, e.g., the *Apology, Meno,* and *Gorgias,* present Socrates in conversations that illustrate his major ideas—the unity of virtue and knowledge and of virtue and happiness. They also contain Plato's moving account of the last days and death of Socrates. Plato's goal in dialogues of the middle years, e.g., the *Republic, Phaedo, Symposium,* and *Timaeus,* was to show the rational relationship between the soul, the state, and the cosmos. The later dialogues, e.g., the *Laws* and *Parmenides,* contain treatises on law, mathematics, technical philosophic problems, and natural science. Plato regarded the rational soul as immortal, and he believed in a world soul and a Demiurge, the creator of the physical world. He argued for the independent reality of Ideas, or Forms, as the immutable archetypes of all temporal phenomena and as the only guarantee of ethical standards and of objective scientific knowledge. Virtue consists in the harmony of the human soul with the universe of Ideas, which assure order, intelligence, and pattern to a world in constant flux. Supreme among them is the Idea of the Good, analogous to the sun in the physical world. Only the philosopher, who understands the harmony of all parts of the universe with the Idea of the Good, is capable of ruling the just state. In Plato's various dialogues he touched upon virtually every problem that has occupied subsequent philosophers; his teachings have been among the most influential in the history of Western civilization, and his works are counted among the world's finest literature. See also NEOPLATONISM.

Platt Amendment, a rider attached to the Army Appropriations bill of 1901. It stipulated the conditions for U.S. intervention in CUBA that virtually made the island a U.S. protectorate. Proposed by Sen. Orville H. Platt of Connecticut, it was part of a Cuban-U.S. treaty until abrogated in 1934. Under its terms the U.S. established—and has retained—a naval base on Guantánamo Bay.

Plattdeutsch [plät'doich], Low German, spoken mainly in N Germany, a region of lowlands. See LANGUAGE (table).

platypus, semiaquatic egg-laying MAMMAL, or MONOTREME (*Ornithorhynchus anatinus*), of TASMANIA and E Australia. Also called duckbill, it has a rubbery, duckbill-shaped muzzle, no teeth, and no external ears. Its head, body, and tail are broad, flat, and covered with dark-brown fur; its feet are webbed. The adult male is about 2 ft (60 cm) long. The platypus eats small freshwater animals, which it hunts with the aid of electroreceptors on its bill, and lives in burrows along stream banks.

Plautus (Titus Maccius Plautus), c.254–184 B.C., Roman comic poet. His plays, adapted from Greek New COMEDY, are popular and vigorous representations of middle-class and lower-class life. Writing in idiomatic Latin and with a genius for situation and coarse humor, Plautus is famous for his stock comic figures, e.g., the knavish, resourceful slave or the braggart soldier. His works were freely adapted by JONSON, SHAKESPEARE, MOLIÈRE, and others.

player piano: see PIANO.

Plaza Lasso, Galo [plä'sä lä'sō], 1906–87, president of ECUADOR (1948–52). An experienced diplomat and liberal democrat, he per-

mitted unprecedented political freedoms and brought a measure of economic prosperity to the country. He later served as a UN mediator.

plebeians: see PLEBS.

plebs or **plebeians** [Lat., *plebs* = people], general body of Roman citizens, as distinct from the PATRICIAN class. They lacked, at first, most of the patrician rights, but gradually achieved political equality by 300 B.C.

Pleiad [from Pleiades], group of seven tragic poets of ALEXANDRIA who flourished c.280 B.C. Only the work of Lycophron survives. A group of seven 16th-cent. French poets took the name **Pléiade.** They included Pierre de RONSARD (the leader) and Joachim DU BELLAY. Their purpose was to encourage the writing of French as against Latin so as to establish a vigorous literary language. They cultivated the use of classical and Italian forms, e.g., the SONNET.

Pleiades, a galactic cluster (see STAR CLUSTER) in the constellation Taurus.

Pleiades, in Greek mythology, seven daughters of ATLAS, attendants of ARTEMIS. Pursued by ORION, they were turned into stars.

Pleistocene epoch: see GEOLOGIC ERA (table).

Plekhanov, Georgi Valentinovich, 1857–1918, Russian revolutionary and social philosopher, often called the father of Russian Marxism. Opposed to political terror, he broke (1879) with the populist movement and left Russia (1880). Turning to MARXISM, he helped to found the group that became the Russian Social Democratic Labor party and with V.I. LENIN, published the newspaper *Iskra* [spark]. His view that socialist revolution could not occur in Russia until CAPITALISM and industrialization developed further became the basis for the anti-Leninist Menshevik position after the party split (1903) into BOLSHEVISM AND MENSHEVISM. After the Feb. 1917 RUSSIAN REVOLUTION he returned from exile and opposed the Bolsheviks; after their victory he retired from political life. Among his works are *Socialism and Anarchism* (tr. 1895) and *Fundamental Problems of Marxism* (tr. 1929).

Plessy v. Ferguson, case decided in 1896 by the U.S. SUPREME COURT, upholding Louisiana's right to segregate racially "separate but equal" railway carriages. The Court held that the 14th amendment to the U.S. CONSTITUTION mandated political but not social equality. The decision led to comprehensive Southern segregation laws, maintained until BROWN V. BOARD OF EDUCATION (1954).

pleurisy, inflammation of the pleura, the membrane that covers the LUNGS and lines the chest cavity. It is sometimes accompanied by fluid (effusion) that fills the chest cavity; when the fluid is infected, the condition is known as empyema. Dry pleurisy usually occurs with bacterial infections, whereas pleurisy with effusion is associated with chronic lung conditions, such as TUBERCULOSIS. Treatment is directed at the underlying cause.

Pliny the Elder, A.D. c.23–A.D. 79, Roman naturalist; b. Cisalpine Gaul. His one surviving work, *Historia naturalis,* consists of 37 books that deal with the nature of the physical universe, geography, anthropology, zoology, botany, and mineralogy. Although impressive in scope, this encyclopedic work, mostly secondhand information, is useless as science. His nephew, **Pliny the Younger,** 62?–c.113, was an orator and statesman who is remembered for his letters, which are an excellent mirror of Roman life.

Pliocene epoch: see GEOLOGIC ERA (table).

PLO: see PALESTINE LIBERATION ORGANIZATION.

PL/1: see PROGRAMMING LANGUAGE.

Plotinus, 205–270, Hellenistic philosopher, founder of NEOPLATONISM; b. Egypt. He went to Alexandria c.232 to devote himself to philosophy. After 244 he lived in Rome, where his school gained a wide following. In addition to Plato, Plotinus drew on other Greek philosophers, and on Zoroastrianism and possibly Hinduism. He explained the deity by developing the idea of emanation, and his teachings are infused with MYSTICISM. Although he rejected Christianity, Plotinus' influence on the early Christian thinkers, particularly St. AUGUSTINE, was profound. Plotinus' writings were collected by his pupil Porphyry under the title *The Enneads.*

Plovdiv, city (1989 est. pop. 375,000), S central Bulgaria, on the Maritsa R. Bulgaria's second largest city, it is the chief market for a fertile area and has such industries as lead and zinc smelting, textiles, and food processing. Built by the Thracians, it was held (4th cent. B.C.–8th cent. A.D.) by Macedon, Rome, and Byzantium. It fell to Turkey c.1360 and passed to Russia in 1877. In 1885 it became part of Bulgaria. It has several Bulgarian Orthodox churches and Turkish mosques.

plover, common name for some shore BIRDS of the family Charadriidae, small to medium in size, found worldwide in ice-free lands. Plovers are wading birds with markings of black or brown above and white below. The best-known plovers in America are the noisy killdeer (*Charadrius vociferus*), found in pasturelands, the black-bellied (*Squatarola squatarola*) and golden (*Pluvialis dominica*) plovers, which migrate as far as 2,000 mi (3,220 km) annually, and the piping plover (*Charadrius melodus*), which is endangered along the Atlantic coast.

plum, name for many species of trees (genus *Prunus*) of the ROSE family, and their fruits. Numerous varieties and hybrids exist. The name *damson* is applied to several varieties of the common garden plum (*P. domestica*) having small leaves and small, oval, usually tart fruits. Greengage and prune plums are also varieties of *P. domestica.* Many varieties are used as ornamentals; these usually have red or purple foliage and double pink, white, or lilac flowers. Prunes are dried plums.

plumbago: see GRAPHITE.

Plutarch, A.D. 46?–c.120, Greek essayist and biographer. After traveling widely, he settled as a priest in his native BOEOTIA. His great work is *The Parallel Lives,* paired biographies of Greeks and Romans. Sir Thomas North's translation (1579) profoundly affected English literature, e.g., supplying the material for Shakespeare's *Julius Caesar* and *Antony and Cleopatra.* Plutarch's pride in Greece does not prejudice his treatment of Roman subjects. Concerned primarily with character and morality, he employed anecdotal material.

Pluto, in astronomy, 9th and usually most distant PLANET from the sun, at a mean distance of 3.67 billion mi (5.90 billion km). Because of the high eccentricity (0.250) of its elliptical orbit, Pluto occasionally (e.g., between 1978 and 2000) comes closer than the planet NEPTUNE to the sun. Discovered in 1930 by Clyde Tombaugh, Pluto has a diameter of c.1,400 mi (2,300 km). Its surface consists largely of frozen nitrogen. It is thought to have a rocky, silicate core; its thin atmosphere contains methane. Pluto forms a double planet system with its one known satellite, **Charon,** which has a diameter about half of Pluto's. Charon was discovered by James Christy in 1978.

Pluto, in Greek religion, god of the underworld, son of CRONUS and RHEA; also called HADES and, by the Romans, Dis. He ruled Hades with his wife, PERSEPHONE.

plutonium (Pu), radioactive element, first produced artificially by Glenn SEABORG and colleagues in 1940 by deuteron bombardment of uranium oxide. It is a silver-gray TRANSURANIUM ELEMENT in the ACTINIDE SERIES and is found in very small quantities in nature in association with uranium ores. Plutonium is a fission fuel for NUCLEAR REACTORS and weapons (see ATOMIC BOMB; NUCLEAR ENERGY). It is an extremely dangerous poison, collecting in bones and altering the production of white blood cells. See ELEMENT (table); PERIODIC TABLE.

Plymouth, city (1991 pop. 243,373), Devon, SW England, on Plymouth Sound. The Three Towns that Plymouth has comprised since 1914 are Plymouth, Stonehouse, and Devonport. Plymouth is an important port and naval base. It was the last port touched by the MAYFLOWER before its voyage to America in 1620.

Plymouth, town (1990 pop. 45,608), seat of Plymouth co., SE Mass., on Plymouth Bay; founded 1620. Plymouth is the oldest settlement in New England and a major tourist attraction. It has light industries but is primarily known for its historical sights, including Plymouth Rock, near which is moored the replica *Mayflower II;* several 17th-cent. houses; and the Plimoth Plantation re-creation of the settlement.

Plymouth Colony, settled by the PILGRIMS in MASSACHUSETTS in 1620. The settlers had difficulty surviving early hardships, although a treaty with neighboring tribes assured peace for 50 years. Under the MAYFLOWER COMPACT the colony developed into a quasi-theocracy, ruled by a governor (see BRADFORD, WILLIAM) and a council; a representative body, the General Court, was introduced in 1638. The colony expanded to include 10 towns and in 1643 joined the New England Confederation, which gave it critical aid

during KING PHILIP'S WAR (1675–76). Plymouth Colony was incorporated into the royal colony of Massachusetts in 1691.

Pm, chemical symbol of the element PROMETHIUM.

pneumoconiosis, any of a group of chronic LUNG diseases caused by the inhalation of dust particles. Commonly known as black lung and primarily found among coal miners, sandblasters, and metal grinders, it may be caused by the inhalation of SILICA (silicosis), ASBESTOS (asbestosis), IRON filings (siderosis), COAL dust, or other mineral or metal dust. Particles collect in the lungs and become sites for the development of fibrous tissue that replaces elastic lung tissue, often resulting in decreased lung function. Symptoms include shortness of breath, wheezing, cough, and susceptibility to PNEUMONIA, TUBERCULOSIS, and other respiratory infections. See also OCCUPATIONAL DISEASE.

pneumonia, acute infection of one or both lungs that can be caused by a bacterium, usually the pneumococcus bacterium, virus, fungus, or other organism. Symptoms include high fever, pain in the chest, difficulty in breathing, coughing, and sputum. Viral pneumonia is generally milder than the bacterial form. *Pneumocystis carinii* pneumonia, which is caused by a parasitic protozoan, generally only occurs in patients whose immune system is suppressed, as in AIDS or LEUKEMIA. ANTIBIOTICS are used to treat bacterial pneumonia and have greatly reduced the mortality rate of the disease.

Po, chemical symbol of the element POLONIUM.

Pocahontas, c.1595–1617, daughter of Chief Powhatan of the POWHATAN CONFEDERACY of Virginia. She is said to have saved the life of Capt. John SMITH as Powhatan was about to execute him. Later, held hostage at Jamestown for the return of her father's English prisoners, she became a Christian and married (1614) a settler, John ROLFE. The union brought peace for eight years. Rolfe took her to England (1616), where she was received as a princess. She died during the trip home and was buried at Gravesend, England.

Pocatello, city (1990 pop. 46,080), seat of Bannock co., SE Idaho, on Portneuf R. near its junction with the Snake R.; inc. 1889. A railroad center since 1882, it is a shipping and processing point for a livestock and farm area; it has phosphate mining and other industries, and a sizable tourist trade. Idaho State Univ. is located there.

Po Chü-i [bô jü-ē], 772–846, Chinese poet. A prolific author, he wrote in simple, clear language. "Everlasting Wrong" (806), his most noted poem, recounts the sufferings of Emperor Ming Huang (685–762) and Yang Kuei-fei, his ill-fated concubine.

pocket gopher: see GOPHER.

Podgorny, Nikolai Viktorovich, 1903–83, Soviet political leader. He was chairman of the Ukrainian Communist party (1957–63) and became (1960) a full member of the Presidium. Although he was elected chairman (1965–77) of the Presidium after KHRUSHCHEV's fall, he was later removed from the the body and demoted (1977) to deputy of the Supreme Soviet.

Podhoretz, Norman, 1930–, American editor and essayist; b. Brooklyn, N.Y. As chief editor (1960–) of *Commentary,* he turned the Jewish monthly into an influential forum of social criticism. He has written two memoirs, *Making It* (1967), which traces his rise to power among New York intellectuals, and *Breaking Ranks* (1979), which explains his switch from liberalism to neoconservatism.

podiatry, science concerned with disorders, diseases, and deformities of the feet. Podiatrists treat such common conditions as bunions, corns and calluses, and ingrown toenails; perform minor surgery; and prescribe medicines and orthopedic devices. A practitioner in the U.S. must be licensed; training is similar to that for medicine in most respects, except that it is largely limited to a single area of the body.

Poe, Edgar Allan, 1809–49, one of the most brilliant and original writers in American literature; b. Boston. Orphaned in 1811, he was raised by Mr. and Mrs. John Allan of Richmond, Va. He attended the Univ. of Virginia and West Point briefly but was forced to leave both because of infractions. After publishing three volumes of poems (1827, 1829, 1831) Poe was an editor, critic, and short-story writer for magazines and newspapers in Richmond, Philadelphia, and New York City. His compelling short stories, such as "The Masque of the Red Death" and "The Fall of the House of Usher," create a universe that is beautiful and grotesque, real and fantastic. Poe is also considered the father of the modern detective story, e.g., "The Murders in the Rue Morgue" (1841). His poems (including "The Bells," "The Raven," and "Annabel Lee") are rich with musical phrases and sensuous images. Poe was an intelligent and witty critic who often theorized about the art of writing, as in his essay "The Poetic Principle." His most important works include *The Narrative of Arthur Gordon Pym* (1838), *Tales of the Grotesque and Arabesque* (1840), and *The Raven and Other Poems* (1845). A complex, tormented figure, Poe died of alcoholism.

poet laureate, British title conferred by the crown on a poet whose duty it is to write commemorative verse. It is an outgrowth of medieval custom and later royal patronage of poets; the modern laureateship is usually a lifetime appointment. Ben JONSON had what amounted to a laureateship, but DRYDEN, in 1670, was the first given the title. Among later laureates have been WORDSWORTH (1843–50), TENNYSON (1850–92), John MASEFIELD (1930–67), John BETJEMAN (1972–84), and Ted HUGHES (1984–). In 1985 the U.S. Congress established an American poet laureateship, elevating what had previously been the position of poetry consultant to the Library of Congress. The U.S. post is awarded yearly by the librarian of Congress, but a poet may hold it for a series of years. The American poet laureate is not obligated to write any verse. The first U.S. poet laureate was Robert Penn WARREN (1986–87); Mona Van Duyn, the current U.S. poet laureate, was appointed in 1992.

poetry. For LYRIC poetry, see BALLAD; ELEGY; ODE; PASTORAL; SONNET. For narrative poetry, see EPIC; ROMANCE. Dramatic poetry is treated incidentally in the article TRAGEDY. See also technical discussions of FREE VERSE; PENTAMETER; RHYME.

Poggio Bracciolini, Gian Francesco [pôd'jō brät'chōlē'nē], 1380–1459, Italian humanist. Chancellor and historiographer of the republic of Florence, he rediscovered many classical works, e.g., LUCRETIUS' *On the Nature of Things.* His *Facetiae* (1474) is a collection of earthy fables and anticlerical satires.

pogrom, violent government-condoned attacks perpetrated against Russian Jews between 1881 and the RUSSIAN REVOLUTION. Backed by official ANTI-SEMITISM, they stimulated large-scale Jewish emigration to the U.S. Pogroms also existed in Germany and Poland under HITLER.

Poincaré, (Jules) Henri [pwăNkărā'], 1854–1912, French mathematician, physicist, and author; cousin of Raymond POINCARÉ. One of the greatest mathematicians of his age, Poincaré, by research in the theory of functions, enlarged the field of mathematical physics. He also did notable work in differential equations and celestial mechanics and wrote extensively on the philosophy of science.

Poincaré, Raymond, 1860–1934, French statesman; cousin of Jules POINCARÉ. He served as president (1913–20) and premier (1912–13, 1922–23, 1926–29). A conservative and a nationalist, he called for harsh punishment of Germany after World War I and sent (1923) French troops into the RUHR to force Germany to pay reparations. In 1928 he stabilized the franc.

poinsettia: see SPURGE.

Pointe-Noire [pwăNt-nwär], city (1984 pop. 294,203), chief seaport of Congo, on the Atlantic Ocean. Oil refining and offshore oil drilling are major industries; processed food and wood and aluminum products are manufactured. The city is also a sport-fishing center. Founded in 1883, Pointe-Noire became important after construction of the harbor and completion (1948) of the railroad to BRAZZAVILLE. It was (1950–58) the capital of the French Congo.

pointer, large SPORTING DOG; shoulder height, 23–26 in. (58.4–66.4 cm); weight, 50–60 lb (22.7–27.2 kg). Its short coat is usually white, with liver, black, yellow, or orange markings. Developed in England over 300 years ago, it hunts game birds by scent. It stands rigidly poised with its nose facing the game, directing the hunter to it.

pointillism: see POSTIMPRESSIONISM.

poison, any chemical that produces a harmful effect on a living organism. Almost any substance can act as a poison if it enters the body in sufficiently large quantities or in an abnormal way; e.g., water inhaled into the lungs becomes an asphyxial poison. The severity of a poison is determined by the nature of the poison itself,

the concentration and amount ingested, the route of entry, the length of exposure, and the age, size, and health of the victim. Common poisonous substances include ARSENIC, CYANIDE, STRYCHNINE, LEAD, MERCURY, acids, venoms, HERBICIDES, and CURARE and other drugs.

poison gas, any of various gases sometimes used in CHEMICAL WARFARE or riot control because of their poisonous or corrosive nature. These gases may be roughly grouped according to the portal of entry into the body and their physiological effects. Vesicants (blister gases, e.g., mustard gas and lewisite) produce blisters on all body surfaces; lacrimators (tear gas) cause severe eye irritation; sternutators (vomiting gases) cause nausea; nerve gases inhibit proper nerve function; and lung irritants cause pulmonary edema. World War I marked the first effective use of poison gas and the introduction of gas masks. The use of poison gas has been limited since World War I by fear of retribution, although the military powers have continued to develop new gases.

poison hemlock, lethally poisonous herb (*Conium maculatum*) of the CARROT family, native to the Old World but now naturalized in parts of the U.S. It has clusters of small white flowers and a purple-mottled stem. The poisonous principle (the ALKALOID coniine) causes paralysis, convulsions, and eventual death. The plant was used in ancient Greece to execute criminals; a famous example was SOCRATES.

poison sumac: see POISON IVY.

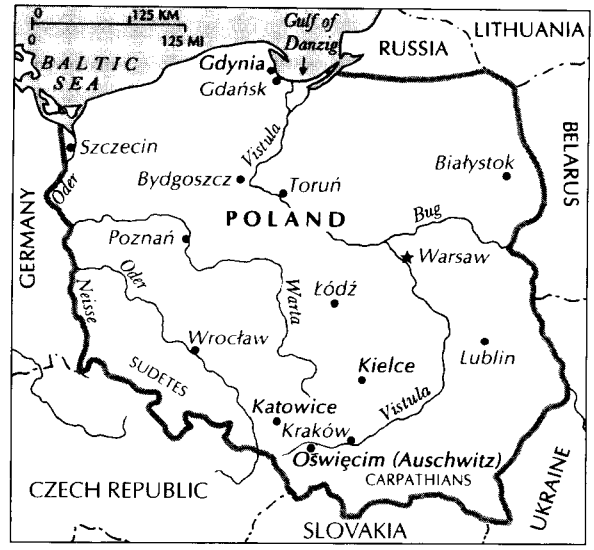
Poitier, Sidney, 1927–, African-American film actor and director; b. Miami, Fla. He has starred in such films as *The Defiant Ones* (1958); *Lilies of the Field* (1963; Academy Award); *In the Heat of the Night* (1967); *A Patch of Blue* (1973) and *A Piece of the Action* (1977), both of which he directed; and, for television, *Separate but Equal* (1992).

Poitiers, Diane de: see DIANE DE POITIERS.

Poitiers [pwätyā'], city (1990 pop. 82,507), capital of Vienne dept., W Central France. It is an industrial, agricultural, and communications center. Before Roman rule it was the capital of the Pictons, a Gallic people. Later, its Christian orthodoxy and its monasteries made it a religious center. The Visigoths, Franks, Muslims, Normans, and English held it or sacked it in turn. In 1356 EDWARD THE BLACK PRINCE defeated JOHN II of France there. Historic architecture includes Roman amphitheaters and churches, and homes dating from the 4th cent. to the Renaissance.

poker, card game, traditionally a cutthroat gambling game, now an internationally popular social game. It remains basically a gambling game played for either money or chips. During betting intervals, each player must fold (leave the game), call (equal the bet made), or raise (increase the bet made). All bets are placed together to form a pot. The game's object is to win the pot either by holding the best hand or by bluffing (inducing opponents to drop). The two basic forms are draw poker, in which all cards remain hidden, and stud poker, in which some are dealt face-up.

Poland, Pol. *Polska,* officially Republic of Poland, republic (1992 est. pop. 38,386,000), 120,725 sq mi (312,677 sq km), central Europe; bordered by Germany (W), the Baltic Sea and the Kaliningrad oblast of Russia (N), Lithuania (NE), Belarus and Ukraine (E), and the Czech Republic and Slovakia (S). Major cities include WARSAW (the capital), ŁÓDŹ, KRAKÓW, WROCŁAW, POZNAŃ, and GDAŃSK. The country is generally low-lying, except in the south, where the Sudeten and CARPATHIAN mountains form a natural barrier between Poland and the Czech Republic and Slovakia. Poland's main rivers, including the Vistula and the Oder, are important routes to the BALTIC SEA. Industry, which has expanded rapidly since World War II, contributes more than half of the gross domestic product. Leading manufactures include machinery, iron and steel, chemicals, textiles, and processed food. Agricultural products include rye, potatoes, sugar beets, and wheat. Poland is an important producer of coal, sulfur, and copper. Industry was largely controlled by the state, but steps toward privatization have been taken; most farms are privately run. Nearly all of the population is Polish, and Roman Catholicism is the dominant religion.



History. The Slavic groups that occupied the area of present-day Poland were first united under the Piast dynasty and Christianized in the 10th cent. The crown eventually passed to the Jagiello dynasty (r.1386–1572), under whom Poland enjoyed its golden age. The arts and sciences flourished, and a Polish-Lithuanian state, created in 1569, maintained an empire that reached from the Baltic to the Black Sea. In the 16th and 17th cent. much territory was lost to Sweden and Russia, and with the accession (1697) of the electors of Saxony as kings of Poland, national independence was virtually lost (see NORTHERN WAR; POLISH SUCCESSION, WAR OF THE). Three successive partitions (1772, 1793, 1795) among Prussia, Austria, and Russia resulted in the disappearance of Poland from the map of Europe. Polish nationalism persisted, and in 1918, following World War I, an independent Poland was proclaimed, with Joseph PILSUDSKI as chief of state. The Treaty of VERSAILLES (1919) redrew Poland's boundaries, but a dispute over the eastern border led to war with Russia (1920–21); the Treaty of Riga awarded Poland parts of its claims. A republican constitution was adopted in 1921, but in 1926 Pilsudski assumed dictatorial power, which passed to a military junta after his death (1935). On Sept. 1, 1939, citing as cause Poland's refusal to surrender the port of Gdańsk (Danzig), Germany invaded Poland, thus precipitating WORLD WAR II. On Sept. 17 Russia (then allied with Germany) invaded from the east, and the country was divided between Germany and Russia. When Germany attacked the USSR in 1941, all of Poland came under German rule. Massacres, starvation, and CONCENTRATION CAMPS such as that at Oświęcim (Auschwitz) decimated the population; about 6 million Poles, including some 3 million Jews, were killed. The Germans were expelled from Poland in 1945, and a provisional government was set up under Soviet auspices. Government-controlled elections in 1947 gave the Communists full control, and in 1952 Poland became a people's republic on the Soviet model. In 1956 widespread riots against Soviet control brought to power "rightist deviationist" Władysław Gomułka. A period of increased freedom followed, but by the 1960s Gomułka had reverted to the more rigid policies of his predecessors. Rapidly increasing food prices led to riots in 1970, and Gomułka was replaced by Edward Gierek, who instituted many reforms and controlled inflation. Poland's gravest postwar crisis began in 1980 (and removed Gierek from power), when strikes by factory workers, miners, and farmers spread throughout the country. An independent labor union, known as SOLIDARITY and led by Lech WALESA, demanded greater worker control in industry. The nation's economy deteriorated, bringing severe shortages of food and other goods. In 1981 Gen. Wojciech JARUZELSKI became premier. He imposed martial law, and Solidarity leaders were arrested. In 1982 Solidarity itself was banned. Martial law was ended in 1984, and all imprisoned Solidarity members released by 1986. In 1985 Jaruzelski became president. In 1989 the government agreed to legalize the union and reorganize the parliament and presidency. In limited free elections, Solidarity-supported candidates won (1989) nearly

all the seats they contested. The parliament narrowly reelected Jaruzelski president, and he offered the premiership to Tadeusz Mazowiecki of Solidarity. Mazowiecki initiated a transition to a free-market economy, which brought economic hardship and disruption. In 1990 Walesa became president, defeating Mazowiecki in a free election. In 1991 parliamentary elections gave 29 parties seats. Hanna Suchocka became Poland's first woman premier in 1992, but she lost a no-confidence vote the next year. In new elections the Democratic Left Alliance (former Communists) and Polish Peasant party (PPP) together won a majority, and Waldemar Pawlak, of the PPP, became (1993) premier.

Poland, Partitions of, three successive efforts (1772, 1793, 1795) by Austria, Russia, and Prussia to remove Poland from the map by dividing its territories among themselves. In 1772 large parts of the country were divided among FREDERICK II of Prussia, CATHERINE II of Russia, and MARIA THERESA of Austria. In 1793, after it had become apparent that the remaining portion of independent Poland was showing signs of regeneration, Russia and Prussia invaded the country and took more land. Only the central section of Poland remained independent, and the three powers took that in 1795. Poland's partition was confirmed by the Congress of VIENNA (1814–15), but Russia received a much larger share.

Polaris or **North Star,** star nearest the north celestial pole (see ASTRONOMICAL COORDINATE SYSTEMS). It is in the Little Dipper portion of the constellation Ursa Minor (see URSA MAJOR). Polaris's location less than 1° from the pole makes it a very important navigational star; it always marks due north from an observer. See PRECESSION OF THE EQUINOXES.

polarized light, light in which the vibration of the electric or magnetic field is confined to one plane. Ordinary light consists of a mixture of waves vibrating in all directions perpendicular to its line of propagation. Polarized light can be obtained to a varying extent (depending on the angle of incidence) by reflection. It can also be obtained by double refraction in certain crystals, such as calcite. These crystals have the property of refracting unpolarized light in two different directions, the ordinary ray and the extraordinary ray; both are polarized in directions perpendicular to each other.

Polaroid camera: see LAND, EDWIN HERBERT.

pole, magnetic: see MAGNETIC POLE.

police dog: see GERMAN SHEPHERD.

poliomyelitis or **polio,** acute viral infection that, in its severe form, invades the nervous system and causes paralysis. In its mild form the disease produces mild symptoms (e.g., low-grade fever, malaise), or none. Also known as infantile paralysis, it is found worldwide, occurring mainly in children. The SALK vaccine (injected killed-virus vaccine) and the SABIN vaccine (oral live-virus vaccine) have greatly reduced the incidence of polio, nearly eradicating it from developed nations. In 1985 the World Health Organization began an effort to eradicate polio worldwide by 2000. The last reported case of polio in the Americas was in 1991.

Polish Corridor, strip of German territory awarded to newly independent Poland by the Treaty of VERSAILLES in 1919, providing access to the Baltic Sea. Free German transit was permitted across the area, which separated EAST PRUSSIA from the rest of Germany. Disputes over the corridor and the adjacent free city of Danzig (see GDAŃSK) later led to the German invasion of Poland (1939) and WORLD WAR II.

Polish language, member of the West Slavic group of the Slavic subfamily of the Indo-European family of languages. See LANGUAGE (table).

Polish Succession, War of the, 1733–35, European conflict arising out of rival claims to the Polish throne. France supported STANISLAUS I, while the Holy Roman emperor and Russia supported AUGUSTUS III. In 1734 Stanislaus was forced to flee to France, but the war continued along the Rhine and in Italy. There Spain and Sardinia allied themselves with France, hoping to regain Italian territories then in the control of the emperor. The Treaty of Vienna (1735) called for a complicated dynastic reshuffling. Stanislaus (and France) got the duchies of Lorraine and Bar; Spain got Naples and Sicily; and the emperor retained Parma.

politburo, the central policy-making and governing body of the Communist party of the Soviet Union (1917–91) and of other Communist parties. The politburo of the USSR was ostensibly elected by the party's central committee to direct party affairs between central committee plenary sessions; in reality, it governed the country. Although its size varied, it consisted of 15 voting members and 5 to 8 nonvoting members. It was called the presidium from 1952 to 1966.

political action committee (PAC), American organization formed by a corporation, labor union, or association to raise money for political activity. Funds can be gathered by voluntary contributions from members, employees, or shareholders. Since the election reform of 1974, which limited individual campaign contributions and set guidelines for PACs, their number has grown to over 4,000. Many represent special interest groups, e.g., the National Rifle Association or United Auto Workers; others are large conservative or liberal coalitions. Most PACs have directed their contributions toward congressional elections, in which they can contribute $5,000 to a candidate for each campaign (primary, runoff, and general election). Some, however, have conducted independent negative campaigns against candidates they oppose.

political science, study of the processes, institutions, and activities of government. Although the study of politics dates back to ARISTOTLE and PLATO, political science only emerged as a separate discipline toward the end of the 19th cent. It includes the fields of political theory, national government, comparative government, and international relations.

Polk, James Knox, 1795–1849, 11th president of the U.S. (1845–49); b. Mecklenburg co., N.C. He practiced law in Columbia, Tenn., before serving in the state legislature (1823–25) and the U.S. House of Representatives (1825–39), where he was Speaker (from 1835) and a leading Jacksonian Democrat. He was elected (1839) governor of TENNESSEE but was defeated for reelection by the Whig candidate. When the 1844 Democratic convention became deadlocked, Polk, a "dark horse," was advanced as a compromise candidate for president and won nomination. He narrowly defeated Henry CLAY in the 1844 election. As president, Polk proved to be his own man, even ignoring former Pres. Andrew JACKSON's wishes on several matters. His promises to achieve "four great measures"—reduction of the tariff, reestablishment of an independent treasury, settlement of the Oregon boundary dispute, and acquisition of California—were kept. Despite the aggressive Democratic slogan of FIFTY-FOUR FORTY OR FIGHT, Polk resolved the dispute with Britain over OREGON by adopting the 49th parallel as the territory's northern boundary. His ordering U.S. troops to the Rio Grande brought about the MEXICAN WAR, which resulted in U.S. acquisition not only of California but of the entire Southwest. Few presidents have equaled Polk's record of attaining his stated aims. Hard work undermined his health, however, and he died a few months after leaving office.

poll, technique for determining popular attitudes or opinions on given questions. Preelection polling by U.S. newspapers dates from 1824, and polling at voting places to report election returns dates from 1883; magazines conducted national polls in the early 20th cent. A scientific method called sampling was developed in the 1930s. Using a small percentage of voters, a pollster could predict election outcomes more accurately than with the old straw-ballot technique. George GALLUP's correct prediction in the 1936 presidential election brought wide recognition of the sampling method. Polling technique has grown increasingly sophisticated and is an important part of social science methodology; it is also widely used in market research and in advertising. Poll results also now influence decisions by government officials. The creation of opinion by polling itself, the so-called bandwagon effect, has drawn criticism. Politicians and special-interest groups have sometimes attempted to use this effect to political advantage by asking deliberately slanted questions under the guise of a poll.

Pollaiuolo [pōl-läyōō-ô'lō], family of Florentine artists. **Jacopo Pollaiuolo** was a noted 15th-cent. goldsmith. His son and pupil, **Antonio Pollaiuolo,** 1429?–1498, goldsmith, painter, sculptor, and engraver, headed one of Florence's foremost workshops. He is said to have been the first artist to study anatomy by dissection. His mastery of figures in action can be seen in the painting *Dancing Nudes* (Arcetri, Italy) and in a painting and a bronze statuette of *Hercules and Antaeus* (both: Uffizi). In Rome he executed the bronze tomb of Sixtus IV. His brother, **Piero Pollaiuolo,** 1443–96,

The key to pronunciation appears on page xiii.

was associated with him. Piero is generally considered an inferior artist, as seen in his independent works, e.g., the *Virtues* (Uffizi). Their nephew **Simone del Pollaiuolo,** 1457–1508, nicknamed Il Cronaca, was an architect, responsible for the noble Strozzi palace. He also worked on the Great Hall of the Palazzo Vecchio (1495) and the Church of San Salvatore al Monte (1504).

pollen, minute, usually yellow grains, borne on the anther sac at the tip of the stamen (the male reproductive organ of the FLOWER) or in the male cone of a CONIFER. Pollen grains are the male GAMETOPHYTE generation of seed plants. They are formed by the division, or MEIOSIS, of pollen mother cells and contain half the number of chromosomes of the parent plant. See also POLLINATION.

pollination, transfer of POLLEN from the male reproductive organ (the stamen of a FLOWER or staminate cone of a CONIFER) to the female reproductive organ (pistil or pistillate cone) of the same or another flower or cone. The most common agents of pollination are flying insects (for most flowering plants) and wind (for most trees and all GRASSES and conifers). The devices that operate to ensure cross-pollination and prevent self-pollination are highly varied and intricate. They include different maturation times for the pollen and eggs of the same plant; separate staminate and pistillate flowers on the same or separate plants; chemical properties that make the pollen and eggs of the same plant sterile to each other; and special mechanisms and arrangements that prevent the pollinating agent from transferring a flower's pollen to its stigma. Pollination should not be confused with FERTILIZATION, which it may precede by some time—a full season in some conifers.

polliwog: see TADPOLE.

Pollock, Jackson, 1912–56, American painter, pioneer of ABSTRACT EXPRESSIONISM; b. Cody, Wyo. Influenced by PICASSO and also by SURREALISM in his attempt to express, rather than illustrate, feeling, Pollock developed an abstract art in which he vigorously drew or "dripped" complicated linear rhythms onto enormous canvases. His attack on the canvas and his devotion to the act of painting led to the term "action painting." His work is in important collections throughout the U.S.

poll tax, uniform tax levied on every adult in the community. Poll taxes are traceable to ancient tax systems and have long been criticized as an unfair burden on the poor. Historically, in the U.S., they were enacted in the South as a prerequisite for voting, disfranchising many African Americans and poor whites. The 24th amendment to the U.S. CONSTITUTION (1964) forbids a poll tax as a prerequisite for voting in federal elections, and in 1966 the Supreme Court extended the ruling to all elections.

pollution, contamination of the environment as a result of human activities. During the 20th cent. pollution problems have arisen in all industrialized areas as well as in various inland and coastal waters and stretches of ocean. The capacity of the BIOSPHERE to disperse, degrade, and assimilate human wastes is in question (see ECOLOGY). An early sign of environmental limits was the air pollution of the INDUSTRIAL REVOLUTION, brought on by the burning of coal to run mills and machinery. It was not until after World War II, however, that pollution came to be viewed by many as a threat to the health of the planet. By the 1960s, population increases, industrial expansion, and burgeoning truck and automobile use were producing wastes in such quantity that natural dispersing and recycling processes could not always keep pace. Exacerbating the problem was the appearance of synthetic substances that degrade extremely slowly or not at all: plastics, fibers, organic pesticides such as DDT, industrial chemicals such as PCBS (polychlorinated biphenyls), and the wastes from their manufacture. Thus, garbage and toxic chemicals polluted the land and infiltrated ground and surface waters. Pesticides have poisoned wildlife, and industrial waste products have contaminated drinking water and, in more severe cases, caused evacuation of homes (e.g., Love Canal area, Niagara Falls, N.Y., 1978). Effects of industrial wastes have spread over larger areas as well, e.g., when toxic MERCURY reached high concentrations in widely distributed species of food fish in the early 1970s. Airborne industrial wastes created ACID RAIN and, with automobile emissions, produced severe air-pollution problems, including SMOG, in many urban and suburban communities. The contribution of pollutants to global environmental problems, such as GLOBAL WARMING and depletion of the earth's OZONE LAYER, has prompted international meetings and agreements. Radioactive materials from the nuclear reactor accident at CHERNOBYL spread through E Europe and Scandinavia; lack of appropriate disposal facilities has led some countries to dump radioactive wastes in the oceans. Current evidence strongly implicates various pollutants in numerous human health problems, such as CANCER; BIRTH DEFECTS; genetic changes; chronic headaches, fatigue, and irritability; and digestive disorders. By the 1970s many organizations and governments were seeking means of controlling pollution (see ENVIRONMENTALISM). In the U.S., Congress established the Environmental Protection Agency and passed numerous laws for pollution control. WASTE DISPOSAL, long considered routine, has also become an increasingly complex science and a major industrial challenge. Waste disposal specialists seek solutions to the safe disposal of many hazardous substances, including highly toxic radioactive wastes. See also NOISE POLLUTION.

pollution allowance, government-issued permit to emit a certain amount of a pollutant; the holder of the permit may use it to pollute legally or may sell the permit for a profit. The allowance issued to a polluter is reduced over time as permitted levels of a pollutant are cut. By specifying reductions in emissions but leaving the polluter to decide how to cut them, the system is intended to provide incentives to lessen both pollution and compliance costs. A company that cuts its pollution below its permitted level may sell the surplus allowance; a company that exceeds its limits without purchasing an extra allowance is fined. Under the 1990 Clean Air Act, federal allowances for sulfur dioxide emissions are issued to polluters; additional allowances are auctioned.

Pollux, Greek hero: see CASTOR AND POLLUX.

Polo, Marco, 1254?–1324?, Venetian traveler in CHINA. He left Venice in 1271 with his father and uncle, who had previously journeyed as far east as Kaifeng, in China (1266). The party reached the court of KUBLAI KHAN, in Cambuluc (present-day BEIJING), in 1275. Marco Polo became the khan's favorite and served him in China, India, and SE Asia. He returned to Venice in 1295. His account of his travels has been of great value to historians.

polo, ball and goal game played on horseback. Outdoor polo is played by two teams of four on a grass field with goalposts at either end. An indoor match is played with teams of three. In both versions, play is directed toward striking a ball (wooden in outdoor polo, rubber in indoor) with a long, flexible mallet into the goal. Because of the frequent collisions between horses (called polo ponies), each player must change mounts several times during a match. The origin of polo is uncertain, but it was played by British officers in India in the 19th cent. and then spread to England and the U.S.

polonium (Po), radioactive element, discovered in PITCHBLENDE by Marie CURIE in 1898. Extremely rare, it has 34 isotopes, more than any other element. Polonium has found use in small, portable radiation sources and in the control of static electricity. See ELEMENT (table); PERIODIC TABLE.

Pol Pot, 1928?–, Cambodian Communist leader; b. Saloth Sar. After the KHMER ROUGE victory in Cambodia in 1975, he became (1976) prime minister. Under his regime, widespread executions, forced labor, and famine killed an estimated 3 million Cambodians. In 1979 Vietnam invaded and ousted the Khmer Rouge from Phnom Penh, establishing a government led by Heng Samrin, but Pol Pot remained head of the Khmer Rouge, which retained control of large areas of Cambodia. In late 1979 he was replaced as prime minister by Khieu Samphan and named Khmer Rouge army chief. He officially retired in 1985, but he is believed still to head the Khmer Rouge.

Polybius [pōlĭ'bēəs], 203? B.C.–120 B.C., Greek historian; b. Megalopolis. In Rome, under the patronage of the Scipio family, he wrote a great universal history. Of the 40 books written, only the first five survive intact. Polybius tried to explain the sudden rise of Rome; his history covers the Mediterranean world from before c.220 to 146 B.C.

Polydorus, Greek sculptor: see LAOCOÖN.

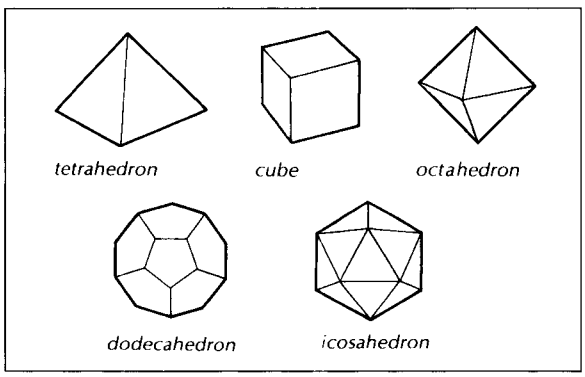
polyester: see SYNTHETIC TEXTILE FIBERS.

polygamy: see MARRIAGE.

polygon, closed plane figure bounded by straight-line segments (sides) intersecting at points called vertices. Polygons of 3, 4, 5, 6,

7, 8, 10, and 12 sides are called, respectively, triangles, quadrilaterals, pentagons, hexagons, heptagons, octagons, decagons, and dodecagons. In a regular polygon, e.g., an *equilateral triangle* or a *square* (four sides), the sides are of equal length and meet at equal angles. A triangle is *isosceles* if two sides are equal and *scalene* if all sides differ in length; a *right triangle* has one right angle (90°). A quadrilateral is a *rhombus* if its four sides are equal, a *trapezoid* if it has one pair of parallel sides, and a *parallelogram* if it has two pairs of parallel sides. A *rectangle* is a parallelogram with four right angles.

polyhedron, closed solid bounded by plane faces, each of which is a POLYGON. There are only five possible regular polyhedrons, having congruent faces, each a regular polygon and meeting at equal angles. These are the Platonic solids: the tetrahedron (bounded by four equilateral triangles); the hexahedron, or cube (six squares); the octahedron (eight equilateral triangles); the dodecahedron (12 regular pentagons); and the icosahedron (20 equilateral triangles).



The five regular polyhedrons

Polyhymnia: see MUSES.

Polykleitos, Polycletus, or **Polyclitus** [pŏlĭklī'təs, -klē'-, -klī'-], two Greek sculptors of the school of Argos. **Polykleitos,** the elder, fl. c.450–c.420 B.C., made many bronze statues of athletes. His ideal of physical perfection, the "canon of Polykleitos," became the standard for sculptors. It is seen in his statues the *Doryphorus,* or *Spear-Bearer* (Naples), the *Diadumenus* (National Mus., Athens), and an *Amazon,* all known through copies. **Polykleitos,** the younger, fl. 4th cent. B.C., a sculptor and architect, designed the great theater at EPIDAURUS.

polymer, chemical compound with high molecular weight consisting of a number of structural units linked together by covalent bonds. The simple molecules that may become structural units are themselves called monomers. A structural unit is a group having two or more bonding sites. In a linear polymer, the monomers are connected in a chain arrangement and thus need only have two bonding sites. When the monomers have three bonding sites, a nonlinear, or branched, polymer results. Naturally occurring polymers include CELLULOSE, PROTEINS, natural RUBBER, and SILK; those synthesized in the laboratory have led to such commercially important products as PLASTICS, synthetic fibers, and synthetic rubber.

polymerase chain reaction (PCR), laboratory process in which a particular DNA segment from a mixture of DNA chains is rapidly replicated, producing a large, readily analyzed sample of a piece of DNA. In PCR, DNA is immersed in a solution containing the ENZYME DNA polymerase, unattached nucleotide bases (the subunits that DNA is composed of), and "primers," short sequences of nucleotides designed to bind with an end of the desired DNA segment. Two primers are used: one primer binds at one end of the desired segment on one of the two paired DNA strands, and the other primer binds at the other end but on the other strand. The solution is heated to break the bonds between the strands of the DNA. When the solution cools, the primers bind to the separated strands, and DNA polymerase quickly builds a new strand by joining the free nucleotide bases to the primers. When this process is repeated, a strand that was formed with one primer binds to the other primer, resulting in a new strand that is restricted solely to the desired segment. Thus, the region of DNA between the primers is selectively replicated. Further repetitions of the process can produce billions of copies of a small piece of DNA in several hours. PCR was developed in 1985 by Kary B. Mullis, who was awarded the 1993 Nobel Prize in chemistry for his work. It is used in DNA FINGERPRINTING and in medical tests to identify diseases from the infectious agent's DNA. See also NUCLEIC ACID.

Polynesia, one of the three main divisions of Oceania, in the central and S Pacific Ocean. The principal island groups include the Hawaiian islands (see HAWAII), TONGA, Samoa (see AMERICAN SAMOA; WESTERN SAMOA), and the islands of FRENCH POLYNESIA. Languages spoken are of Malayo-Polynesian origin.

Polynesian languages: see MALAYO-POLYNESIAN LANGUAGES.

Polynices: see SEVEN AGAINST THEBES.

polynomial, mathematical expression containing terms of one or more variables or constants that are connected by addition or subtraction. No variable can appear as a divisor or have fractional exponents. In one unknown, the general form of a polynomial is $a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \ldots + a_{n-1}x + a_n$ where n is a positive integer and $a_0, a_1, a_2, \ldots, a_n$ are any numbers. The *degree* of a polynomial in one variable is the highest power of the variable. A polynomial of degree 2, i.e., $ax^2 + bx + c$ (where a, b, and c are any numbers), is called a *quadratic.*

polyp and medusa, names for the two body forms of animals (COELENTERATES) of the phylum Cnidaria—one, the polyp or hydroid, is stationary; the other, the medusa, is free-swimming. Both consist of a cylindrical body with a mouth surrounded by stinging tentacles at one end. The polyp is elongated and attaches to the ocean bottom with the mouth and tentacles pointing upward; the medusa is rounded and swims with the mouth down and tentacles dangling. Some cnidarians are always polyps, some are always medusae, and some take both medusa and polyp forms during their life cycles. Common polyps are the SEA ANEMONE and HYDRA; a common medusa is the JELLYFISH. In many species, such as CORAL, the polyps form colonies. The Portuguese man-of-war is an elaborate floating colony of polyplike and medusalike individuals.

polypeptide: see PEPTIDE.

Polyphemus [pŏlĭfē'məs], in Greek mythology, a CYCLOPS. In the *Odyssey,* ODYSSEUS and his men were imprisoned in his cave, but they escaped by making him drunk and blinding him.

polyphony, music whose texture is formed by the harmonic interweaving of several independent melodic lines through the use of COUNTERPOINT. Contrasting terms are *homophony,* wherein one part dominates while the others form a chordal accompaniment; and *monophony,* wherein there is a single melodic line (as in PLAINSONG). Polyphony developed by the late 9th cent. and culminated in the great age of polyphony in the 15th and 16th cent. Although polyphony was overshadowed by HARMONY in the BAROQUE period and by homophony in the classical and romantic periods, in the 20th cent. there has been renewed interest in polyphonic aspects of musical texture and structure.

polypodiophyte, member of a division (Polypodiophyta, sometimes called Pterophyta or Filicophyta) of the plant kingdom consisting of the FERNS.

polypropylene, lightweight PLASTIC, a POLYMER of propylene. It is less dense than water and resists moisture, oils, and solvents. It is used to make packaging material, textiles, luggage, ropes that float, and, because of its high melting point (250°F/121°C), objects that must be sterilized.

polytheism, belief in a plurality of gods, not necessarily equal in importance, each of which is distinguished by a special function. The Indian VEDAS, for example, feature Agni the fire god, Vayu the wind god, and Indra the storm god. Dynastic Egypt had hundreds of deities, but worship (as in Greek Olympianism) was city-centered. The gods of polytheistic systems are organized into a cosmic family, featured in legend and myth and expressing beliefs about the individual's relationship to the universe. The lesser deities of polytheism tend to diminish with time until the religion exhibits monotheistic tendencies. Thus the Olympian sky god ZEUS became the head of all Olympian deities; the Egyptian RA became the supreme god; and the several thousand Vedic gods were grad-

ually displaced by the trinity of VISHNU, SHIVA, and BRAHMA. See MONOTHEISM.

polyurethanes, large group of PLASTICS that occur in a wide variety of forms. As a flexible foam, it is used for cushions and carpet backings. As a rigid foam, it can be molded into furniture or used as insulation. Some polyurethanes are highly elastic, e.g., Lycra, a fiber used in stretch clothing; others form hard protective coatings.

polyvinyl chloride (PVC), thermoplastic that is a POLYMER of vinyl chloride. By adding plasticizers, hard PVC RESINS can be made into a flexible, elastic PLASTIC, used as an electrical insulator and as a coating for paper and cloth in making fabric for upholstery and raincoats.

Pombal, Sebastião José de Carvalho e Melo, marquês de [pōōmbäl'], 1699–1782, Portuguese chief minister (1756–77) under King Joseph. An anticlerical absolutist, he curbed the INQUISITION and expelled the Jesuits from PORTUGAL. He built up Brazil and strengthened commerce. Pombal ruthlessly put down all opposition, imprisoning thousands. He was deposed after Joseph's death (1777) and was banished.

pomegranate, deciduous, thorny shrub or small tree (*Punica granatum*) native to semitropical Asia and grown in the Mediterranean region. It has long been cultivated as an ornamental and for its fruit. The roughly apple-sized fruit contains many seeds, each within a fleshy red seed coat, enclosed in a tough yellowish-to-deep-red rind. It is eaten fresh or used for grenadine syrup.

Pomerania, largely lowland region in Poland and Germany, bordering the Baltic Sea. W Pomerania became (1181) a duchy of the HOLY ROMAN EMPIRE, while E Pomerania, or Pomerelia, came (1466) under Polish rule and passed (1772) to PRUSSIA, becoming known as West Prussia. Parts of W Pomerania were ruled (1648–1814) by Sweden, and from 1815 to 1919 all of Pomerania was held by Prussia. From 1919 to 1939 Pomerania was divided among Germany, Poland, and the free city of Danzig (GDAŃSK). During WORLD WAR II Germany held (1939–40) all of Pomerania. In 1945 Poland was awarded most of the region; the rest was part of East Germany until German reunification.

Pomeranian, sturdy TOY DOG; shoulder height, c.6 in. (15.3 cm); weight, 3–7 lb (1.4–3.2 kg). Its abundant double coat forms a ruff on the neck. Descended from the larger sledge dogs of Iceland and Lapland, it became popular when Queen Victoria obtained one in the late 19th cent.

Pomona, city (1990 pop. 131,723), Los Angeles co., S Calif. at the foot of the San Gabriel Mts.; inc. 1888. It is a rapidly growing residential, industrial, and commercial suburb of Los Angeles. Manufactures include canned fruits and vegetables, building materials, paper products, and military equipment. It is the seat of California State Polytechnic Univ.

Pompadour, Jeanne Antoinette Poisson Le Normant d'Étioles, marquise de [pŏm'pədôr], 1721–64, mistress of LOUIS XV of France for about five years after 1745. She was his confidante until her death. She urged the appointment of certain ministers and fostered French ties with Austria, but her influence on state policy has been exaggerated.

pompano, marine FISH of the family Carangidae, mackerel like fishes abundant in warm seas around the world. Swift swimmers with deeply forked tails, most are valued as food fish. The family includes the amberfishes, leather jacks, cavallas or jacks, moonfishes, casabes, and pompanos. The best-known leather jack is the pilot fish (*Naucrates ductor*), which follows ships and sharks, feeding on discarded scraps. The amberfishes (genus *Seriola*) include the California yellowtail, weighing up to 40 lb (18 kg), and the amberjack, common off the Florida coast and weighing up to 100 lb (45 kg). The warm-water common pompano, found from the Carolinas to Texas, reaches 18 in. (45 cm) in length and is considered among the most delicious of food fish.

Pompeii, ancient city of S Italy, a port near Naples and at the foot of Mt. Vesuvius. It was a Samnite city before it became Roman (1st cent. B.C.). Pompeii was a flourishing port and a prosperous resort. An earthquake in A.D. 63 damaged the city, and the eruption of Mt. VESUVIUS in A.D. 79 buried Pompeii and the nearby city of Herculaneum under cinders and ashes that preserved their ruins. Pompeii was rediscovered in 1748, and excavations have revealed in great detail the habits and manners of life in Roman times.

Pompeius Magnus: see POMPEY.

Pompey (Cneius Pompeius Magnus) [pŏm'pē], 106–48 B.C., Roman general, the rival of Julius CAESAR. Sometimes called Pompey the Great, he fought for SULLA successfully and forwarded Roman conquests in Spain. He helped to end the slave revolt of SPARTACUS (72 B.C.) and was elected (70 B.C.) consul. Soon afterward he destroyed the pirates infesting the Mediterranean and vanquished (65 B.C.) MITHRIDATES VI of Pontus. Back in Rome, he met senatorial opposition and was driven into alliance with the senate's enemy, Caesar. The First Triumvirate was established (60 B.C.), and Caesar, Marcus Licinius CRASSUS, and Pompey became rulers of Rome. Pompey's wife, JULIA, who was Caesar's daughter, kept peace between her husband and father, but after her death (54 B.C.) Pompey became Caesar's jealous enemy. He went over to the senate and became consul (52 B.C.). Breaking with the senate, Caesar crossed (49 B.C.) the RUBICON, and the civil war began. Pompey was defeated at Pharsala (48 B.C.) and fled to Egypt, where he was killed.

Pompidou, Georges [pôNpēdōō'], 1911–74, president of France (1969–74). From 1944 he was an aide to Charles DE GAULLE, who named him premier in 1962. Elected president after De Gaulle resigned, Pompidou worked to improve France's economy and foreign relations. He died in office.

Pompidou, Centre National d'Art et de Culture Georges: see BEAUBOURG.

Ponce [pōn'sā], city (1990 pop. 159,151), S Puerto Rico. It is an industrial center and the island's chief Caribbean port. Tourism, sugar refining, and distilling are important. Founded in the early 16th cent., it is one of the oldest cities in the Americas.

Ponce de León, Juan [pŏns də lē'ŏn], c.1460–1521, Spanish explorer and European discoverer of FLORIDA. He conquered PUERTO RICO in 1508 and was governor (1509–12). In 1513 he landed in Florida. According to legend, he was seeking a "fountain of youth." He returned in 1521 to settle near Tampa Bay but was mortally wounded in a Native American attack.

Ponchielli, Amilcare [pōngkyĕl'lē], 1834–86, Italian composer of *La Gioconda* (1876) and several other operas.

pond lily: see WATER LILY.

Pons, Lily, 1904–76, French-American coloratura soprano. After 1931 she sang with the METROPOLITAN OPERA (N.Y.C.). She was particularly noted for her performances in DELIBES's *Lakmé* and DONIZETTI's *Daughter of the Regiment*.

Ponselle, Rosa, 1897–1981, American operatic soprano; b. Meriden, Conn. She made her debut in New York City in 1918. Ponselle was noted for her power and expressiveness.

Pontiac, fl. 1760–66, chief of the OTTAWA. He encouraged opposition to the British and participated in PONTIAC'S REBELLION, but his exact role initiating that uprising is uncertain. When the uprising failed (1766), he is said to have gone west and been murdered by ILLINOIS, but this account is not generally accepted.

Pontiac, industrial city (1990 pop. 71,166), seat of Oakland co., SE Mich., on the Clinton R.; founded 1818, inc. as a city 1861. Its early trades, notably carriage making, paved the way for automobile manufacturing, its leading industry. The OTTAWA chief PONTIAC is said to be buried nearby; the area has many parks and lakes.

Pontiac's Rebellion or **Pontiac's Conspiracy,** 1763–66, Native American uprising against the British at the end of the FRENCH AND INDIAN WARS, so called after one of its leaders, PONTIAC, chief of the OTTAWA. Angry at the British for fortifying and settling Native American lands, the Ottawa and allied tribes terrorized white settlers in western Pennsylvania, Maryland, and Virginia but failed to seize British forts at Detroit and Fort Pitt (now Pittsburgh). After some of his strongest allies sued for peace, Pontiac signed a peace treaty and was pardoned.

Pontius Pilate [pŏn'shəs pī'lət], fl. A.D. 26, Roman procurator of JUDAEA. He was supposedly a ruthless governor. His attempt to evade responsibility in the trial of JESUS was caused by his fear of the high priests' power and his difficult responsibility for the peace of Palestine. Tradition says he committed suicide at Rome.

Pontoppidan, Henrik [pôntô'pĭdän], 1857–1943, Danish novelist. His major work, *Lucky Peter* (5 vol., 1898–1904), attacks bourgeois life in Copenhagen. He shared the 1917 Nobel Prize in literature with K.A. GJELLERUP.

Pontormo, Jacopo da, 1494–1556. Florentine painter; b. Jacopo Carrucci. One of the creators of MANNERISM, he painted in a nervous, contorted style. His *Visitation* (the Annunziata, Florence) is famous. He also painted many excellent portraits, including one of Cosimo the Elder (Uffizi).

Pontus, ancient country, NE Asia Minor (now Turkey), on the Black Sea coast. Pontus flourished from the 4th cent. B.C. In the 1st cent. B.C. King MITHRIDATES VI conquered Asia Minor and the Crimea and threatened Greece, but the Romans under POMPEY defeated him in 65 B.C. Rome later joined Pontus to the province of Galatia-Cappadocia.

pony express, horseback relay mail service (1860–61) from Saint Joseph, Mo., to Sacramento, Calif., extending c.2,000 mi (3,200 km). Relay riders traveled the distance in about eight days. After a transcontinental telegraph line was completed in Oct. 1861, the pony express was ended. The **Pony Express National Historic Trail** was established in 1992 to preserve the trail and commemorate those who rode it.

poodle, popular dog, divided into three types, which differ in size: the standard, a NONSPORTING DOG, shoulder height, over 15 in. (38.1 cm), weight, 40–55 lb (18.1–24.9 kg); the miniature, also a nonsporting dog, shoulder height, 10–15 in. (25.4–38.1 cm), weight, 14–16 lb (6.4–7.3 kg); and the toy, a TOY DOG, shoulder height, up to 10 in. (25.4 cm), weight, c.6 lb (2.7 kg). The dense coat, of any solid color, is usually clipped in a variety of styles. The breed probably originated in Germany, but is associated with France, where it was used as a waterfowl retriever.

pool: see BILLIARDS.

poor law: see SOCIAL WELFARE.

pop art, movement that emerged at the end of the 1950s as a reaction against the seriousness of ABSTRACT EXPRESSIONISM. Pop artists used the imagery of comic strips, soup cans, soda pop bottles, and other common images to express abstract formal relationships. Artists such as Roy LICHTENSTEIN and Andy WARHOL attempted to fuse elements of popular and high culture and to erase the boundaries between the two.

Pope, Alexander, 1688–1744, English poet. He suffered physical disabilities and was largely self-taught. By age 17 he was regarded as a prodigy. Known for his literary quarrels, Pope nevertheless had many close friends. His interest in Tory politics was strengthened by friendship with SWIFT and by involvement in the SCRIBLERUS CLUB. Pope's poetry falls into three periods. In the first he wrote descriptive poetry e.g., the *Pastorals* (1709) and *Windsor Forest* (1713); the famous *Essay on Criticism* (1711), defining the doctrine of CLASSICISM; the mock-heroic *Rape of the Lock* (1714), ridiculing fashionable life; and two poems on love, "Elegy to the Memory of an Unfortunate Lady" and "Eloise to Abelard." After 1717, during the second period, his translations of the *Iliad* (1720) and *Odyssey* (1725–26), and his edition of Shakespeare (1725), made him rich. In the last period, living outside London at Twickenham, he wrote moral poems and SATIRES, including *The Dunciad* (1728–43), a mock epic attacking hack writers; *Imitations of Horace* (1733–38), including the "Epistle to Arbuthnot" (1735), his personal apologia; and the famous *Essay on Man* (1734), summarizing current philosophical speculation. A master craftsman, Pope is now generally regarded as the leading 18th-cent. English poet and as the greatest of all English verse satirists.

Popish Plot: see OATES, TITUS.

poplar: see WILLOW.

Popocatépetl [pōpəkät'əpĕtəl, pōpō"kätä'pətəl], [Aztec, = smoking mountain], snow-capped volcano, 17,887 ft (5,452 m) high, second highest peak in Mexico. Quiescent since colonial times, the volcano occasionally emits vast clouds of smoke and sulfur fumes.

Popper, Sir Karl Raimund, 1902–, Anglo-Austrian philosopher; b. Vienna. A professor (1949–69) at the London School of Economics, Popper viewed knowledge as an individual, unpredictable act of genius not limited to verifiable statements (as the proponents of LOGICAL POSITIVISM held). His studies of the philosophical and political consequences of work in the sciences and what he called the pseudo-sciences (e.g., psychology) and his attacks on historicism (the view that there are historical laws) as a tool of totalitarian thought are presented in *The Logic of Scientific Discovery* (1931) and *The Open Society and Its Enemies* (1945). His later works include *Objective Knowledge* (1972) and *The Self and Its Brain* (with J.C. Eccles; 1977).

poppy, name for some members of Papaveraceae, a family composed chiefly of herbs of the Northern Hemisphere, typified by a milky or colored sap. Many are cultivated for their brilliantly colored but short-lived blossoms. The true poppy genus, *Papaver,* includes the Oriental poppy (*P. orientale*), bearing a large scarlet flower with a purplish-black base; the corn poppy (*P. rhoeas*); and the Iceland poppy (*P. nudicaule*). The opium poppy (*P. somniferum*) is the most important species economically. The sap of its unripe seed pods is the source of the narcotics OPIUM, MORPHINE, CODEINE, and HEROIN. Its seed (poppyseed) is not narcotic and is used as birdseed and in baking; oil from the seeds is also used in cooking and for paints, soaps, and varnishes. Other genera in the family are also called poppies, e.g., the celandine poppy (*Stylophorum diphyllum*) and the California poppy (*Eschscholtzia californica*), the state flower of California.

popular music: see COUNTRY AND WESTERN MUSIC; FOLK SONG; JAZZ; REGGAE; ROCK MUSIC; SALSA.

popular sovereignty: see SQUATTER SOVEREIGNTY.

populations, stellar: see STELLAR POPULATIONS.

Populist party, American political party expressing the agrarian protest of the late 19th cent., when farmers suffered from declining agricultural prices. Many believed that the federal government's currency policy favored Eastern banks and industrialists at the expense of farmers and workers. Delegates from farm and labor groups met at Omaha in 1892 and formed the Populist party. Its platform called for the free coinage of silver and plenty of paper money, among other popular reforms. The Populist presidential candidate, James B. WEAVER, won more than 1 million votes in the 1892 election. But after the Democrats adopted free coinage of silver and ran William J. BRYAN for president in 1896, and agrarian insurgency had declined, in part as the result of rising farm prices, the Populist party dissolved. In some states the party was known as the People's party.

porcelain, white, hard, nonporous, translucent pottery. First made by the Chinese during the T'ang period (618–906) to withstand the great heat of their kilns, traditional porcelain was hard paste (a combination of kaolin, a white clay that melts at high temperature; and petuntse, a feldspar mineral that forms a glassy cement to bind the vessel permanently). It was exported to the Islamic world and highly prized. During the Yüan period (1280–1368) blue-and-white ware was produced with cobalt blue from the Middle East, and from the 14th to 17th cent. other colors were used as well. Most European porcelain is soft paste (clay combined with an artificial compound, e.g., ground glass) and is not as strong as Chinese porcelain. In Europe, porcelain was first commercially produced (1710) in Meissen, Germany. The English have strengthened porcelain with bone ash since 1750.

porcupine, member of either of two RODENT families, characterized by having some of its hairs modified as bristles, spines, or quills. Loosely attached, the quills pull out easily, remaining embedded in predators that come in contact with them. The North American, or Canadian, tree porcupine (*Erethizon dorsatum*) is found in wooded areas over most of North America, excluding the SE U.S. It forages in trees at night. Members of most species weigh 50 to 60 lb (23 to 27 kg).

porphyry, igneous ROCK of large crystals (phenocrysts) embedded in a groundmass. The term refers only to the rock's texture, not to its chemical or mineral composition.

porpoise, small WHALE of the family Phocaenidae, distinguished from the DOLPHIN by its smaller size (4–6 ft/120–180 cm) and rounded, beakless head. Black above and white below, porpoises are found in all oceans and prey on fish. In North America dolphins are often called porpoises.

port: see WINE.

Port-au-Prince, city (1987 est. pop. 800,000), SW Haiti, capital of Haiti. The country's largest city, commercial center, and chief seaport, it is laid out like an amphitheater around a bay. Founded in 1749 by French sugar planters, it became the colonial capital in 1770, replacing Cap-Haïtien. Although it has some manufactures, e.g., cement, food processing, and textiles, it has remained eco-

The key to pronunciation appears on page xiii.

nomically backward and has suffered frequent damage from earthquakes, fires, and civil warfare.

Porter, Cole, 1891–1964, American composer and lyricist; b. Peru, Ind. He is noted for his witty, sophisticated lyrics and affecting melodies. His MUSICALS include *Kiss Me, Kate* (1948) and *Can-Can* (1953). "Night and Day," "Begin the Beguine" and "Let's Do It" are among his best-known songs.

Porter, Katherine Anne, 1890–1980, American author; b. Indian Creek, Tex. Her masterful short stories, accomplished in style, form, and language, are included in such volumes as *Flowering Judas* (1930), *Pale Horse, Pale Rider* (1939), and her collected short stories (1965; Pulitzer). Her one novel, *Ship of Fools* (1962), is a moral allegory set aboard a German ship in 1931.

Porter, William Sydney: see O. HENRY.

porter: see BEER.

Portinari, Candido, 1903–62, one of Brazil's best-known modern painters. He was noted for his scenes of Brazilian life, and his mature style was fluid, expressionistic, and somewhat surrealistic. Portinari is known for his murals, e.g., *War* and *Peace* (1955; UN General Assembly Building, N.Y.C.).

Portland. **1** City (1990 pop. 64,358), seat of Cumberland co., SW Maine, on Casco Bay and including five islands in the bay; settled c.1632, inc. 1786. Maine's largest city and commercial center, it has a deepwater harbor, and imports oil and other goods destined for Montreal. It is the shipping and processing point for a vast farming, lumbering, and resort area, and has shipyards, canneries, and foundries. Portland was state capital from 1820 to 1832. The LONGFELLOW house and Portland Head Lighthouse (est. 1791) are noteworthy. **2** City (1990 pop. 437,319; met. area 1,239,842), seat of Multnomah co., NW Oreg., on the Willamette R.; inc. 1851. Founded in 1845, it grew rapidly as a supply point for western gold fields. The largest city in Oregon and the leading exporting port on the West Coast, it manufactures paper and wood products, electronic instruments, and machinery. The city grew rapidly after 1850, serving as a supply point for the California and Alaska gold fields. Its varied architecture includes a neoclassical city hall and the postmodernist Portland Building designed by Michael Graves. The Univ. of Portland, Reed College, and museums of science and advertising are among the many institutions in the area. The region is noted for its dramatic scenery; Mt. Hood is nearby.

Port Louis, city (1987 est. pop. 140,000), capital of Mauritius, on the Indian Ocean. It is the country's largest city and its economic center. Its economy is based on its well-sheltered port, which handles the country's international trade. Sugar is the leading export, and manufactures include cigarettes and rum. Founded by the French in 1735, Port Louis became an important naval base. It is largely populated by descendants of laborers who came from India in the 19th cent. Points of interest include the hilltop Citadel (1838).

Port Moresby, town (1990 pop. 193,242), capital of Papua New Guinea, on the SE coast of the island of NEW GUINEA. The nation's largest city and chief port, it was founded by Capt. John Moresby, who landed there in 1873. It was the chief Allied base on New Guinea during WORLD WAR II. A new capital is being built in suburban Waigani.

Pôrto Alegre, city (1990 est. pop. 1,387,000), SE Brazil, capital of Rio Grande do Sul state, at the mouth of the Guaíba R. A major commercial center and the nation's chief river port, it exports agricultural products and has a shipyard and processing industries. It is noted as a cultural and literary center. Founded c.1742, it is a handsome, modern city, with many colonial and baroque buildings preserved.

Port of Spain, city (1990 pop. 50,878), capital of Trinidad and Tobago, on the island of Trinidad. The nation's industrial hub and one of the major shipping centers in the Caribbean, it also has fine botanical gardens. It was the capital (1958–62) of the Federation of the WEST INDIES.

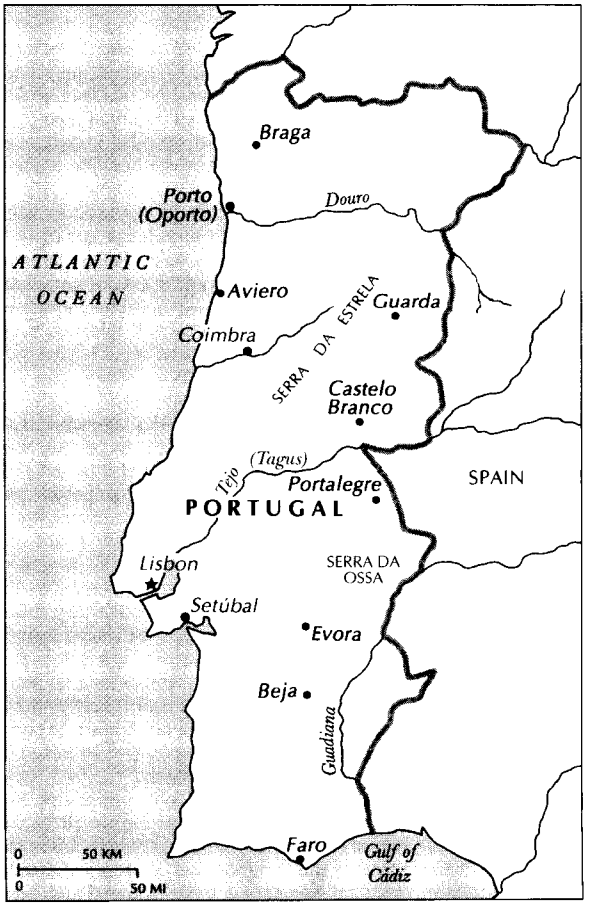
Portolá, Gaspar de [pôrtōlä'], fl. 1734–84, Spanish explorer in the Far West. He was sent in 1767 to be governor of the Californias and to expel the Jesuits (see JESUS, SOCIETY OF). He founded SAN DIEGO in 1769 and the mission of San Carlos, in Monterey Bay, in 1770. He was governor of Puebla, Mexico, from 1776 to 1784.

Porto-Novo, city (1984 est. pop. 164,000), capital of Benin, a port on the Gulf of Guinea. It is the shipping center for an agricultural region whose chief product is palm oil (the leading export). The capital of a small African kingdom in the 16th cent., Porto-Novo became (17th cent.) a Portuguese trading post and a center of slave trafficking to the Americas. It was taken by the French in 1883 and became the capital of Dahomey (now BENIN) in 1900.

Portsmouth, city (1990 pop. 103,907), SE Va., on the Elizabeth R. and HAMPTON ROADS, adjacent to NORFOLK; est. 1752, inc. 1858. Forming with Norfolk a major naval operations center, Portsmouth has a huge naval hospital and the largest concentration of drydocks in the nation. From the 18th cent. many U.S. warships were built there, including the CHESAPEAKE, the ironclad *Virginia* (see MONITOR AND MERRIMACK), and the first battleship and aircraft carrier. The city is also a busy commercial seaport.

Portugal, officially Portuguese Republic, republic (1992 est. pop. 10,449,000), 35,553 sq mi (92,082 sq km), SW Europe, on the W Iberian Peninsula; bordered by Spain (E and N) and the Atlantic Ocean (W and S). It includes the MADEIRA ISLANDS and the AZORES in the Atlantic Ocean. MACAO, Portugal's last overseas territory, will revert to China in 1999. Principal cities are LISBON (the capital), OPORTO, Coimbra, and Setúbal. Northern Portugal is dominated by mountains and high plateaus, while the south is mostly rolling countryside and plains. The country is crossed by the Tagus and Douro rivers. Portuguese agriculture, although noted for its vineyards, olive groves, and almond trees, is hampered by antiquated techniques, and food must be imported. Fishing (tuna and sardines) is important, as are food processing and the manufacture of textiles and clothing, chemicals, and cement. There are large forests, and Portugal supplies a major portion of the world's cork. The great majority of the largely homogeneous population are Roman Catholic, and Portuguese is the official language.

History. The area that is now Portugal (see LUSITANIA) was conquered (A.D. c.5) by the Romans, overrun (from the 5th cent.) by Germanic tribes, and taken (711) by the MOORS. Portugal became



an independent kingdom in 1139 under ALFONSO I, and with the conquest of Algarve in 1249 by ALFONSO III the Moors were driven out and the kingdom consolidated. The reign of JOHN I (r.1385–1433), founder of the Aviz dynasty, introduced Portugal's glorious period of colonial and maritime expansion; by the 15th cent. the Portuguese empire extended to Asia, Africa, and America. But decline was rapid. In 1580 PHILIP II of Spain seized Portugal, which remained under Spanish rule until a revolt in 1640 established the Braganzas, Portugal's last royal line. In the Napoleonic Wars, French forces occupied (1807–11) Portugal (see PENINSULAR WAR) and the royal family fled to the Portuguese colony of BRAZIL. In 1822 Brazil became independent. JOHN VI was forced to accept a liberal constitution in the same year, but opposition to the monarchy remained strong. In 1910 a revolution overthrew Manuel II and established a Portuguese republic. A period of great instability ensued. In 1926 a military coup overthrew the government, and in 1932 Antonio de Oliveira SALAZAR became prime minister and virtual dictator of a right-wing corporative state, a position he held until ill health forced his replacement by Marcello Caetano in 1968. In 1974, a bloodless coup brought a moderate form of democracy. Almost all Portuguese overseas territories subsequently gained independence, GUINEA-BISSAU in 1974, and ANGOLA, CAPE VERDE, MOZAMBIQUE, and SÃO TOMÉ AND PRINCIPE in 1975. In the years since, Portugal has seen increasing stability. Aníbal Cavaço Silva, of the center-right Social Democratic party, has been premier since 1985.

Portuguese language, member of the Romance group of the Italic subfamily of the Indo-European family of languages. See LANGUAGE (table).

portulaca: see PURSLANE.

Posada, José Guadalupe [pōsä'thä], 1852–1913, Mexican artist. An enormously popular artist, he strongly influenced the generation of OROZCO and RIVERA. Posada's work is characterized by violent imagery, distortion, caricature, and vigorous lines and contrasts. An ardent opponent of the Porfirio DÍAZ dictatorship, he produced thousands of prints attacking it, which were sold cheaply to the masses.

Poseidon [pōsī'dən], in Greek religion, god of the sea, protector of all waters. Powerful, violent, and vengeful, he carried the trident, with which he caused earthquakes. He was the husband of Amphitrite and the father of many sons, most either brutal men (e.g., ORION) or monsters (e.g., POLYPHEMUS). He was also important as Hippios, god of horses, and was the father of PEGASUS. The Romans identified him with NEPTUNE.

positivism, in philosophy, a system of thought opposed to METAPHYSICS and maintaining that the goal of knowledge is simply to describe the phenomena experienced. Its basic tenets are contained in the works of Francis BACON, George BERKELEY, and HUME. The term itself was coined by COMTE, whose doctrines influenced the development of much of 19th- and 20th-cent. thinking, especially that of LOGICAL POSITIVISM.

positron: see ANTIMATTER; ELECTRON.

positron emission tomography: see PET SCAN.

Postal Service, United States, independent U.S. agency reorganized (1971) from the former Post Office Dept. to provide mail processing and delivery services within the U.S. It also protects the mails from loss or theft and is empowered to change postal rates and to ban from the mails what it considers to be seditious, fraudulent, or obscene. It is governed by an 11-member board and headed by the postmaster general.

postimpressionism, term coined by Roger FRY, referring to the work of some late 19th-cent. painters who, although they developed their varied styles quite independently, were united in their rejection of IMPRESSIONISM. They include CÉZANNE, VAN GOGH, GAUGUIN, MATISSE, PICASSO, and BRAQUE. The term embraces a far wider school of thought than the neo-impressionism of SEURAT and SIGNAC, whose more systematic approach (called divisionism or pointillism) used dabs of pure color that were supposed to be mixed by the viewer's eye to produce intense color effects.

postmodernism, in architecture, international movement that emerged in the 1960s and became prominent in the late 1970s and 80s. A reaction to the orthodoxy and austerity of the INTERNATIONAL STYLE, it is characterized by the incorporation of historical details, use of decorative structural elements, a more personal and exaggerated style, and some reference to popular modes of building. Postmodernism was greatly affected by the writings of Robert VENTURI. The style is evident in his buildings and in those of such architects as Michael GRAVES, Denise Scott Brown, and Robert Stern, and in the later work of Philip JOHNSON.

post-traumatic stress disorder (PTSD), mental disorder that follows an occurrence of extreme psychological stress, such as that encountered in war or resulting from violence, childhood abuse, or serious accident. Symptoms include emotional numbness, nightmares or "flashbacks," insomnia, heightened sensitivity to sudden noises, and outbursts of violent behavior.

postulate: see AXIOM.

potassium (K), metallic element, discovered in 1807 by Sir Humphry DAVY, who decomposed potash with an electric current. It is a soft, silver-white, extremely reactive ALKALI METAL. Potassium is the seventh most abundant element in the earth's crust and the sixth most abundant of the elements in solution in the oceans. It is an essential nutrient for plants and animals. Potassium compounds are used in fertilizers, soaps, explosives, glass, baking powder, tanning, and water purification. See ELEMENT (table); PERIODIC TABLE.

potassium hydroxide: see ALKALI.

potassium nitrate: see SALTPETER.

potato or **white potato,** perennial plant (*Solanum tuberosum*) of the NIGHTSHADE family, and its swollen underground stem (tuber), a widely used vegetable. Probably native to the Andes, the potato was introduced (via Europe) into North America c.1600. With its high carbohydrate content, it is a primary food for Western peoples; it is also a source of STARCH, flour, ALCOHOL, dextrin, and fodder. Potatoes are usually propagated by planting pieces of the tubers that bear two or three "eyes," the buds of the underground stems or by planting seed potatoes or mini-tubers. The SWEET POTATO is unrelated.

potato blight: see BLIGHT; MILDEW.

Potemkin, Grigori Aleksandrovich, 1729–91, Russian field marshal and favorite of CATHERINE II. He took part in the coup that made Catherine czarina (1762) and was created count for serving in her first war with Turkey (1768–74). Her lover for a time, he remained one of her chief advisers, encouraging her in an unsuccessful plan to break up the OTTOMAN EMPIRE and reestablish a Christian empire in the conquered region. For his part in annexing the Crimea (1783) he was created prince and appointed governor of the new province, which he administered ably.

potential, electric, work per unit electric charge expended in moving a charged body from a reference point to any given point in an electric field. The potential at the reference point is considered to be zero, while the reference point itself is usually chosen to be at infinity. The change in potential associated with moving a charged body is independent of the actual path taken and depends only on the initial and final points. Potential is measured in VOLTS and is sometimes called voltage. See also ELECTRIC CIRCUIT; ELECTROMOTIVE FORCE.

potential energy: see ENERGY.

potentiometer or **voltage divider,** manually adjustable variable electrical resistor that has a RESISTANCE element attached to an ELECTRIC CIRCUIT by three contacts, or terminals. The ends of the resistance element are attached to the two input voltage conductors of the circuit, and the third contact, attached to the output of the circuit, is usually a movable terminal that slides across the resistance element, dividing it into two resistors. Because the position of the movable terminal determines what percentage of the input voltage (see POTENTIAL, ELECTRIC) is applied to the circuit, a potentiometer can be used to vary the magnitude of the voltage, e.g., in radio volume and television brightness controls.

Potiphar: see JOSEPH.

potlatch, lavish ceremonial feast among Northwest Coast tribes (see NORTH AMERICA, INDIGENOUS PEOPLES OF), at which the host distributed valuable gifts to guests to earn prestige. Recipients were obliged to reciprocate with more lavish gifts at a future potlatch. In its modern form, at the end of the 19th cent., the potlatch was used to bankrupt an enemy.

Potomac, scenic river of the E U.S., flowing 285 mi (459 km) SE from the vicinity of Cumberland, Md., to the Chesapeake Bay.

The key to pronunciation appears on page xiii.

Washington, D.C., just below the Great Falls, is the head of navigation.

Potosí, city (1985 est. pop. 113,000), capital of Potosí dept., S Bolivia. Built at an altitude of c.13,780 ft (4,200 m) in the ANDES Mts., it is one of the highest cities in the world. It was founded in 1545 at the foot of one of the richest ore mountains ever discovered. Its silver mines were eclipsed by more accessible ones in Peru and Mexico after 1600, but modern technology has again made the area a source of silver, as well as of tin, lead, zinc, and copper.

Potsdam, city (1989 est. pop. 143,000), capital of BRANDENBURG, E Germany. A rail junction and industrial center, it produces processed foods, textiles, boats, and other goods. It was the chief residence of FREDERICK II of Prussia, who built (1745–47) the palace and park of Sans Souci. The city was badly damaged in WORLD WAR II. The Potsdam Conference (1945) was held there by the Allies.

Potsdam Conference, meeting (July 17–Aug. 2, 1945), of the principal Allies of WORLD WAR II (the U.S., the USSR, Great Britain) to clarify and implement agreements previously reached at the YALTA CONFERENCE. The chief participants were Pres. TRUMAN, Premier STALIN, and Prime Min. CHURCHILL (who was replaced by ATTLEE after Churchill's Conservative party lost the British election). The resulting Potsdam Agreement established four-power (American, British, Russian, French) occupation zones for postwar Germany. A comprehensive reordering of the German economy and German institutions was part of the agreement. The Council of Foreign Ministers was established to consider peace settlements. The conference issued an ultimatum to Japan either to surrender or risk total destruction. The rift between the Soviet Union and the Western Allies caused the Potsdam Agreement to be consistently breached, which was an early manifestation of the COLD WAR.

Potter, Beatrix, 1866–1943, English author and illustrator. Her unsentimental, humorous animal stories, with her own drawings and watercolors, number 25 and include *The Tale of Peter Rabbit* (1902) and *The Tailor of Gloucester* (1903).

Poulenc, Francis [pōōlăNk′], 1899–1963, French composer and pianist, one of "les SIX." His lyrical, spontaneous works include piano pieces, e.g., *Mouvements perpetuels* (1918); songs; the ballet *Les Biches* (1924); chamber music; the Mass in G (1937); and operas, e.g., *Dialogue of the Carmelites* (1957).

Pound, Ezra Loomis, 1885–1972, one of the most influential and controversial figures in 20th-cent. poetry; b. Hailey, Idaho. In 1907 he left the U.S. for Europe, eventually settling in England. There he led the IMAGISTS before founding VORTICISM, and there he encouraged and influenced other writers such as T.S. ELIOT and James JOYCE. In 1920 he moved to Paris; by 1925 he was settled in Italy, where he developed many of the economic theories that led him to broadcast Fascist propaganda during World War II. Indicted for treason after the war, he was confined to a U.S. mental hospital (1946–58). On his release he returned to Italy. Pound's major poems are "Homage to Sextus Propertius" (1918); *Hugh Selwyn Mauberley* (1920); and the *Cantos* (1925–60), a brilliant, often obscure, epic that weaves together many diversified cultural threads in an attempt to reconstruct the history of civilization. He is also noted for his translations from many languages.

Pound, Roscoe, 1870–1964, American jurist; b. Lincoln, Nebr. He was dean of Harvard law school (1916–36). In influential works on jurisprudence, like *Spirit of the Common Law* (1921), Pound argued for greater recognition of social interests in legal thinking.

pound: see ENGLISH UNITS OF MEASUREMENT; WEIGHTS AND MEASURES, table.

pound-foot: see TORQUE.

Poussin, Nicolas [pōōsăN′], 1594–1665, French painter. Although he spent most of his life in Italy, his painting became the standard for French classical art. He studied MANNERISM in France and antique monuments in Rome. The BAROQUE styles of Pietro da CORTONA and Giovanni Lanfranco can be seen in several of Poussin's works, e.g., *Martyrdom of St. Erasmus* (1629; Vatican). The works of TITIAN and VERONESE influenced his choice of mythological and elegiac subjects whereas his preoccupation with the works of antiquity and of RAPHAEL resulted in a new clarity of composition, e.g., *Adoration of the Magi* (1633; Dresden). He was also interested in the philosophical possibilities of painting, and this intellectualization influenced painting far into the 19th cent. As first painter to LOUIS XIII, he administered the decoration of the Great Gallery of the LOUVRE. His later works emphasized the contemplative aspects of his subject. In such works as the *Death of Phocion* (1648) he constructed a classical landscape ordered with mathematical precision. Of his last works, the four paintings in the series *The Four Seasons* (1660–64; Louvre) are the most imposing.

Powell, Adam Clayton, Jr., 1908–72, African-American politician and clergyman; b. New Haven, Conn. As pastor (from 1937) of New York City's Abyssinian Baptist Church, he became known as a militant African-American leader and flamboyant U.S. congressman (1945–70). He was expelled (1967) by the House of Representatives for misusing public funds and unbecoming conduct, but the U.S. Supreme Court overturned (1969) his expulsion.

Powell, Anthony, 1905–, English novelist. In his 12-volume series *A Dance to the Music of Time,* which begins with *A Question of Upbringing* (1951) and ends with *Hearing Secret Harmonies* (1976), he provides a panoramic look at English upper- and middle-class life over a 60-year period.

Powell, Colin (Luther), 1937–, African-American U.S. army general, the highest ranking African-American officer in U.S. history and chairman (1989–93) of the Joint Chiefs of Staff; b. N.Y.C. He served two tours of duty (1962–63, 1968–69) during the Vietnam War and later served in both command (commander, 2d Brigade, 101st Airborne Division, 1976–77; commander, V Corps, Europe, 1986) and political (military assistant to the Deputy Defense Secy., 1979–81, and to the Defense Secy., 1983–86) positions. From 1987 to 1989 he was Pres. Reagan's national security adviser. In 1989 he was made a four-star general and was appointed chairman of the Joint Chiefs of Staff. Powell played an influential role in the planning of U.S. strategy during the PERSIAN GULF WAR.

Powell, John Wesley, 1834–1902, American geologist and ethnologist; b. Mt. Morris (now part of New York City). Noted for his explorations of the western U.S., he made a survey of the Colorado R. in 1869, passing through the Grand Canyon by boat, a hazardous feat described in his *Explorations of the Colorado River* (1875). His efforts helped establish the U.S. Geological Survey, which he headed from 1881 to 1894.

Powell, Lewis Franklin, Jr., 1907–, associate justice of the U.S. SUPREME COURT (1971–87); b. Suffolk, Va.; grad. Washington and Lee Law School (1931) and Harvard Law School (1932). He was a practicing lawyer and president (1964–65) of the American Bar Association prior to his appointment to the Supreme Court by Pres. Nixon. Powell tended to take conservative positions on the Court, especially in criminal justice cases, but he sometimes voted with the Court's liberals on social issues, such as abortion.

power, in physics, the time rate of doing WORK or of producing or expending ENERGY. The unit of power in the METRIC SYSTEM is the watt, which equals 1 joule per second. It is also the amount of power that is delivered to a component of an electric circuit when a current of 1 ampere flows through the component and a voltage of 1 volt exists across it. The ENGLISH UNIT OF MEASUREMENT is the horsepower, which equals 550 foot-pounds per second or 746 watts.

power, electric, is the rate per unit of time at which electric ENERGY is consumed or produced. Electric POWER is usually measured in watts or kilowatts (1,000 watts). The energy supplied by a current to an appliance enables it to work or to provide other forms of energy such as light or heat. The amount of electric energy an appliance uses is found by multiplying its power rating by the operating time. Units of electric energy are usually watt-seconds (joules), watt-hours, or kilowatt-hours (the choice for commercial applications). Generally, practical electric-power-generating systems convert mechanical energy into electric energy (see GENERATOR). Whereas some electric plants obtain mechanical energy from moving water (water power or hydroelectric power), the vast majority derive it from heat engines in which the working substance is steam generated by heat from combustion of fossil fuels or nuclear reactions (see NUCLEAR ENERGY; NUCLEAR REACTOR). Although the conversion of mechanical energy to electric energy may approach 100% efficiency, the conversion of heat to mechanical energy is about 41% efficient for a fossil-fuel plant and about 30% for

a nuclear plant. It is thought that a magnetohydrodynamic generator, which operates by using directly the kinetic energy of gases produced by combustion, would have an efficiency of about 50%. Although FUEL CELLS develop electricity by direct conversion of hydrogen, hydrocarbons, alcohol, or other fuels, with an efficiency of 50 to 60%, their high cost has restricted their use to space programs. SOLAR ENERGY has been recognized as a feasible power source. It can be exploited through wind TURBINES, PHOTOVOLTAIC CELLS, and heat engines, as well as through both conventional and low-head hydroelectric power plants. Research and development is bringing down the costs. An important problem in utilizing solar energy is related to the variable nature of sunlight and wind. To minimize energy losses from heating of conductors and to economize on the material needed for conductors, electricity is usually transmitted at the highest voltages possible. As modern TRANSFORMERS are virtually loss free, the necessary steps upward or downward in voltage are easily accomplished. Electric utilities producing power are tied together by transmission lines into large systems called power grids. They are thus able to exchange power, so that a utility with low power demand can assist another with a high demand. See also ENERGY, SOURCES OF.

Powhatan Confederacy, a group of 30 Native American tribes of the Eastern Woodlands (see NORTH AMERICA, INDIGENOUS PEOPLES OF), of the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). The Powhatan lived in 200 palisaded settlements along coastal Virginia and Chesapeake Bay, hunting, fishing, and raising corn. Chief Powhatan, or Wahunsonacock, was head of the confederacy when JAMESTOWN was settled in 1607. The English seized his best land, but secured peace through John ROLFE's marriage (1614) to Powhatan's daughter POCAHONTAS. In 1622 Powhatan's successor, Opechancanough, attacked the English, killing 350; he was murdered after leading a last uprising (1644). After 1722 the tribes mixed with the settlers, and the confederacy disappeared. Their descendants include the Chickahominy and other small tribes of the Virginia and Chesapeake area.

Poznań [pôz'nänyə], Ger. *Posen,* city (1989 est. pop. 586,000), W central Poland, on the Warta R. It is a port and producer of machinery, metals, and chemicals. Founded by the 10th cent., it passed to Prussia (1793, 1815) before reverting (1919) to Poland. In 1956 labor unrest in Poznań spread to other cities, leading to major political changes in Poland. The city possesses a Gothic cathedral and a 16th-cent. city hall.

Pr, chemical symbol of the element PRASEODYMIUM.

Prado, Madrid, national Spanish museum of painting and sculpture, one of the finest in Europe. Situated on the Paseo del Prado, it was begun by the architect Juan de Villanueva in 1785 for Charles III, as a museum of natural history, and finished under Ferdinand VII. It was maintained by the royal family and called the Royal Museum until 1868, when it became national property. The Prado has priceless masterpieces from the Spanish, Flemish, and Venetian schools, e.g., works by El GRECO, GOYA, RUBENS, and TITIAN.

praetor or **pretor,** in ancient Rome, a magistrate. In 242 B.C. two praetors were appointed; the urban praetor decided cases in which citizens were parties, and the peregrine praetor decided cases between foreigners.

Praetorians, bodyguard of the ancient Roman emperors, formally organized in the time of AUGUSTUS from the troop that had guarded the general commanding in Rome. They attended the emperor wherever he went, had special privileges, and in times of trouble chose many of the emperors. CONSTANTINE I disbanded them in 312.

pragmatic sanction, decision of state dealing with a matter of great importance. The **Pragmatic Sanction of Bourges,** issued by CHARLES VII of France in 1438, sharply limited papal power over the church in France. It began a long period of tense relations between church and state in France. There have been many pragmatic sanctions, but, when used alone, the term always refers to the **Pragmatic Sanction,** 1713, issued by Holy Roman Emperor CHARLES VI, whereby all the HAPSBURG lands would be inherited by his daughter, MARIA THERESA (but not the imperial dignity, which was elective). Owing to a long campaign by the emperor, most of the European powers accepted the sanction; the major exception was the Bavarian elector (later Emperor CHARLES VII), who was married to one of the Hapsburg princesses passed over in favor of Maria Theresa. In spite of the guarantees her father had obtained, when Maria Theresa acceded to the Hapsburg succession in 1740, she had to defend her rights in a long and bitter struggle, the war of the AUSTRIAN SUCCESSION. (1740–48). The treaty of Aix-la-Chapelle (1748) confirmed the Pragmatic Sanction.

pragmatism, method of philosophy in which the truth of a proposition is measured by its correspondence with experimental results and by its practical outcome. Thus pragmatists hold that truth is modified as discoveries are made and that it is relative to time and place and purpose of inquiry. C.S. PEIRCE and William JAMES were the originators of the system, which influenced John DEWEY.

Prague [präg], Czech *Praha,* city (1990 pop. 1,214,772), capital and largest city of the Czech Republic, on both banks of the Vltava R. It is a port, an industrial center producing automobiles, machinery, and other manufactures, and one of Europe's great historic cities. A trading center by the 10th cent., it became the capital of BOHEMIA and was later (14th–17th cent.) one of the residences of the emperors of the HOLY ROMAN EMPIRE. The religious reformer John HUSS taught at its university (est. 1348). HAPSBURG rule began in 1526. Prague figured prominently in the THIRTY YEARS WAR (1618–48), the War of the AUSTRIAN SUCCESSION (1740–48), the SEVEN YEARS WAR (1756–63), and the REVOLUTIONS OF 1848. In 1918 it became the capital of the new Czechoslovak republic. It was occupied (1939–45) by the Germans during World War II. In 1968 Prague was the center of Czech resistance to the Soviet invasion. With the dissolution of Czechoslovakia in 1993, Prague became the capital of the Czech Republic. The old section is an architectural treasure, the site of such buildings as Hradčany Castle (14th cent.) and the Gothic Cathedral of St. Vitus. The city's cultural tradition is typified by such figures as KEPLER, SMETANA, DVOŘÁK, KAFKA, and ČAPEK.

Praia, city (1980 pop. 37,676), capital of CAPE VERDE.

prairie dog, short-tailed, ground-living, herbivorous RODENT (genus *Cynomys*) of the SQUIRREL family, found in the W U.S. and N Mexico and related to ground squirrels, CHIPMUNKS, and marmots. Prairie dogs, named for their barking cries, are 12 to 15 in. (30 to 36 cm) long with short, buff-colored fur. Black-tailed prairie dogs live in colonies of connected burrows; these may extend many miles and include thousands of individuals.

prairies, generally level, originally grass-covered and treeless plains of North America, stretching from Ohio to the Great Plains. They correspond to the PAMPAS and LLANOS of South America, the STEPPE of Eurasia, and the high VELD of South Africa. Often called the vanishing grasslands, prairies are among the most productive agricultural regions.

Prakrit [prä'krĭt], any number of languages belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See LANGUAGE (table).

praseodymium (Pr), metallic element, discovered in 1855 by C.A. von Welsbach. It is a soft, malleable, ductile, silver-yellow RARE-EARTH METAL in the LANTHANIDE SERIES. Its compounds are used in carbon electrodes for arc lighting and to color enamel and glass. See ELEMENT (table); PERIODIC TABLE.

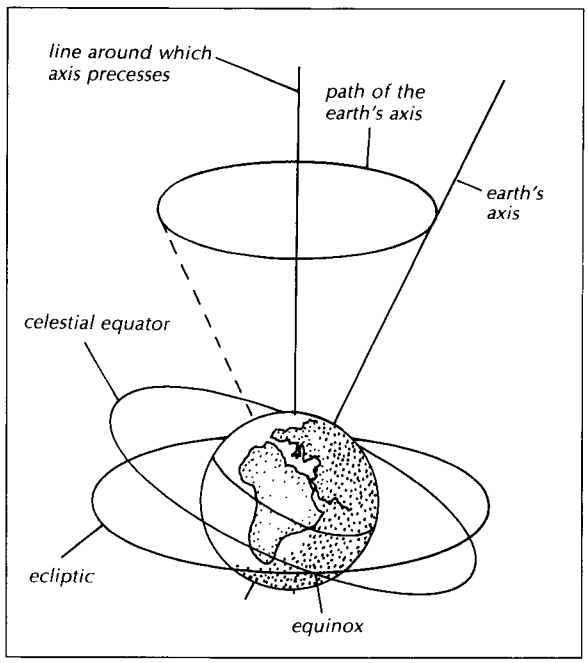
Praxiteles [präksĭt'əlēz], fl. c.370–330 B.C., famous Attic sculptor. His *Hermes with the Infant Dionysus* is the only undisputed extant original by any of the ancient masters. Copies of his most renowned statues, e.g., the *Aphrodite of Cnidus* (Vatican), *Apollo Sauroctonus* (Vatican), and *Apollino* (Florence), illustrate his choice of youthful gods and other beings in which joy of life finds expression. In its delicate, perfect modeling and strength of conception, his treatment of marble is unsurpassed.

praying mantis, large, slender, slow-moving winged INSECT, so called because of its habit of standing on its hind legs, with the forelegs raised as if in prayer. Mantises range in length from 1 to 5 in. (2.5 to 12.5 cm). Their typically green or brown PROTECTIVE COLORATION camouflages them among leaves and twigs. Voracious predators, they feed on insects and other invertebrates; the female often eats the male after mating.

Precambrian time or **Precambrian era:** see GEOLOGIC ERA (table).

precession of the equinoxes, westward motion of the EQUINOXES along the ECLIPTIC. The precession, first noted (c.120 B.C.) by HIPPARCHUS and explained (1687) by Isaac NEWTON, is primarily due to the gravitational attraction of the moon and sun on the earth's

equatorial bulge, which causes the earth's axis to describe a cone in somewhat the same fashion as a spinning top. As a result, the equinoxes, which lie at the intersections of the celestial equator and the ecliptic, move on the celestial sphere (see ASTRONOMICAL COORDINATE SYSTEMS). Similarly, the celestial poles move in circles on the celestial sphere, so that at various times different stars occupy positions at or near one of these poles (see POLARIS). After about 26,000 years the equinoxes and poles lie again at nearly the same points on the celestial sphere. The gravitational influences of the other planets cause a much smaller amount of precession.



Precession of the equinoxes (the points at which the earth's celestial equator intersects its ecliptic) is due to the slow rotation of the earth's axis around a perpendicular to the ecliptic.

precipitate, a solid obtained by precipitation, i.e., the separation of a substance from a SUSPENSION, sol (see COLLOID), or SOLUTION. In a suspension, such as sand in water, the solid spontaneously precipitates (settles out) on standing. In a sol the particles are precipitated by coagulation. A solute may be precipitated by evaporation or by the addition of a compound that reacts with the solute to form an insoluble precipitate. In each case, the precipitate formed may settle out spontaneously or may be collected by filtration or centrifugation.

pre-Columbian art and architecture. Long before Europeans arrived in the Western Hemisphere, Mexico, Central America, and the Andean region of South America were the site of indigenous civilizations whose remains reveal exceptional artistic achievement. The MAYA of Yucatán and adjacent areas of Central America developed (300 B.C.–A.D. 300) an elaborate calendar, monumental palaces and pyramids, polychrome pottery, stone stelae, and stylized wall paintings and bas-reliefs. Their diverse architectural styles are seen at Tikal, Piedras Negras, Palenque, and UXMAL. The OLMEC civilization, to the west, is noted for its stone carvings: small, detailed jade objects and colossal, realistic basalt heads. The finest Olmec period, 800–400 B.C., is typified by objects found at La Venta. To the west of the Olmec and Maya regions was TEOTIHUACÁN, an extraordinary urban center of pyramids, temples, and royal processional roads dating from the 1st cent. A.D. to 700. To the south are the ruins of Copán and Quiriguá, with their huge, elaborately carved stelae. More delicate forms are seen in the stucco sculptures of Palenque. After Teotihuacán was destroyed (c.700) by invaders, much of north and central Mexico was dominated by the TOLTEC, who invaded such Maya areas as CHICHÉN ITZÁ (c.987) and influenced local styles. The last native conquerors were the AZTEC, whose civilization fell to the Spanish in 1519. By 1344 the Aztec had founded a magnificent capital, Tenochtitlán, on the site of present-day MEXICO CITY. Its eclectic style drew on traditions of conquered areas and reflected the harsh Aztec religion in carved depictions of human sacrifice. Craftsmen of subjugated groups, especially the MIXTEC, created magnificent works in jade, gold, feathers, pottery, and textiles. The Mixtec and ZAPOTEC built superb architectural and decorative structures in OAXACA, at Monte Albán and Mitla, until A.D. c.900. Ceramic figurines of early date (c.500 B.C.) have been found at Tlatilco, in the Valley of Mexico. Fanciful, often grotesque terra-cotta figurines were created (A.D. c.300–900) in the western Mexican states of Nayarit, Jalisco, and Colima. In Peru, pre-Inca cultures produced such splendid works as the Cupisnique pottery of the north coast, the pottery and textiles of Paracas, and the pottery of the NAZCA and Mochica civilizations. The painted portrait heads of the Mochica are the high point of realism in pre-Columbian art. Their Pyramid of the Sun, the largest in South America, attests to their gifts as builders. Other pre-Inca cultures include the TIAHUANACO and the CHIMU. The Chimu capital, CHAN CHAN, was a great center until the INCA conquered the Chimu in the 15th cent. The cities of CUZCO and MACHU PICCHU and the fortresses of Sacsacsahuamán and Ollantaytambo show the unsurpassed engineering skill of the Inca. Their stone carving and metalwork is of the highest quality in the world. The Inca civilization was conquered by the Spanish in 1538.

predestination, in theology, doctrine that asserts that God predestines from eternity the salvation of certain souls. So-called double predestination, as in Calvinism, is the added assertion that God also foreordains certain souls to damnation. Based on the omniscience and omnipotence of God, predestination is closely related to the doctrines of divine providence and grace. The Roman Catholic Church teaches that predestination is consistent with FREE WILL since God moves the soul according to its nature. Calvinism rejects the role of free will, maintaining that grace is irresistible.

preeclampsia: see TOXEMIA.

pregnancy and birth. *Pregnancy,* the process in which the female mammal carries and nurtures within it the developing young, is the period between fertilization of an egg (conception) and expulsion of a developed fetus (birth). Once fertilized, an egg divides into a tiny ball of cells and embeds itself in the wall of the uterus, a muscular, expandable organ. At this early stage of development, the growing organism is called the embryo. Some cells of the embryo develop into the placenta (a disk of tissue that brings nourishment from the mother and accepts waste substances from the fetus); the umbilical cord (the cord between embryo and placenta, carrying nutrients and waste); and the protective amniotic sac and fluid surrounding the embryo. During the course of human pregnancy, changes take place in the mother's body to meet the fetal demands on it: The uterus and breasts enlarge, and blood composition and volume change. It takes about 280 days for the embryo (in later stages called the fetus) to develop the structures and organs of a fully formed human. *Birth* is the process by which the fetus is expelled from the uterus. Rhythmic contractions of the uterus, called labor, dilate the neck (cervix) of the uterus and expel the baby and later the placenta. *Natural childbirth* is birth with little or no use of painkilling drugs. In the Lamaze method, prospective parents are taught physical and mental techniques for reducing pain and discomfort and participating more fully in the birth process. Birth by the "Leboyer method" emphasizes extremely gentle handling of the newborn. CESAREAN SECTION is delivery of an infant by removing it from the uterus surgically. See also AMNIOCENTESIS; CHORIONIC VILLUS SAMPLING; GYNECOLOGY; MIDWIFERY.

prehistoric man: see HUMAN EVOLUTION.

premenstrual syndrome (PMS), any of various symptoms experienced by women of childbearing age in the days immediately preceding MENSTRUATION. The symptoms include behavioral changes, emotional upsets, swelling and soreness of the breasts, and headaches. Some 70–90% of menstruating women are said to have PMS on a cyclical basis. The exact cause is unknown, but it may be due to various hormonal imbalances.

premier: see PRIME MINISTER.

Prendergast, Maurice Brazil, 1859–1924, American painter; b. St. John's, N.F., Canada. A member of the EIGHT, Prendergast traveled to Europe many times and evolved a style akin to POST-IMPRESSIONISM but executed with freer brush strokes. His landscapes and figure compositions evoke the quality of a lively tapestry, e.g., *Promenade, Gloucester* (Whitney Mus., N.Y.C.).

Pre-Raphaelites, brotherhood of English painters and poets, formed in 1848 to protest low standards in British art. The principal founders were D.G. ROSSETTI, W. Holman HUNT, and John MILLAIS. They turned from the materialism of industrialized England, seeking refuge through literary symbolism and imagery in the beauty and simplicity of the medieval world. Influenced by the NAZARENES, they imitated the innocence of style of Italian painters prior to RAPHAEL. They attracted numerous followers, e.g., Edward BURNE-JONES and William MORRIS, before the movement disbanded after 1853. Their works are nostalgic in tone, and brightly colored, with meticulous detail and mannered style.

Presbyterianism, form of Christian church organization based upon administration by a hierarchy of courts composed of clerical and lay presbyters. In polity it stands between episcopacy and CONGREGATIONALISM. Presbyters (or elders) manage the spiritual conduct of the church; deacons and trustees may handle temporal affairs. The church courts, from lowest to highest, are the court of the congregation or session; the presbytery or colloquy; the synod; and the general assembly, presided over by a moderator. Presbyterianism is the main branch of the Reformed churches and embodies the principles of CALVINISM. It holds the Bible as the sole rule of faith and has two sacraments, baptism and the Lord's Supper. Calvinism first influenced the churches of Geneva and of the HUGUENOTS, and John KNOX founded (1557) a Presbyterian church in Scotland. Francis MAKEMIE, an Irish missionary, set up the first presbytery in America at Philadelphia in 1706. In 1983 the United Presbyterian Church in the United States of America and the Presbyterian Church in the United States merged to form the Presbyterian Church (USA). It has about 2.9 million members. In Europe the Church of Scotland, the Calvinistic Methodist Church in Wales, the Presbyterian Church of England, and the Presbyterian Church of Ireland are major Presbyterian bodies.

preschool education: see HEAD START; KINDERGARTEN; NURSERY SCHOOL.

Prescott, William Hickling, 1796–1859, American historian; b. Salem, Mass. He is famous for two colorful, vivid accounts of the exploits of the CONQUISTADORS, *History of the Conquest of Mexico* (1843) and *The Conquest of Peru* (1847).

preserving: see CANNING.

president, head of state and often head of government in modern REPUBLICS. Presidential powers vary widely. In parliamentary republics, such as India and Italy, the office is largely ceremonial, with executive power exercised by the PRIME MINISTER or premier. In France and Russia the president has considerable power but shares some executive functions with the premier. In the U.S. the president is the head of state and commander in chief of the armed forces, as well as the chief executive officer, responsible for carrying out the law. A U.S. citizen must be at least 35 years old and native-born to be president, and can serve only two four-year terms. In some countries presidents have assumed dictatorial powers, occasionally installing themselves as "president for life."

presidium: see POLITBURO.

Presley, Elvis, 1935–77, American singer; b. Tupelo, Miss. Influenced by rhythm and blues and COUNTRY AND WESTERN MUSIC, he played guitar and rose to stardom in 1956, dominating ROCK MUSIC until 1963. In performance he had a pleasant baritone voice and an aggressive, sexual delivery. His hits include "Heartbreak Hotel" and "Don't Be Cruel."

press, freedom of the, liberty to print information and opinions without prior government restraint. The publisher is legally responsible for what is printed and can be sued for LIBEL and other infringements of the law. The struggle against CENSORSHIP began in England in the 16th–17th cent. In the American colonies it began in 1734, when the John Peter ZENGER case established the precedent that criticism that is true is not libelous. Freedom of the press, guaranteed by the federal government under the 1st amendment to the U.S. CONSTITUTION, is guaranteed by the states under the 14th amendment. Restrictions have occurred, however During WORLD WAR I the Espionage (1917) and Sedition (1918) acts censored pro-German publications. Justice Oliver Wendell HOLMES set down (1919) a criterion of "clear and present danger," stil a guideline for Congress and the courts. In WORLD WAR II the Office of Censorship obtained general voluntary compliance. Censorship for national security reasons was carefully limited by the Supreme Court in the "Pentagon Papers" case (1971), in which the *New York Times* was allowed to print secret government documents concerning the Vietnam War. Freedom of the press may also be limited by restricted access to government information; this concerned was addressed by the FREEDOM OF INFORMATION ACT. The extension of freedom of the press to the electronic media is complicated by the fact that radio and television airwaves are public property, and that broadcasters operate under licensing agreements.

pressure, ratio of the force acting on a surface to the area of the surface. A fluid (liquid or gas) exerts a pressure on all bodies immersed in it. For a fluid at rest, the difference in pressure between two points in it depends upon only the density of the fluid and the difference in depth or altitude between the two points. Atmospheric pressure is measured with a BAROMETER. Other instruments for measuring pressure are commonly termed pressure gauges; they include the Bourdon gauge and the manometer. See also ARCHIMEDES' PRINCIPLE; GAS LAWS; HYDRAULIC MACHINERY.

Prester John, legendary Christian priest and king who ruled over a vast, wealthy empire in either Asia or Africa. Dating from the 12th cent., his legend was fueled in the Middle Ages by widely circulated letters purporting to be his.

pretor: see PRAETOR.

Pretoria, city (1985 pop. 443,059), administrative capital of South Africa and of TRANSVAAL prov. The city has important industries, especially iron and steel, as well as automobile assembly plants, railroad and machine shops, and flour mills. Founded in 1855, it became the capital of the South African Republic (the Transvaal) in 1860.

Pretorius, Andries Wilhelmus Jacobus, 1799–1853, Boer leader. His defeat (1838) of the ZULUS led to the founding of the Boer Republic of Natal. In 1848 he created the nucleus of what became the TRANSVAAL. The city of PRETORIA is named for him. His son, **Martinus Wessel Pretorius,** 1818?–1901, became the first president (1857–77) of the Transvaal; concurrently he was president (1859–63) of the Orange Free State. After Britain annexed the Transvaal in 1877, he served with Paul KRUGER in a government opposed to British rule. See also SOUTH AFRICA.

preventive medicine, medical practice that focuses on preventing physical or mental illness in the individual or the community. It encompasses such activities as VACCINATION, diet and health counseling, various diagnostic procedures, public hygiene, and educational campaigns. Modern dentistry has made extensive use of preventive techniques in reducing tooth and gum disease.

Previn, André, 1929–, American conductor, composer, and pianist; b. Germany, as Andreas Ludwig Priwin. He has recorded classical music since 1946, and in the 1950s he made a number of highly successful JAZZ piano albums. He has also composed film scores. Previn conducted the London Symphony (1968–79) and Royal Philharmonic (1987–92) and served as musical director of the Pittsburgh Symphony (1976–1984), Los Angeles Philharmonic (1984–89), and Royal Philharmonic (1985–86).

Prevost, Sir George [pre'vō], 1767–1816, British soldier and governor in chief (1811–15) of CANADA. As commander of British forces in the WAR OF 1812 he was publicly humiliated for a British retreat (1813) and defeat (1814) at Plattsburg.

Prévost d'Exiles, Antoine François [prāvō'dāgzēl], known as **Abbé Prévost,** 1697–1763, French author. He entered a Benedictine abbey (1720), but fled (1728) to lead an adventurous life in England, Holland, and Germany. Returning to France, he was named head of a priory (1754) by the pope. Of his writings, only the brilliant psychological novel *Manon Lescaut* is still widely read.

Priam, in Greek mythology, king of Troy, husband of HECUBA.

priapulid, member of a small phylum (Priapulida) of predatory unsegmented marine worms that live in the sand and mud at the sea bottom. The largest are 4–6 in. (10–17 cm) long, but most species are less than .05 in. (.2 cm) in size. They have a spiny body with

an anterior that can be everted or inverted into the trunk for locomotion or feeding.

Price, (Mary) Leontyne, 1927–, African-American soprano; b. Laurel, Miss. She has sung at the METROPOLITAN OPERA (N.Y.C.) since 1961, and is known for the range and power of her voice, e.g., in the title roles of VERDI's *Aïda* and PUCCINI's *Madame Butterfly*.

Pride, Thomas, d. 1658, parliamentary soldier in the ENGLISH CIVIL WAR. Acting on orders of the army council, he undertook (Dec. 1648) **Pride's Purge,** expelling 143 members (mostly Presbyterians) from Parliament on grounds they were royalists.

Priestley, J(ohn) B(oynton), 1894–1984, English writer. His works include criticism, e.g., *The English Novel* (1927); novels such as *Bright Day* (1946); social and experimental drama, e.g., *The Glass Cage* (1957); history; mysteries; and social criticism.

Priestley, Joseph, 1733–1804, English theologian and scientist. Trained for the Presbyterian ministry, he later adopted Unitarian views and wrote widely on theological and philosophical issues. His improved techniques for studying gases led to his discovery of sulfur dioxide, ammonia, and what he called "dephlogisticated air," the gas that Antoine LAVOISIER named OXYGEN. He was an opponent of orthodox doctrines, England's colonial policy, and the slave trade. Due to his sympathy with the aims of the French Revolution, his house was wrecked and his library and laboratory were destroyed. In 1794 he emigrated to the U.S.

primate, member of the mammalian order Primates, which includes human beings, APES (e.g., GIBBONS, ORANGUTANS, CHIMPANZEES, and GORILLAS), MONKEYS (e.g., BABOONS and MANDRILLS), and prosimians, or lower primates (e.g., TREE SHREWS, LEMURS). Nearly all inhabit warm climates and are arboreal, although a few are terrestrial. Unspecialized anatomically, primates are distinguished by social organization and evolutionary trends within the order tending toward increased dexterity and intelligence.

Primaticcio, Francesco [prēmätēt'chō], 1504–70, Italian painter, called Le Primatice by the French. He was influenced by GIULIO ROMANO's methods of illusionism. Invited (1532) by FRANCIS I of France to help decorate the castle at Fontainebleau, he became director of the project in 1540. Only a few of his works there survive. He decorated other châteaus, designed tomb monuments for Francis I and Henry II, and extended the influence of Italian art in France.

prime meridian, meridian designated 0° LONGITUDE, from which all other longitudes are measured. By international convention, it passes through the original site of the Royal Observatory in GREENWICH, England. For this reason it is often called the Greenwich meridian.

prime minister or **premier,** in parliamentary systems, the head of government, but not of state, and chief member of the CABINET. Under the procedure evolved in Great Britain and followed by most parliamentary systems, the officeholder is the leader of the party with a majority of members in the legislature and is himself or herself a member of that body. If support is lost in the legislature, the prime minister is expected to resign. In France and Russia the premier, appointed by the president, has fewer powers than the premiers of many other countries.

prime number: see NUMBER THEORY.

prime rate: see INTEREST.

primitivism, in art, fresh and fanciful style of works by untrained artists such as Henri ROUSSEAU and Grandma MOSES; also, the style of early American naïve painters such as Edward HICKS and various European schools prior to c.1450.

Primo de Rivera, Miguel [prē'mō thā rēvā'rä], 1870–1930, Spanish dictator (1923–30). Seizing power in a coup (1923), he dissolved the CORTES and established a military directory. Although his military government was replaced (1925) by a civil one, he continued to rule with an iron hand. After a liberal uprising failed (1929), he was forced to resign (1930) because of his government's economic failures.

primrose, name for the genus *Primula* of the family Primulaceae, low perennial herbs found on all continents. The family includes the primroses, cyclamens (genus *Cyclamen*), and pimpernels (genus *Anagallis*). Species of all these genera are cultivated as rock-garden, border, and pot plants. The primrose is a common and favored wildflower of England, and several species are indigenous to North America. The EVENING PRIMROSE is not a true primrose. Cyclamens are chiefly native to the Alps; *C. indicum* is a common florists' pot plant in the U.S. The scarlet pimpernel (*A. arvensis*), native to Eurasia but naturalized in the U.S., has flowers that close on the approach of bad weather.

Prince Edward Island, province (1991 pop. 129,765), 2,184 sq mi (5,657 sq km), E Canada. Canada's smallest and least populous province, it is separated from New Brunswick and Nova Scotia by the Northumberland Strait. CHARLOTTETOWN is the capital. One of the Maritime Provinces, Prince Edward Island has generally low, level land and is c.140 mi (225 km) long and up to 35 mi (56 km) wide. White sandy beaches line the deeply indented north shore, where Prince Edward Island National Park attracts many tourists. Much of its economy depends on government (federal and provincial) spending and employment. Fishing is an important industry, and livestock, fruits, vegetables, and potatoes are also produced. Manufacturing is largely limited to food processing. Jacques CARTIER landed on the island in 1534, and CHAMPLAIN named it Île St. Jean in 1603. The French made the first permanent settlement in 1719, and the British gained permanent control of the island in 1763. That year the island was annexed to Nova Scotia, but it became a separate colony in 1769. In 1799 it was renamed in honor of Edward, duke of Kent. Lord SELKIRK established (1803) a colony of Scots there, and their descendants still form a large part of the population. Responsible (cabinet) government was achieved in 1851. In 1864 delegates from the Maritime Provinces met at Charlottetown to discuss union, the first step toward Canadian confederation, achieved in 1867. Prince Edward Island did not join the confederation until 1873. Catherine Callbeck became Canada's first female provincial premier in 1993 when she led the Liberals to a sweep. The province sends four senators (appointed) and four representatives (elected) to the national parliament.

Princeton, borough (1990 pop. 12,016) and adjacent township (1990 pop. 13,198), W N.J.; settled late 1600s, borough inc. 1813. It is the seat of Princeton Univ., the Inst. for Advanced Study, other educational institutions, and many corporate headquarters and research centers. Princeton was the scene of a Revolutionary War victory by WASHINGTON's army (Jan. 3, 1777), and the university's administration building, Nassau Hall, was the seat of the CONTINENTAL CONGRESS from June to Nov. 1783. Princeton was the birthplace of Paul ROBESON and the home of Albert EINSTEIN.

Princeton University, at Princeton, N.J. Founded in 1746 as the College of New Jersey, at Elizabeth, N.J., by evangelical Presbyterians, it was moved in 1756 to Princeton, where it was to become one of the nation's leading institutions of higher education. It gained university status in 1896 and, under Woodrow WILSON, introduced (1905) the preceptorial system, which led to a greater degree of individualized instruction. In addition to its college and graduate school, Princeton is noted for its school of public and international affairs and for plasma physics, aerospace, and population research.

printed circuit, ELECTRIC CIRCUIT in which the metallic conducting paths connecting circuit components are affixed to a flat, insulating base board typically composed of plastic, glass, ceramic, or some other DIELECTRIC. Conducting paths may be placed on the base by etching, die stamping, or spraying the pattern through a stencil or mask. The circuit components, such as RESISTORS and CAPACITORS, are not usually produced by these processes but rather are mounted afterward on the base.

printer, COMPUTER output device that records data as a sequence of discrete alphanumeric or graphic characters on paper or another medium. *Impact printers* use a mechanical hammering device to produce each character. A formed character printer forces metal or plastic characters against an inked ribbon to produce a sharp image on paper; the characters may be on a moving bar, a rapidly rotating chain, a rotatable ball, or wheel spokes. A *dot matrix printer* uses a matrix of tiny pegs that, when hit from behind against a ribbon, impart a set of dots to form a character on the paper; a wide variety of characters and graphics are created using different dot combinations. Non-impact printers use thermal and electrostatic, rather than mechanical, techniques. *Bubble-jet printers* (or *ink-jet printers*) squirt heated ink through a matrix of holes to form characters. *Laser printers* form an image of the output on

a selenium-coated drum using laser light that is turned on and off by data from the computer and then transfer the output from the drum using PHOTOCOPYING techniques. *Thermal-wax-transfer printers* and *dye-sublimation printers* use heat to transfer color pigment from a ribbon to a special paper to produce photographic-quality color images.

printing, the reproduction of lettered or illustrated matter through the use of mechanical, photographic, or electrostatic devices. In addition to the letters themselves, the elements involved in printing include the press and various methods for setting type and for making the reproducing printing surface, or plate. The press used by Johannes GUTENBERG in 15th-cent. Germany was a hand press, in which ink was rolled over the raised surfaces of hand-set letters held within a form and the form was then pressed against a sheet of paper. The hand press remained in use for all forms of printing until the early 19th cent. A steam-powered press with a flat type-bed was used by *The Times* of London beginning in 1814. In 1847 the American Richard Hoe developed a high-speed rotary press in which the printing surface was wrapped around a cylinder. Later presses used continuous rolls of PAPER and incorporated folding, cutting, and paper-moving devices that vastly increased printing speed. The first mechanical typesetter, the Linotype machine, was invented by Ottmar Mergenthaler in 1884. Operated by a typewriter-keyboard, it assembles brass matrices into a line and casts the line as a single metal slug. Other machine-set type systems were developed, notably the Monotype (first used in 1897), which casts individual characters from a punched tape produced by a keyboard operator. The development of photocomposed "cold type" (as distinguished from "hot," or cast-metal, type) has further increased typesetting speeds. Computerized phototypesetters project the digitized images of type onto a film that is then used to make a plate. **Letterpress** is printing from a raised, inked surface. Various inventions have improved the letterpress printing surface, especially the stereotype, which can produce a large metal plate of a newspaper page from a mold made of pulp; and the later electrotype, which uses an electrolytic process to create a curved metal plate. In **intaglio,** the design to be produced is cut below the surface of the plate, and the incised lines are filled with ink that is then transferred to paper (see ENGRAVING; ETCHING). Photogravure is an intaglio process in which the plate is produced photographically. **Offset,** or **planographic, printing,** derived from LITHOGRAPHY, uses a plate treated so that ink will adhere only to the areas that will print the design. The plate transfers its ink to a rubber cylinder, which in turn offsets it onto paper. Color printing is achieved by photographically separating four basic colors (black, magenta, yellow, and cyan, a blue-green) from the original picture, making a plate for each color, then using the plates to print the colors consecutively over one another. See also PHOTOCOPYING.

prion, unidentified infectious agent thought to cause a group of human and animal diseases (Creutzfeldt-Jacob disease, kuru, scrapie, bovine spongiform encephalitis) known as **prion diseases.** The diseases slowly attack brain tissue, often leaving microscopic spongelike holes, and are characterized by accumulations of abnormal forms of a protein, called *prion protein,* that occurs naturally in brain tissue. Prion dieases have both hereditary and infectious components; some scientists believe the abnormal prion protein is the infectious agent. There is no effective treatment. See also SLOW VIRUS.

Priscian (Priscianus Caesariensis) [prĭsh'ən], fl. 500, Latin grammarian who taught at Constantinople. His *Commentarii grammatici,* in 18 books, long a standard text, was the basis of work by Rabanus Maurus in the Middle Ages.

prism, in optics, a piece of translucent glass or crystal with a triangular cross section, used to form a SPECTRUM of light by separating it according to colors. Prisms are also used in optical instruments, such as binoculars, for changing the direction of light rays by total internal reflection.

prison, place of confinement for the punishment and rehabilitation of criminals. By the late 18th cent. in Europe, when imprisonment punished all but capital crimes, Cesare BECCARIA and John Howard began urging reform of inhumane conditions, efforts continued in the 19th cent. by Elizabeth FRY and, in the U.S., by Dorothea DIX. Irish influences led to the practice of parole. In the U.S., 20th-cent. reforms, aimed primarily at rehabilitation, include psychiatric aid, vocational training, and work-release programs, although the notorious chain gangs, in which chained convicts are forced to do heavy labor, and corporal punishment have not entirely disappeared. U.S. prisons range from local jails to state and federal penitentiaries, with special facilities for juveniles, the sick, and the criminally insane. Overcrowding, tense race relations, and insufficiently professional correctional staffs contributed to major riots in U.S. prisons in recent decades, and rates of recidivism (return to crime) among prisoners have remained high. Since 1982 many states have used prison "boot camps" with military-like regimens in an attempt to shock first offenders and bolster their self-esteem, as well as lower the long-term costs of crime and imprisonment, but the results of such programs are unclear.

Pritchett, V(ictor) S(awdon), 1905–, English writer. A craftsman who has contributed to several genres, he is best known for his short stories, collected in many volumes, e.g., *Complete Collected Stories* (1991). Other works include *A Cab at the Door* (1968) and *Midnight Oil* (1972), memoirs; and *The Tale Bearers* (1980), literary essays.

privacy, right of, the right to be protected from unwarranted intrusion by the government, media, or other institutions or individuals. The U.S Supreme Court decision in GRISWOLD V. CONNECTICUT (1965) banned intrusion into marital privacy as a violation of constitutional rights, and sexual privacy was a main foundation of the court's ROE V. WADE decision (1973) overturning state ABORTION statutes. The Privacy Act of 1974 provides for disclosure of, and personal access to, all federal records containing personal information, regulates their transfer to others, and allows for legal remedies in cases of their misuse under the law. The Right to Financial Privacy Act (1978) limits federal access to financial records but places few restrictions on access by states, businesses, and others. The privacy of most other information is not guaranteed. Computer and telecommunications advances have made credit, medical, and other data a readily available, highly marketable commodity, raising many concerns about individuals' privacy.

privatization, return of businesses to private ownership after they have been the property of the state. It is the reverse of NATIONALIZATION. With the collapse of the Soviet empire and its Communist economies, the trend toward privatization has been particularly strong in the nations of the former USSR and Eastern Europe. Privatization has also increased in Western Europe, e.g., Great Britain and France, and in many underdeveloped nations as socialism has lost credibility. In the U.S., the term has often been broadly applied to the contracting out of the management of public schools, prisons, airports, sanitation services, and a variety of other government-owned institutions, especially at the state and local levels.

probability, branch of MATHEMATICS that measures the likelihood that an event will occur. The theory of probability was first developed by Blaise PASCAL in the 17th cent. as a means of solving gambling problems; it was advanced by Pierre de LAPLACE in the early 19th cent. Given an experiment (e.g., tossing a coin), each possible outcome is assigned a number, called a probability measure, that corresponds to its chance of occurring. Probabilities must be between 0 and 1 inclusive (0 corresponding to impossibility, 1 to certainty), and the sum of all probabilities of simple outcomes of an experiment must be 1. For example, if a symmetrical coin is to be tossed, both possible outcomes, heads and tails, have probabilities of ½, because they have equal chances of occurring. Probabilities are often assigned on the basis of relative frequency of occurrence. For example, if weather records for 40 years show that the sun shone 32 times on July 1, then one would assign a probability of $^{32}/_{40}$, or ⅘, to the event that the sun will shine on July 1. Similar probability computations are used in insurance calculations. By adding or multiplying the probabilities of simple events, one can determine the probabilities of compound events, e.g., the probability that a husband and wife will both live to be 70. Sometimes sophisticated counting techniques, such as PERMUTATIONS AND COMBINATIONS, must be used. The application of probability to data collected from samples is the province of STATISTICS.

Procopius [prōkō'pēəs], d. 565?, Byzantine historian. His high con-

nections and public offices give his histories great value as first-hand accounts. His chief works are *Procopius's History of His Own Time* and the largely scandalous and often scurrilous court chronicle *Secret History of Procopius.*

prodigal son, parable of JESUS about a young man who leaves home and becomes a wastrel; repentant, he returns and is received with joyful welcome.

productivity, in economics, the output of any aspect of production per unit of input. It is a measure of the output of a worker, machine, or an entire national economy in the creation of goods and services to produce wealth. Output can be measured in output per acre for land, per hour for labor, or as a yearly percentage for capital. A high national productivity typically indicates efficient production of goods and services and a competitive economy.

profit, in economics, the amount of money remaining from a business enterprise after all expenses, including taxes, have been paid. It is also called return on capital, or earnings. The various kinds of profit include that of the entrepreneur, as payment for management or risk-taking; that of the capitalist, in the form of interest; and that of the landlord, in the form of rent. Profit is the major incentive for production in a capitalist country, but with the rise of a salaried managerial class it has become less personal and more institutional in character.

progeria, syndrome of unknown etiology causing premature aging in children; also known as Hutchinson-Gilford syndrome. Affected children appear normal up to the first year of life. Gradually, characteristics of the disorder become apparent—retarded growth and physical development, loss of body fat, absence of body hair, and baldness. Eventually the child develops dry, wrinkled skin, ARTERIOSCLEROSIS, and other conditions associated with old age. There is no treatment, and death occurs by the second decade.

progesterone, female sex hormone that induces changes in the lining of the uterus essential for implantation of a fertilized egg (see MENSTRUATION). In a pregnant woman, progesterone prevents spontaneous abortion (miscarriage) and prepares the MAMMARY GLANDS for milk production.

programming language, syntax, grammar, and symbols or words used to give instructions to a COMPUTER. Because computers work with binary numbers (see NUMERATION), first-generation languages, called machine languages, required the writing of long strings of binary numbers to represent such operations as add, subtract, and compare. Later improvements allowed octal, decimal, or hexadecimal representation of binary strings. It is difficult to write error-free programs in machine language; many languages have been created to make programming easier and faster. Symbolic, or assembly, languages—second-generation languages—were introduced in the early 1950s. They use simple mnemonics such as "A" for add or "M" for multiply, which are translated into machine language by a COMPUTER PROGRAM called an assembler. An extension of such a language is the macro instruction, a mnemonic (such as "READ") for which the assembler substitutes a series of simpler mnemonics. In the mid-1950s, a third generation of languages came into use. Called high-level languages because they are largely independent of the hardware, these algorithmic, or procedural, languages are designed for solving a particular type of problem. Unlike machine or symbolic languages, they vary little between computers. They must be translated into machine code by a program called a *compiler* or *interpreter.* The first such language was FORTRAN (*FOR*mula *TRAN*slation), developed about 1956 and best used for scientific calculation. The first commercial language, COBOL (*CO*mmon *B*usiness *O*riented *L*anguage), was developed about 1959. ALGOL (*ALGO*rithmic *L*anguage), developed in Europe about 1958, is used primarily in mathematics and science, as is APL (*A P*rogramming *L*anguage), published in 1962. PL/1 (*P*rogramming *L*anguage *1*), developed in the late 1960s, and ADA (for Ada Augusta, countess of Lovelace, biographer of Charles BABBAGE), developed in 1981, are designed for both business and scientific use. For PERSONAL COMPUTERS the most popular languages are BASIC (*B*eginners *A*ll-purpose *S*ymbolic *I*nstruction *C*ode), developed in 1967 and similar to FORTRAN, and Pascal (for Blaise PASCAL, who built the first successful mechanical calculator), introduced in 1971 as a teaching language. Modula 2, a Pascal-like language for commercial and mathematical applications, was introduced in 1982. The C language, introduced (1972) to implement the Unix operating system, has been extended to C++ to deal with the rigors of OBJECT-ORIENTED PROGRAMMING. Fourth-generation languages are nonprocedural—they specify what is to be accomplished without describing how. The first one, FORTH, developed in 1970, is used in scientific and industrial control applications. Most fourth-generation languages are written for specific purposes. Fifth-generation languages, which are still in infancy, are an outgrowth of ARTIFICIAL INTELLIGENCE research. PROLOG (*PRO*gramming *LOG*ic) is useful for programming logical processes and making deductions automatically. Many other languages have been designed to meet specialized needs. GPSS (*G*eneral *P*urpose *S*ystem *S*imulator) is used for modeling physical and environmental events, and SNOBOL (*S*tring-*O*riented *S*ymbolic *L*anguage) and LISP (*LIS*t *P*rocessing) are designed for pattern matching and list processing. LOGO, a version of LISP, was developed in the 1960s to help children learn about computers. PILOT (*P*rogrammed *I*nstruction *L*earning, *O*r *T*esting) is used in writing instructional software, and Occam is a nonsequential language that optimizes the execution of a program's instructions in PARALLEL-PROCESSING systems.

program trading, form of computerized securities trading, also known as **index arbitrage.** Program traders exploit price differences between stock-index futures and the stocks represented by such futures using sophisticated computer programs, simultaneously monitoring and making trades in the commodity and stock markets. Program trading was widely blamed for the stock market crash on Oct. 19, 1987 (see BLACK MONDAY). Restrictions on, and the opposition of businesses to, such trades have since led most brokerage firms to abandon the practice.

progression, in mathematics, SEQUENCE of quantities, called terms, with a fixed relationship between consecutive terms. In an *arithmetic progression* each term is derived from the preceding one by adding a given number d, called the common difference. An example is 3, 7, 11, 15, . . . , where $d = 4$. The nth, or general, term is $a + (n - 1)d$, where a is the first term. In a *geometric progression* each term is derived by multiplying the preceding term by a given number r, called the common ratio. In the sequence 1, 3, 9, 27, . . . , for example, $r = 3$. The nth term is ar^{n-1}. In a *harmonic progression* the terms are the reciprocals of the terms of an arithmetic progression, e.g., ⅓, ⅐, 1/11, 1/15, ...

Progressive Conservative party, Canadian political party formed (1942) by the merger of the Conservative party and elements of the Progressive party. The Conservative party, which advocated strong ties to Britain and national economic development, dominated post-confederation (1867) Canadian politics. After the 19th cent., it was in relative decline. The 1942 merger led the party to advocate a more reform-minded program, and John DIEFENBAKER, prime minister from 1957 to 1963, forged a new party base in the W provinces. The issue of autonomy for Quebec, however, contributed to the two decades of mostly Liberal rule that followed. Progressive Conservative leader Brian MULRONEY was prime minister from 1986 to 1993, when the unpopularity of his economic policies led him to resign. Kim CAMPBELL, the party's and Canada's first female leader, briefly governed and led the party (1993) before she and all but two of the party's parliamentary candidates were rejected at the polls. She was succeeded as party leader by Jean Charest.

progressive education, movement in American education. Between the late-19th and mid-20th cent. many educational programs grew out of the American reform effort called the progressive movement and its sources in the philosophies of Jean Jacques ROUSSEAU, Johann PESTALOZZI, and Friedrich FROEBEL. A pluralistic phenomenon, it embraced industrial training, agricultural and social education, and educational theorists' new instructional techniques. The progressives insisted that education be a continuous reconstruction of living experience, with the child the center of concern. John DEWEY maintained that schools should reflect society. His Laboratory School in Chicago (1896–1904), the public schools of Gary, Ind., and Winnetka, Ill., and such independent schools as the Dalton School and the Lincoln School of Teachers College, Columbia Univ. (both N.Y.C.), were notable progressive institutions. Progressive education gained wide acceptance in American schools in the first half of the 20th cent., and by the

1950s, after its alleged collapse, the progressive movement had effected a permanent transformation in the character of the American school. Other reform movements in education similar to, or affected by, progressive education include the open classroom and the reforms of Maria MONTESSORI.

Progressive party, three separate political organizations that were active in the presidential elections of 1912, 1924, and 1948. The first Progressive party (the Bull Moose party) was formed by dissident Republicans who supported former Pres. Theodore ROOSEVELT against Pres. William H. TAFT. Its platform called for the direct election of U.S. senators, WOMAN SUFFRAGE, and many social reforms. The party drew over 4 million votes, more than Taft received, and resulted in the election of the Democratic candidate, Woodrow WILSON. The second Progressive party nominated Sen. Robert M. LA FOLLETTE for president and advocated public control of natural resources and recognition of labor unions, among other reforms. La Follette polled nearly 5 million votes in 1924 but carried only his home state of Wisconsin. The party remained active in the state until 1946. The third Progressive party accused Pres. Harry S TRUMAN of fomenting the COLD WAR and ran the former vice president Henry A. WALLACE against him in 1948. Wallace polled only slightly more than 1 million votes as Truman won reelection.

prohibition, laws outlawing the manufacture and distribution of alcoholic beverages. In the 19th cent., U.S. TEMPERANCE MOVEMENTS urged prohibition, and the Prohibition party made it (1869) a national issue. It gained impetus in World War I, when conservation policies limited liquor output. In 1919 the 18th amendment to the CONSTITUTION established prohibition, but enforcement, through the VOLSTEAD ACT, failed to abolish bootlegging and the widespread lawbreaking associated with it. The 21st amendment repealed (1933) prohibition.

Prokofiev, Sergei Sergeyevich [prōkôf'ēēf], 1891–1953, Russian composer. A student of GLIÈRE and RIMSKY-KORSAKOV, he toured the world as a pianist and conductor until 1938, when he returned to the USSR. His early works are often harsh and strident; later pieces are lyrical, simplified, and popular in style. Prokofiev's important works include seven symphonies, e.g., the *Classical Symphony* (1916–17); concertos; chamber music; operas, e.g., *The Love for Three Oranges* (1921); ballets, including *Romeo and Juliet* (1935–36; 1940); the symphonic fairy tale *Peter and the Wolf* (1936); and orchestral suites, e.g., *Lieutenant Kije* (1934).

proletariat, in Marxist theory, the class of workers who depend for their means of existence on the sale of their labor for purposes of industrial production. Karl MARX believed that this class, formed by the rise of CAPITALISM, would become the overwhelming majority, revolt against their exploitation, seize power from the BOURGEOISIE, or capitalist class, and create a classless society.

Prometheus, in Greek mythology, TITAN benefactor of man, whom, in one legend, he created. He stole fire from the gods, gave it to man, and taught him many arts and sciences. In retaliation, ZEUS plagued man with PANDORA and her box of evils, and chained Prometheus to a mountain, where an eagle preyed on his liver. In some myths HERCULES released him. Prometheus is the subject of many literary works, including AESCHYLUS' *Prometheus Bound* and SHELLEY's *Prometheus Unbound.*

promethium (Pm), artificially produced radioactive element, first identified definitely by J.A. Marinsky and colleagues in 1945 by ion-exchange chromatography. It is a RARE-EARTH METAL in the LANTHANIDE SERIES. The promethium-147 isotope is used in the making of phosphorescent materials, in nuclear-powered batteries for spacecraft, and as a radioactive tracer. See ELEMENT (table); PERIODIC TABLE.

pronghorn or **prongbuck,** hoofed herbivorous MAMMAL (*Antilocapra americana*) of the W U.S. and N Mexico. Related to the ANTELOPES, it is the size of a goat, with a light brown coat and pronged horns. It lives in small bands on open plains, browsing on shrubs and grasses. The pronghorn is the swiftest of North American mammals. Nearly exterminated by hunting, it is now protected.

propane ($CH_3CH_2CH_3$), colorless gaseous HYDROCARBON that occurs in NATURAL GAS and PETROLEUM. Propane is sold compressed in cylinders, often mixed with other hydrocarbons, and is used as fuel in lamps, gas grills, certain home and portable stoves, and certain cigarette lighters.

proper motion (μ), apparent angular motion of a star on the celestial sphere, usually measured in seconds of arc per year. A star's transverse velocity v_T, i.e., its motion across the line of sight to the star (as opposed to its RADIAL VELOCITY, or line-of-sight velocity), is calculated in kilometers per second from the equation $v_T = 4.74\ \mu/p$, where p is the star's PARALLAX, expressed in seconds of arc.

Propertius, Sextus, c.50 B.C.–c.16 B.C., Roman elegiac poet, a member of the circle of MAECENAS. A master of the Latin ELEGY, he wrote with vigor and passion.

property, in law, the right of ownership, i.e., the exclusive right to possess, enjoy, and dispose of an object of value; also, the object of value possessed, enjoyed, and disposed of by right of ownership. Modern Anglo-American property law provides for the ownership of nearly all things of economic value; there are exceptions, such as the high seas or outer space, which are not subject to ownership. The law divides property into realty (real property) and personalty (personal property). Realty is chiefly land and improvements built thereon; personalty is chiefly movable objects whose distribution the owner can determine by sale, WILL, or gift. Realty, in medieval times, was the basis of wealth and the keystone of the social structure; its ownership was controlled to protect society. The ownership of personalty, being of minor importance, was almost unfettered. With the rise of commerce and a large landless middle class, personalty became the dominant form of property, and the law of realty gradually became assimilated in most respects into that of personalty. For special types of property, see COPYRIGHT, PATENT.

prophet, in the BIBLE, religious leader of Israel, especially in the period of the kingdoms and the Babylonian captivity. In Israel the prophet was believed to have been inspired by God to guide the chosen people. The Major Prophets are ISAIAH, JEREMIAH, EZEKIEL, and DANIEL. The Minor Prophets are HOSEA, JOEL, AMOS, OBADIAH, JONAH, MICAH, NAHUM, HABAKKUK, ZEPHANIAH, HAGGAI, ZECHARIAH, and MALACHI. The title is also given to others, e.g., MOSES and ELIJAH. A Christian belief is that the HOLY GHOST "spoke through the prophets" (Nicene CREED), who foretold the life and passion of Jesus. Some varieties of Protestantism (e.g., ANABAPTISTS) have emphasized "inspired" utterance or behavior. Islam recognizes MUHAMMAD as the last and greatest of the prophets.

proportion, in mathematics, the equality of two RATIOS. Two pairs of quantities a, b and c, d are in proportion if $a/b = c/d$. For example, the lengths of two sides of any triangle and the lengths of the corresponding two sides of any similar (same-shaped) triangle are in proportion.

proprietary medicine: see PATENT MEDICINE.

Proserpine: see PERSEPHONE.

prosimian: see PRIMATE.

prostate gland, gland in the male REPRODUCTIVE SYSTEM situated below the neck of the bladder, encircling the urethra. The prostate produces a thin, milky, alkaline fluid that is secreted into the urethra at the time of emission of semen, providing an added medium for the life and motility of sperm. Prostatic enlargement, common in men over 50, can interfere with urination; it is treated by surgically removing the prostate or by giving finasteride (Proscar), a drug that shrinks the enlarged gland.

prosthesis, an artificial replacement for a missing body part, or a device designed to improve a specific body function. Prostheses include artificial limbs, false teeth, hearing aids, artificial kidneys, and implanted pacemakers. Recent improvements have included lighter materials, more realistic appearance, and greater flexibility, which allow a more normal continuation of daily activities, including participation in such sports as skiing, basketball, and running.

prostitution, granting of sexual access for payment. An epidemic of SEXUALLY TRANSMITTED DISEASE in 16th-cent. Europe led to the first serious efforts to control prostitution, and public health considerations motivated much subsequent regulatory legislation. International cooperation to control the traffic in prostitutes began in 1899. In the U.S. James Robert Mann's White Slave Traffic Act (1910) forbade interstate and international transportation of women for immoral purposes. Today houses of prostitution are illegal in all states but Nevada. In Britain a parliamentary act of 1959 forbids open solicitation but permits the practice of prosti-

The key to pronunciation appears on page xiii.

tution at home. Some European nations regulate prostitution as a public health measure.

protactinium (Pa), radioactive element, discovered as a decay product of uranium-238 by K. Fajans and O. Göhring in 1913. A shiny silver-gray metal with 14 isotopes, it is found in uranium ores. Alpha decay of protactinium leads to formation of ACTINIUM. See ELEMENT (table); PERIODIC TABLE.

Protagoras, c.490–421 B.C., Greek philosopher. One of the leading SOPHISTS, he is most famous for the saying "Man is the measure of all things." He held that all truth is relative to the individual who holds it. Protagoras denied the possibility of objective knowledge and refused to differentiate between sense and reason. None of his works has survived, but his views are presented in the Platonic dialogue that bears his name.

protective coloration, in animals, coloration or color pattern that facilitates escape from observation by predators or prey or serves as a warning device to predators or others of the same species. The most widespread form of protective coloration is called cryptic resemblance, in which the coloration and patterns on the skin of the animal enable it to blend in with the coloration of its habitat. In some animals (e.g., the CHAMELEON), the pigmentation changes to resemble the surrounding environment. Some animals undergo a seasonal variation (e.g., the WEASEL, which is usually brown with white underparts, but in snowy regions acquires a white coat in winter and is known as an ERMINE).

protectorate, in international law, state which, while retaining nominal independence, surrenders part of its sovereignty, such as control over foreign affairs, in return for protection by a stronger state. (The relationship between the two states may also be termed a *protectorate.*) The territory of the protected state remains distinct from, and its nationals are not citizens of, the protecting state. Protectorates appear in ancient Greek and Roman history; in modern times, European colonies were often governed as protectorates, but this form of political relationship is disappearing from today's world. See also TRUSTEESHIP, TERRITORIAL.

protein, any of the group of highly complex organic compounds found in all living cells. Protein is the most abundant class of all biological molecules, comprising about 50% of cellular dry weight. Classified by biological function, proteins include the ENZYMES, which catalyze cellular reactions; collagen, keratin, and elastin, which are structural, or support, proteins; HEMOGLOBIN and other transport proteins; casein, ovalbumin, and other nutrient proteins; antibodies, which are necessary for IMMUNITY; protein HORMONES, which regulate METABOLISM; and proteins such as actin and myosin, the contractile muscle proteins, that perform mechanical work. Structurally, proteins are large molecules composed of one or more chains of varying amounts of the same 22 AMINO ACIDS, which are linked by PEPTIDE bonds. Each protein is characterized by a unique and invariant amino acid sequence. Protein chains may contain hundreds of amino acids; some proteins also incorporate phosphorus or such metals as iron, zinc, and copper. The amino acid sequence also determines the molecule's three-dimensional structure; this so-called native state is required for proper biological function. The information for the syntheses of the specific amino acid sequences from free amino acids is carried by the cell's NUCLEIC ACIDS. Dietary protein is food that contains the amino acids necessary to construct the proteins described above. Complete proteins, generally of animal origin, contain all the amino acids necessary for human growth and maintenance; incomplete proteins, from plant sources such as grains, legumes, and nuts, lack sufficient amounts of one or more essential amino acid. See also RNA.

Protestantism, form of Christian faith and practice that originated with the principles of the REFORMATION. The term, used in many senses, applies to Christians not belonging to the Roman Catholic Church or to an Orthodox Eastern church. Two distinct branches of Protestantism grew out of the Reformation. The evangelical churches of Scandinavia and Germany were followers of Martin LUTHER, and the reformed churches in other countries were followers of John CALVIN and Huldreich ZWINGLI. A third major branch, episcopacy, developed in England, but since the OXFORD MOVEMENT in the 19th cent. many Anglicans reject the term because they tend to agree with Roman Catholics on most doctrinal points except the primacy of the pope.

Protestant Union, 1608–21, also known as the Evangelical League, an alliance of German Protestant rulers of cities and states for the avowed purpose of a mutual defense of their lands, persons, and rights. It was formed to block attempts by the Holy Roman emperor and the Catholic princes of Germany to restore all church lands that had been appropriated by the Protestant princes. Never very effective, the union went out of existence three years after the outbreak of the THIRTY YEARS WAR.

protist, member of the taxonomic kingdom Protista (or Protoctista), which consists of one-celled organisms that live freely or in small colonies, such as PROTOZOANS and ALGAE. Most protists were formerly classified as either animals or plants.

Protogenes [prōtŏj'ənēz], fl. c.300 B.C., Greek painter, considered second only to APELLES by the ancients. His best-known work, the *Ialysus,* was removed by VESPASIAN to Rome, where it perished in the burning of the Temple of Peace.

proton, subatomic particle having a single positive electrical charge and constituting the nucleus of the ordinary hydrogen ATOM. Every atomic nucleus contains one or more protons. The mass of the proton is about 1,840 times the mass of the ELECTRON and slightly less than the mass of the neutron. Protons are made of still smaller particles called QUARKS. In 1919 Ernest RUTHERFORD discovered the proton as a product of the disintegration of the atomic nucleus. The antiproton, the proton's antiparticle (see ANTIMATTER), was discovered in 1955. Research into the possibility that the proton may decay has been inconclusive but suggests that its lifetime is at least 10^{31} years. See ELEMENTARY PARTICLES.

protoplasm, term once used for the fundamental material of which all living things were thought to be composed. It is still accepted that all living organisms are made largely of the same classes of substances (e.g., salts and organic molecules), that some of these are organized into structures large enough to be seen in the microscope, and that water almost always is the most abundant material. The term is rarely used anymore in a strictly scientific sense. The unity of living matter is now described in terms of the CELL as the unit of all living organisms and of molecules such as PROTEINS and NUCLEIC ACIDS.

protozoan, member of an informal grouping (sometimes considered a subkingdom) of microscopic one-celled PROTISTS. Most are solitary, but a few live in simple colonies. The majority are aquatic, living in fresh or salt water; some live in soil. Despite their small size and lack of multicellular organization, protozoans carry on all the metabolic functions of higher animals: digestion, excretion, respiration, and coordination of movement. Some species can photosynthesize, and many are parasitic (see MICROSPORA and APICOCOMPLEXA), often causing diseases in humans and other animals.

Proudhon, Pierre Joseph [prōōdhôN'], 1809–65, French social theorist. He achieved notice with his anarchist pamphlet *What Is Property?* (1840). After the REVOLUTION OF 1848 he became a member of the constituent assembly. He advocated "mutualism," in which small groups would interact economically and politically within the framework of agreement on basic principles. Opposed to force, he believed that ethical progress would make government superfluous. His works include *System of Economic Contradictions; or, The Philosophy of Poverty* (1846).

Proust, Joseph Louis [prōōst], 1754–1826, French chemist. He discovered grape sugar and established the law of definite proportions (also known as Proust's law), which states that elements in a compound are present in a fixed proportion by weight.

Proust, Marcel, 1871–1922, French novelist. He was one of the great literary figures of modern times. As a youth, he mingled ambitiously in Parisian society, but later he became increasingly withdrawn. After 1907, he lived mainly in a cork-lined room, working at night on his monumental cyclic novel, *Remembrance of Things Past* (1913–27; tr. 1922–32, in 7 vol.). Discursive, but alive with brilliant metaphor and sense imagery, the work is rich in psychological, philosophical, and sociological understanding, a vital theme being the link between external and internal reality found in time and memory. In Proust's scheme, the individual is isolated, society is false and ruled by snobbery, and artistic endeavor is raised to a religion.

Provençal [prôväNsäl'], member of the Romance group of the Italic subfamily of the Indo-European family of languages. Although spoken by several million people in France, it has no official status in that country. Also called LANGUE D'OC, Provençal became important in the Middle Ages as the medium of the great literature of the TROUBADOURS. See LANGUAGE (table).

Provence [prôväNs'], region and former province, SE France. NICE and MARSEILLES are the chief cities. Fruits, vegetables, and cattle are economic mainstays. The coast was settled (c.600 B.C.) by the Greeks and later colonized (2d cent. B.C.) by the Romans. Christianity was implanted early. In 933 Provence became part of the kingdom of ARLES. It later passed to the Angevin dynasty of Naples (1246) and to France (1486).

Proverbs, book of the OLD TESTAMENT, 20th in the Authorized Version, a collection of moral and other maxims. The practical teachings are individual and universal rather than nationalistic. Ascribed to SOLOMON, the book probably dates from the 9th to the 2d cent. B.C.

Providence, city (1990 pop. 160,728), state capital and seat of Providence co., NE R.I., a port on Providence Bay; founded 1636 by Roger WILLIAMS, inc. as a city 1832. The largest city in the state, it is a major shipping center famous for its silverware and jewelry industries. Other manufactures include textiles and electronic equipment. An early refuge for religious dissenters, Providence industrialized after the Revolution. Points of interest include Brown Univ.; the Rhode Island School of Design; the old statehouse; and the capitol, designed by McKim, Mead, and White.

Provincetown, resort town (1990 pop. 3,561), SE Mass., on the tip of CAPE COD; founded c.1700, inc. 1727. The PILGRIMS landed there (1620) before proceeding to PLYMOUTH. Once a whaling and smuggling center, Provincetown in the 20th cent. gained fame as an artists' colony and well-preserved colonial settlement. Fishing and tourism are its main industries. The Cape Cod National Seashore is adjacent to the town.

Provisions of Oxford, 1258, a scheme of governmental reform forced upon HENRY III of England by his barons. Drawn up by Simon de MONTFORT, it provided for an advisory council and tried to limit the king's power to tax. Henry's repudiation (1261) of the agreement led to the BARONS' WAR (1263–67), in which the king triumphed.

Provo, city (1990 pop. 86,835), seat of Utah co., N central Utah, on the Provo R., near Utah Lake; inc. 1851. Settled by MORMONS in 1849, it grew as a shipping point for the region's mines. Fruit, iron and steel manufactures, and textiles are its leading products. Brigham Young Univ. is located in the city. The Wasatch Range is nearby.

Prudhoe Bay, inlet of the Arctic Ocean, N Alaska. Oil from large deposits (the first discovered in 1968) is transported S to the port of Valdez via the Alaskan Pipeline (completed in 1977). Prudhoe Bay oil makes Alaska the leading petroleum-producing state in the U.S.

Prud'hon, Pierre Paul [prüdôN], 1758–1823, French painter. Noted for his subtle use of light and shadow, he gained recognition with *Truth Descending from the Heavens Led by Wisdom* (1796; Louvre). His portrait of Empress Josephine is in the Louvre.

prune: see PLUM.

Prussia, former kingdom, and largest and most important of the German states. BERLIN was the capital. Originally, Prussia was the name only of the area later called EAST PRUSSIA. In 1618, by then a duchy, it passed to the elector of BRANDENBURG. In 1660 full independence from Polish suzerainty was obtained by FREDERICK WILLIAM, the Great Elector. The electors of Brandenburg gradually acquired other lands, and in 1701 Elector Frederick III had himself crowned "king in Prussia" as Frederick I. He remained a prince of the Holy Roman Empire as elector of Brandenburg, but not as king of Prussia, which lay outside imperial boundaries. This gave the kings of Prussia some independence from the emperor. King FREDERICK WILLIAM I (r.1713–40) worked to unify the state and built an efficient army. His son FREDERICK II (r.1740–86) won most of SILESIA from Austria in the War of the AUSTRIAN SUCCESSION and entered the SEVEN YEARS WAR. Prussia gained further territory in the partitions of POLAND (1772–95). The kingdom was eclipsed by the rise of France under NAPOLEON I but had a major part in the defeat (1813–15) of the French. In 1862 Otto von BISMARCK became Prussian premier; he sought to unify Germany under Prussian leadership. After territorial gains in the AUSTRO-PRUSSIAN WAR and the FRANCO-PRUSSIAN WAR, the Prussian king was proclaimed (1871) emperor of Germany as WILLIAM I. Thereafter, the history of Prussia is essentially that of GERMANY. Prussia remained a kingdom in the German Empire until Germany became a republic in 1918. Prussia was abolished as a state in 1947 and divided among West Germany, East Germany, the Russian Republic of the USSR (now Russia), and Poland.

Pryor, Richard, 1940–, African-American comedian; b. Peoria, Ill. His wildly inventive comic style is seen in such films as *Silver Streak* (1976), *Richard Pryor Live in Concert* (1979), *Stir Crazy* (1980), and *Jo Jo Dancer Your Life Is Calling* (1986).

Richard Pryor

Psalms or **Psalter,** book of the OLD TESTAMENT, 19th in the Authorized Version, a collection of 150 poetic pieces, since the last centuries B.C. the chief hymnal of the Jews and subsequently of Christians. Many are attributed to DAVID, SOLOMON, and others. Most took their present form between c.537 B.C. and c.100 B.C. Bible versions vary in dividing them, and numbering is therefore confusing. According to the text, the psalms are in five groups (numbering according to the Authorized Version): 1–41; 42–72; 73–89; 90–106; 107–150. They vary in tone and subject. Psalms of contrition, or penitential psalms, include 6, 32, 38, 51 (Miserere), and 130 (De profundis). Some are imprecatory, e.g., 52, 64, 137. Some, e.g., 78, 105–107, emphasize Israel's history. Didactic psalms include 37, 49, and 50. Some seem especially adapted to public worship, e.g., 95 (Venite). Others have been regarded as Messianic, e.g., 2, 8, 16. There are psalms elsewhere in the BIBLE, e.g., 1 Sam. 2.1–10. The history of translation of the psalms is more extensive than that of any other part of the Old Testament.

Psalter: see PSALMS.

psaltery: see STRINGED INSTRUMENT.

psilotophyte, member of a division (Psilotophyta) of vascular plants characterized by the lack of roots; one species also lacks leaves. The green stem carries out PHOTOSYNTHESIS, and the life cycle is very much like that of FERNS.

Psyche [sī'kē], in Greek mythology, personification of the human soul. Loved by EROS, she was forbidden to look at him. When she disobeyed he left her, but after a series of trials she became immortal and was reunited with him forever.

psychedelic drug: see HALLUCINOGENIC DRUG.

psychiatry, branch of medicine concerned with the diagnosis and

The key to pronunciation appears on page xiii.

treatment of mental disorders. Psychiatrists are licensed physicians who complete a three-year residency in psychiatry after their medical training. Modern techniques such as PSYCHOTHERAPY and PSYCHOANALYSIS can be traced to the pioneering work of Sigmund FREUD, who turned to the behavior and emotional history of the patient for clues to his or her psychological disorder. Research has discovered that biological, genetic, psychological, and social components contribute to many types of mental illness. This causal diversity is reflected in treatment, which may include the use of drugs that influence NEUROTRANSMITTER functions in the brain, ELECTROCONVULSIVE THERAPY (ECT), PSYCHOTHERAPY, and BEHAVIOR THERAPY.

psychoanalysis, system of PSYCHOTHERAPY. The origins of psychoanalysis can be traced to Sigmund FREUD's observation that the physical symptoms of patients suffering from HYSTERIA tended to disappear after apparently forgotten material was made conscious. From this he developed the basic postulate of psychoanalysis: the existence of a dynamic UNCONSCIOUS that influences every action but operates with material that is not subject to recall by normal processes. This "forgetting" he termed repression (see DEFENSE MECHANISM), and he made the conscious recognition of repressed experiences the keystone of psychoanalytic therapy. After experimenting with HYPNOTISM to probe the unconscious, Freud introduced two techniques—free association, whereby patients voice their thoughts exactly as they arise, and DREAM interpretation; these are still the main therapeutic tools of psychoanalysis. In addition, Freud and his followers developed a vast theory of the human psyche that stresses the role of two instincts—the sexual instinct and the death instinct. According to the theory, these two drives balance one another in the well-adjusted individual; if dammed up, they produce NEUROSIS. Freud also developed a theory of the human personality, dividing it into three parts: the id (reservoir of unconscious instinctual drives, dominated by the pleasure principle and desirous of instant gratification); the superego (internal censor, or conscience); and the ego (mediator between the id, the superego, and the demands of society or reality). Other significant figures in the field of psychoanalysis include C.G. JUNG, Alfred ADLER, Otto RANK, Karen HORNEY, Erich FROMM, Harry Stack SULLIVAN, and Carl ROGERS. Although traditional psychoanalysis has been criticized for its rigidity, costliness, and failure to consider biological causes, psychoanalytic theory has greatly influenced child rearing, social-work practice, education, the social sciences, medicine, and the arts.

psychobiology, study of anatomical and biochemical structures and processes and their effect on behavior. It is closely related to physiological psychology. Areas of investigation include hormonal and biochemical changes in nerves, glands, and muscles, and how these changes influence development, emotions, and learning.

psycholinguistics, study of the psychological states and mental activity associated with language usage. An important focus is the largely unconscious application of grammatical rules that enables the production and comprehension of sentences. Psycholinguists investigate the relationship between language and thought and often study linguistic performance and language acquisition, especially in children. The work of Noam CHOMSKY and other proponents of TRANSFORMATIONAL-GENERATIVE GRAMMAR have greatly influenced the field.

psychological warfare, a number of propaganda techniques designed to weaken the enemy's morale and to discredit the government of the opposition. Among those used are propaganda broadcasts intended for enemy troops and civilians and the forced political indoctrination of prisoners of war under stressed conditions, popularly known as brainwashing.

psychology, science or study of the thought processes and behavior of humans and other animals in their interaction with their environment. Psychologists study sensory perception, emotion and motivation, problem solving, use of language and other mental tasks, group interaction, adjustment to social and physical environment, and the normal and abnormal development of these processes. Psychology encompasses a very broad range of specialties and approaches including BEHAVIORISM; GESTALT; neuropsychology, which studies the interaction of brain function and behavior; and clinical psychology, which focuses on the diagnosis and treatment of psychological problems.

psychosis, broad category of psychological disturbance, encompassing the most serious emotional disturbances, often rendering the individual incapable of staying in contact with reality. Until fairly recently, the term was broadly employed in contrast with NEUROSIS, which denoted milder mental disturbances. Psychoses have traditionally included such symptoms as hallucinations and delusions, and such disorders as PARANOIA and SCHIZOPHRENIA. The symptoms can be classified as organic, i.e., those associated with actual damage to the brain caused by advanced syphilis, senility, and drug abuse; or functional, i.e., those in which there is no brain damage. ELECTROCONVULSIVE THERAPY and drug therapy are used to treat people with serious psychological disorders. Refinement in diagnostic criteria led, in the 1980s, to the abandonment of the term *psychosis* in psychiatry, in favor of more precise nomenclature.

psychosomatic disorder, emotional disturbance that is manifested as a physical disorder, such as childhood ASTHMA, ULCERS, HYPERTENSION, endocrine disturbances, and possibly even HEART DISEASE. In most cases the illness occurs only when there is both a physiological predisposition and psychological stress. Treatment may involve a medical regimen or techniques such as BIOFEEDBACK as well as PSYCHOTHERAPY. Psychosomatic medicine is now subsumed under the broader field of **behavioral medicine**, which includes the study of a wider range of physical ailments. Studies suggesting that a large percentage of deaths are rooted in behavior have underlined the importance of the discipline.

psychotherapy, treatment of mental disorders using psychological methods. Psychotherapy does not include physiological interventions, such as drug therapy or ELECTROCONVULSIVE THERAPY. Psychotherapy usually stresses helping patients to examine their own ideas about themselves and their lives; it may involve treatment of an individual, a family, or a group. Sigmund FREUD developed the original form of psychotherapy, PSYCHOANALYSIS. BEHAVIOR MODIFICATION aims to eliminate undesirable habits or irrational fears using the principles of conditioning. Cognitive therapies try to show the client that certain, usually negative, thoughts are irrational, the goal being to restructure such thoughts into positive, constructive ideas. GROUP PSYCHOTHERAPY allows clients to observe the effects of behaviors on others in a controlled setting.

psychotomimetic drug: see HALLUCINOGENIC DRUG.

Pt, chemical symbol of the element PLATINUM.

pterosaur, any member of an order (Pterosauria) of extinct flying reptiles that lived 210 million to 135 million years ago. They had an elongated fourth finger that formed the leading edge of their two membranous, featherless wings. Some were as small as sparrows, but some pterodactyls had wingspans of 40 ft. (12 m). Pterosaurs lived near water and ate insects and other animals.

Ptolemaic system, historically the most influential of the geocentric cosmological theories, i.e., theories that placed the earth motionless at the center of the universe with all celestial bodies revolving around it. The system is named for the astronomer PTOLEMY (Claudius Ptolemaeus), who in the 2d cent. A.D. combined simple circular motions to explain the complicated wanderings of the planets. Ptolemy explained RETROGRADE MOTION by assuming that each planet moved in a circle called an epicycle, whose center was in turn carried around the earth in a circular orbit called a deferent. The Ptolemaic system dominated astronomy until the advent of the heliocentric COPERNICAN SYSTEM in the 16th cent.

Ptolemy [tŏl'əmē], rulers of the Macedonian dynasty of EGYPT (323 B.C.–30 B.C.). **Ptolemy I,** d. 284 B.C., a leading general of ALEXANDER THE GREAT, became one of the DIADOCHI. After Alexander's death he received Egypt, declared himself king (305 B.C.), and laid the basis for Ptolemaic administration. He sought to make ALEXANDRIA the cultural center of the Greek world, especially by founding its library. His son, **Ptolemy II,** c.308–246 B.C. (r.285–246), continued his father's work, completing the Pharos (see SEVEN WONDERS OF THE WORLD). He encouraged the translation of the PENTATEUCH into the Greek Septuagint and had a canal built from the Nile to the Red Sea. Ptolemy ended the war with Syria and increased his prestige by siding with Rome in the first PUNIC WAR. His son, **Ptolemy III,** d. 221 B.C. (r.246–221), renewed war with

Syria. During his reign Egyptian fleets controlled most of the coast of Asia Minor, and the kingdom was enlarged. **Ptolemy V,** d. 180 B.C. (r.205–180), came to the throne as a small boy. Civil war characterized his reign; Syrian and Macedonian invasions cost Egypt all of Palestine and much of Asia Minor. **Ptolemy VI,** d. 145 B.C. (r.180–145), became king as an infant; the Syrians forced him to share the throne with his brother (later Ptolemy VII). Trouble between the brothers brought about intervention by Rome. Ptolemy VI was killed while fighting over the Syrian throne. **Ptolemy VII,** d. 116 B.C. (r.145–116), put his brother's young son to death and succeeded to the throne. He survived a revolt (130–127) by his brother's widow, Cleopatra, and ruled peacefully though despotically. He drove the scholars from Alexandria, causing the spread of Alexandrian culture. **Ptolemy XI,** d. 51 B.C. (r.80–58, 55–51), was unseated by the Alexandrians because of his misrule but was restored with the aid of POMPEY. He made the Roman senate executor of his will and named Pompey guardian of his son, Ptolemy XII. **Ptolemy XII,** 61?–47 B.C. (r.51–47), was from the start overshadowed by his sister, CLEOPATRA, who became his wife and ruled with him. She revolted (48) against the power of his advisers. At this juncture the defeated Pompey arrived in Egypt and was killed by Ptolemy's adviser Pothinus. Julius CAESAR followed immediately, fell under Cleopatra's influence, and forced Ptolemy to share the throne again.

Ptolemy (Claudius Ptolemaeus), fl. 2d cent. A.D., Greco-Egyptian mathematician and geographer, the last great astronomer of ancient times. He systematized and recorded the knowledge of Alexandrian men of science. In his famous treatise, the 13-volume *Almagest,* which remained influential until the time of COPERNICUS, he presented the geocentric cosmological theory known as the PTOLEMAIC SYSTEM; the treatise also contained a catalog of more than 1,020 stars, as well as a table of chords and other mathematical information. His *Geography,* despite its many errors, remained in use until the 16th cent. Ptolemy discovered the irregularity in the moon's motion known as the evection and wrote the *Tetrabiblos,* a study of astrology.

Pu, chemical symbol of the element PLUTONIUM.

public access television, in the U.S., noncommercial cable television channels set aside for nonprofit organizations and private citizens. The purpose is to avoid monopolization of cable TV by a few sources and to ensure programming of local community interest. The 1984 Cable Act allows municipalities to require cable franchise holders to provide a public access channel and make available equipment, studio space, and technical assistance.

public debt: see DEBT, PUBLIC.

public relations, activities and policies used to create public interest in a person, idea, product, institution, or business establishment. The field began in the early 20th cent., when American businesses responded to attacks by social reformers. Public relations serves particular interests by presenting them to the public in the most favorable light. Toward this end, many research techniques and communications media are used. Public relations differs from propaganda, which is generally government supported, international in scope, and political in nature. The earliest form of public relations and still the most widely practiced is publicity, whose principal instrument is the press release.

public television, noncommercial television with largely educational programming. In the U.S., it began as National Educational Television (NET), but was reorganized in 1968 as government-financed public TV under the Corporation for Public Broadcasting. Public TV avoids the limits on content that result from the pressures of advertisers. Despite severe cuts in government funding, public TV, through viewer subscriptions and corporate underwriting, continues to produce shows that would not be seen on commercial TV, particularly children's programming and documentaries. Shows are selected and distributed by the Public Broadcasting System, an association of public TV stations.

Public Works Administration (PWA), federal agency established (1933) by the NEW DEAL administration of Pres. Franklin D. ROOSEVELT to promote employment and increase public purchasing power. It administered the construction of many public buildings, bridges, dams, and other similar projects. The PWA became a division of the Federal Works Agency in 1939 and was liquidated in the 1940s.

Puccini, Giacomo [pōōt-chē'nē], 1858–1924, Italian composer. One of the pre-eminent composers of Italian opera, he is noted for his lyric style, masterful orchestration, and his sometimes sentimental effects, as in *Manon Lescaut* (1893), *La Bohème* (1896), *La Tosca* (1900), *Madame Butterfly* (1904), and *Turandot* (produced, 1926).

Pudovkin, Vsevolod Ilarionovich [pōōdôf'kĭn], 1893–1953, Russian film director. Ranked with EISENSTEIN and DOVZHENKO, he used MONTAGE in such films as *Mother* (1926), *The End of St. Petersburg* (1927), and *Heir to Genghis Khan* (1928).

Puebla, city (1990 pop. 1,054,921), E central Mexico, capital of Puebla state. It is a major agricultural and industrial center and a tourist resort noted for the colored tiles that decorate its buildings. It has one of the finest cathedrals in Mexico. Founded in the mid-16th cent., it long was a vital link between Mexico City and the coast.

Pueblo, Spanish name for the indigenous people who occupied stone or adobe community houses in more than 80 villages (pueblos) in the Southwestern culture area (see NORTH AMERICA, INDIGENOUS PEOPLES OF). They are the descendants of the prehistoric Anasazi culture (see CLIFF DWELLERS) of Utah, Colorado, Arizona, New Mexico, and N Mexico. By 2000 B.C. the earliest agriculturalists, known as the Cochise culture, were raising corn. The Mogollon people, with the first bows and arrows and true pottery in North America, built the first village settlements in the 1st cent. A.D., while their contemporaries, the basket makers, were living in caves. Irrigation and surface houses with KIVAS developed between 400 and 700, but multistoried cliff houses on MESAS marked the Great Pueblo Period, from 1050 to the end of the 13th cent. By 1630, 90 years after CORONADO had explored the Pueblo villages, Spanish missionaries had converted 60,000 Pueblos to Christianity. In 1680 Popé led the pueblos in a revolt that drove the Spanish out for 12 years; those in New Mexico were recaptured in 1692, but the Western Pueblos remained free. The contemporary Pueblos are quite diverse linguistically (see NATIVE AMERICAN LANGUAGES) and culturally. Their culture is the oldest N of Mexico, dating back 700 years for the still-occupied HOPI, ZUÑI, and ACOMA pueblos. Several of the two dozen surviving pueblos have retained pre-Spanish social systems and community organization to a surprising degree. They are sedentary farmers; men are weavers and women potters. The position of women remains high, and the KACHINA cult and other secret societies continue to enjoy major emphasis. In 1990 there were over 50,000 Pueblos in the U.S.

Pueblo, city (1990 pop. 98,640), seat of Pueblo co., S central Colo., on the Arkansas R., in the foothills of the Rockies; inc. 1885. It is the trade and shipping center for a timber, coal, and farm area. Its steel industry is huge; wire, concrete, and lumber are also produced. The city was laid out (1860) on the site of a trading post (1842).

Puente, Tito (Ernesto Antonio Puente, Jr.), 1923–, American musician and bandleader; b. N.Y.C. A popularizer in the 1950s of such Latin American musical forms as the cha-cha and mambo, he was instrumental in the development of the SALSA in the 1970s.

Puerto Rico [Span., = rich port], officially Commonwealth of Puerto Rico, island (1990 pop. 3,522,037), 3,425 sq mi (8,871 sq km), West Indies, c.1,000 m (1,610 km) SE of Miami. It is a self-governing entity in association with the U.S. The capital is SAN JUAN; other urban centers include BAYAMÓN, PONCE, Carolina, and Caguas. Easternmost of the Greater Antilles, it is bounded by the Atlantic (N), the Caribbean (S), the Dominican Republic (W), and the Virgin Islands (E). Puerto Rico is crossed by mountain ranges, notably the Cordillera Central, which rises to 4,389 ft (1,388 m). The climate is tropical. Sugarcane was long the chief product, but it has been superseded by livestock and dairy production. Coffee, tobacco, and fruits are other leading crops. The dense population, however, depends chiefly on industrial employment; the manufacture of machinery, chemicals, pharmaceuticals, textiles, electronic equipment, and plastics, as well as oil refining, are important. Tourism is also a major source of revenue. Population growth and social problems have led to much emigration, and one third of all Puerto Ricans live in the U.S. Puerto Ricans share the rights and

The key to pronunciation appears on page xiii.

duties of U.S. citizens, except that they do not pay federal income taxes and do not vote in national elections (unless living on the mainland). The Puerto Ricans are descended from Spanish colonists, with admixed aboriginal native and African strains. Spanish and English are the official languages, but Spanish is predominant. Roman Catholicism is the main religion.

History. When COLUMBUS arrived in 1493, Arawaks lived on Puerto Rico, which they called Boriquén or Borinquén. PONCE DE LEÓN began the conquest in 1508. Sugar culture was introduced, strategic San Juan was fortified, and African slaves replaced the annihilated Arawaks as workers in a growing plantation culture. In the 19th cent. popular unrest led finally to Spain's granting of some autonomy in 1898. After the SPANISH-AMERICAN WAR, Puerto Rico was ceded (1898) to the U.S., which set up (1900) an administration under an American governor. Meanwhile an independence movement grew. In 1917 Puerto Ricans were granted U.S. citizenship. As U.S. holdings in the one-crop sugar economy increased, large corporations encroached on land that had been used to grow subsistence food, and the subsequent economic distress was not relieved until World War II. After the war, "Operation Bootstrap," encouraging American industrial investment with tax incentives, began to change the nature of the economy. In 1952 the Commonwealth of Puerto Rico was proclaimed. Nationalist agitation continued, however. By the 1960s statehood advocates and supporters of continued commonwealth status held power alternately, while advocates of independence eschewed the electoral process. In 1992 Pedro Rosello, a statehood advocate, was elected governor, but voters chose commonwealth status by a narrow margin in a 1993 referendum.

Puerto Vallarta [väyär'tä], city (1990 pop. 111,175), Jalisco state, W Mexico. Since the 16th cent. it has been a stopover for ships sailing along the coast. Today it is one of Mexico's largest resorts, known for its sports fishing and luxurious facilities.

Pueyrredón, Juan Martín de [pwārrādōn'], 1776–1850, Argentine general, supreme director of the United Provinces of La Plata (1816–19). He resisted the invasion of Buenos Aires by the British (1806). He held several posts in the revolutionary government, including that of commander of the patriot Army of the North (1811–12).

puffin, migratory diving BIRD of the AUK family. Puffins have dumpy bodies, short legs set far back, small wings, and a large, brilliantly colored bill adapted for carrying several fish at once. Clumsy on land and in flight, they are expert swimmers. Puffins nest in colonies in burrows or rock cavities on northern islands.

Pugachev, Emelian Ivanovich [pōōgəchôf'], d. 1775, leader of the 1773–74 Russian peasant uprising. A Don COSSACK, he claimed to be PETER III, announced the end of serfdom, and gathered an army of Cossacks, serfs, and TATARS. After seizing towns in the Volga and Ural regions he was caught and executed. The revolt led CATHERINE II to strengthen serfdom.

Puget Sound, island-studded inlet of the Pacific Ocean, NW Washington, extending S c.100 mi (160 km) to Olympia and navigable by large ships. Seattle and Tacoma are important shoreline cities. Discovered in 1787, the sound was explored and named in 1792 by Capt. George Vancouver for his aide, Peter Puget.

Puig, Manuel, 1932–90, Argentine novelist. One of Latin America's most creative writers, he explored the myths and realities of contemporary Argentine life. He is best known for the novel *Kiss of the Spider Woman* (1976), which was made into a film (1985) and Broadway musical (1993). Other novels include *Betrayed by Rita Hayworth* (1968) and *Blood of Requited Love* (1982).

Pulaski, Casimir [pəlăs'kē], c.1748–1779, Polish patriot and soldier. After fighting against Russian domination of Poland, he commanded (1777–79) patriot troops in the AMERICAN REVOLUTION. He was killed while leading his own cavalry unit, the Pulaski Legion, in the attack on SAVANNAH.

Pulitzer, Joseph, 1847–1911, American newspaper publisher; b. Hungary. As owner and publisher after 1878, he made the St. Louis *Post-Dispatch* a success; in 1883 he bought the New York *World.* His aggressive methods of building up this paper; its Sunday issue; and the use of illustrations, news stunts, crusades against corruption, cartoons, and bold news coverage helped his paper compete with HEARST's *Journal* in sensationalism and in circulation. Later his *World* became the outstanding Democratic organ in the U.S. After 1890 partial blindness kept him from political activity, but he directed his papers no less closely than before. He left funds to endow what is now the graduate school of journalism at Columbia Univ., and he endowed the PULITZER PRIZES.

Pulitzer Prizes, annual awards for achievements in American journalism, letters, and music. The prizes are paid from the income of a fund left by Joseph PULITZER to the trustees of Columbia Univ. They have been awarded by the trustees each May since 1917, on the recommendation of an advisory board, with American themes preferred. Fourteen prizes are given in journalism. The prizes in letters are for fiction, drama, poetry, history, biography or autobiography, and general nonfiction, and the music prize was added in 1943. Each is accompanied by $3,000 award.

pulley: see MACHINE.

pulsar, in astronomy, a celestial object that emits brief, sharp pulses of radio waves. The pulses recur at precise intervals; the time between pulses ranges from 1.5 msec to 4 sec. Pulsars are believed to be rotating NEUTRON STARS that emit radio waves in a narrow beam. Because of the rotation of the star, the beam will sweep across the line of sight, causing the observed pulses.

pulse, in botany, common name for Leguminosae or Fabaceae, a large family of herbs, shrubs, and trees, also called the pea, or legume, family. The family is typified by usually compound leaves, a fruit that is a LEGUME (a type of pod), and FLOWERS with an irregular butterflylike shape. Many species have thorny branches. The seeds of the family are rich in PROTEIN; in many areas where meat is scarce, legumes, e.g., BEANS, PEAS, LENTILS, PEANUTS, SOYBEANS, and CAROB, are staples. Some species are fodder and forage plants, e.g., CLOVER, ALFALFA, soybeans, and vetch. The root nodules of these food and forage plants have BACTERIA that fix NITROGEN (see NITROGEN CYCLE), making them valuable as cover crops and green manure (see FERTILIZER). The family also provides gums and RESINS, dyes and tannins, timber, medications, oils, flavorings, fibers, and insecticides, and some legumes are ornamentals, e.g., ACACIAS, LOCUSTS, MIMOSAS, and WISTERIAS.

pulse, in physiology, alternate expansion and contraction of artery walls as HEART action varies blood volume within them. Artery walls are elastic and become distended by the increase in blood volume when the heart contracts. When the heart relaxes, this volume decreases and the walls contract, propelling the blood through the arteries. The result is a pressure wave, with a pulsation for each heartbeat. See also BLOOD PRESSURE.

puma or **cougar,** New World member (*Felis concolor*) of the CAT family. Also called mountain lion, catamount, and panther, it ranges from S British Columbia to southernmost South America. Pumas vary in size (up to 7 ft/2.1 m) and color according to locale and live in many kinds of country, preying on animals as large as deer.

pumice, volcanic glass formed by the solidification of LAVA permeated with gas bubbles. It has the chemical composition of GRANITE, but is of low enough density to float on water. Pumice is used primarily as an ABRASIVE.

pump, device to lift, transfer, or increase the pressure of a fluid (liquid or gas) or to create a VACUUM. In a simple *reciprocating pump* used to lift water, a piston moves back and forth in a cylinder equipped with intake and outflow valves. On the piston's upstroke, atmospheric pressure forces water into the empty space beneath the piston. On the downstroke, the water in the cylinder is forced to flow above the piston. Reversing direction, the piston moves up, allowing more water to come up under it into the cylinder and lifting the water held above it to an outlet pipe. The *rotary pump* is like the reciprocating pump in that it allows a fluid to fill a space that then decreases in volume. The rotary pump, however, has no valves and uses rotating components in place of a piston. A *jet pump* (e.g., a perfume atomizer) uses a fast-moving stream of liquid or air as the moving force. COMPRESSORS are used to force air or other gases into a closed container.

pumpkin, common name for the genus *Cucurbita* of the GOURD family, including the pumpkins and squashes. Although the names are often used interchangeably, pumpkin, in the U.S., usually refers to *C. pepo* and its varieties (which also include the summer squashes). The most popular of these is a vine bearing orange

fruits, or pumpkins, used as pie filling and also carved into jack-o'-lanterns at Halloween. Squash usually refers to *C. maxima*, which includes the winter squashes (e.g., Hubbard), or *C. moschata*, which includes the cushaws.

Punch and Judy, traditional English puppet play, deriving from COMMEDIA DELL'ARTE. Punch is cruel and boastful; his wife, Judy, whom he beats, is a loud, faithless nag.

Punic Wars, three distinct conflicts between Carthage and Rome. When they began, Rome had nearly completed the conquest of Italy, while CARTHAGE controlled NW Africa and the islands and the commerce of the W Mediterranean. When they ended, Carthage was ruined, and Rome was the greatest power W of China. The **First Punic War,** 264–241 B.C., grew immediately out of a quarrel between the Sicilian cities of Messana (now Messina) and Syracuse that involved Rome and Carthage. The Romans won naval victories at Mylae (260) and Cape Ecnomus (256), but a Roman excursion to Africa failed (255). Although HAMILCAR BARCA blocked the Romans in Sicily, a Roman victory at sea off the Aegadian Isles (241) caused Carthage to sue for peace. The treaty gave Sicily to Rome, but the Romans, contrary to the treaty, invaded Sardinia and Corsica. When the Carthaginians under HANNIBAL took (219) the Spanish city of Saguntum (present-day Sagunto), a Roman ally, Rome declared war. This **Second Punic War,** or Hannibalic War, 218–201 B.C., was one of the titanic struggles of history. It was marked by Hannibal's invasion of Italy and his initial victory there, but Hannibal's ultimate failure came at the battle of ZAMA (202) in Africa. Carthage surrendered its Spanish province and its war fleet to Rome and never recovered. The **Third Punic War,** 149–146 B.C., originated when Rome charged Carthage with a breach of treaty. Rome declared war, blockaded the city, and razed it.

Punjab [Sanskrit, = five rivers], historic region, bounded by the Indus R. (W) and Jumna R. (E), in Pakistan and NW India. A center of the ancient INDUS VALLEY CIVILIZATION, it is a semiarid but productive wheat-growing region, irrigated by the Jhelum, Chenab, Ravi, Sutlej, and Beas rivers, which unite to form the Panjnad R. and join the INDUS R. The Punjab was a province of British India from 1849 until 1947, when it was partitioned. The western areas (c.58,000 sq mi/150,220 sq km) became the province of West Punjab (now Punjab) in Pakistan, and the eastern areas (c.91,000 sq mi/235,690 sq km) became part of India, where they now form, after several reorganizations, the states of Haryana, Punjab, and part of Himachal Pradesh. Over 60% of the people of Punjab are SIKHS, and Sikh separatists have sought an independent nation since 1947.

Punjabi [pŭnjä'bē], language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See LANGUAGE (table).

punk rock: see ROCK MUSIC.

Purcell, Henry [pûr'səl], c.1659–1695, considered England's finest native composer. He was the organist at Westminster Abbey (1679–95). Combining lyrical melody, harmonic invention, and mastery of COUNTERPOINT to create an English BAROQUE style, he wrote the opera *Dido and Aeneas* (1689); *The Fairy Queen* (1692), a MASQUE; songs for public occasions, e.g., odes for St. Cecilia's Day; instrumental works; and church music.

purgatory, in the teaching of the Roman Catholic Church, the state after death in which the soul destined for heaven is purged of all unpunished or unrepented minor SINS. Souls in purgatory may be aided by the prayers of the living. The Orthodox have not adopted the Western terms for the concept of purgatory, and Protestants have generally abandoned it.

Purim: see under JEWISH HOLIDAYS.

purine, type of organic compound found in the NUCLEIC ACIDS of plant and animal tissue. The two major purines distributed almost universally in living systems are the bases adenine and guanine, present in DNA and RNA.

Puritanism, in the 16th and 17th cent., a movement for reform in the Church of England that had a profound influence on the social, political, ethical, and theological ideas in England and America. Originating in the reign of ELIZABETH I, the movement opposed the ecclesiastical establishment and aimed at purifying the church—hence the name Puritan. Many Puritans sided with the parliamentary party in the ENGLISH CIVIL WAR and held great power between 1640 and 1660. They were cast out of the Church of England after the RESTORATION. In America the early New England settlements were Puritan in origin and theocratic in nature. The spirit of Puritanism long persisted there, and the idea of congregational democratic government was carried into the political life of the state as one source of modern democracy.

purslane, common name for some plants of Portulaceae, a family of chiefly New World herbs and shrubs. The true purslanes, or portulacas (genus *Portulaca*), include many species indigenous to the U.S. The pussley, or common purslane (*P. oleracea*), is a common trailing weed in America; it and the European variety are used as potherbs and greens. Some species, e.g., the showy-blossomed rose moss, or garden purslane (*P. grandiflora*), are cultivated in gardens. Many wildflowers are members of the family, including the bitterroot (*Lewisia rediviva*), the state flower of Montana.

Pusan, city (1985 pop. 3,514,798), extreme SE South Korea. It is the nation's second largest city and largest port, with an excellent natural harbor. It has served as a main southern gateway to Korea from Japan and is also the southern terminus of the main railroad line from SEOUL. A leading industrial, commercial, and shipbuilding center, Pusan is also a popular resort city. During the KOREAN WAR it was (Aug.–Sept. 1950) the site of a UN beachhead. Historic landmarks include several medieval palaces.

Pusey, Edward Bouverie [pyōō'zē], 1800–82, English clergyman, leader in the OXFORD MOVEMENT. In 1828 he was made regius professor of Hebrew at Oxford and canon of Christ Church. He formally aligned himself with the Oxford movement in late 1833 and wrote the tracts on fasting (1834) and baptism (1836) in the series *Tracts for the Times.* When John Henry NEWMAN withdrew from the Oxford movement in 1841, Pusey became its leader. He strongly defended High Church views and advocated the doctrine of the Real Presence, holding that the body and blood of Jesus Christ were actually present in the Eucharist. He assisted (1845) in the establishment of the first Anglican sisterhood, and his sermon "The Entire Absolution of the Penitent" (1846) established the Anglican practice of private confession. In 1851 he preached "The Rule of Faith," which is credited with checking secessions to Roman Catholicism.

Pushkin, Aleksandr Sergeyevich [pŏŏsh'kĭn], 1799–1837, Russian poet and prose writer. Born to a noble family, he published his first major poem, *Russlan and Ludmilla,* in 1820. In that year both his "Ode to Liberty" and some satirical verses offended the court, and he was exiled to S Russia. There he composed such Byronic poems as *The Prisoner of the Caucasus* (1821). He was ordered to his family's estate in 1824 but was pardoned in 1826, settling first in Moscow and then in St. Petersburg. He died of wounds received in a duel. The first to use the vernacular and to draw heavily on Russian history and folklore, Pushkin is revered as the founder of modern Russian poetry. His masterpiece is the verse-novel *Eugene Onegin* (1825–31), adapted as an opera by TCHAIKOVSKY. Among his other works are the verse-drama *Boris Godunov* (1831), the basis of a MOUSSORGSKY opera; the historical poem *The Bronze Horseman* (1833); the story "The Queen of Spades" (1834), also adapted by Tchaikovsky; *The Captain's Daughter* (1836), a short novel of the 1773–75 PUGACHEV uprising; and *The Negro of Peter the Great* (1837), an unfinished novel about Pushkin's maternal great-grandfather.

Pushtu [pŭsh'tōō], language belonging to the Iranian group of the Indo-Iranian subfamily of the Indo-European family of languages. It is also called Pashto and Afghan. See LANGUAGE (table).

pussy willow: see WILLOW.

Putnam, Israel, 1718–90, American Revolutionary general; b. Salem (now Danvers), Mass. A farmer, he joined the Continental army and was prominent at the battle of BUNKER HILL. He commanded the disastrous battle of Long Island (1776). His cousin, **Rufus Putnam,** 1738–1824, b. Sutton, Mass., was also an American Revolutionary general. A founder of the OHIO COMPANY OF ASSOCIATES, he supervised (1788) the building of Marietta, Ohio.

puts and calls, in securities trading, contracts allowing the holder to buy (a call) or sell (a put) a given stock at a specific price in a designated period of time. Both are options that add flexibility to the securities market and permit investors to diminish their risks. In return for a put or call, an investor pays a fee to the seller of the

option, who pays a commission to the broker who brought the parties together. Calls are generally used by investors seeking to profit from a rise in stock prices while avoiding sharp losses; puts are used to profit from a fall in stock prices. Both are generally written for one to six months.

Puvis de Chavannes, Pierre [püvē' də shävän'], 1824–98, French mural painter. After studying with DELACROIX, he secured his reputation with the painting *War* (Amiens). His chaste murals with allegorical figures are in the Sorbonne and the Boston Public Library.

Pu Yi, Henry, 1906–67, last emperor (1908–12) of China, under the name Hsuan T'ung. In 1934 he became Emperor K'ang Te of the Japanese puppet state of Manchukuo, or Manchuria. Captured (1945) by the Russians, he was returned (1950) to China and imprisoned until 1959.

PVC: see POLYVINYL CHLORIDE.

Pygmalion, in Greek mythology, king of Cyprus, sculptor of a beautiful statue of a woman. When he prayed to APHRODITE for a wife like it, she brought the statue (Galatea) to life, and Pygmalion married her.

Pygmies or **Pigmies,** nomadic hunting and gathering peoples of equatorial Africa (sometimes called Negrillos) whose adult males average under 5 ft (1.5 m) in height. They were probably the sole inhabitants of the Congo valley before farming was developed. Numbering c.150,000, they live in small bands, dependent largely on the forest for their food, although they trade with the settled agriculturalists around them. Pygmy groups include the Akkas, in the upper Nile R. valley; the Batwas, in the great bend of the Congo R.; and the Mbuti, in the Ituri forest of NE Zaïre.

Pyle, Ernie (Ernest Taylor Pyle), 1900–45, American journalist; b. Dana, Ind. In 1935 he began writing a syndicated column about the lives of typical Americans. During WORLD WAR II he wrote about the experiences of ordinary soldiers and sailors, and became one of the most popular war correspondents. Awarded the Pulitzer Prize for distinguished correspondence in 1944, he was killed by Japanese fire.

Pyle, Howard, 1853–1911, American illustrator and writer; b. Wilmington, Del. Pyle specialized in writing and illustrating tales of chivalry and adventure for young people, e.g., *The Merry Adventures of Robin Hood* (1883), reconstructing the past with engaging simplicity and penetrating realism.

Pylos [pī'lŏs], harbor of ancient MESSENIA, Greece, site of a 13th-cent.-B.C. Mycenaean palace, possible dwelling of King Nestor, in Greek mythology. The Bay of Pylos was the scene of an Athenian victory over SPARTA (425 B.C.) and, in modern times, of the battle of Navarino (1827) in the Greek war of independence.

Pym, Barbara (Mary Crampton), 1913–80, English writer. After success with such novels as *Excellent Women* (1952) and *A Glass of Blessings* (1958), her works went out of print. In 1977, after publishing *Quartet in Autumn*, she was praised by several British critics. Her books are quiet comedies, often dealing with older, usually frustrated, and isolated characters.

Pym, John, 1583?–1643, English statesman. He was a leading Puritan opponent of the royalist party of CHARLES I in both the Short and Long Parliaments. Charles tried to remove him from the Commons by military arrest. After the outbreak of the ENGLISH CIVIL WAR Pym arranged an alliance (1643) with Scotland based on English acceptance of the Solemn League and Covenant (see COVENANTERS).

Pynchon, Thomas, 1937–, American novelist; b. Glen Cove, N.Y. Considered a major writer, he is noted for his extravagant sense of humor and imagination. He creates a wild, dark, and labyrinthine world in novels that include *V.* (1963), *The Crying of Lot 49* (1966), *Gravity's Rainbow* (1973), *Slow Learner* (1984), and *Vineland* (1990).

Pyongyang [pyŭng'yäng'], city (1986 est. pop. 2,000,000), capital of North Korea, NW Korea. Near large iron and coal deposits, it is a major industrial center, producing steel, machinery, and armaments. Korea's oldest city, Pyongyang was founded, according to legend, in 1122 B.C. and served as the capital of several Korean kingdoms. It became the capital of North Korea in 1948 and was captured (1950) by UN forces during the KOREAN WAR. The city was later retaken by the North Koreans and rebuilt along modern lines. Only six gates remain of Pyongyang's great walls. Other landmarks include tombs (1st cent. B.C.) with notable murals.

pyorrhea: see PERIODONTITIS.

pyramid. The true pyramid exists only in Egypt. Usually of stone, it is square in plan, with triangular sides facing the compass points, sloping at an angle of about 50° and meeting at an apex. The oldest Egyptian tombs are MASTABAS. The true pyramid evolved about the IV dynasty (2680–2565 B.C.) and was favored through the VI dynasty (2420–2258 B.C.). Later pyramid tombs were archaisms. Each monarch built his own pyramid, in which his mummified body might be preserved for eternity. Entrance was through an opening in the north wall. A small passage, traversing lesser chambers, led to the sepulchral chamber, excavated from the bedrock deep beneath the immense pile. Usually of stone blocks laid in horizontal courses, pyramids were sometimes of mud brick with stone casing. Most notable are the three pyramids of Gizeh (IV dynasty). The Great Pyramid of Khufu or Cheops (2680 B.C.), one of the SEVEN WONDERS OF THE WORLD, is the largest ever built—13 acres (5.3 hectares) in area and 482 ft (147 m) high. Pyramidal structures are found also in Mesopotamia (the ZIGGURAT) and in Central America and Mexico. The Mayan pyramids, built in steep, receding blocks, were topped by ritual chambers. Some had interior tomb crypts.

Pyramus and Thisbe [pĭr'əməs, thĭz'bē], in classical myth, Babylonian lovers. Arriving at their trysting place, Thisbe fled a lion and dropped her mantle. Pyramus found the garment bloodied and, thinking Thisbe dead, killed himself. On returning, Thisbe killed herself. The white fruit of the mulberry tree that stood on the spot, was bloodied and remained red.

Pyrenees, mountain range, SW Europe, separating Spain from France. Rich in timber, pasturage, and hydroelectric power resources, the range extends 270 mi (435 km) from east to west and reaches a high point of 11,168 ft (3,404 m) in the Pico de Aneto in Spain. Along the steep slopes on the French side are many resorts and the noted place of pilgrimage, LOURDES.

pyrimidine, type of organic compound based on a six-membered carbon-nitrogen ring. Virtually all animal and plant tissue contains the pyrimidines thymine, cytosine, and uracil as part of certain COENZYMES and in the NUCLEIC ACIDS.

pyrite or **iron pyrites,** the most common sulfide mineral (FeS_2), brass yellow in color, found in crystals and massive, granular, and stalactite forms. In spite of its nickname, "fool's gold," it is often associated with gold. Pyrite, widely distributed in rocks of all ages, is used chiefly as a source of SULFUR for sulfuric acid.

pyroxene, name for a group of widespread magnesium, iron, and calcium silicate minerals. They are commonly white, black, and brown, but other varieties occur. Found chiefly in igneous and metamorphic rocks, they are abundant in lunar rocks.

Pyrrhus [pĭr'əs], c.318–272 B.C., king of EPIRUS. He invaded MACEDON (291) but was driven out (c.286). To aid the Tarentines, he went to Italy (280), where he defeated the Romans at Heraclea and Asculum, but with such heavy losses that he said: "One more such victory and I am lost"; thus the term "Pyrrhic victory." Defeated by the Romans at Beneventum (275), he turned again to Macedon, defeating Antigonus II (273). He was later killed in Argos. His sole accomplishment was the ruin of Epirus.

pyrrophyte, member of a division (Pyrrophyta) of the PROTIST kingdom consisting of mostly single-celled and photosynthetic organisms (dinoflagellates) that move using long, whiplike flagella. Traditionally considered PLANTS, pyrrophytes are extremely abundant in tropical oceans, where they are important in the food chain and largely responsible for the phosphorescence visible at night.

Pythagoras, c.582–c.507 B.C., pre-Socratic Greek philosopher. We know little of his life and nothing of his writings; all of our knowledge comes from his followers, the **Pythagoreans,** a mystical brotherhood he founded at Crotona. Members of the order regarded Pythagoras as a demigod and attributed all their doctrines to him. They believed in the transmigration of souls, and followed moral and dietary practices in order to purify the soul for its next embodiment. Skilled mathematicians, they influenced early Euclidian geometry, e.g., through the Pythagorean theorem (which states that the square of the length of the hypotenuse of a right triangle

equals the sum of the squares of the lengths of the other two sides). They were also among the first to teach that the earth is a spherical planet revolving about a fixed point. Beginning with the discovery of numerical relations between musical notes, they taught that the essence of all things was number and that all relationships—even abstract concepts like justice—could be expressed numerically.

Pythian games, in ancient GREECE, games held at DELPHI every four years to honor APOLLO. They included musical, literary, and athletic contests.

Pythias: see DAMON AND PYTHIAS.

python, nonvenomous constrictor SNAKE of the BOA family, found in tropical regions of the Old World and the South Pacific islands. It kills its prey by squeezing them in its coils. The reticulated, or royal, python (*Python reticulatus*), one of the largest snakes in the world, may reach a length of 30 ft (9 m) or more.

Q

Qaddafi, Muammar al- [käddä'fē], 1942–, Libyan army officer and head of state (1969–). He led the 1969 army coup that deposed King Idris I. As head of state he has blended Arab nationalism, revolutionary socialism, and Islamic orthodoxy into a stridently anti-Western and anti-Israeli dictatorship, financed by LIBYA's vast oil resources. In 1986 Qaddafi survived a U.S. air raid launched in response to Libya's support of TERRORISM, but several of his children were hurt or killed.

Qatar [kä'tär], officially State of Qatar, independent emirate (1992 est. pop. 484,000), c.4,400 sq mi (11,400 sq km), on a largely barren peninsula in the PERSIAN GULF, bordering Saudi Arabia and the United Arab Emirates (S). The capital is DOHA. The economy of Qatar is dominated by oil, which accounts for over 90% of exports and government income. Oil revenues have been used to diversify the economy, including the development of natural gas fields, chemicals, iron and steel, cement, and fertilizer industries and banking. A minority (25%) of the population are Qataris (Arabs of the WAHHABI sect of Islam); the rest are largely Pakistanis, Indians, other Arabs, and Iranians. Arabic is the official language, but English is also widely spoken. The country is an absolute monarchy. Qatar was ruled by BAHRAIN from the 1700s until the mid-1800s, when Great Britain and the Ottoman Empire began vying for control of the peninsula. It was a British protectorate from 1916 until 1971, when it became independent. The present emir, Sheikh Khalifa ibn Hamad al-Thani, came to power in 1972 after ousting his cousin.

Qingdao or **Tsingtao** [both: chĭng-dow], city (1990 est. pop. 2,060,000), SE Shandong prov., E China, on the YELLOW SEA. Famous for its beaches, Qingdao is one of China's tourist centers and the leading industrial city in Shandong province. It makes textiles, machinery, railroad equipment, and processed food and tobacco. Leased to Germany (1898–1919), the city retains German influences in architecture and in the beer from its well-known brewery, established by the Germans. It was the site of a U.S. naval base from 1945 to 1949.

Qiqihar or **Tsitsihar** [both: chē-chē-här], city (1990 est. pop. 1,380,000), S central Heilongjiang prov., NE China. It is an industrial city producing locomotives, machine tools, and other heavy industrial goods. One of the oldest Chinese communities in NE China, it is in winter one of the coldest of all Chinese urban areas.

Qom or **Qum** [both: kôm], city (1986 pop. 543,139), W central Iran. Located in a semiarid region, it is an industrial and transportation center. Important to Shiite Muslims since early Islamic times, Qom contains the lavish tomb of Fatima al-Masuma (d. 816) and became a place of pilgrimage in the 17th cent. After 1979 the city was the home of Ayatollah KHOMEINI.

quadrature, in astronomy: see ELONGATION; SYZYGY.

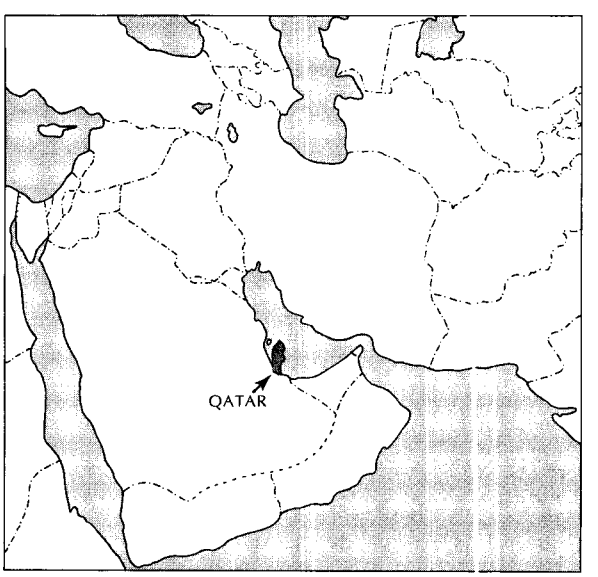
Quadruple Alliance, one of three European alliances. **1** The Quadruple Alliance of 1718 was formed by Great Britain, France, the Holy Roman emperor, and the Netherlands, in opposition to PHILIP V of Spain and his efforts to nullify the results of the War of the SPANISH SUCCESSION by taking over Sicily. It was generally successful. **2** The Quadruple Alliance of 1814 consisted of Great Britain, Austria, Prussia, and Russia and aimed at strengthening the coalition against NAPOLEON I. It is sometimes confused with the HOLY ALLIANCE (to which Britain did not belong). **3** The Quadruple Alliance of 1834 consisted of Great Britain, France, Spain, and Portugal. Its purpose was to strengthen the government of ISABELLA II of Spain against the pretensions of the CARLISTS. The alliance broke up after the Spanish marriages (of Isabella and her sister) in 1846, which Britain opposed.

quail, name for small, extremely popular game BIRDS of the PHEASANT family, including the New World quails, the Old World quails and PARTRIDGES, and the true pheasants. In parts of the U.S. the BOBWHITE is called quail. The California quail (*Lophortyx californicus*), grayish with black and white markings and a forward-curving head plume, can be found in city parks. Quails have great reproductive potential, laying 12 to 15 eggs per clutch. They eat harmful insects and seeds and travel in flocks called coveys.

Quakers: see FRIENDS, RELIGIOUS SOCIETY OF.

Quantrill, William Clarke, 1837–65, Confederate guerrilla leader in the American CIVIL WAR; b. Dover, Ohio. His band of irregulars fought and pillaged in Missouri and Kansas, and sacked (1863) LAWRENCE, Kans., killing 150 civilians. Quantrill was killed by Union troops.

quantum chromodynamics (QCD), quantum field theory that describes the properties of the STRONG INTERACTIONS between QUARKS



The key to pronunciation appears on page xiii.

and between PROTONS and NEUTRONS in the framework of QUANTUM MECHANICS. Quarks possess a distinctive property called color that governs their binding together to form other ELEMENTARY PARTICLES. Analogous to electric charge in charged particles, color is of three varieties, arbitrarily designated as red, blue, and yellow. Quarks interact by emitting and absorbing gluons. Eight kinds of gluons are required to transmit the strong force between quarks, e.g., a blue quark might interact with a yellow quark by exchanging a blue-antiyellow gluon. See also QUANTUM ELECTRODYNAMICS.

quantum electrodynamics (QED), quantum field theory that describes the properties of ELECTROMAGNETIC RADIATION and its interaction with electrically charged matter in the framework of QUANTUM MECHANICS. The fundamental equations of QED apply to the emission and absorption of light by atoms and the basic interactions of light with ELECTRONS and other ELEMENTARY PARTICLES. Charged particles interact by emitting and absorbing PHOTONS, the particles of light that transmit electromagnetic forces. For this reason, QED is also known as the quantum theory of light. See also QUANTUM CHROMODYNAMICS.

quantum mechanics or **quantum theory,** branch of mathematical physics that deals with the emission and absorption of energy by matter and with the motion of material particles. Because it holds that energy and matter exist in tiny, discrete amounts, quantum mechanics is particularly applicable to ELEMENTARY PARTICLES and the interactions between them. According to the older theories of classical physics, energy is treated solely as a continuous phenomenon (i.e., WAVES), and matter is assumed to occupy a very specific region of space and to move in a continuous manner. According to the quantum theory, energy is emitted and absorbed in a small packet, called a quantum (pl. quanta), which in some situations behaves as particles of matter do; particles exhibit certain wavelike properties when in motion and are no longer viewed as localized in a given region but as spread out to some degree. The quantum theory thus proposes a dual nature for both waves and particles, with one aspect predominating in some situations and the other predominating in other situations. Quantum mechanics is needed to explain many properties of matter, such as the temperature dependence of the SPECIFIC HEAT of solids, as well as when very small quantities of matter or energy are involved, as in the interaction of elementary particles and fields, but the theory of RELATIVITY assumes importance in the special situation where very large speeds are involved. Together they form the theoretical basis of modern physics. (The results of classical physics approximate those of quantum mechanics for large scale events and those of relativity when ordinary speeds are involved.) Quantum theory was developed principally over a period of thirty years. The first contribution was the explanation of BLACKBODY radiation in 1900 by Max PLANCK, who proposed that the energies of any harmonic oscillator, such as the atoms of a blackbody radiator, are restricted to certain values, each of which is an integral (whole number) multiple of a basic minimum value. The energy E of this basic quantum is directly proportional to the frequency ν of the oscillator, or $E = h\nu$, where h is a constant, now called Planck's constant, having the value 6.63×10^{-34} joule-second. In 1905 Albert EINSTEIN proposed that the radiation itself is also quantized according to this same formula, and he used the new theory to explain the PHOTOELECTRIC EFFECT. Niels BOHR used the quantum theory in 1913 to explain both atomic structure and atomic spectra, showing the connection between the energy levels of an atom's electrons and the frequencies of light given off and absorbed by the atom. Quantum mechanics, the final mathematical formulation of the quantum theory, was developed during the 1920s. In 1924 Louis de BROGLIE proposed that particles exhibit wavelike properties. This hypothesis was confirmed experimentally in 1927 by Clinton J. Davisson and Lester H. Germer, who observed DIFFRACTION of a beam of electrons. Two different formulations of quantum mechanics were presented following de Broglie's suggestion. The wave mechanics of Erwin SCHRÖDINGER (1926) involves the use of a mathematical entity, the wave function, which is related to the probability of finding a particle at a given point in space. The matrix mechanics of Werner HEISENBERG (1925) makes no mention of wave functions or similar concepts but was shown to be mathematically equivalent to Schrödinger's theory. Quantum mechanics was combined with the theory of relativity in the formulation of P.A.M. DIRAC (1928), which also predicted the existence of ANTIPARTICLES. A particularly important discovery of the quantum theory is the uncertainty principle, enunciated by Heisenberg in 1927, which places an absolute theoretical limit on the accuracy of certain measurements; as a result, the assumption by earlier scientists that the physical state of a system could be measured exactly and used to predict future states had to be abandoned. Other developments of the theory include quantum statistics, presented in one form by Einstein and S.N. Bose (Bose-Einstein statistics, which apply to BOSONS) and in another by Dirac and Enrico FERMI (Fermi-Dirac statistics, which apply to FERMIONS); quantum electronics, which deals with interactions involving quantum energy levels and resonance, as in LASERS; quantum gravitation, the quantum theory of gravitational fields; and **quantum field theory.** In quantum field theory, interactions between particles result from the exchange of quanta: electromagnetic forces arise from the exchange of PHOTONS, weak nuclear forces (see WEAK INTERACTION) from the exchange of W AND Z PARTICLES, strong nuclear forces (see STRONG INTERACTION) from the exchange of gluons, and GRAVITATION from the exchange of gravitons. See also QUANTUM ELECTRODYNAMICS; QUANTUM CHROMODYNAMICS.

quark, any of a group of ELEMENTARY PARTICLES that are the basic constituents of all hadrons. Quarks have fractional charges of ⅓ or ⅔ of the basic charge of the electron or proton. There is evidence for five kinds, or flavors, of quarks: up, down, strange, charm, and bottom; a sixth, labeled top, has yet to be discovered. Each flavor of quark is believed to come in three varieties, differing in a property called color. The baryons, a subgroup of the hadrons that includes the proton and neutron, consist of three quarks. A proton consists of two up quarks and a down quark, and a neutron of two down quarks and an up quark. Three antiquarks make up the antibaryons. Mesons, the other subgroup, consist of a quark-antiquark pair.

quarrying, open, or surface, excavation of rock used for various purposes, including construction, ornamentation, and road building. The methods depend on the desired shape of the stone and its physical characteristics. Sometimes the rock is shattered by the use of explosives (e.g., for roadbeds). For building stones, a process called broaching, or channeling, is used, whereby holes are drilled and wedges inserted and hammered until the stone splits off. This method was probably used by the ancient Egyptians and the Incas.

quartz, one of the commonest rock-forming minerals (SiO_2), and one of the most important constituents of the earth's crust. It occurs in crystals, often distorted and commonly twinned. Varieties are classified as crystalline (e.g., AMETHYST) and cryptocrystalline (having crystals of microscopic size, e.g., CHALCEDONY and CHERT). SAND and SANDSTONE are clastic quartzes.

quartzite, ROCK composed of firmly cemented QUARTZ grains, commonly resulting from the METAMORPHISM of sandstone and distinguished from the latter by fracturing across, rather than along, the line of cementing material between its constituent grains of sand.

quasar, one of a class of faint blue celestial objects, starlike in appearance, that are currently believed to be the most distant and most luminous objects in the universe. The spectral lines of quasars have enormous RED SHIFTS that seem to imply that they are receding from our galaxy with speeds as great as 95% of the speed of light. If HUBBLE'S LAW for the expansion of the universe is extrapolated to include quasars, they may be as far as 12 billion LIGHT-YEARS away and consequently as intrinsically luminous as 1,000 galaxies combined.

quasicrystal or **quasiperiodic solid,** solid body that exhibits such crystalline features as symmetry and repeating patterns of unit cells (regular arrangements of atoms, molecules, or ions) but—unlike a CRYSTAL—requires more than one type of unit cell to achieve large-scale order. Quasicrystals exhibit symmetries (e.g., icosahedral and decagonal) not seen in crystals. Quasicrystals are usually metallic alloys and have stronger magnetic properties and exhibit greater elasticity at higher temperatures than crystals.

Quasimodo, Salvatore, 1901–68, Italian poet and translator; b. Sicily. Five volumes of verse (1930–38) established him as a leader of Italy's "hermetic" poets, whose verbal complexity was derived from

the French SYMBOLISTS. His later, more humanistic poetry includes *Day after Day* (1947) and *To Give and To Have* (1966). Quasimodo was awarded the 1959 Nobel Prize in literature.

Quayle, J(ames) Danforth, 1947–, vice president of the U.S. (1989–93); b. Indianapolis. A conservative Indiana Republican, he served in the U.S. House of Representatives (1977–81) and Senate (1981–89). In 1988 he was elected vice president on the ticket headed by George BUSH. Quayle led the Bush administration's efforts to reduce government regulations, particularly environmental ones, that affected businesses.

Quebec, Fr. *Québec,* province (1991 pop. 6,895,963), 594,855 sq mi (1,540,680 sq km), E Canada, bounded by Hudson Strait (N), Labrador and the Gulf of St. Lawrence (E), New Brunswick and the U.S (S), Hudson Bay and Ontario (W). Quebec is the largest and second most populous of the provinces. It is the center of French Canadian culture, French-speaking people making up c.80% of the population. The chief cities include MONTREAL, the largest city; QUEBEC city, the capital; LAVAL; and TROIS RIVIÈRES. The CANADIAN SHIELD covers the northern nine tenths of the province. To the south lies the great SAINT LAWRENCE R., along whose banks are the lowlands that are the centers of agriculture and industry. In the southeast, south of the St. Lawrence, are the APPALACHIAN Highlands and the GASPÉ PENINSULA. The forests of the north yield valuable timber, and throughout the north copper, iron, zinc, silver, and gold are mined. Asbestos is found in the Appalachian Highlands. The rivers have been, and are being, extensively developed for hydroelectric power. The small farms of the lowlands produce dairy products, sugar beets, and tobacco. Quebec's main manufactures are refined petroleum, food products, motor vehicles, clothing, furniture, iron and steel, chemicals, and metal and paper products.

History. Jacques CARTIER explored (1534–35) the St. Lawrence region, and in 1608 CHAMPLAIN built a trading post on the site of Quebec city. French explorers, traders, and missionaries then penetrated the continent, and in 1663 the area, known as New France, became a royal colony. After the FRENCH AND INDIAN WAR of 1754–63 the colony came under British rule. To conciliate the French inhabitants the British passed (1774) the QUEBEC ACT, by which the area retained its French language and institutions. After the American Revolution, many British UNITED EMPIRE LOYALISTS came to Quebec, and in 1791 Upper Canada (now ONTARIO) was separated from Quebec (Lower Canada). French Canadian resentment against the British led to an unsuccessful revolt (1837) sparked by Louis PAPINEAU. Upper and Lower Canada were united in 1841, but in 1867 Quebec and Ontario joined the Canadian confederation as separate provinces. In the 20th cent. Quebec sought to broaden its provincial rights in Canada. In 1976 the separatist Parti Québécois won a large majority in the provincial assembly and passed laws to discourage the use of English, but Quebec voters rejected the party's "sovereignty-association" plan in a 1980 referendum. Since 1985 the Liberal party, led by Robert Bourassa and, since 1994, by Daniel Johnson, has controlled the assembly. Separatism revived in 1990 when the 1987 Meech Lake accord, which recognized Quebec as a "distinct society," failed to be ratified by all the provinces. Quebec sends 24 senators (appointed) and 75 representatives (elected) to the national parliament.

Quebec, Fr. *Québec,* city (1991 pop. 167,517), provincial capital of Quebec, part of the Québec urban community (1991 pop. 490,271), on the St. Lawrence R. The population is largely French-speaking, and the city is a focus of French Canadian nationalism. The chief industries are shipbuilding and tourism. Features of special interest include the historic Old Lower Town, centered in restored Place Royale at river level; the old Upper Town, dominated by the huge Chateau Frontenac hotel (1892), at the top of Cape Diamond, a 300-ft-high (90-m) bluff; the Citadel fortress (1832); and the Parliament Building or National Assembly (1877–86). Quebec was founded by CHAMPLAIN in 1608 and, after a brief period of English rule (1629–32), was made the capital of New France in 1663. In 1759 English forces under James Wolfe defeated the French under Gen. MONTCALM on the Plains of Abraham and captured the city. It became the capital of Lower Canada (now Quebec province) in 1791 and was twice the capital of the United Provinces of Canada (1851–55, 1859–65).

Quebec Act, 1774, creation of a permanent British government in CANADA, which also granted religious freedom to Roman Catholics. The THIRTEEN COLONIES considered it one of the INTOLERABLE ACTS because it nullified many of their claims to Western lands; thus it helped to start the AMERICAN REVOLUTION.

Quechua, Kechua [both: kĕch'o͞o-ə, -wä], or **Quichua** [kēch'wä], linguistic family belonging to the Andean branch of the Andean-Equatorial stock of Native American languages. See NATIVE AMERICAN LANGUAGES (table).

Queen Anne's lace or **wild carrot,** herb (*Daucus carota*) of the CARROT family, native to the Old World but naturalized in North America. Similar in appearance to the cultivated carrot (which is believed to be derived from this plant), it has feathery foliage but a woody root. The tiny white flowers bloom in a lacy, flat-topped cluster or umbel.

Queen Anne's War: see FRENCH AND INDIAN WARS.

Queensberry, John Sholto Douglas, 8th **marquess of:** see BOXING.

Queensland, state (1992 est. pop. 3,022,000), 667,000 sq mi (1,727,530 sq km), NE Australia. Almost half of Queensland's residents live in metropolitan BRISBANE, the capital. Sugar is the main export crop; cotton and wheat are also important. Tropical fruits are grown in the half of the state located in the tropics. Beef cattle and sheep predominate in drier areas W of the EASTERN HIGHLANDS, where the Great Artesian Basin (376,000 sq mi/973,840 sq km) is a valuable water source. Queensland has deposits of bauxite (near Weipa); copper, silver-lead, zinc, and phosphate (near Mt. Isa); nickel (near Townsville); and coal, oil, and natural gas. Tourism and manufacturing have grown in importance since the 1960s. Originally settled as a penal colony (1824–43, at Moreton Bay), Queensland became a separate colony in 1859 and a federated state of Australia in 1901.

Quemoy: see MATSU AND QUEMOY.

Quental, Antero de [kēntäl'], 1842–91, Portuguese poet. The author of *Odes modernas* (1865), *Sonetos* (1881), and other volumes, he also helped organize the Portuguese Socialist party. Ill health led to his suicide. He is considered a principal modern Portuguese poet.

Quesnay, François [kĕnā'], 1694–1774, French economist, founder of the physiocratic school. A physician to Louis XV, he began his economic studies in 1756, when he wrote for the *Encyclopédie.* His chief work is *The Economical Table* (1758), which he and his followers believed summed up the natural law of economy. Quesnay and other PHYSIOCRATS greatly influenced the thought of Adam SMITH.

Quetzalcoatl [Nahuatl, = feathered serpent], ancient deity and legendary ruler of the TOLTEC in Mexico. An early Toltec ruler credited with the discovery of corn, the arts, and science is also called Quetzalcoatl. As god of civilization, identified with the wind and the planet Venus, Quetzalcoatl represented the forces of good and light. The name was adopted by the AZTEC and linked to their chief god; their emperor MONTEZUMA mistook the invading Spanish for the hosts of Quetzalcoatl returning (as promised in legend) from travels over the sea. The MAYA Kulkulcán, also represented by a feathered serpent, probably derived from the same historical figure as Quetzalcoatl.

Quevedo y Villegas, Francisco Gómez de [kāvā'thō ē vēlyā'gäs], 1580–1645, Spanish writer. A major figure of the GOLDEN AGE, he wrote brilliant moral satires such as *Visions* (1627); the picaresque novel *The Life of Buscón* (1626); much verse; and political and religious works.

Quezon, Manuel Luis [kā'sōn], 1878–1944, first president (1935–44) of the Commonwealth of the PHILIPPINES. He crusaded tirelessly for Philippine independence from the U.S. During WORLD WAR II he led a government-in-exile in the U.S.

Quezon City, city (1990 pop. 1,667,000), central Luzon, Philippines, adjacent to MANILA. Although it is the nation's largest city, it is usually considered a Manila suburb. It was the Philippine capital from 1948 to 1976, when Manila replaced it. It is the seat of the Univ. of the Philippines.

quicklime: see CALCIUM OXIDE.

quicksilver: see MERCURY.

Quidor, John [kĭdôr'], 1801–81, American painter; b. Tappan, N.Y. Best known for scenes inspired by the writings of Washington IRV-

ING, Quidor often mingled the macabre with humor in scenes placed in mysterious romantic settings.

quilting, form of needlework in which two layers of fabric separated by an interlining are sewn together, usually in a pattern of back or running stitches. A traditional means of adding warmth to fabric in Europe and Asia, it has been used in America since colonial times to make bed covers (quilts). Until c.1750 quilts were of the pieced, or patchwork, type; later, appliqué and trapunto (padding or cording) also became popular. Old quilts are prized by collectors. The art survives in rural Southern areas and in traditional communities, such as the Amish, and has also been revived by textile artists.

quince, shrub or small tree (genera *Chaenomeles* and *Cydonia*) of the ROSE family. The common quince (*Cydonia oblonga*) is a spineless tree. Its edible fruit is similar to the related APPLE and PEAR but is very astringent and is used mainly in preserves; marmalade is said to have first been made from quince. Flowering quinces (genus *Chaenomeles*) are cultivated for their profuse, usually thorny branches and scarlet, pink, or white flowers.

Quine, Willard Van Orman, 1908–, American philosopher and mathematical logician; b. Akron, Ohio. He studied under WHITEHEAD and CARNAP and taught (1936–78) at Harvard Univ. Much of his work deals with the implications of viewing language as a logical system. He disputed KANT's distinction between analytic and synthetic statements, arguing that any statement can be held to be true once a language's system of reference is adjusted. In the field of logic he made important contributions to SET theory. His works include *A System of Logic* (1934), *Word and Object* (1938), *Philosophy of Logic* (1969), and *Methods of Logic* (3d ed., 1972).

quinine, ALKALOID isolated from the bark of several species of *Cinchona* trees. Prior to the development of synthetic agents, quinine was the specific drug treatment for MALARIA. It is used in a soft drink known as tonic, which is often mixed with alcoholic beverages. Excessive use may cause cinchonism, a condition characterized by ringing of the ears, dizziness, and headache.

Quintilian (Marcus Fabius Quintilianus), A.D. c.35–c.95, Roman rhetorician and teacher. His influential *Institutio oratoria,* a survey of education, literature, the principles of rhetoric, and the life and training of the orator, demonstrates the necessity of moderation and good taste.

Quiroga, Juan Facundo, 1790–1835, Argentine leader. As overlord of the Andean provinces he was a zealous and ruthless advocate of federalism. He rejected the unitarian constitution of 1826 and participated in the civil strife that followed. He was later assassinated, probably at ROSAS's instigation.

Quisling, Vidkun, 1887–1945, Norwegian fascist leader. Minister of defense (1931–33), he founded the fascist Nasjonal Samling national unity party. He helped the Germans prepare the conquest of Norway (1940), and they installed him as premier (1942–45). After the war he was tried for high treason and shot. From his name came the word *quisling* [traitor].

Quito [kē'tō], city (1990 pop. 1,387,887), N central Ecuador, capital of Ecuador and of Pichincha prov. Though unimportant economically, it is Ecuador's political and cultural center and second largest city. It is famous for its splendid setting, lying at an elevation of 9,350 ft (2,850 m) in a fertile Andean valley at the foot of a volcano. The colonial city was built at the site of the capital of the INCA kingdom of Quito, captured for Spain in 1534. In 1822 it was liberated from Spain by Antonio José de SUCRE. Although the city has often been damaged by earthquakes, many fine examples of Spanish colonial architecture remain, including the great Church of San Francisco.

Quivira [kēvē'rä], land explored by CORONADO (1541) and other Spanish explorers. The exact site is unknown, but it is generally identified with Wichita villages in Kansas.

Qum: see QOM.

Qumran [kōōmrän'], ancient village on the northwest shore of the Dead Sea, in the Israeli-occupied WEST BANK. It is famous for the nearby caves in which the DEAD SEA SCROLLS were found. The first archaeologists to excavate the ruins at Qumran identified them with an ascetic community that produced the scroll known as the *Manual of Discipline,* but recent interpretations by other archaeologists have suggested the inhabitants of the ruins lived in relative luxury.

R

Ra or **Re,** in EGYPTIAN RELIGION, sun god, one of the most important gods of ancient Egypt. Called the creator and father of all things, he was chief of the cosmic deities. Early Egyptian kings alleged descent from him. Various other Egyptian gods, e.g., AMON, were identified with him. His symbol is the PYRAMID.

Ra, chemical symbol of the element RADIUM.

Rabat, city (1990 est. pop. 1,472,000), capital of Morocco, on the Atlantic Ocean at the mouth of the Bou Regreg estuary. The city is a minor port and has textile industries. There have been settlements there since ancient times. It became a Muslim fortress A.D. c.700 and was a stronghold of corsairs in the 17th and 18th cent. Prior to independence (1956), Rabat was the capital of the French protectorate of Morocco. Landmarks include the old city walls and the ruins of the Tour Hassan (12th cent.), a large, unfinished mosque.

rabbi [Heb., = my teacher], the title of a Jewish religious leader. The term first came into common use among Palestinian Jews in the late 1st cent. A.D. During the Middle Ages the rabbi, in addition to being a legal scholar, began to assume the roles of teacher, preacher, and communal leader. In the 1970s the Reform and Conservative rabbinical seminaries began to admit female students, and the acceptance of women rabbis has made slow but steady progress. Orthodox Judaism has maintained its traditional position against women rabbis.

rabbit, MAMMAL of the family Leporidae, which includes the HARE. Rabbits and hares have large front teeth, short tails, and hind legs and feet adapted for running and jumping. The term *rabbit* generally refers to small, running animals that give birth to blind, naked young; *hare* refers to larger, hopping forms with longer ears and legs whose young are born furred and open-eyed. Wild rabbits are up to 16 in. (41 cm) long and have grayish-brown fur. The European common rabbit (*Oryctolagus cuniculus*), native to S Europe and Africa, is now found worldwide. It lives in elaborate, adjoining warrens and is chiefly nocturnal, feeding on vegetation. All domestic rabbits belong to this species.

Rabelais, François [räblā'], c.1490–1553, French humanist, one of the great comic geniuses of literature. Joining the Franciscan order, Rabelais studied Greek and Latin as well as science, law, philology, and letters. He later left the Franciscans to become a Benedictine monk. He received (1530) a degree in medicine from the Univ. of Montpellier, where he later taught (1537–38). He went to Lyons (1532) to practice medicine, and it was there that his satirical masterpiece, *Gargantua and Pantagruel* (1532–62), was published. The work, in five books, is as gigantic in scope as the physical size of its heroes. Beneath its broad, often ribald humor

are serious discussions of education, politics, philosophy, and religion. The breadth of Rabelais's learning and his zest for life are evident. The work was condemned by the Sorbonne, however, and Rabelais was saved from persecution for heresy only by the protection of his friend, Cardinal Jean du Bellay. He spent his last years as curate at Meudon (1550–52).

Rabi, Isidor Isaac [rōb'ē], 1898–1988, American physicist; b. Austria. He taught physics at Columbia from 1929 and was chairman (1952–56) of the general advisory committee to the U.S. Atomic Energy Commission. Rabi is known for his work on magnetism, molecular beams, and quantum mechanics. He won the 1944 Nobel Prize in physics for his discovery and measurement of the radio-frequency spectra of atomic nuclei whose magnetic spin has been disturbed.

rabies or **hydrophobia,** acute, often fatal disease of mammals, caused by a virus transmitted from an animal to another animal or to humans through infected saliva, usually through a bite. After a variable incubation period, rabies produces fever, headache, nausea, and pain at the site of the bite, followed by convulsions, inability to drink fluids (hence hydrophobia), apathy, and death. An antirabies vaccine is administered to the bite victim to prevent the disease from developing, and vaccine-laced bait can control the disease in wild animals.

Rabin, Yitzhak, 1922–, Israeli general and political leader, first native-born prime minister of Israel (1974–77, 1992–). A brigade commander in the 1948 ARAB-ISRAELI WAR, Rabin rose to chief of staff by 1964 and was credited with Israel's victory in the Six-Day War (1967). After serving (1968–73) as ambassador to the U.S., he was elected to parliament as a Labor party deputy. He served (Mar.–May 1974) as labor minister before becoming prime minister. As defense minister (1984–90) in the Labor-Likud coalition government, he ordered a harsh crackdown on the Arab uprising in the WEST BANK in the late 1980s. Rabin ousted Shimon PERES as Labor party leader in 1992 and led Labor to victory in the national elections, becoming prime minister and defense minister. In 1993 he agreed to a peace accord with the PLO that called for limited Palestinian self-rule in Jericho and the Gaza Strip.

Rabinowitz, Shalom: see SHOLOM ALEICHEM.

raccoon, nocturnal New World MAMMAL (genus *Procyon*) with a heavily furred body, pointed face, and handlike forepaws. It has mixed gray, brown, and black hair, a black face mask, and black rings on the tail. The common raccoon of North America (*Procyon lotor*) is found from S Canada to South America, except in parts of the Rocky Mts. and in deserts. Highly omnivorous, it is adaptable to civilization and will feed on garbage. Its fur is commercially valuable.

race, one of the group of populations constituting humanity. Genetically, a race may be defined as a group with gene frequencies differing from those of the other groups in the human species (see GENETICS), although the genes in question make up a tiny percentage of the total human genome. The term *race* is inappropriate when applied to national, religious, or cultural groups, nor can the biological criteria of race be equated with mental characteristics (intelligence, personality, character). Races arose in response to MUTATION, selection, geographic adaptation, and genetic drift; racial differentiation occurred relatively late in history. In the 19th and early 20th cent., Joseph Arthur Gobineau and Houston Stewart Chamberlain attributed cultural and psychological values to race, proposing theories of racial superiority, an approach that culminated in the vicious racial doctrines of Nazi Germany. By limiting the criteria to certain physical characteristics, anthropologists at one time agreed on the existence of three relatively distinct groups of people, namely, Caucasoid, Mongoloid, and Negroid, distinguished by such traits as skin color, hair type and color, shape of body, head, and facial features, and blood traits. Today, however, anthropologists stress the heterogeneity of world population, and many reject the concept of race outright.

Rachel, wife of JACOB and mother of JOSEPH and Benjamin. She is one of the four Jewish matriarchs.

Rachel [räshĕl'], 1828–58, French actress; b. Switzerland as Elisa Félix. The great tragic actress of her day, she excelled in the works of RACINE (*Phèdre*) and CORNEILLE.

Rachmaninoff, Sergei Vasilyevich [räkhmä'nēnôf], 1873–1943, Russian composer, conductor, and pianist. His romantic, dramatic music was strongly influenced by his friend TCHAIKOVSKY. His notable works include four piano CONCERTOS, Prelude in C Sharp Minor (1892), Rhapsody on a Theme by Paganini (1934), three SYMPHONIES, and many songs.

Racine, Jean [räsēn'], 1639–99, French dramatist. He is the prime exemplar of French CLASSICISM. His third play, *Andromaque* (1667), established him as France's leading tragic dramatist, displacing CORNEILLE and earning him the patronage of Louis XIV as well as the enmity of Corneille's friends (including MOLIÈRE). His next six tragedies were all masterpieces, unsurpassed in nobility of verse, simplicity of diction, psychological realism, and dramatic construction: *Britannicus* (1669), *Bérénice* (1670), *Bajazet* (1672), *Mithridate* (1673), *Iphigénie en Aulide* (1674), and *Phèdre* (1677). His only comedy was *The Litigants* (1668), satirizing the law courts. A concerted attack on *Phèdre* led Racine to give up the theater, but Mme de MAINTENON persuaded him to write *Esther* (1689) and *Athalie* (1691) for performance at her school in Saint-Cyr. These differ from the earlier plays in their biblical subjects and use of a chorus.

Racine, industrial city (1990 pop. 84,298), seat of Racine co., SE Wis., on Lake Michigan, at the mouth of the Root R.; inc. 1848. It is a port with diversified manufactures, including floor wax and farm and electrical machinery. Three buildings in Racine were designed by Frank Lloyd WRIGHT.

Rackham, Arthur, 1867–1939, English illustrator and watercolorist. He is best known for his delicately colored, imaginative children's book illustrations, e.g., for *Peter Pan* (1906) and *Alice in Wonderland* (1907).

racquetball, sport played indoors by two or four players, combining elements of handball and such racket games as SQUASH. It is played on a standard handball court 40 ft (12.2 m) long, 20 ft (6.1 m) wide, and 20 ft high, with a back wall at least 12 ft (3.6 m) high. The fiber-strung racket is attached to the player's wrist with a thong, and the ball is slightly larger and lighter than that used in handball. Racquetball was developed in the early 1950s and enjoyed a boom in popularity throughout the U.S. in the 1970s.

radar [*ra*dio *d*etection *a*nd *r*anging], system or technique for detecting the position, motion, and nature of a remote object by means of radio waves reflected from its surface. Pulse radar systems use a single directional ANTENNA to transmit and receive the waves. They transmit pulses of electromagnetic waves (usually MICROWAVES), some of which are reflected by objects in the path of the beam. Reflections are received by the radar unit, processed electronically, and converted into images on a CATHODE-RAY TUBE. The antenna must be connected only to the transmitter when sending and only to the receiver while receiving; this is accomplished by switching from one to the other and back again in the fraction of a microsecond between pulses. The distance of the object from the radar source is determined by measuring the time required for the radar signal to reach the target and return. The direction of the object with respect to the radar unit is determined from the direction in which the pulses were transmitted. In most units, the beam of pulses is continuously rotated at a constant speed, or it is scanned (swung back and forth) over a sector at a constant rate. Pulse radar is used primarily for aircraft and naval navigation and for military applications. In **Doppler radar,** or continuous-wave radar, two antennas are used—one to transmit and the other to receive. Because the time a continuous-wave signal takes to reach the target and return cannot be measured, Doppler radar cannot determine distance. The velocity of the object is determined using the DOPPLER EFFECT. If the object is approaching the radar unit, the frequency of the returned signal is greater than the frequency of the transmitted signal; if the object is receding, the returned frequency is less; and if the object is not moving relative to the radar unit, the frequency of the returned signal is the same as the frequency of the transmitted signal. Doppler radar can measure wind rotation inside a thunderstorm and is used to identify possible tornadoes. See also STEALTH TECHNOLOGY.

Radcliffe, Ann (Ward), 1764–1823, English novelist. Her *Romance of the Forest* (1791), *Mysteries of Udolpho* (1794), and *The Italian* (1797), characterized by brooding landscapes, terror, and suspense, were among the first gothic romances.

Radcliffe-Brown, Alfred Reginald, 1881–1955, English anthropologist. He viewed social relations and institutions as interdependent parts of a social system, analyzing them in relation to the whole. His structural-functional analyses greatly advanced social anthropology as a science. He also contributed to the study of KINSHIP.

Radcliffe College: see HARVARD UNIVERSITY.

radial velocity, the speed with which a star moves toward or away from the sun. It is measured from the RED SHIFT or blue shift in the star's spectrum. See also PROPER MOTION.

radiation, the emission or transmission of energy in the form of WAVES through space or through a material medium; the term also applies to the radiated energy itself. The term includes electromagnetic, acoustic, and particle radiation, and all forms of ionizing radiation. According to QUANTUM MECHANICS, ELECTROMAGNETIC RADIATION may be viewed as made up of PHOTONS. Acoustic radiation is propagated as sound waves. Examples of particle radiation are alpha and beta rays in RADIOACTIVITY, and COSMIC RAYS.

radiation sickness, illness caused by the effects of radiation on body tissues. It may be acute, delayed, or chronic and may occur as a result of cumulative exposure to small doses of radiation (as in a plant, a laboratory, or the environment); or exposure to radiation from a nuclear explosion or accident. Symptoms may be mild and transitory, or severe, depending on the type of radiation, the dose, and the rate at which exposure is experienced. They include weakness, loss of appetite, vomiting, diarrhea, a tendency to bleed, increased susceptibility to infection, and—in severe cases—brain damage and death. Mild radiation sickness is a common side effect of radiation therapy for CANCER. Exposure to radiation is of concern even in small doses because of possible long-term genetic effects and increased cancer rates in exposed people.

radio, transmission or reception of ELECTROMAGNETIC RADIATION in the radio frequency range from one place to another without wires. For the propagation and interception of radio waves, a transmitter and receiver are employed. A radio wave carries information-bearing signals; the information may be encoded directly on the wave by periodically interrupting its transmission (see TELEGRAPH) or impressed on the carrier frequency by a process called MODULATION, e.g., amplitude modulation (AM) or frequency modulation (FM). In its most common form, radio transmits sounds (voice and music) and pictures (TELEVISION). The sounds (or images) are converted into electrical signals by a MICROPHONE (or camera tube), amplified (see AMPLIFIER), and used to modulate a carrier wave that has been generated by a transmitter. The modulated carrier is also amplified, then applied to an ANTENNA that converts the electrical signals to electromagnetic waves that radiate into space at the speed of light. Receiving antennas intercept part of this radiation, convert it back into electrical signals, and feed it to a receiver. Once the basic signals have been separated from the carrier wave, they are fed to a LOUDSPEAKER or CATHODE-RAY TUBE, where they are converted into sound and visual images, respectively. Some celestial bodies and interstellar gases emit relatively strong radio waves that are observed with radio telescopes composed of very sensitive receivers and large directional antennas (see RADIO ASTRONOMY). Long-range radio signals enable communications between astronauts and ground-based controllers and carry information from SPACE PROBES as they travel to and encounter distant planets. The invention of the TRANSISTOR and other microelectronic devices (see MICROELECTRONICS) led to the development of portable transmitters and receivers. Military applications of radio include the proximity fuse and various types of RECONNAISSANCE SATELLITES. Radio signals sent by NAVIGATION SATELLITES can be used by special receivers to determine one's position. Citizens band (CB) radios, operating at frequencies near 27 megahertz, are used in vehicles for communication while traveling. See also BROADCASTING; COMMUNICATIONS SATELLITES; RADAR.

radioactive dating: see DATING.

radioactive nuclear waste: see WASTE DISPOSAL.

radioactivity, spontaneous disintegration or decay of the nucleus of an atom by emission of particles, usually accompanied by ELECTROMAGNETIC RADIATION. Natural radioactivity is exhibited by several elements, including RADIUM and URANIUM. The radiation produced is of three types: the *alpha particle,* which is a nucleus (two protons and two neutrons) of an ordinary helium atom; the *beta particle,* which is a high-speed electron or, in some cases, a positron (the electron's antiparticle); and GAMMA RADIATION, which is a type of electromagnetic radiation with very short wavelengths. The rate of disintegration of a radioactive substance is commonly designated by its half-life, which is the time required for one half of a given quantity of the substance to decay. Radioactivity may be induced in stable elements by bombardment with particles of high energy. See also DATING; ISOTOPE.

radio astronomy, study of celestial bodies by means of the radio waves they emit and absorb naturally. These waves are received by specially constructed antennas called radio telescopes. The most common design consists of a parabolic "dish" of open metal latticework that focuses the radio waves into a concentrated signal that is filtered, amplified, and, finally, analyzed using a computer. Groups of antennas can also be linked by computer to form a single radio telescope, such as the Very Large Array and Very Long Baseline Array of the NATIONAL RADIO ASTRONOMY OBSERVATORY. The radio signals received from outer space are extremely weak, and long observing times are required to collect a useful amount of energy. There are several basic types of galactic radio emissions. The type first discovered, accidentally in 1931 by Karl JANSKY, is spread over a wide band of radio frequencies. It is produced when free electrons are scattered by collisions with heavier ions in the ionized interstellar gases surrounding hot, bright STARS. A second type, called synchrotron radiation, is emitted by energetic electrons as they rapidly spiral within the strong magnetic fields existing in the vicinity of SUPERNOVA remnants. A third type, originating in INTERSTELLAR MATTER, radiates at discrete frequencies characteristic of the quantum jumps (see QUANTUM MECHANICS) made by electrons in the atoms and molecules, e.g., atomic hydrogen and formaldehyde, in the interstellar medium. PULSARS, stellar radio sources that regularly radiate periodic bursts of energy, were discovered in 1968. Radio waves also come from outside our Milky Way galaxy. Some extragalactic sources are detected only by their radio emission, but others have been identified with optically observed GALAXIES and QUASARS. In addition to localized radio sources, there is uniform low-level radio noise from every direction in the sky. This cosmic background radiation is believed to be an indication that the universe began with an explosive "big bang" rather than having always existed in an unchanging steady state (see COSMOLOGY).

Radio Free Europe, broadcasting organization headquartered in Munich, Germany, that provides daily programs to the peoples of Poland, the Czech Republic, Slovakia, Romania, Bulgaria, the Baltic states, and the former Yugoslav republics in their own languages; broadcasts to Hungary ended in 1993. Founded in 1950, it is privately operated, although mainly financed by the U.S. government. Its broadcasts include news and political commentaries, music, sports, and other entertainment. In 1976 Radio Free Europe was merged with **Radio Liberty,** which broadcasts to the former republics of the USSR and was founded in 1951.

radioimmunoassay (RIA), highly sensitive laboratory technique used to measure minute amounts of substances including antigens, hormones, and drugs present in the body. The substance or antigen (a foreign substance in the body that causes antibody production) to be measured is injected into an animal, causing it to produce antibodies. Serum containing the antibodies is withdrawn and treated with a radioactive antigen and later with a nonradioactive antigen. Measurements of the amount of radioactivity are then used to determine the amount of antigen present. The technique was developed by Solomon Berson and Rosalyn Yalow. Yalow was awarded the 1977 Nobel Prize in physiology or medicine for her work.

radioisotope: see ISOTOPE.

radiometer, instrument for the detection or measurement of ELECTROMAGNETIC RADIATION, particularly INFRARED RADIATION. Radiometers that function by increasing the temperature of the device are called thermal detectors; examples include the bolometer and the THERMOCOUPLE.

radiosonde, group of instruments for simultaneous measurement and radio transmission of meteorological data. The instrument package is usually carried into the atmosphere by a WEATHER BALLOON; it may, however, also be carried by a rocket (rocketsonde) or dropped by parachute (dropsonde).

radio telescope: see RADIO ASTRONOMY.

radish, herb (*Raphanus sativus*) of the MUSTARD family, with an edible, pungent root used as a relish. There are many varieties, with red, white, or black roots of different shapes and sizes, some quite large. HORSERADISH is not a radish but a related plant of the mustard family.

Radisson, Pierre Esprit [rädēsōN′], c.1632–1710, French explorer. His accounts of his travels are questioned in part, but he is said to have been with the first explorers to enter MINNESOTA. He transferred his allegiance to the English, made trips to HUDSON BAY (1668, 1670), and was influential in the formation of the HUDSON'S BAY COMPANY.

radium (Ra), radioactive metallic element, discovered in PITCHBLENDE in 1898 by Pierre and Marie CURIE. It is a rare, lustrous, white ALKALINE-EARTH METAL that resembles barium in its chemical properties. Radium compounds are found in uranium ores. The RADIOACTIVITY of radium and its compounds is used in the treatment of cancer. Radium compounds are mixed with a phosphor in luminous paints. In its radioactive decay, radium emits alpha, beta, and gamma rays and produces heat. See ELEMENT (table); PERIODIC TABLE.

radon (Rn), gaseous radioactive element, discovered by Ernest RUTHERFORD in 1899. A colorless, chemically unreactive INERT GAS, it is the densest gas known. Highly radioactive (emitting alpha rays), it is used chiefly in the treatment of cancer by radiotherapy. In homes and other buildings in some areas of the U.S., radon produced by the radioactive decay of uranium-238 present in soil and rock can reach levels regarded as dangerous, but the seriousness of the problem is unclear. See ELEMENT (table); PERIODIC TABLE.

Raeburn, Sir Henry, 1756–1823, Scottish portrait painter. He was influenced by Sir Joshua REYNOLDS. His forceful work displays his virtuoso brush technique. He painted over 700 portraits, mostly of notable Scots; many are in the National Gallery of Scotland, Edinburgh.

Raffles, Sir Thomas Stamford Bingley, 1781–1826, British East Indian administrator. As lieutenant governor of Java (1811–15) and of Bencooleen, in SUMATRA (1818–23), he launched many reforms. In 1819 he secured the transfer of SINGAPORE to the British EAST INDIA COMPANY.

Rafsanjani, (Ali Akbar) Hashemi, 1934–, Iranian religious and political leader, president of Iran (1989–). A Shiite cleric and supporter of Ayatollah KHOMEINI, Rafsanjani was imprisoned several times during the 1960s and 70s. After the Shah's ouster (see MUHAMMAD REZA SHAH PAHLEVI), he helped found the Islamic Republican party and became parliament speaker (1980–89). From 1988 to 1989 he was also acting commander in chief of the armed forces. In 1989 Rafsanjani was elected president. He has sought to revive Iran's economy and has moved to improve relations with the West and reestablish Iran as a regional power. He was reelected in 1993.

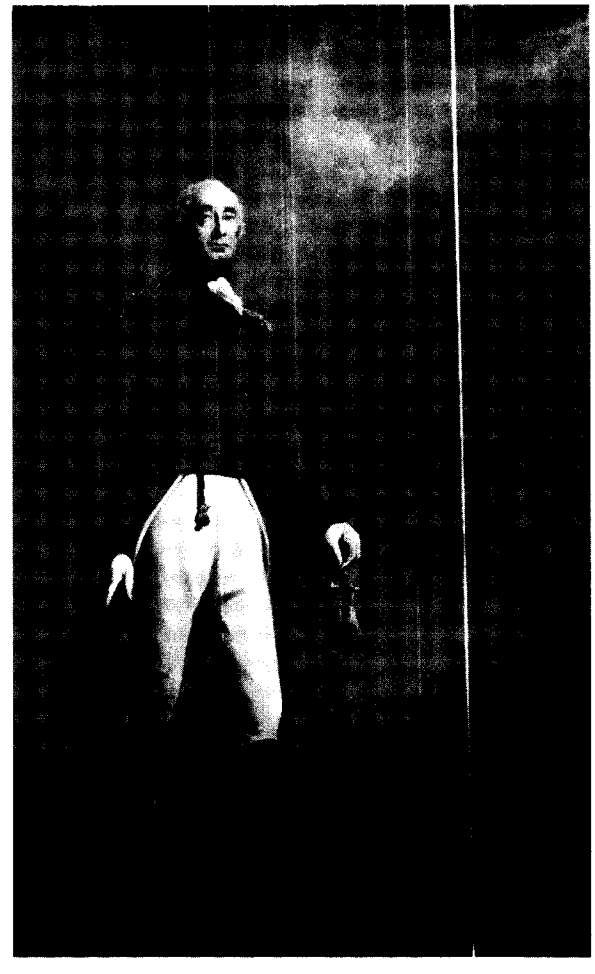
Ragnarok [räg′nərŏk″], in Norse mythology, doomsday, on which the gods of ASGARD, led by Odin (see WODEN), would fight the forces of evil, led by LOKI. After the battle, the universe would be destroyed by fire and a new golden age would appear.

ragtime: see JAZZ.

ragweed, weedy herb (genus *Ambrosia*) of the COMPOSITE family, mostly native to America. They have greenish flowers and subdivided leaves. Their POLLEN is one of the primary hay fever irritants, especially that of the common ragweed (*A. artemisiifolia*) and great ragweed (*A. trifida*).

rail, name for some marsh BIRDS of the family Rallidae, cosmopolitan in distribution, except in polar regions. Their extremely slender bodies are protectively colored in drab browns and reds. There are two major types: the long-billed rails, which include the king and water rails; and those with short, conical bills, including the black rails. Rails, including the gallinule and coot, are probably the most widely distributed bird family.

railroad or **railway,** form of transportation most commonly consisting of steel rails, called tracks, on which freight cars, passenger cars, and other rolling stock are drawn by one or more powered LOCOMOTIVES. Other types of railroads include single, self-propelled cars; cable-drawn units, used on steep grades; and monorails, whose cars travel along a single rail. Crude railways pulled by horses along wooden rails were used for mining purposes as early as the 16th cent., but the modern railroad began with the steam locomotives pioneered by the Englishmen Richard Trevithick and George STEPHENSON in the early 1800s. Steam-powered freight and passenger services were first provided by the Stockton and Darlington Railway in England in 1825. In the U.S., the Baltimore & Ohio RR began operation in 1828 with horse-drawn cars, but after the successful run (1830) of the *Tom Thumb,* a locomotive built by Peter COOPER, steam power was used. Many short-run railroads began to appear in the U.S. in the 1840s. Early improvements in railroading included sleeping cars, patented (1856) by G.M. Pullman; the first all-steel car (1859); and the use of steel rather than wrought iron rails (by 1863). U.S. railroad building reached a historic climax with the completion of the first transcontinental railway. The Union Pacific, building westward from Nebraska, and the Central Pacific, building eastward from California, met at Promontory Point, Utah, on May 10, 1869. Railroad tracks, which had varied in width for many years (preventing cars from passing from one line to another), were standardized in the mid-1880s at 4 ft 8½ in. (1.44 m). After the CIVIL WAR, which gave tremendous impetus to railroads, the great battles of the railway financiers began, involving such people as Cornelius VANDERBILT, Jay GOULD, James FISK, J.J. Hill, and E.H. HARRIMAN. Competition from other sources led to the decline of U.S. railroads beginning in the 1920s. After World War II railroad companies claimed annual deficits in passenger service. Their plight was dramatized when the Penn Central filed for bankruptcy in 1970. In that year Congress acted to create Amtrak, a quasipublic agency that took over all intercity passenger service in the U.S., and in 1976 the federal government set up the ConRail system to operate six bankrupt railroads in the northeast.



Henry Raeburn portrait of the Rt. Hon. Francis Hastings

ConRail was privatized in 1987. Despite sharp cutbacks in service and track mileage, both systems suffered persisting financial problems. In most countries other than the U.S. railroads have long been nationalized or heavily subsidized by government. High-speed passenger trains, such as the "bullet" and TGV trains, have been developed in Japan, France, and Germany, and maglev trains (see MAGNETIC LEVITATION) have been run experimentally on short tracks in several countries. See also MONORAIL.

rain, liquid form of precipitation. It consists of drops of water falling from CLOUDS; if the drops are very small, they are collectively termed *drizzle.* Clouds contain huge amounts of tiny water droplets. Raindrops are formed as additional water vapor from the air condenses on the droplets. When the raindrops become too heavy to be supported by the air currents in the cloud, they slowly fall. Collisions with other raindrops continue to increase their size until they hit the ground. Under warm, dry conditions, raindrops can evaporate completely before they land; such raindrops are called *virga.* Rainfall is one of the primary factors of climate. Average annual rainfall can vary from less than 1 in. (2.5 cm) in an arid DESERT to over 400 in. (1,000 cm) in some rainforests. Factors that control rainfall include the belts of converging-ascending air flow (see DOLDRUMS), air temperature, moisture-bearing winds, ocean currents, location and elevation of mountains, and the proximity of large bodies of water. See also HAIL; SLEET; SNOW.

rainbow, arc showing the colors of the spectrum, which appears when sunlight shines through water droplets. It often appears after a brief shower late in the afternoon. The sun, the observer's eye, and the center of the arc must be aligned—the rainbow appears in the part of the sky opposite the sun. It is caused by the refraction and reflection of light rays from the sun: a ray is refracted as it enters the raindrop, reflected from the drop's opposite side, and refracted again as it leaves the drop and passes to the observer.

Rainey, Joseph Hayne, 1832–87, first African-American elected to the U.S. House of Representatives; b. Georgetown, S.C. The son of a free man, he fled to the West Indies during the Civil War. Returning to South Carolina, he served (1867–70) as a Republican in the state senate. In the U.S. House of Representatives (1870–79) he was a leader in the fight to secure civil rights for the newly freed slaves.

rain forest, type of forest found in areas of high precipitation and typically containing a vast array of plant and animal life. The best known and most ecologically diverse are the tropical rain forests of South America and Asia, but there are important temperate rain forests, such as those in the NW U.S. and New Zealand. In the late 20th cent. the clearing of these areas for logging, agriculture, and other purposes has precipitated erosion and species loss and perhaps accelerated GLOBAL WARMING.

Rainier III [rĕnyā'], 1923–, prince of MONACO (1949–). He succeeded his grandfather, Louis II, as prince and married (1956) American film actress Grace Kelly (see GRACE, princess of Monaco).

raisin: see GRAPE.

Rajputs, dominant people of Rajputana, an historic region of NW India coextensive with present-day Rajasthan. Mainly Hindus of the warrior CASTE, but including some Muslims, their many clans claim divine origin. They were powerful in the 7th cent., but by 1616 had submitted to the MOGULS. In the 18th cent. they expanded their territory, but they were driven back by the British in the 19th cent. Many Rajput princes maintained states under the British, but they gradually lost power after India gained independence (1947).

Rákóczy [rä'kôtsĭ], noble Hungarian family. **Sigismund Rákóczy,** 1544–1608, was elected (1607) prince of Transylvania to succeed Stephen BOCSKAY. His son, **George I Rákóczy,** 1591–1648, became prince of Transylvania in 1630. In 1644 he attacked Holy Roman Emperor FERDINAND III, overran Hungary, and obtained (1645) religious freedom for Hungarians. He was succeeded as prince by his son, **George II Rákóczy,** 1621–60, who was deposed in 1657 and died in a Turkish invasion of Transylvania. His grandson, **Francis II Rákóczy,** 1676–1735, led a Hungarian uprising (1703) against Austrian rule. He was elected (1704) "ruling prince" by the diet, and the Hungarian nobles proclaimed (1707) the HAPSBURG dynasty deposed in Hungary. Rákóczy, however, suffered severe defeats (1708, 1710), and the Austrians and Hungarians negotiated a peace at Szatmar in 1711. Rákóczy refused to accept it and thereafter lived in exile. He is a national hero in Hungary.

Raleigh or **Ralegh, Sir Walter,** 1554?–1618, English soldier, explorer, courtier, and man of letters. A favorite of ELIZABETH I, and a rival of Robert Devereux, earl of ESSEX, Raleigh was given position and vast estates in Ireland. He conceived and organized the colonizing expeditions to America that ended tragically with the "lost colony" on ROANOKE ISLAND, Va. With Christopher MARLOWE and George CHAPMAN, he was associated with the poetic group known as the "school of night," which won a reputation for atheism. In 1595 he embarked on an expedition up the Orinoco R. in Guiana in search of EL DORADO. His fortunes fell with the accession of JAMES I, who was convinced of his enmity. He was convicted of treason and imprisoned in the tower. Released in 1616, he made another expedition to the Orinoco in search of gold. It failed, and he returned to England where he was executed under the original sentence of treason. Raleigh wrote poetry, political essays, and philosophical treatises.

Raleigh, city (1990 pop. 207,951), state capital and seat of Wake co., central N.C. The state's second largest city, it is a government, cultural, trade, and industrial center, manufacturing food, pharmaceutical, and electrical products. It is also an airline hub. With Durham and Chapel Hill, it is part of North Carolina's Research Triangle complex. Selected as the capital in 1788, it was laid out and incorporated in 1792. Points of interest include the birthplace of Andrew JOHNSON and several 18th-cent. houses.

Rallis, George John, 1918–, Greek political leader. He served in the legislature from 1950 and held cabinet posts before being imprisoned and exiled (1967–68) by the military regime then in power. Named foreign minister in 1978, Rallis became prime minister in 1980 but lost the 1981 election to Andreas Papandreou (see under PAPANDREOU, GEORGE).

Rama or **Ram,** Hindu hero and god: see RAMAYANA.

Ramadan, in ISLAM, the ninth month of the Muslim year, during which all Muslims must fast during daylight hours. Indulgence of any sort, e.g., food, drink, or sexual activity, is forbidden during the fast; a few, e.g., soldiers and the sick, are excused. Ramadan, which commemorates the first revelation of the KORAN to MUHAMMAD, falls in different seasons because of the lunar calendar.

Ramakrishna or **Sri Ramakrishna Paramahansa,** 1836–86, Hindu mystic. He became a devotee of the goddess KALI c.1855 and lived for the rest of his life at her temple in Dakshineswar, outside Calcutta. He taught that all religions are valid means of approaching God. His saintliness attracted a large following, and after his death his teachings were spread by disciples, in the West notably by Swami Vivekananda, a major exponent of VEDANTA philosophy.

Ramanujan, Srinivasa [rämä'nōōjən], 1889–1920, Indian mathematician. A self-taught genius in pure mathematics, he made original contributions to function theory, power series, and number theory.

Ramapithecus: see HUMAN EVOLUTION.

Ramayana, story of Rama, classical Sanskrit epic of India, probably composed in the 3d cent. B.C. Based on legend, it is traditionally the work of Valmiki, a minor character. The *Ramayana* relates the adventures of Rama, who is deprived of his throne by guile and exiled with his wife, Sita. When Sita is abducted by a demon king, he allies himself with Sugriva, the monkey king, and Hanuman, a monkey general. After a great battle in Lanka (Sri Lanka), Rama frees Sita and regains his kingdom. In contemporary Hinduism, Rama, who is also called Ram, is often worshipped as a god.

Rameau, Jean Philippe [rämō'], 1683–1764, French composer and theorist. His two treatises on HARMONY introduced the important theory of chord inversion. He wrote elegant harpsichord and chamber works, and more than 30 stage works, e.g., the opera *Castor et Pollux* (1737).

Rameses or **Ramesses:** see RAMSES.

Ramos, Fidel Valdez, 1928–, Philippine general and politician, president of the Philippines (1992–). A career army officer, he became deputy chief of staff of the armed forces in 1981 and chief of staff in 1986. When AQUINO challenged MARCOS's "victory" in the 1986 presidential election, Ramos supported her. He served (1988–92) as Aquino's defense secretary, and he won the 1992 presidential election with her backing.

Rampal, Jean-Pierre, 1922–, French virtuoso flutist. He has played in several chamber groups and is most celebrated as a soloist of great brilliance.

Ramsay, Allan, 1685?–1758, Scottish poet. A pastoral comedy, *The Gentle Shepherd* (1725), is his most famous work. Ramsay compiled several collections of Scottish poems and songs, contributing greatly to the vernacular revival climaxed by Robert BURNS.

Ramsay, Sir William, 1852–1916, Scottish chemist. He synthesized (1876) pyridine from acetylene and prussic acid. Ramsay discovered helium and was codiscoverer (with Lord RAYLEIGH) of argon and (with Morris Travers) of krypton, neon, and xenon. Knighted in 1902, he won the 1904 Nobel Prize in chemistry for his work on gases.

Ramses [răm'sēz], **Rameses,** or **Ramesses** [both: răm'əsēz"], Egyptian kings of the XIX and XX dynasties. **Ramses I,** d. c.1314 B.C., succeeded Horemheb, the founder of the XIX dynasty, ruled one year, and was succeeded by his son Seti I. Seti's son, **Ramses II,** d. 1225 B.C. (r.1292–1225 B.C.), usurped the throne from his brother. Under him EGYPT acquired unprecedented splendor, the empire extending from S Syria to the fourth cataract of the Nile. War with the HITTITES continued until he concluded a treaty (1280) and married (1267) a Hittite princess. He left monuments throughout Egypt, notably at KARNAK, LUXOR, and THEBES, and the great rock temple at ABU SIMBEL. The period was characterized by great luxury, increased slavery, and the growth of a mercenary army, all contributors to Egypt's eventual decline. Ramses II was probably the pharaoh of exile in the OLD TESTAMENT. **Ramses III,** d. 1167 B.C. (r. c.1198–1167), second king of the XX dynasty, fought off invasions by the Libyans and by Mediterranean sea peoples. He was the last Egyptian king to hold part of PALESTINE. Under him the accumulation of slaves and riches weakened the social structure. His wife, TIY, plotted against him. The XX dynasty was to be ruled by eight other kings named Ramses until it ended in 1090 B.C.

Rancho Cucamonga, city (1990 pop. 101,409), S Calif. Situated in a vast suburban corridor, it is part of San Bernadino's metropolitan area. A rapidly growing residential area, it almost doubled in population between 1980 and 1990. It is the site of the restored 19th-cent. Casa de Rancho Cucamonga.

Rand, Ayn, 1905–82, Russian-American novelist; b. Saint Petersburg, Russia. After coming (1926) to the U.S., she worked as a screenwriter. Her novels espouse a philosophy of rational self-interest that opposes the altruistic tendencies of the modern welfare state. Her best-known novels include *The Fountainhead* (1943) and *Atlas Shrugged* (1957).

Rand, the: see WITWATERSRAND.

Randolph, A(sa) Philip, 1889–1979, African-American labor leader; b. Crescent City, Fla. In 1925 he founded the Brotherhood of Sleeping Car Porters, then an African-American union, and was president until 1968. An untiring fighter for CIVIL RIGHTS, he is credited with helping to establish the Fair Employment Practices Committee in World War II. He was a leading opponent of segregation in the armed forces and of racial discrimination in organized labor. He was appointed (1955) a vice president of the AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS and directed (1963) the massive March on Washington for Jobs and Freedom.

Randolph, Edmund, 1753–1813, American statesman; b. Williamsburg, Va. A founding father of the United States, he proposed (1787) the Virginia plan, which considerably influenced the CONSTITUTION OF THE UNITED STATES; the plan called for a bicameral legislature with a lower house elected according to population and an upper house elected by the lower. He was the nation's first attorney general (1789–93) and its second secretary of state (1794–95). His cousin, **John Randolph,** 1773–1833, b. Prince George co., Va., served five terms (between 1799 and 1829) in the U.S. Congress and vigorously opposed FEDERALIST PARTY policies. Edmund Randolph's uncle, **Peyton Randolph,** c.1721–1775, b. Williamsburg, was president (1775) of the first CONTINENTAL CONGRESS.

Ranger, in space exploration: see SPACE PROBE, table.

Rangoon: see YANGON.

Rank, Otto, 1884–1937, Austrian psychoanalyst. As one of Sigmund FREUD's first and most valued pupils, Rank analyzed the underlying significance of myths. In his later work, he diverged from Freud and emphasized the birth trauma as the central cause of NEUROSIS.

Ranke, Leopold von [räng'kə], 1795–1886, German historian, generally recognized as the father of the modern objective historical school. An outstanding teacher, he inaugurated at the Univ. of Berlin the seminar system of teaching history. His *Universal History* (9 vol., 1881–88) and his studies of aspects of the 16th, 17th, and 18th cent. demonstrate his aim to reconstruct unique periods of the past as they actually were and to avoid injecting the history of former times with the spirit of the present.

Ransom, John Crowe, 1888–1974, American poet and critic; b. Pulaski, Tenn. A great stylist, he wrote elegant, impersonal verse in such collections as *Poems about God* (1919) and *Two Gentlemen in Bonds* (1926). He taught at Vanderbilt Univ. (1914–37), where he was a founder of the *Fugitive* (1922–25), and at Kenyon College (1937–58), where he founded the influential *Kenyon Review.* A "new critic," he voiced his literary theories in such works as *The World's Body* (1938) and *The New Criticism* (1941).

Rao, P(amulaparti) V(enkata) Narasimha, 1921–, Indian politician, prime minister of India (1991–). A member of the Congress-I party (see INDIAN NATIONAL CONGRESS), Rao held (1980–89) various ministerial posts in the governments of Indira and Rajiv GANDHI. After Rajiv Gandhi's assassination, Rao was chosen to lead the Congress party and became prime minister upon winning (1991) a plurality of seats in parliament. He moved decisively to reduce the government's economic role and encourage foreign investment, but was confronted with religious unrest incited by the Hindu religious parties.

Rao, Raja [rou], 1909–, Indian novelist. Among his works, written in English, are the novels *Kanthapura* (1938), *The Serpent and the Rope* (1960), and *Comrade Kirillov* (1976), and *The Cow of the Barricades and Other Stories* (1947). From 1965 to 1980 he was professor of philosophy at the Univ. of Texas.

rape, in law, the crime of performing sexual intercourse without the subject's consent. The victim may be deemed legally incapable of consent if incapacitated (e.g., drugged or intoxicated) or below an age specified by statute (statutory rape). In recent years statutory definitions of rape have been in flux. For example, by some definitions the rapist may be of either sex; in actuality, however, almost all instances of prosecuted rape involve an assault by a man on a woman. In some countries, and in several U.S. states, a wife may charge her husband with rape.

Raphael Santi or **Raphael Sanzio,** 1483–1520, major Italian RENAISSANCE painter; b. Urbino. Raphael's work is the clearest expression of the harmony and balance of High Renaissance composition. His father, Giovanni Santi, court poet and painter to the duke of Urbino, taught him the elements of art. After his father's death, Raphael entered the workshop of PERUGINO, whose influence is seen in *The Crucifixion* and *The Knight's Dream* (both: National Gall., London). The Colonna Altarpiece (Metropolitan Mus.) marks the end of Raphael's Perugian period. The five predella scenes, including *Agony in the Garden* (Metropolitan Mus.) and *Pietà* (Gardner Mus., Boston), show the influences of MICHELANGELO, MASACCIO, LEONARDO, and Fra Bartolomeo. In these scenes he achieved a freer, more able, deeper interpretation than in his earlier work. In Florence (1504–8) he produced his self-portrait (Uffizi) and the numerous Madonnas renowned for their sweetness of expression. At Rome, his style matured, benefiting from Michelangelo's influence. He was wholly responsible for the Stanza della Segnatura in the Vatican (see VATICAN CITY), the two largest walls representing the *School of Athens* and the *Triumph of Religion.* In the Stanza d'Eliodoro he painted, among others, *The Miracle of Bolsena* and *The Deliverance of St. Peter.* The *Sistine Madonna* (Dresden) is from his Roman period. In 1514 he succeeded BRAMANTE as chief architect of the Vatican, and he designed ten tapestries for the SISTINE CHAPEL. Raphael was deeply indebted to the sculpture of antiquity, and he achieved a harmony and monumentality of interpretation that were emulated far into the 19th cent.

rap music or **hip-hop,** influential genre of popular music that originated in the mid-1970s among African-American and Hispanic performers in New York City. Rap generally consists of chanted, often improvised, street poetry usually accompanied by disco or funk music. Detractors have criticized many performer's boastful pro-

motion of violence and misogyny; others admire rap's inventiveness and sociopolitical awareness. Rap performers of the late 1980s and early 90s included Public Enemy, NWA (Ice Cube), and Queen Latifah.

rare-earth metals, group of chemical elements including those in the LANTHANIDE SERIES, usually YTTRIUM, sometimes SCANDIUM and THORIUM, and rarely ZIRCONIUM. Promethium, which is not found in nature, is not usually considered a rare-earth metal. The metals occur together in minerals as their oxides (RARE EARTHS) and are difficult to separate because of their chemical similarity. The cerium metals are a subgroup, consisting of the elements with atomic numbers between 57 and 63 and ytterbium.

rare earths, oxides of the RARE-EARTH METALS. The name of an earth is formed from the name of its element by replacing *-um* with *-a*. Once thought to be very scarce, they are widely distributed and fairly abundant in the earth's crust. Rare-earth minerals include bastnasite, cerite, euxenite, gadolinite, MONAZITE, and samarskite. Mixed rare earths are used in glassmaking, ceramic glazes, and glass-polishing abrasives, and as catalysts for petroleum refining. Individual purified rare earths are used in lasers and as color-television picture-tube phosphors.

Rasmussen, Knud Johan Victor, 1879–1933, Danish explorer and ethnologist; b. Greenland. Of Eskimo ancestry through his mother, he began in 1902 a lifelong study of the ESKIMO and in 1910 established Thule station as a base for exploration. Seeking proof that the Eskimo originated in Asia, he was the first to traverse (1921–24) the NORTHWEST PASSAGE. His translated works include *Across Arctic America* (1927).

raspberry, name for several thorny shrubs (genus *Rubus*) of the ROSE family and for their fruit (see BRAMBLE).

Rasputin, Grigori Yefimovich [răspyōō'tĭn], 1872–1916, Russian holy man and courtier. A semiliterate peasant, he mixed religious fervor with sexual indulgence. His ability to check the bleeding of the czarevich, a hemophiliac, gave him power over Czarina ALEXANDRA FEODOROVNA and, through her, over Czar NICHOLAS II. In 1911 Rasputin's unscrupulous appointees began to fill high posts. After 1915, with the czar at the front in WORLD WAR I, the government was increasingly undermined. Amid suspicions that Rasputin and the czarina were plotting to make peace with Germany, a group of nobles murdered him.

Rastafarianism, religious-cultural movement that began (1930s) in Jamaica. Rastafarians believe that HAILE SELASSIE, also named Ras Tafari, the last emperor of Ethiopia, is the messiah. REGGAE music is heavily influenced by Rastafarianism. There are some 180,000 Rastafarians worldwide.

rat, any of various stout-bodied RODENTS, usually having a pointed muzzle and long, scaly tail. The name refers particularly to the two species of house rat, the brown, or Norway, rat (*Rattus norvegicus*) and the black, or Alexandrine, rat (*R. rattus*). The brown rat is the larger of the two, growing up to 10 in. (25 cm) long, excluding the tail, and sometimes weighing more than a pound (.5 kg). Rats spread human diseases and destroy food supplies; efforts to exterminate them have been relatively unsuccessful. Many other rodents are also called rats, e.g., the MUSKRAT.

ratio, the quotient of two numbers, often used for comparison. For example, in a school with 500 children and 25 teachers, the teacher-pupil ratio is 25/500 = 1/20.

rational number: see NUMBER.

rattan, climbing PALM (genera *Calamus* and *Daemonorops*) of tropical Asia. Rattan leaves, unlike those of most palms, are not clustered in a crown, and they have long barbed tips by which the plant climbs to treetops. Commercial rattan, a tough, flexible CANE of uniform diameter used for wickerwork, is obtained from the plant's long stem.

rattlesnake, poisonous New World SNAKE of the PIT VIPER family, distinguished by a rattle at the end of the tail. The rattle, a series of dried, hollow segments of skin, makes a whirring sound when shaken, serving to warn attackers. Most species are classified in the genus *Crotalus*, including the largest and deadliest, the eastern diamondback rattlesnake, *C. adamanteus*, of the S and SE U.S. The SIDEWINDER is a North American desert species.

Ratzel, Friedrich, 1844–1904, German geographer. A major influence on other geographers, he pioneered in developing anthropogeography and helped found modern political geography. In *Anthropogeography* (2 vol., 1882–91) and *Political Geography* (1897), he emphasized the importance of *Lebensraum*—the physical space occupied by a population—as a factor determining human activity.

Rauschenberg, Robert [rou'shənbûrg], 1925–, American artist; b. Port Arthur, Tex. Executed with great spontaneity, his paintings use images and objects from everyday life. *Gloria* (1956) is typical of his collages known as "combines."

Ravel, Maurice [răvĕl'], 1875–1937, French composer. With DEBUSSY he became a leading exponent of IMPRESSIONISM, composing highly original, fluid music within classical forms. His works for the piano include *Valses Nobles et Sentimentales* (1911) and *Le Tombeau de Couperin* (1917). Among his orchestral works are *Rhapsodie Espagnole* (1908) and *Bolero* (1928).

raven, the largest member of the CROW family, found in arctic and temperate regions of the Northern Hemisphere. The raven (*Corvus corax*) is a glossy, black scavenging bird about 26 in. (66 cm) long with a call resembling a guttural croak; it can be taught to mimic human speech.

Ravenna, city (1990 pop. 136,166), in Emilia-Romagna, N central Italy, connected to the Adriatic by a canal. It is a farm-market and industrial center. A Roman naval port, it was the capital of the Western Empire (402–76), of the Ostrogoths (5th–6th cent.), and of the Byzantine exarchs (6th cent.–751). PEPIN THE SHORT took it from the LOMBARDS and gave it to the pope (754). Ruled by the Da Polenta family (13th–15th cent.), it returned to papal control in 1509. Ravenna is famous for its 5th- and 6th-cent. mosaics, as in the Church of San Vitale (547), and for its Roman and Byzantine buildings.

Rawalpindi, city (1981 pop. 457,091), NE Pakistan. It is an industrial center producing refined oil and gas, steel, chemicals, and other manufactures. Sikhs settled the area in 1765. When the British occupied the PUNJAB in 1849, Rawalpindi became a major military outpost; it remains the Pakistani army's headquarters. It was Pakistan's interim capital from 1959 to 1970.

Rawlings, Jerry, 1947–, Ghanaian military and political leader. He led a coup that ousted the military junta in 1979, but stepped aside to allow a civilian president, Hilla Limann, to govern. In Dec. 1981, Rawlings deposed Limann and suspended the constitution, banning all political parties, and later introduced (1983) economic reforms that helped revive the economy. Rawlings won a free presidential election in 1992.

Rawlinson, Sir Henry Creswicke, 1810–95, English Orientalist and administrator. The results of his deciphering of the CUNEIFORM of the Behistun inscriptions of Darius I were published in 1846. He also helped prepare *The Cuneiform Inscriptions of Western Asia* (5 vol., 1861–64).

Rawls, John, 1921–, American philosopher; b. Baltimore. His *A Theory of Justice* (1971) greatly influenced liberal thinking. It gives a systematic account of justice as fairness, outlines the proper reach of (and limitations on) individual liberty, and distinguishes acceptable from unacceptable forms of social inequality.

Ray or **Wray, John,** 1627–1705, English naturalist. He was extremely influential in laying the foundations of systematic biology. Together with his pupil Francis Willughby, he planned a complete classification of the animal and vegetable kingdoms. His work—the botanical part of the project—includes the important *Historia plantarum* (3 vol., 1686–1704). Ray was the first to name and make the distinction between monocotyledons and dicotyledons and the first to define and explain the term *species* in its modern sense.

Ray, Man, 1890–1976, American artist; b. Philadelphia. A founder of the DADA movement in Paris and New York, Ray was celebrated for his surrealist paintings, photographs, and films. He invented the rayograph, a photograph made by direct application of objects to a light-sensitive plate.

Ray, Satyajit, 1912–92, Indian film director; b. Bengal. His trilogy *The Song of the Road* (1955), *The Unvanquished* (1957), and *The World of Apu* (1958) brought Indian film to world attention. His other work includes *Two Daughters* (1961), *Distant Thunder* (1973), *The Middleman* (1975), and *The Stranger* (1991). In 1992

Scene from The World of Apu, *directed by Satyajit Ray, 1958*

he was awarded a special Academy Award for lifetime achievement.

ray, flat-bodied cartilaginous marine FISH (order Batoidea), related to the SHARK. Most rays have broad, flat, winglike pectoral fins along the sides of the head, whiplike tails, eyes and spiracles on top of the head, and mouth and GILL slits underneath. Many rays, such as the skates, lie on the seafloor and feed on smaller animals, e.g., snails. Fertilization is internal, and most bear live young. The largest rays are the top-swimming mantas, which may be up to 22 ft (7 m) wide and weigh up to 3,000 lb (1,360 kg). Rays also include stingrays and sawfishes.

Rayburn, Sam, 1882–1961, U.S. legislator; b. Rome co., Tenn. A Democratic U.S. representative from Texas (1913–61), he helped to pass NEW DEAL legislation. Rayburn served a record 17 years (1940–61, except for two terms) as Speaker of the House. One of his protégés was Lyndon B. JOHNSON.

Rayleigh, John William Strutt, 3d **Baron,** 1842–1919, English physicist. He was professor (1887–1905) at the Royal Institution, London. For discovering argon (with Sir William RAMSAY) he won the 1904 Nobel Prize in physics. He is known for his research in sound and light, his study of Boyle's law (see GAS LAWS) applied to low-pressure gases, and his determination of electrical units.

rayon, synthetic fiber made from CELLULOSE, or textiles woven from such fiber. Silklike rayon, the first SYNTHETIC TEXTILE FIBER, was produced in 1884 by a French scientist, Hilaire de Chardonnet. In rayon manufacturing, cellulose, chiefly from wood pulp, is dissolved by chemicals and forced under pressure through minute holes in a metal spinneret, emerging as filaments. The filaments are doubled and twisted into silky yarns or cut into staple lengths and spun. Spun rayon can be treated to simulate wool, linen, or cotton.

Rb, chemical symbol of the element RUBIDIUM.

Re, chemical symbol of the element RHENIUM.

reactance: see IMPEDANCE.

reactor, nuclear: see NUCLEAR REACTOR.

Reading, city (1990 pop. 78,380), seat of Berks co., SE Pa., on the Schuylkill R.; founded 1748, inc. as a city 1847. An early iron-producing town, it was an ordnance center during the Civil War. Today it is best known for its factory outlets, especially in clothing, and has diverse manufactures. The birthplace of Daniel BOONE is nearby.

Reagan, Ronald Wilson, 1911–, 40th president of the U.S. (1981–88); b. Tampico, Ill. A film actor who was president of the Screen Actors Guild, he was a supporter of the NEW DEAL long before he joined the Republican party in 1962 and began to champion right-wing causes. As governor of California for two terms (1967–75), he cut state welfare and medical services and education funds. After leaving office, he campaigned for the 1976 Republican presidential nomination but lost narrowly to Pres. Gerald FORD. Four years later he won the nomination and, with his running mate, George BUSH, resoundingly defeated Pres. Jimmy CARTER. His presidency had barely begun when he was shot by a would-be assassin, John Hinckley, Jr., on Mar. 30, 1981; he recovered quickly. Advocating a balanced budget to combat inflation, he reversed long-standing political trends by obtaining Congressional passage of large income-tax cuts, decreased social-program spending, and increased defense spending (for both conventional weapons and such programs as the STRATEGIC DEFENSE INITIATIVE). He was reelected in 1985, defeating Democratic candidate Walter MONDALE. Reagan adopted a firm stance in relations with the USSR and against possible Communist expansion, especially in Central America (see IRAN-CONTRA AFFAIR). Nonetheless, he made important steps in U.S./Soviet nuclear disarmament negotiations, signing the INF treaty with the USSR (see DISARMAMENT, NUCLEAR). His tax and spending policies, however, led to enormous peacetime budget deficits, greatly increasing the national debt.

realism, in art, broadly, an unembellished rendering of natural forms. Specifically, the term refers to the mid-19th-cent. movement against French academicism. Realist painters portrayed ugly or commonplace subjects without idealization. Major realists include COURBET, J.F. MILLET, and DAUMIER. See also PHOTOREALISM.

realism, in literature, an attempt to describe life without idealization or romantic subjectivity. Although not limited to any one century or school, it is most often identified with the 19th-cent. French writers Gustave FLAUBERT and Honoré de BALZAC. George ELIOT introduced it in England, W.D. HOWELLS in the U.S. Realism has been chiefly concerned with the commonplaces of middle-class life. In drama it is most often associated with Henrik IBSEN. A reaction against its emphasis on externals led to the psychological realism of Henry JAMES and others. See also NATURALISM.

realism, in philosophy. **1** In medieval philosophy, realism was the position that universals or general concepts have existence independent of both the human mind and individual objects. It is a position directly opposite to NOMINALISM. **2** In EPISTEMOLOGY, realism represents the theory that individual things exist independently of the mind's perception of them, as opposed to IDEALISM, which holds that reality exists only in the mind.

real number: see NUMBER.

Réaumur, René Antoine Ferchault de [rā'əmyoor] 1683–1757, French physicist and naturalist. He invented an alcohol thermometer and the Réaumur temperature scale. He studied the composition of Chinese porcelain, which led him to develop an opaque glass, and the composition and manufacture of iron and steel, and published (1734–42) an exhaustive study of insects.

Rebecca or **Rebekah,** in the BIBLE, wife of ISAAC and mother of JACOB and ESAU. Jacob was his mother's favorite, and for him she devised their deception of the blind Isaac. She is one of the four Jewish matriarchs.

recall: see INITIATIVE, REFERENDUM, AND RECALL.

recession: see under DEPRESSION.

Recife, chief city (1990 est. pop. 1,375,000) of NE Brazil, a port on the Atlantic Ocean; also known as Pernambuco. Cut by many waterways, it lies partly on the mainland and partly on an island and is often called the Brazilian Venice. It is an important transportation center; its economy is based on the processing and export of cotton, sugar, and coffee. Industrial products include glass, ceramics, pharmaceuticals, and synthetic rubber. Founded (1548) by the Portuguese, Recife was briefly held by the British (1595) and the Dutch (1630–54).

recitative, musical declamation for solo voice, used in OPERA and ORATORIO for dialogue and narration. Its development at the end of the 16th cent., enabling words to be clearly understood and natural speech rhythms to be followed, made possible the rise of opera. In the 17th cent., the rapid patter of *recitative secco,* punctuated by occasional accompanying chords, served only to advance the action; by the 18th cent., more strict measure and full orchestral accompaniment helped to highlight recitative passages of dramatic interest. In Wagner's *Sprechgesang,* the melody is completely molded to the text.

recombinant DNA: see GENETIC ENGINEERING.

reconnaissance satellite, artificial SATELLITE launched by a country to provide intelligence information on the military activities of foreign countries. There are four major types. *Early-warning satellites*

detect enemy missile launchings. *Nuclear-explosion detection satellites* are designed to detect and identify nuclear explosions in space. *Photo-surveillance satellites* provide photographs of enemy military activities, e.g., the deployment of intercontinental ballistic missiles (ICBMs). There are two subtypes: close-look satellites provide high-resolution photographs that are returned to earth via a reentry capsule, whereas area-survey satellites provide lower-resolution photographs that are transmitted to earth via radio. Later satellites have combined these two functions. Other satellites use radar to provide images of enemy activity when there is cloud cover or it is dark. *Electronic-reconnaissance (ferret) satellites* pickup and record radio and radar transmissions while passing over a foreign country. The U.S. and Russia (before 1991, the USSR) have launched numerous reconnaissance satellites since 1960.

Reconstruction, in U.S. history, period (1865–77) of readjustment following the CIVIL WAR. When the war ended the defeated South was a ruined land, and its old social and economic order had collapsed. Pres. Andrew JOHNSON tried to shift political control in the South from the old planter aristocracy to small farmers and artisans by disenfranchising all former Confederate officers and making certain property liable to confiscation. Under the provisional governors he appointed, most Southern states abolished slavery and ratified the Thirteenth Amendment (1865), guaranteeing freedom for African Americans. However, they also enacted laws severely limiting the civil rights of African Americans (the "Black Codes") and elected disenfranchised Confederate leaders to state and federal offices. Radical Republicans in Congress, led by Thaddeus STEVENS, refused to seat Southern representatives and passed various Reconstruction acts, which were designed to protect African Americans, over the president's vetoes. African-American civil rights were incorporated in the Fourteenth Amendment (1868). Radical congressmen enacted the Reconstruction Act of 1867 that set up five military districts in the South and made army authority supreme. When Johnson continued to oppose the radical leaders and defied the Tenure of Office Act, Congress impeached him; he was not convicted, but his program was scuttled. After the Fifteenth Amendment (1870) had guaranteed African Americans the right to vote, terrorist groups such as the KU KLUX KLAN kept them from voting. Eventually, radical Republican governments were overthrown and white rule was restored. Reconstruction officially ended in 1877, when all federal troops were withdrawn from the South. Its legacy was the one-party "solid South" and a lasting racial bitterness.

Reconstruction Finance Corporation (RFC), U.S. government agency (1932–57) created during the GREAT DEPRESSION to stimulate the economy by lending money to financial, industrial, and agricultural institutions. During the NEW DEAL its operations were broadened to finance war plants, loan money to foreign governments, and pay for disaster damages. RFC loans totaled about $50 billion.

Reconstructionist Judaism: see JUDAISM.

recorder: see WIND INSTRUMENT.

record player or **phonograph,** device for reproducing sound that has been recorded as a spiral, undulating groove on a disk; it was superseded by the COMPACT DISC player in the 1980s. The disk, or phonograph record, is placed on the record player's motor-driven turntable, which rotates the record at a constant speed. A tone arm, containing a pickup at one end, is placed on the record and touches the groove with a stylus, or needle, that vibrates as the record revolves. The TRANSDUCER, also part of the pickup, converts these vibrations into corresponding electrical signals, which are increased in size by an AMPLIFIER and then passed to a LOUDSPEAKER that converts them into sound. The turntable, amplifier, and loudspeaker are typically separate components in modern sound-reproducing systems. The first phonograph was built by Thomas EDISON in 1877. See also STEREOPHONIC SOUND.

rectifier, component of an ELECTRIC CIRCUIT that changes alternating current to direct current. Rectifiers operate on the principle that current passes through them freely in one direction, but only slightly or not at all in the opposite direction. See also DIODE; ELECTRON TUBE.

recycling: see WASTE DISPOSAL.

redbird: see CARDINAL.

red cedar: see ARBORVITAE; JUNIPER.

Red Cloud, 1822–1909, chief of the Oglala SIOUX. He led opposition to the BOZEMAN TRAIL through Native American lands in Colorado and Montana. The Fetterman Massacre (1866) and Red Cloud's raids finally led to the trail's abandonment (1868). Red Cloud later lived at peace with whites, but he was deposed as chief (1881) and retired to the Pine Ridge Reservation, S.D.

Red Cross, international organization concerned with alleviating suffering and promoting public health; formed (1863) at the urging of Jean Henry DUNANT, a Swiss citizen who had witnessed the suffering at the battle of Solferino (1859). The GENEVA CONVENTION of 1864 adopted the red cross as a symbol of neutral aid. Most governments have signed later treaties and conventions. Today there are over 150 national societies, and two international bodies based in Geneva; the blanket agency for all Red Cross groups is the International Movement of the Red Cross and Red Crescent. The work of the Red Cross has grown to include aid to refugees, e.g., Arab refugees in the Middle East; exchanges of sick and wounded soldiers, initiated during the Korean War; and disaster relief. The American Red Cross (founded 1881 by Clara BARTON) also conducts a blood-supply program.

red giant: see STELLAR EVOLUTION.

Redgrave, family of English actors. **Sir Michael Redgrave,** 1908–85, was the star of many plays, e.g., *Hamlet, Macbeth, Uncle Vanya,* and *The Family Reunion* (1939), and several films, e.g., *The Lady Vanishes* (1939) and *The Browning Version* (1951). His elder daughter, **Vanessa Redgrave,** 1937–, starred in the London production of *The Prime of Miss Jean Brodie* (1966) and has appeared in such films as *Blow-Up* (1967), *Isadora* (1968), *Julia* (1976), *The Ballad of the Sad Cafe* (1991), and, for television, *Playing for Time* (1980). Her outspoken support for left-wing causes has made her a controversial figure. Her sister, **Lynn Redgrave,** 1943–, best known for her role in the film *Georgy Girl* (1966), has also appeared on the stage, e.g., *Saint Joan* (1977), and on television.

Red Guards, in Chinese history, politically active students of the CULTURAL REVOLUTION (1966–69), who organized units to carry out MAO ZEDONG's aim of rerevolutionizing Chinese society. As their numbers grew, the units engaged in factional struggles, and in 1968 Mao suppressed the movement.

Redon, Odilon [rədôN'], 1840–1916, French painter and lithographer. An artist of lyrical and mystical vision, he created translucent flower pieces and often depicted literary subjects, symbolically conceived and related to the work of writers such as POE and BAUDELAIRE. *Silence* (Mus. Mod. Art, N.Y.C.), is a representative work. He was a precursor of SURREALISM.

red pepper: see PEPPER.

Red River, flowing 1,222 mi (1,967 km) from two branches in the Texas Panhandle to join the Mississippi R. in Louisiana. Blocked until the mid-1800s by the Great Raft, a 160-mi (257-km), centuries-old logjam, the river is now navigable to Shreveport, La. During the Civil War, Union forces were defeated there at Sabine Crossroads.

Red River Rebellion: see RIEL, LOUIS.

Red River Settlement, pioneer colony, largely in MANITOBA, Canada, founded by the HUDSON'S BAY COMPANY and settled (1812–15) by impoverished Scottish and Irish immigrants. Fur traders and métis (half-breeds), goaded by the rival NORTH WEST COMPANY, opposed the colony violently; 22 persons were killed in the 1816 massacre of Seven Oaks. The violence ended (1821) with union of the two companies, and the Red River settlements flourished.

Red Sea, narrow sea, c.1,450 mi (2,330 km) long and up to 225 mi (362 km) wide, separating NE Africa and the Arabian Peninsula. It connects with the Gulf of ADEN (S) through the narrow BAB EL MANDEB and divides in the north to form the Gulfs of Suez and Aqaba. The sea, which has a high salt content and is dotted with small islands and dangerous coral reefs, forms an important link in the MEDITERRANEAN SEA–SUEZ CANAL–INDIAN OCEAN sea lane.

red shift, the systematic increase in the wavelength of all light received from a celestial object; it is observed in the shifting of individual lines in the SPECTRUM of the object toward the red, or longer-wavelength, end of the visible spectrum. Most observed red shifts are the result of the DOPPLER EFFECT; they are also produced

by gravitation in dense, compact stars in accordance with the general theory of RELATIVITY. See also HUBBLE'S LAW; QUASAR.

reduction, in chemistry: see OXIDATION AND REDUCTION.

redwood: see SEQUOIA.

Redwood National Park: see NATIONAL PARKS (table).

Reed, Sir Carol, 1906–76, English film director. Among his films are *The Stars Look Down* (1939), *Odd Man Out* (1946), *The Fallen Idol* (1948), *The Third Man* (1949), *Outcast of the Islands* (1941), *Our Man in Havana* (1960), and *Oliver!* (1968; Academy Award).

Reed, John, 1887–1920, American journalist; b. Portland, Ore. His *Ten Days That Shook the World* (1919) is considered the best eyewitness account of the 1917 RUSSIAN REVOLUTION. Reed helped found the Communist Labor party in the U.S. He died of typhus in Moscow and is buried at the Kremlin.

Reed, Thomas Brackett, 1839–1902, American legislator; b. Portland, Me. A Republican congressman (1876–99) and Speaker of the House (1889–91, 1895–99), "Czar" Reed used the office to facilitate orthodox Republican legislation.

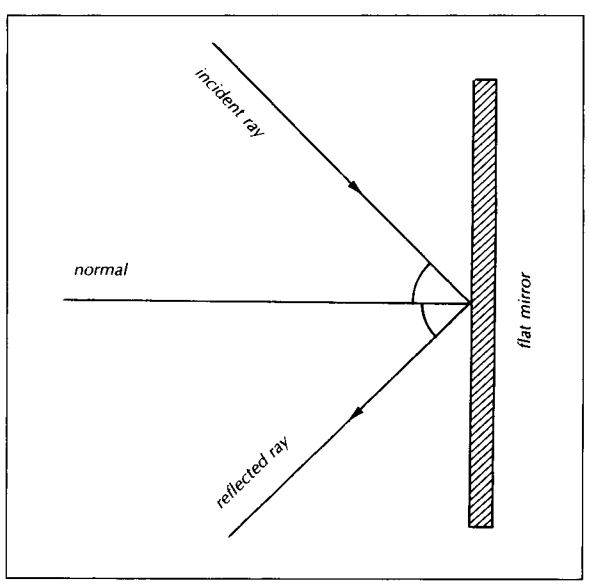
Reed, Walter, 1851–1902, American army surgeon; b. Gloucester Co., Va. In 1900 he headed a commission to investigate a YELLOW-FEVER outbreak among U.S. soldiers in Cuba. Using volunteers, the commission proved Carlos Juan FINLAY's theory that the disease was transmitted by a mosquito and not by direct contact. In 1901 it published its findings.

reed, name for several plants of the GRASS family. The common American reed (*Phragmites communis*) is a tall perennial widely distributed in wet places. It has stout, creeping rootstalks and a large, plumelike panicle. The giant reed (*Arundo donax*), similar in appearance but native to the Mediterranean region, has long been used to make reed instruments, e.g., the panpipe of PAN.

reef: see CORAL REEFS.

referendum: see INITIATIVE, REFERENDUM, AND RECALL.

reflection, return of a wave, such as light, from a surface it strikes into the medium through which it has traveled. The law of reflection states that the angle of reflection (the angle between the reflected ray and the normal, or line perpendicular, to the surface at the point of reflection) is equal to the angle of incidence (the angle between the incident ray and the normal). See ECHO; MIRROR; REFRACTION.



Reflection from a flat mirror

Reformation, religious revolution in Western Europe in the 16th cent. Beginning as a reform movement within the Roman Catholic Church, the Reformation ultimately led to freedom of dissent. The preparation for the movement was long and there had been earlier calls for reform, e.g., by John WYCLIF and John HUSS. Desire for change within the church was increased by the RENAISSANCE, with its study of ancient texts and emphasis on the individual. Other factors that aided the movement were the invention of printing, the rise of commerce and a middle class, and political conflicts between German princes and the Holy Roman emperor. The Reformation began suddenly when Martin LUTHER posted 95 theses on the church door at Wittenberg on October 31, 1517. Open attack on the doctrines and authority of the church followed and led to Luther's breach with the church (1520), which the Diet of Worms (1521) failed to heal. His doctrine was of justification by faith alone instead of by sacraments, good works, and mediation, and it placed a person in direct communication with God. Luther's insistence on reading the Bible placed on the individual a greater responsibility for his own salvation. The new church spread in Germany and Scandinavia, especially among princes and people who hoped for a greater degree of freedom. The conflict between the Lutherans and the Catholic Emperor CHARLES V was long and bitter. A temporary settlement was reached at the Peace of Augsburg (1555), but continued discord contributed later to the THIRTY YEARS WAR. Outside Germany, a different type of dissent developed under Huldreich ZWINGLI in Zürich, and within Protestantism differences arose, such as doctrinal arguments on the Lord's Supper. These were debated, inconclusively, at the Colloquy of Marburg (1529) by Luther and Philip MELANCHTHON on one side and Zwingli and Johannes Oecolampadius on the other. More radical ideas were spread, particularly among the lower classes, by such leaders as CARLSTADT, Thomas MÜNZER, and JOHN OF LEIDEN. In 1536 Geneva became the center for the teachings of John CALVIN, perhaps the greatest theologian of Protestantism. In France the HUGUENOTS, fired by Calvin's doctrine, resisted the Catholic majority in the Wars of RELIGION (1562–98). Calvinism superseded Lutheranism in the Netherlands, and it spread to Scotland through the efforts of John KNOX. In England the Reformation took its own course. HENRY VIII issued the Act of Supremacy (1534), which rejected papal control and created a national church (see ENGLAND, CHURCH OF). Calvinistic thought was, however, strong in England, and it influenced later reforms. On the Continent, divisions within the Protestant churches served to forward the Counter Reformation (see REFORMATION, CATHOLIC), which rewon some territory for Catholicism. The end (1648) of the Thirty Years War brought some stabilization, but the force of the Reformation did not end. The movement, and its fruit, Protestantism, has continued to exert influence to the present day, with its emphasis on personal responsibility and individual freedom, its refusal to take authority for granted, and its influence in breaking the hold of the church upon life and the consequent secularization of life and attitudes.

Reformation, Catholic, 16th-cent. reform of the Roman Catholic Church, largely in response to the Protestant Reformation; popularly called the Counter Reformation. Since the time of St. Catherine of Siena (14th cent.) there had been a growing demand in the church for reform, but it was hampered by church quarrels, notably the Great SCHISM. Consequently the church became home to many ills such as SIMONY, worldliness, and corruption among the higher clergy, ignorance in the priesthood, and general spiritual apathy. It was not until 1543, when PAUL III became pope and St. IGNATIUS OF LOYOLA founded the Jesuits (see JESUS, SOCIETY OF) that major reform began. Paul summoned the Council of TRENT, which was the central feature of the Catholic Reformation; the Jesuits became the reform's crusaders. The council uprooted simony, standardized worship, reorganized church administration, set educational requirements for priests, and scrutinized the morals of the clergy. A new spirit entered the church, as seen in the work of Saints Charles Borromeo, THERESA of Ávila, and VINCENT DE PAUL, and Catholicism reclaimed its initiative in Europe.

Reform Bills, in British history, name given to three major measures in the 19th cent. that liberalized representation in Parliament. Despite population shifts and the rise of new social classes during the INDUSTRIAL REVOLUTION, representation in Parliament had not altered much since the 17th cent. The **Reform Bill of 1832,** passed by Charles GREY's Whig ministry, redistributed the seats in the interest of larger cities and gave the vote to middle-class men. Benjamin DISRAELI and the Conservatives passed the **Reform Bill of 1867,** enfranchising working men in the towns and more than

doubling the electorate. The **Reform Bill of 1884,** under William GLADSTONE, reduced rural qualifications and added 2 million voters. It was not, however, until the passage of the REPRESENTATION OF THE PEOPLE ACTS in the 20th cent. that Britain adopted universal male and female suffrage.

Reformed Church in America, Protestant denomination founded in colonial times by Dutch settlers and formerly known as the Dutch Reformed Church. In Holland the Reformed Church grew in the 16th cent. from the Calvinist Reformation. In 1571 the synod at Emden adopted presbyterian polity and formulated a liturgical form of worship. The Belgic Confession of Faith (1561) and the Heidelberg Catechism (1563) formed the basis of faith. In America a congregation was formed in New Amsterdam in 1628. In 1754 an assembly declared itself independent of the classis (i.e., governing body) of Amsterdam, and in 1792 a constitution was adopted. The present name became official in 1867. In 1990 the church reported a membership of 326,850.

Reform Judaism: see JUDAISM.

refraction, the deflection of a wave on passing obliquely from one transparent medium into a second medium in which its speed is different, as the passage of a light ray from air into glass. The index of refraction of a transparent medium is equal to the ratio of the speed of light in a vacuum to the speed of light in the medium. Snell's law states that the ratio of the sine of the angle i of incidence (angle between the incident ray and the normal, or line perpendicular to the boundary between the two mediums at the point of refraction) to the sine of the angle r of refraction (angle between the refracted ray and the normal) is equal to the ratio of the refracting medium's index of refraction n_r to the original medium's index of refraction n_i.

refrigeration, process for drawing heat from substances to lower their temperature, often for purposes of preservation. Mechanical refrigeration systems (first patented in 1834) are based on the principle that absorption of heat by a fluid (refrigerant) as it changes from a liquid to a gas lowers the temperature of the objects around it. In the compression system, employed in electric home refrigerators, a COMPRESSOR, controlled by a thermostat, exerts pressure on a refrigerant gas (usually FREON or AMMONIA, but a hydrochlorofluorocarbon is expected to replace freon in the mid-1990s), forcing it to pass through a condenser, where it loses heat and liquefies. When the liquid is circulated through refrigeration coils, it vaporizes, drawing heat from the air surrounding the coils. The refrigerant gas then returns to the compressor, and the cycle is repeated. In the absorption system, widely used in commercial installations, ammonia is used to cool brine, which is then piped into the refrigerated space. See also AIR CONDITIONING; HEAT PUMP.

Regency style, in English architecture, flourished during the regency and reign of GEORGE IV (1811–30). The major architect was John NASH, who built the Royal Pavilion, Brighton (1815–22), an example of diversity of style with its Indian exterior and exotic Asian furnishings. The main trend, however, was neoclassical, as seen in the work of John Soane and in Nash's Regent's Park, London. Bay windows, balconies, and eclectic furniture design were characteristic.

Regensburg, city (1989 est. pop. 119,000), Bavaria, S Germany, a port at the confluence of the Danube and Regen rivers. It is an industrial center with such manufactures as electronic equipment and motor vehicles. Founded by the Romans, it was a medieval trade center, a free imperial city, and the home (16th–19th cent.) of the imperial diet. In 1810 it passed to BAVARIA. An airplane-manufacturing center during WORLD WAR II, it was heavily bombed. Its historic buildings include a Gothic cathedral (13th–16th cent.).

Reger, Max [rā'gər], 1873–1916, German composer, pianist, and conductor. He was highly esteemed for such complex organ music as *Fantasy and Fugue in C Minor* and *Fantasy and Fugue on Bach.* His many other works include compositions for orchestra and for piano and over 300 songs.

reggae, Jamaican popular music that developed in the 1960s among Kingston's poor blacks, drawing on American "soul" music. Many of its highly political songs proclaim the tenets of the Rastafarian religious movement. Springy, offbeat rhythm characterizes its sound. Bob Marley (1945–81) and his group, the Wailers, and Toots and the Maytals are among the best-known performers.

Regina, city (1991 pop. 179,178), provincial capital, S Saskatchewan, W Canada, on Wascana Creek and Lake. Oil refining and the processing of agricultural products are major industries. Regina (named in honor of Queen Victoria) was founded in 1882 and was the capital (1883–1905) of the Northwest Territories before becoming (1905) the capital of newly created Saskatchewan.

Regulator movement, organized efforts by backcountry settlers in North and South Carolina to restore law and order in the 1760s. In SOUTH CAROLINA, planters and small farmers created an association to try criminals and resolve legal disputes. In NORTH CAROLINA the Regulators protested actions of corrupt officials with acts of violence. When law and order were restored by 1771, the Regulators disbanded.

Rehnquist, William Hubbs: see SUPREME COURT, UNITED STATES (table 1).

Rehoboam [rē"əbō'əm], Hebrew king, son of SOLOMON. After Solomon's death (c.922 B.C.) the northern tribes revolted against Rehoboam and set up the kingdom of Israel with JEROBOAM I as their king. Rehoboam continued to rule the southern kingdom of Judah.

Reich, Wilhelm, 1897–1957, Austrian psychiatrist and biophysicist. He broke with FREUD, fled Nazi Germany, and later settled in New York City. He emphasized the importance of sexual fulfillment for personal well-being. Later, he argued that sexual success depended partly on orgone energy. The orgone box, a device he invented to restore energy, was declared a fraud by the Food and Drug Administration. He died in prison while serving a two-year sentence for contempt of court and violation of the Food and Drug Act. He became a hero of student radicals of the 1960s, with their motto "make love, not war."

Reichstadt, Napoleon, duke of: see NAPOLEON II.

Reichstag, German imperial parliament; name for the Diet of the Holy Roman Empire, for the lower chamber of the federal parliament of the North German Confederation, and for the lower chamber of the federal parliament of Germany (1871–1945). Under the German empire, the Reichstag had little real power and was mainly a deliberative body. In the republic established in 1919, it became the supreme legislative body; it represented the people directly, and the upper chamber, the Reichsrat, represented the various German states. Shortly after HITLER took power (1933), he dissolved the Reichstag and called for new elections. A violent campaign ensued, and on Feb. 27, 1933, a fire destroyed part of the Reichstag building. Hitler used the fire, which was later known to have been set by a lone arsonist, to blame the Communists and whip up public furor. As a result, the Nazis won a slight majority in the elections. In March the Reichstag voted Hitler dictatorial powers. Thereafter, it was summoned to meet only sporadically and to approve important government measures. After WORLD WAR II, the Reichstag and Reichsrat were replaced by other legislative bodies.

Reign of Terror, 1793–94, period of the FRENCH REVOLUTION. It was essentially a war dictatorship to preserve the republic during the FRENCH REVOLUTIONARY WARS. The Committee of Public Safety was created (Apr. 6, 1793) to rule the nation and included Maximilien ROBESPIERRE, the dominant member, and Lazare CARNOT. It aimed to root out counterrevolutionaries, raise new armies, and regulate the economy. The Law of Suspects (Sept. 1793) defined those who could be arrested for treason and was enforced by the Committee of General Security and the Revolutionary Tribunal; several thousand were guillotined. The government was centralized, and the nation was mobilized militarily. Price and wage ceilings were set. In June 1794 the Revolutionary Tribunal was strengthened, and executions increased. However, popular discontent grew, and the Reign of Terror was ended by the overthrow (July 1794) of Robespierre.

reindeer, ruminant MAMMAL (genus *Rangifer*) of the DEER family, found in arctic and subarctic regions of Eurasia and North America. The Eurasian reindeer (*R. tarandus*) stands about 4 ft (120 cm) at the shoulder and weighs about 250 lb (113 kg); its long fur is light brown in summer and whitish in winter. Domesticated for centuries in Lapland and S Siberia, they provide meat, milk, clothing, and transportation. A reindeer can travel 40 mi (64 km) a day, pulling twice its own weight. The wild reindeer of North America are called CARIBOU.

Reiner, Fritz, 1888–1963, American conductor; b. Budapest. After serving as conductor of the People's Opera in Budapest (1911–14) and the Court Opera in Dresden (1914–21), he came (1922) to the U.S. as conductor of the Cincinnati Symphony (1922–31). He was later musical director of the Pittsburgh Symphony (1938–48), the Metropolitan Opera (1948–53), and the Chicago Symphony (1953–62). He was known for his ruthless insistence on precision and clarity.

Reinhardt, Max, 1873–1943, Austrian theatrical director; b. Max Goldmann. A great innovator and a master of spectacle, he staged gigantic productions, full of pageantry and color, at his theaters in Berlin. His world-famous productions included *The Lower Depths, Oedipus Rex,* and *The Miracle.* He founded the Salzburg Festival in 1920. He fled NAZI Germany in 1933, becoming a U.S. citizen in 1940.

relativity, physical theory, introduced by Albert EINSTEIN, that discards the concept of absolute motion and instead treats only relative motion between two systems or frames of reference. Space and time are no longer viewed as separate, independent entities but rather as forming a four-dimensional continuum called SPACE-TIME. In 1905 Einstein enunciated the special relativity theory, in which the hypothesis that the laws of nature are the same in different moving systems also applies to the propagation of light, so that the measured speed of light is constant for all observers regardless of the motion of the observer or of the source of light. From these hypotheses Einstein reformulated the mathematical equations of physics. In most phenomena of ordinary experience the results from the special theory approximate those based on Newtonian dynamics, but the results deviate greatly for phenomena occurring at velocities approaching the speed of light. Among the assertions and consequences of the special theory are the propositions that the maximum velocity attainable in the universe is that of light; that mass increases with velocity; that mass and energy are equivalent; that objects appear to contract in the direction of motion; that the rate of a moving clock seems to decrease as its velocity increases; that events that appear simultaneous to an observer in one system may not appear simultaneous to an observer in another system. The special theory became the foundation of the study of ELEMENTARY PARTICLE and of QUANTUM MECHANICS. Einstein expanded the special theory of relativity, which is principally concerned with submicroscopic physics, into a general theory (completed in 1915) that is principally concerned with the large-scale effects of GRAVITATION (see also COSMOLOGY). The general theory recognizes the equivalence of gravitational and inertial mass, and asserts that material bodies produce the curvature of the space-time continuum and that the path of a body is determined by this curvature. The theory predicts that a ray of light is deflected by a gravitational field; observations of starlight passing near the sun, first made by Arthur EDDINGTON and colleagues during a 1919 eclipse of the sun, confirmed this. The theory also predicts a RED SHIFT of spectral lines of substances in a gravitational field, a result confirmed by observation of light from white dwarf stars. Finally, the theory also accounts for the entire observed perihelion motion of the planet Mercury, only part of which could be explained by Newtonian CELESTIAL MECHANICS. Reconciling the theory with QUANTUM MECHANICS in a UNIFIED FIELD THEORY has proven difficult. Superstring theory (see STRING THEORY) may be able to link quantum gravitation (the study of quantum fields in a curved space-time) with the other quantum theories. See also MOTION.

relay, electromechanical switch in which the variation of current in one ELECTRIC CIRCUIT controls the flow of electricity in another circuit. A relay consists of a movable contact connected to an ELECTROMAGNET by a spring. When the electromagnet is energized by the controlling current, it exerts a force on the contact that overcomes the pull of the spring and moves the contact so as to either complete or break a circuit. When the electromagnet is de-energized, the contact returns to its original position.

religion, a system of thought, feeling, and action shared by a group that gives members an object of devotion; a code of ethics governing personal and social conduct; and a frame of reference relating individuals to their group and the universe. Usually, religion concerns itself with what transcends the known, the natural, or the expected; it is an acknowledgment of the extraordinary, the mysterious, and the supernatural. The evolution of religion cannot be precisely determined. In addition to the more elementary forms of belief and practice, such as ANIMISM, ancestor worship, totemism, and SPIRITISM, there are the commonly termed higher religions, which embody a principle of transcendence. These include POLYTHEISM, in which there are many gods; DUALISM, which posits equally powerful deities of good and evil; MONOTHEISM, in which there is a single god; supratheism, in which the devotee participates in the religion through a mystical union with the godhead; and PANTHEISM, in which the universe is identified with God. Religions are also classifed as revealed (i.e., by divine agency) or nonrevealed (i.e., the result of human inquiry). JUDAISM, CHRISTIANITY, and ISLAM are revealed religions, and BUDDHISM, HINDUISM, and TAOISM are largely nonrevealed religions.

Religion, Wars of, 1562–98, series of civil wars in France, also called the HUGUENOT Wars. The successive Protestant leaders were Louis I de CONDÉ, Gaspard de COLIGNY, and Henry of Navarre (later HENRY IV). The Catholic party was headed by the house of GUISE. CATHERINE DE' MEDICI and her sons, CHARLES IX and HENRY III, vainly tried to straddle the issue. The wars were marked by cruelty on both sides. The first three wars (1562–63, 1567–68, 1568–70) ended favorably for the Protestants. The massacre of SAINT BARTHOLOMEW'S DAY began the fourth war (1572–73). The fifth and sixth wars (1574–76, 1577) granted religious freedom; the Catholic LEAGUE was formed in retaliation. The seventh war (1580) was inconsequential. In 1585 Henry of Navarre was named heir presumptive to Henry III, and that precipitated the War of the Three Henrys (the third was Henri, 3d duc de Guise). After Henry IV's accession (1589) he was forced to fight the League and its ally, Spain; he defeated them in 1594. The Treaty of Vervins and the Edict of NANTES restored peace and temporarily established religious toleration.

relocation center, in U.S. history, camp in which Japanese and Japanese-Americans were interned during World War II. Fearing a Japanese invasion, the army, under the War Relocation Authority, forcibly moved approximately 120,000 people, most of whom were American citizens, from the West Coast. Although some who proved their loyalty were released after July 1943, most were detained until Dec. 1944; the last center closed in Mar. 1946. The internees suffered property losses estimated at $400 million. In 1988 the government agreed to give $20,000 and an apology to each of the surviving internees.

Remarque, Erich Maria [rəmärk'], 1897–1970, German-American novelist. His first novel and masterpiece is *All Quiet on the Western Front* (1929), a bitter antiwar story based on his experiences in World War I. His later works deal with the postwar situation in Germany. After 1939, Remarque lived in the U.S.

Rembrandt Harmenszoon van Rijn or **Ryn** [rĕm'brănt], 1606–69, Dutch painter, etcher, and draftsman, the greatest master of the Dutch school. He got his most valuable training in the Amsterdam studio of Pieter Lastman, who influenced his sense of composition and frequent choice of religious and historical themes. Rembrandt's works sometimes reflected the dramatic use of light and shadow of CARAVAGGIO, e.g., *The Money Changer* (Berlin). The more detailed, delicate manner of ELSHEIMER is seen in *The Tribute Money* (London). Rembrandt returned to Leiden, his birthplace, in 1625. There he began to teach and started the series of nearly 100 self-portraits that reveal his continued stylistic growth and profound self-awareness. In 1632 he moved to Amsterdam where he became established as a portrait painter with his group portrait *Anatomy Lesson of Dr. Tulp* (1632; The Hague), a traditional subject to which he gave radical treatment. His joyous marriage to Saskia van Ulyenburgh, a burgomaster's daughter, brought him wealth and social position. During this period his work acquired a new richness of color and plasticity of form, best seen in *The Sacrifice of Abraham* (Saint Petersburg). In 1642 Saskia died giving birth to Titus, their only son, who was later to become Rembrandt's favorite subject. During that same year he completed his most famous group portrait, *The Shooting Company of Capt. Frans Banning Cocq* (Rijks Mus., Amsterdam), called *The Night Watch* before cleaning (1946–47) revealed it to be a daytime scene. In the last 20 years of his life, after his financial ruin, he withdrew from society and created many of his masterpieces, e.g., *Aristotle Contemplating the Bust of Homer* (1653; Metropolitan Mus.), and *The Polish*

Rider (Frick Coll., N.Y.C.). To the late 1660s belong *The Family Group* (Brunswick) and *The Jewish Bride* (Rijks Mus.), both loosely structured, flamelike in color, and psychologically penetrating. *The Syndics of the Cloth Guild* (1662; Rijks Mus.) has been described as the culmination of Dutch portrait painting. Rembrandt's prodigious output included 600 paintings, 300 etchings, and nearly 2,000 drawings. The universal appeal of his art lies in its profound humanity.

Remington, Frederic, 1861–1909, American artist; b. Canton, N.Y. Drawing his inspiration from the American West, he portrayed cowboys, Native Americans, soldiers, and horses in spirited action in his popular bronzes, paintings, and illustrations. Western themes also mark his books, e.g., *Pony Tracks* (1895).

remora, warm-water FISHES of the family Echeneidae, with an oval sucking disk on top of the head. The remora uses this disk to attach itself to large fish, whales, sea turtles, and small boats, thus traveling without effort and eating scraps of the host's prey. The sharksucker species may reach 3 ft (90 cm) in length.

Remus: see ROMULUS.

Renaissance [Fr., = rebirth], term used to describe the rich development of Western civilization that marked the transition from the MIDDLE AGES to modern times. In Italy the Renaissance emerged by the 14th cent. and reached its height in the 15th and 16th cent.; elsewhere in Europe it may be dated from the 15th to the mid-17th cent. In outlook the Renaissance brought new importance to individual expression, self-consciousness, and worldly experience; culturally it was a time of brilliant accomplishments in scholarship, literature, science, and the arts (see RENAISSANCE ART AND ARCHITECTURE). More generally, it was an era of emerging nation-states and exploration, and the beginning of a revolution in commerce. The Renaissance first appeared in Italy, where relative political stability, economic expansion, wide contact with other cultures, and a flourishing urban civilization provided the background for a new view of the world. Fine libraries and learned academies and universities flourished. Scholars, poets, craftsmen, and artists were supported by such great patrons as the MEDICI family of Florence, Popes JULIUS II and LEO X, the doges of Venice, and the SFORZA family of Milan. The increased interest in and knowledge of the classical age was reflected in the works of PETRARCH, and the intellectual orientation was toward a secular HUMANISM, exemplified by the works of Lorenzo VALLA. In literature, the romance of the Renaissance was expressed by BOCCACCIO; MACHIAVELLI provided its most telling political commentary. The humanist emphasis on the individual was typified in the ideal of the Renaissance man, the man of universal genius, best exemplified by LEONARDO DA VINCI. This ideal also led to the courtier, the ideal gentleman whose behavior was codified by CASTIGLIONE. Humanism in art found expression in a more realistic view of nature, seen in the works of Leonardo, MICHELANGELO, and RAPHAEL, while Renaissance architects such as ALBERTI, BRUNELLESCHI, BRAMANTE, and Michelangelo utilized classical forms. In France, classicism in literature was displayed by Pierre de RONSARD and Joachim DU BELLAY; RABELAIS expressed the Renaissance's sensual vitality. In Germany, the Renaissance interacted closely with the Protestant REFORMATION and was somewhat more somber. The Netherlands produced ERASMUS, the most notable of all the humanists, and Germany gave birth to Albrecht DÜRER and the younger Hans HOLBEIN. England was represented in learning and literature by Sir Thomas MORE, Francis BACON, and William SHAKESPEARE. In Spain, Cervantes wrote his masterpiece, *Don Quixote,* and in Sweden, Queen CHRISTINA, patron of DESCARTES, encouraged scholarship, literature, and the arts at court. The Renaissance intellectual outlook and its concomitant cultural manifestations were gradually replaced by those of the ENLIGHTENMENT. The term *renaissance* is now often used to designate the flowering of various civilizations and eras.

Renaissance art and architecture. A radical break with medieval methods of representing the visible world occurred in Italy during the second half of the 13th cent. The sculptor Nicola PISANO evoked interest in the sculptural forms of classical antiquity. In painting, GIOTTO led the way in restoring monumentality and dignity to the human figure and working toward a more realistic depiction of space. After the Black Death in 1348 came a marked decline in artistic activity until the second decade of the 15th cent., when FLORENCE became the center of art and art theory. Together with the early humanists (see HUMANISM), artists shared a growing esteem and enthusiasm for physical nature, the individual, and classical antiquity. The architects BRUNELLESCHI and ALBERTI, along with the sculptor DONATELLO, were the first to visit Rome to study the ancient ruins and incorporate classical principles into their work; they were also intensely preoccupied with representing the dimensions of nature on a flat surface. With MASACCIO and UCCELLO, they pioneered the system of perspective, while Fra ANGELICO and Fra Filippo LIPPI developed a unifying color scheme. Antonio POLLAIUOLO, CASTAGNO, and above all LEONARDO DA VINCI devoted themselves to the study of human anatomy. During the 15th cent. artists came to be supported not only by churchmen but also by private patrons, who demanded pictures of secular subjects, including themselves, and thus the art of portraiture flourished. The MEDICI circle of Neoplatonic thought profoundly influenced BOTTICELLI and MICHELANGELO. In the early 16th cent. the artistic center shifted from Florence to Rome. The works of Leonardo, Michelangelo, and RAPHAEL can be said to have brought to a culmination all the heroic proportions, unequaled harmony, and noble ideals for which the High Renaissance (c.1490–1520) is known. MANNERISM followed. Meanwhile, by the beginning of the 16th cent. Venetian art had come into its full glory with the great Venetian colorists Bellini (see BELLINI, family), GIORGIONE, TITIAN, VERONESE, and TINTORETTO. Their superb achievements came as the effects of the golden age of painting in the Low Countries were felt across Europe. In the 1420s, the van EYCKS developed oil painting and, with it, the ability to achieve subtle variations in light and color. They did not practice geometric perspective, but created the appearance of reality with minutely detailed observations of daily life. Robert CAMPIN, Roger van der WEYDEN, and Hugo van der GOES of the 15th cent. were followed in the 16th cent. by such masters as BOSCH and Pieter Bruegel (see BRUEGEL, family). In Germany, SCHONGAUER and DÜRER made the first and greatest contributions in woodcuts and engraving. FRANCIS I brought Italian architects and painters, such as Leonardo, to France, and in the 1530s the influence of mannerism began to be felt at Fontainebleau. The art of England and Spain was influenced by Netherlandish painting until the 16th cent., when the Italian Renaissance began to permeate Europe. The rebirth of classical architecture that took place in Italy in the 15th cent. and spread in the following century through Europe terminated the supremacy of the Gothic style. The ORDERS OF ARCHITECTURE and the structural elements of Rome—ARCHES, VAULTS, DOMES, and decorative forms—served as a treasury for 15th-cent. designers. Brunelleschi, the earliest great architect of the Renaissance, produced the churches of San Lorenzo and Santo Spirito, and the revolutionary plan for the dome of the Cathedral of Florence. Alberti, the first major theoretical architect of the Renaissance, was influenced by the Roman Vitruvius, and he in turn influenced later architects. Several architects, including Leonardo, designed such variations on the centralized structure as the polygonal and Greek-cross plans, and BRAMANTE's circular Tempietto (c.1502) in Rome. Other great Italian architects were PALLADIO and VIGNOLA. In France, Francis I built many châteaus where Renaissance details were grafted onto Gothic structures. The LOUVRE (begun 1546) usually serves as the start of the classical period in France. The move by Inigo JONES (1619) toward pure classical style decisively established Palladian design in England. In Germany in the mid-16th cent. the medieval love for picturesque forms still dominated, although transferred to classical motifs. Resembling Elizabethan work in England, this German style lacked truly great architects and was never fully developed as in France and England. Nuremberg and Rothenburg ob der Tauber are rich in works of the period. In Spain, Gothic and Moorish forms mingled with the new classical forms; the palace of Charles V at Granada (1527) is a superb building of the period.

René, 1409–80, titular king of Naples (1435–80), rival claimant of ALFONSO V of Aragón and Ferdinand I of Naples. The second son of Louis II of Naples, he inherited through marriage Bar (1430) and Lorraine (1431). On the death (1434) of his brother, Louis III of Naples, he inherited Anjou, Provence, and a claim to the throne of Naples. He was adopted as heir by Queen Joanna II of Naples (d. 1435) but was defeated (1442) by Alfonso V and retired to France. On René's death Anjou passed to the French crown. His titles to

Provence and Naples passed to his nephew Charles, count of Maine (d. 1481), and then to the French crown. His daughter, MARGARET OF ANJOU, married Henry VI of England.

Reno, Janet, 1938–, attorney general of the United States (1993–), the first woman to hold the office; b. Miami, Fla. A graduate of Harvard Law School (1963), she was assistant state's attorney (1973–76) and state's attorney (1978–93) for Dade co., Fla. Known for her attention to child abuse and children's rights cases, juvenile justice reform, and drug abuse cases, she was appointed U.S. attorney general by Pres. CLINTON in 1993.

Reno, city (1990 pop. 133,850), seat of Washoe co., W Nev., on the Truckee R.; inc. 1903. Tourism—spurred by a crisp climate, legalized gambling, resort facilities, a busy entertainment industry, and quick divorce laws—made Reno famous. Mining and agriculture are also important to its economy. Settled at a river ford on the Donner Pass route to California, the city was laid out when the railroad arrived.

Renoir, Jean [rənwär'], 1894–1979, French film director; son of Pierre Auguste RENOIR. Such films as *Le Crime de Monsieur Lange* (1935), *La Grande Illusion* (1937), and *Le Règle du jeu* (1939) exemplify his humanism and cinematic mastery.

Renoir, Pierre Auguste, 1841–1919, French impressionist painter and sculptor; father of Jean RENOIR. At 13 he was a decorator of factory-made porcelain. Later he was a friend of Bazille, MONET, and SISLEY. In the 1870s he began to earn his living with portraiture, e.g., *Madame Charpentier and her Children* (1876; Metropolitan Mus.). Simultaneously he developed the ability to paint joyous, shimmering color and flickering light in outdoor scenes such as the festive *Moulin de la Galette* (1876; Louvre). His ecstatic sensuality, opalescent colors, and admiration of the Italian masters carried him beyond IMPRESSIONISM. His most celebrated paintings include *Luncheon of the Boating Party* (1881; Phillips Coll., Wash., D.C.).

repetitive stress injury (RSI), injury caused by repeated movement of a particular part of the body. Often seen in workers whose physical routine is unvaried, RSI has become epidemic since computers have entered the workplace. Constant computer typing can cause one form of RSI, carpal tunnel syndrome, a sometimes disabling pain and tingling in the thumb and first two fingers, caused by swelling and pressure on the median nerve as it passes through the wrist. To avoid the high costs of RSI, some businesses have introduced ergonomic workstations and enforced rest periods.

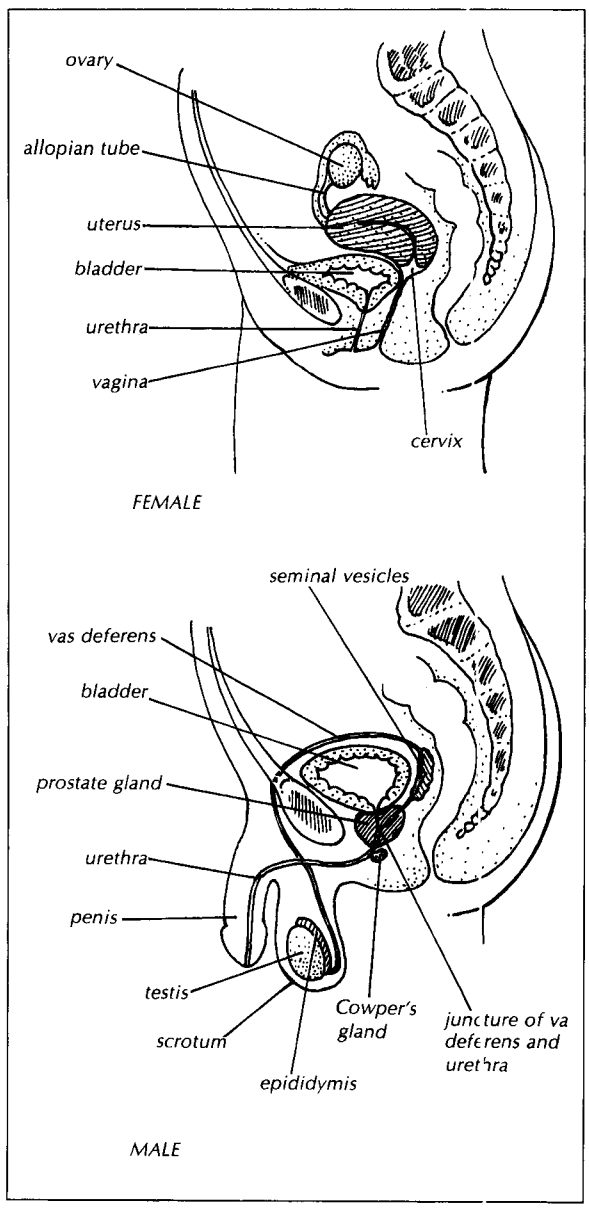
Repin, Ilya Yefimovich, 1844–1930, Russian painter and sculptor. A realist who studied at the St. Petersburg Academy, Repin was influenced by IMPRESSIONISM while visiting Paris (1873–74). He believed that art served a social purpose. In paintings such as *The Arrest of a Political Offender*, he was critical of the political regime.

Representation of the People Acts, laws passed by the British Parliament to continue the franchise reform begun by the REFORM BILLS. The Representation of the People Act of 1918 gave the vote to most women over 30 and to most men over 21. The act of 1928 enfranchised women on the same terms as men. The act of 1949 codified electoral practices, and the act of 1969 lowered the voting age to 18.

Representatives, United States House of: see CONGRESS OF THE UNITED STATES.

reproduction, the ability of living systems to give rise to new systems similar to themselves. The term may refer to self-duplication of a single cell, of a group of cells and organs, or of a complete organism. Reproductive processes vary tremendously, but two fundamental types may be distinguished: asexual reproduction, in which a single organism separates into two or more parts, each genetically identical to the parent; and sexual reproduction, in which a pair of specialized reproductive (sex) cells fuse, creating an individual that combines two sets of genetic characteristics. Asexual reproduction is found in all plants and in some one-celled and invertebrate animals. In one-celled organisms it takes the form of MITOSIS, the division of one individual into two new, identical individuals. Primitive filamentous organisms, such as FLATWORMS, reproduce by fragmentation, in which a piece of the parent breaks off and develops into a new individual. Most fungi, many PROTOZOANS, and some plants reproduce by means of SPORES. In budding, the means by which YEASTS and animals such as the HYDRA reproduce, a small protuberance (bud) on the parent increases in size until a wall forms to separate the new individual. Sexual reproduction occurs in many one-celled organisms and in all multicellular plants and animals; it involves the FERTILIZATION of one sex cell (gamete) by another, producing a new cell (zygote), which develops into a new organism. In higher plants and animals two clearly different kinds of sex cells (distinguished as OVUM and SPERM) fuse. Multicellular plants alternate reproducing sexually and asexually (see GAMETOPHYTE). Although asexual reproduction ensures that beneficial combinations of characteristics will be passed on unchanged, sexual reproduction permits the offspring to inherit endlessly varied combinations of characteristics (because of the fusion of two different parental nuclei), providing for new variations that may improve a species and further enhance its chances of survival.

reproductive system, in animals, the organs concerned with production of offspring. In humans and other mammals the female reproductive system produces the female reproductive cells (eggs, or ova) and includes an organ (uterus) in which the fetus develops.



Reproductive system

The male reproductive system produces the male reproductive cells (sperm) and includes an organ (penis) that deposits the sperm within the female. In the female, the mature egg, or OVUM, passes from the ovary into the fallopian tube, where fertilization occurs if sperm are present. From the fallopian tube the ovum passes into the uterus, or womb. If the egg has not been fertilized, the endometrium (lining of the uterus) degenerates and sloughs off, and MENSTRUATION occurs. If the egg has been fertilized, it becomes embedded in the lining of the uterus about one week after fertilization (see PREGNANCY). The lower end of the uterus, called the cervix, is connected to the vagina, a passage joining the uterus with the external genitals. The vagina receives sperm during sexual intercourse and is the passageway through which menstrual blood is eliminated and birth takes place. In the male reproductive system, SPERM are produced in the testes, two organs contained in the scrotum, an external sac in the groin. The testes also produce the hormone TESTOSTERONE and a portion of the seminal fluid, the liquid in which the sperm are carried. From each testis the sperm move into a passage (epididymis) and then into a long duct (vas deferens); fluids from the PROSTATE GLAND and seminal vesicles also enter this duct. Just before ejaculation, contractions along the ducts mix the sperm with the seminal and prostatic fluids to form semen. During ejaculation semen is propelled into the urethra (the canal through the penis) and discharged. See also BIRTH CONTROL; FERTILITY DRUG; FERTILIZATION; STERILITY.

reptile, dry-skinned, usually scaly, cold-blooded VERTEBRATE of the class Reptilia. Reptiles are found in a variety of habitats in warm and temperate zones and range in size from 2-in. (5-cm) long lizards to 30-ft (9-m) long snakes. Typically they have low-slung bodies with long tails, supported by four short legs; snakes are limbless. They are mostly terrestrial, although a few are aquatic; all breathe air through lungs and have thick, waterproof skins. Unlike AMPHIBIANS, they do not possess GILLS at any stage of their development. Nearly all lay porous, shelled eggs or bear their young on land. The living orders of reptiles are the TURTLES; ALLIGATORS, caimans, CROCODILES, and gavials; LIZARDS and SNAKES; and the TUATARAS. Reptiles evolved from amphibians and were the dominant fauna in the Mesozoic era, often called the Age of Reptiles.

republic, sovereign nation whose chief of state is not a monarch, usually governed by representatives of a widely based electorate. The U.S. is a federal republic, while France is a centralized republic. Technically, Great Britain is a constitutional MONARCHY, not a republic. The USSR, in theory a group of federated and even autonomous regions, was in fact a centralized republic until shortly before its collapse (1991).

Republican party, major American political party, the other being the DEMOCRATIC PARTY. It was founded (1854) by opponents of the extension of slavery into the territories. The election of the Republican presidential candidate, Abraham LINCOLN, in 1860 precipitated the secession of the Southern states and the CIVIL WAR. Lincoln's RECONSTRUCTION policies were opposed by radical Republicans such as Charles SUMNER and Edwin Stanton, whose candidate, Ulysses S. GRANT, was elected in 1868 and 1872. With the election of Rutherford B. HAYES (1876), Republican domination of the South ended. In the period that followed, the Democratic and Republican parties differed little in their policies. Theodore ROOSEVELT succeeded the assassinated William MCKINLEY in 1901 and was reelected in 1904. His policies combined "trust busting" and other domestic reforms with an imperialist foreign policy. The Republicans, under Herbert HOOVER, were blamed for the GREAT DEPRESSION, and the party lost every presidential election between 1932 and 1952, when Dwight D. EISENHOWER became president. The WATERGATE AFFAIR during the administration of Richard M. NIXON damaged the party's prestige. In 1980 a Republican, Ronald REAGAN, was elected president. He was succceeded in 1988 by his vice president, George BUSH, but a recession and anemic recovery led to Bush's defeat (1992) by Democrat Bill CLINTON.

requiem, proper MASS for the souls of the dead, performed on All Souls Day, at funerals, and on request. Since the Second VATICAN COUNCIL, the traditional requiem has been modified: black vestments are no longer required, and the famous *Dies irae* sequence describing the Judgment and asking Jesus for mercy is now optional. Requiem music has a traditional Gregorian setting; other requiem music has been composed, e.g., by Mozart and Verdi.

resin, any of a class of amorphous solids or semisolids. Natural resins occur as plant exudations (e.g., of pines and firs), and are also obtained from certain scale insects. They are typically yellow to brown in color, tasteless, and translucent or transparent. Oleoresins contain ESSENTIAL OILS and are often sticky or plastic; other resins are exceedingly hard, brittle, and resistant to most solvents. Resins are used in VARNISH, SHELLAC, and lacquer and in medicine. Synthetic resins, e.g., BAKELITE, are widely used in making PLASTICS. See also AMBER; TURPENTINE.

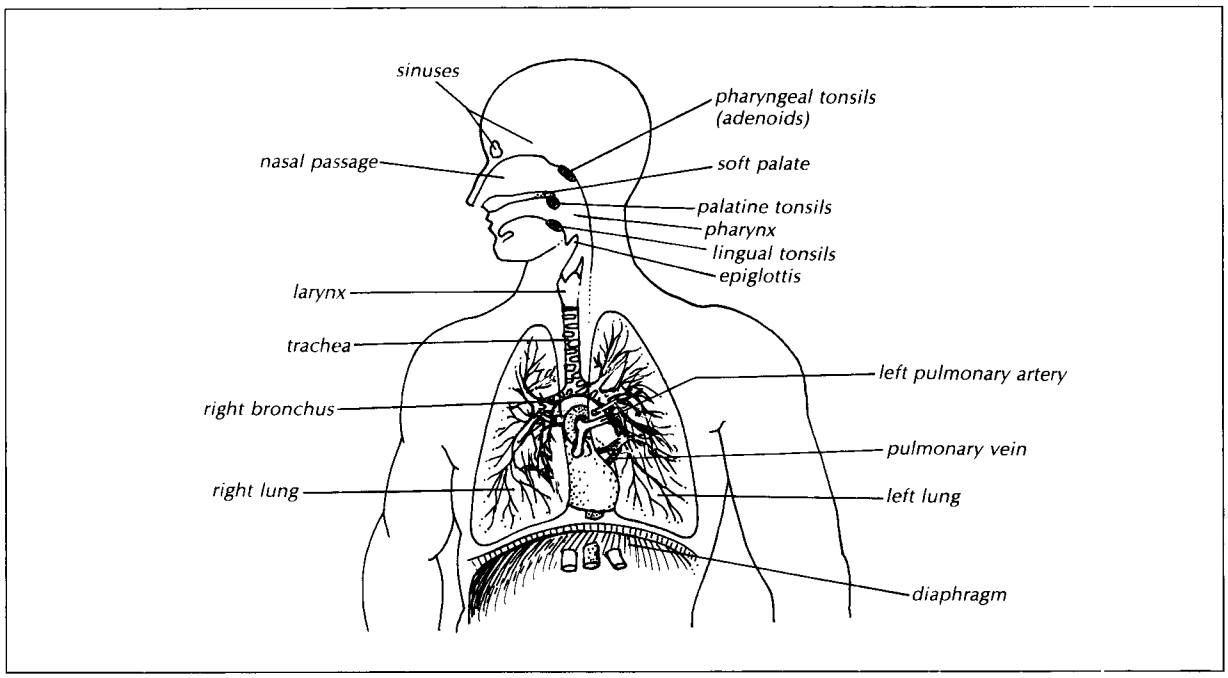
resistance, property of an electric conductor by which it opposes flow of electricity and dissipates electrical energy away from the ELECTRIC CIRCUIT, usually as heat. Resistance is basically the same for alternating- and direct-current circuits. A high-frequency alternating current, however, tends to travel near the surface of a conductor. Because such a current uses less of the available cross section of the conductor, it meets with more resistance than direct current. The unit of resistance is the OHM. See also CONDUCTION; IMPEDANCE; OHM'S LAW; SUPERCONDUCTIVITY.

resistor, two-terminal ELECTRIC CIRCUIT component that generates heat by offering opposition to an electric current. The most common forms of resistors are made from fine wires of special alloys wound onto cylindrical forms or from a molded composition material containing carbon and other substances in varying amounts. Resistors are rated for the maximum amount of power that they can safely handle.

Respighi, Ottorino [rāspē'gē], 1879–1936, Italian composer. He is best known for his romantic SYMPHONIC POEMS, *The Fountains of Rome* (1917), *The Pines of Rome* (1924), and *Roman Festivals* (1929). He also wrote other orchestral works, chamber music, piano pieces, and operas.

respiration, process by which an organism exchanges gases with its environment. The term commonly refers to the overall process by which oxygen is taken from the air and transported to the cells for the OXIDATION of organic molecules, while the products of oxidation, carbon dioxide and water, are returned to the environment. In single-celled organisms, gas exchange occurs directly. The cells lose their high concentration of carbon dioxide to the environment by simple diffusion, while the environment provides its higher concentration of oxygen to the cells, also by diffusion. In complex animals, where internal cells are distant from the external environment, respiratory systems facilitate the passage of gases to and from internal tissues. In lower animals such as FLATWORMS, exchange occurs through a moist surface membrane. In FISH, blood vessels in the gills are exposed for direct exchange with the external (aquatic) environment. In plants, gas exchange occurs in the stomates, respiratory organs found mostly in leaves. In human beings and other vertebrates, gas exchange takes place in the LUNGS. In breathing—the mechanical procedure for getting air to and from the lungs—muscles enlarge the chest cavity to force air in and reduce it to expel air. Actual gas exchange in the lungs occurs in cup-shaped air sacs called alveoli. Organisms that utilize respiration to obtain energy are aerobic, or oxygen-dependent. Organisms able to live in the absence of oxygen are called anaerobic; they obtain energy from fuel molecules solely by FERMENTATION or GLYCOLYSIS. In biochemistry, *respiration* refers to the series of biochemical oxidations in which organic molecules—such as carbohydrates, amino acids, and fatty acids—are converted to carbon dioxide and water. The chemical energy thus obtained is trapped and stored for later use by the cells in ADENOSINE TRIPHOSPHATE (ATP).

Restoration, in English history, the reestablishment of the monarchy on the accession (1660) of CHARLES II. The term often refers to the whole period from 1660 to the fall of JAMES II in 1688. After the death of Oliver CROMWELL, reaction against Puritan and military control favored recall of the exiled king. Upon his return to power, Charles, guided by Edward Hyde, 1st earl of CLARENDON, and others, restored militant Anglicanism and tried to assert the old Stuart absolutism. The unwillingness of both Charles and his brother and successor, James II, to accept their financial dependence on Parliament was one cause of James's deposition in the GLORIOUS REVOLUTION (1688). The period was marked by an advance in colonization and trade, the DUTCH WARS, the birth of the WHIG and TORY



Respiratory system

parties, opposition to Roman Catholicism, and the revival of drama and poetry.

resurrection, arising again from death to life. The resurrection of Jesus is the cornerstone of Christianity. It guaranteed his mission and promised the resurrection of all people. Christian belief is that on Judgment Day people's souls will be reunited with their risen (but glorified and immortal) bodies.

retriever: see SPORTING DOG.

retrograde motion, in astronomy, real or apparent movement of a planet, satellite, asteroid, or comet from east to west relative to the fixed stars. The most common direction of motion in the solar system, for both orbital revolution and axial rotation, is from west to east. Bodies in the solar system with real retrograde orbits include four satellites of Jupiter, one of Saturn, one of Neptune, and some asteroids and comets. All the planets exhibit apparent retrograde motion when they are nearest the earth (at inferior conjunction for the inferior planets and at opposition for the superior planets; see SYZYGY) because of the relative speeds of the planets in their orbits about the sun.

retrovirus, type of RNA VIRUS that, unlike other RNA viruses, reproduces by transcribing itself into DNA. An enzyme called reverse transcriptase allows a retrovirus's RNA to act as the template for this RNA to DNA transcription. The resultant DNA inserts itself into a cell's DNA and is reproduced along with the cell and its daughters. Retroviruses sometimes destroy the cells whose DNA they alter, as in AIDS, and sometimes cause them to become cancerous, as in certain LEUKEMIAS.

Reuben [rōō'bən], in the BIBLE, JACOB's eldest son and ancestor of one of the 12 tribes (see ISRAEL, TRIBES OF). At the occupation of Palestine his tribe, with that of Gad, was allotted pastureland E of the Jordan.

Réunion, overseas department of France (1992 est. pop. 626,000), c.970 sq mi (2,510 sq km), one of the Mascarene Islands, in the Indian Ocean c.430 mi (690 km) E of Madagascar. Saint-Denis, the capital, and Le Port, the main port, are the chief cities. Réunion is a mountainous island of volcanic origin, and the population is concentrated in the coastal lowlands. Sugar, from sugarcane, is the chief product and export; molasses, bananas, and rum are also important. The islanders are the mixed descendants of French colonists and their East African, Indian, and Indochinese slaves and laborers. Most of the inhabitants are Roman Catholic. French, the official language, and a creole patois are spoken. The island was known to the Arabs and visited by the Portuguese in the 1500s but remained uninhabited until settled by the French (c.1642) as a penal colony. In 1665 it became a French East India Company outpost, exporting coffee in the 18th cent. and sugar after 1815. In 1947 Réunion was made a French overseas department.

Reuther, Walter Philip, 1907–70, American labor leader; b. Wheeling, W.Va. After working in a Detroit automobile plant, he became an organizer for the United Automobile Workers (UAW) and rose to the presidency in 1946. He was severely wounded by an unknown assailant in 1948, as was his brother Victor (also a union leader) in 1949. Elected president of the CIO in 1952, he helped engineer (1955) the merger of his organization with the AFL (see AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS). Reuther, a liberal, clashed repeatedly with the more conservative George MEANY, president of the AFL-CIO, and in 1968 he led the UAW out of the federation. Reuther died in a plane crash.

Revelation or **Apocalypse,** 27th and last book of the NEW TESTAMENT, written A.D. c.95 on Patmos by one John; whether he was the disciple St. JOHN is disputed. This book is a mysterious prophetic work, consisting mainly of visions showing the overcoming of evil and persecution and the triumph of God and the martyrs. The careful plan depends heavily on patterns of seven, e.g., letters to seven churches in Asia Minor and the opening of the seven seals on the scroll in the hand of God. The style is majestic, with constant allusion to OLD TESTAMENT prophecies, especially those of EZEKIEL, DANIEL, and ISAIAH. New interpretations of the book have appeared in every period of Christian history.

Revere, Paul, 1735–1818, American Revolutionary leader; b. Boston. A silversmith and soldier, he joined the SONS OF LIBERTY and was a courier (1774) for the rebels. He was immortalized in LONGFELLOW's poem for his "midnight ride" of April 18, 1775, to warn the Massachusetts minutemen about British troop movements at the start of the AMERICAN REVOLUTION (see LEXINGTON AND CONCORD).

revolutions of 1848, series of revolutionary explosions in Europe. Major causes were the crop failures of 1846–47, widespread political repression, and the emergence of NATIONALISM. The most successful was the FEBRUARY REVOLUTION, in France, which overthrew LOUIS PHILIPPE and established the Third Republic. In the German states the liberal revolutions resulted in the FRANKFURT PARLIAMENT, which favored German unification. In the HAPSBURG empire the rev-

olutionists demanded more autonomy; in Italy, however, the RISORGIMENTO sought to expel the Hapsburgs. Despite their early successes, the revolutions generally failed as the old order reestablished control. In some cases the revolutions were put down by force; in others they were taken over by middle-class moderates.

revolver: see SMALL ARMS.

Rex cat: see under CAT.

Rexroth, Kenneth, 1905–82, American poet; b. South Bend, Ind. A leader of the San Francisco literary revival and briefly associated with the BEAT GENERATION, he is best known for his poetry, e.g., *In What Hour* (1940), *In Defense of the Earth* (1956), and *New Poems* (1974). He also wrote many critical essays and translated Asian poetry.

Reye's syndrome, a combination of acute encephalopathy and fatty infiltration of internal organs, especially the liver. Its cause is unknown, but it usually occurs in children following an acute viral infection (particularly influenza and chicken pox), especially when they have been given aspirin or other salicylates while ill. The symptoms, which occur about a week after the virus, are vomiting and disorientation and may be followed by seizures, coma, and respiratory arrest. There is no specific treatment.

Reykjavik, [rā'kyävēk], city (1989 pop. 96,737), SW Iceland, capital of Iceland. It is the country's chief port and center of its cod fishing industry. Founded in 874 A.D., it is the home of the *Althing,* or Icelandic parliament, the oldest in Europe. The city's heating system uses nearby hot springs. Reykjavik was the site of 1986 disarmament talks between the U.S. and USSR.

Reymont, Władysław Stanisław [rā'mônt], 1867–1925, Polish novelist and short-story writer. His novels include *The Promised Land* (1899), attacking modern industrial society, and *The Peasants* (4 vol., 1904–9), the great prose epic of Polish village life. He was awarded the 1924 Nobel Prize in literature.

Reynolds, Albert, 1935–, Irish politician, prime minister of the Republic of Ireland (1992–). A successful business executive, Reynolds won (1977) a seat in the Irish parliament as a member of the FIANNA FÁIL party. Reynolds was minister of posts and telegraphs and of transport (1979–81), of energy (1982), and of industry and commerce (1987–88) under Prime Min. HAUGHEY. In 1988 he became finance minister, but he resigned in 1991 after he challenged Haughey for the party leadership and lost. When Haughey later resigned (1992), Reynolds succeeded him.

Reynolds, Sir Joshua, 1723–92, English portrait painter. Considered historically the most important English painter, he raised the artist to a position of respect in England. After studying first in London, then in Italy, Reynolds used his wit and charm to take London by storm. He was besieged with portrait commissions, ran his own gallery, and was elected president of the Royal Academy when it was founded in 1768. His annual discourses for the Academy were a significant exposition of academic style, propounding eclectic generalization over direct observation, and allusion to the classical past over the present. The Grand Style, thus propounded, greatly influenced English portraiture. Reynolds painted more than 2,000 portraits and historical paintings depicting almost every notable person of his time, including Dr. Johnson, Mrs. Siddons, and Edmund Burke.

Reza Shah Pahlevi, 1877–1944, shah of IRAN (1925–41). An army officer, he led a coup in 1921 and became premier in 1923. In 1925 he deposed the last of the Kajar dynasty, proclaimed himself shah, and proceeded to modernize Iran. In 1941 he was deposed by British and Russian forces because of his German sympathies. He was succeeded by his son, MUHAMMAD REZA SHAH PAHLEVI.

Rf, chemical symbol of the element RUTHERFORDIUM.

Rh, chemical symbol of the element RHODIUM.

Rhaeto-Romanic [rē'tō-rōmăn'ĭk], generic name for several related dialects of the Romance group of the Italic subfamily of the Indo-European family of languages. They include Romansh, an official Swiss language; Ladin; and Friulian. See LANGUAGE (table).

rhea, South American flightless BIRD (order Rheiformes), superficially resembling the OSTRICH. Weighing from 44 to 55 lb (20 to 25 kg) and standing up to 60 in. (152 cm) tall, rheas lack the ostrich's plumelike tail feathers. A herbivore, the rhea inhabits the PAMPAS and SAVANNAS, often feeding with cattle.

Rhea, in astronomy, natural satellite of SATURN.

Rhea, in Greek mythology, a TITAN; wife and sister of CRONUS; mother of ZEUS, POSEIDON, PLUTO, HESTIA, HERA, and DEMETER. She aided Zeus in the overthrow of Cronus. Associated with fertility, her worship was prominent in CRETE. In Rome Rhea was worshiped as Magna Mater and identified with Ops.

Rhee, Syngman, 1875–1965, 1st president (1948–60) of the Republic of KOREA. Educated in the U.S., he became a leader in South Korea during the U.S. occupation following WORLD WAR II. His rule grew autocratic, and in May 1960, after riots, he was forced out of office and into exile in Hawaii.

Rheims [rēmz], Fr. *Reims,* city (1990 pop. 180,620), NE France. It is a center of the CHAMPAGNE industry. A Roman city, it has been an archiepiscopal see since the 8th cent. It is the traditional coronation place of French kings: Clovis I (496) and Charles VII (1429, with JOAN OF ARC at his side) were crowned there. Its Gothic cathedral, heavily damaged in World War I, has been restored. In 1945, at the end of World War II, Germany signed the surrender agreement in Rheims.

rhenium (Re), metallic element, discovered in 1925 by Walter Nodack and colleagues. It is a very dense, high-melting, silver-white metal occurring in platinum and molybdenum ores, and in many minerals. It gives improved ductility and high-temperature strength to its alloys, which are used in electrical contacts, electronic filaments, thermocouples, and photographic flash lamps. See ELEMENT (table); PERIODIC TABLE.

rheumatic fever, serious inflammatory disease occurring as a complication of infection by streptococcal bacteria. Appearing chiefly in children, the disease is characterized by fever, painless nodules under the skin on the elbows or knees, rash, involuntary jerking movements, and inflammation of connective tissue in the joints and in the HEART. When severe, the disease can produce permanent heart damage. The course of the disease and its effects on the heart vary greatly. ANTIBIOTICS, ASPIRIN, CORTISONE, and rest are the usual treatments.

Rh factor, protein substance present on the surface of the red blood cells of most (85% or more) people and capable of inducing an intense antigen-antibody reaction (see IMMUNITY). When Rh-positive blood is given to an Rh-negative person or when fetal Rh-positive blood (inherited from the father) is mixed with maternal Rh-negative blood during pregnancy, the Rh-negative person develops antibodies to the foreign Rh factor. A serious or even fatal reaction may occur in subsequent mixing of two blood types, as in repeat transfusions or other pregnancies involving an Rh-positive fetus. In the latter case, the possibility of a fetal or newborn reaction (called erythroblastosis fetalis) can be prevented by the administration to the Rh-negative mother of a special immune globulin that suppresses antibody formation. In other cases, when the immune globulin is not given, the reaction must be treated by total blood exchange shortly before or after birth. See also BLOOD GROUPS.

Rhine, (Ger. *Rhein,* Fr. *Rhin,* Du. *Rijn*), principal river of W Europe, rising in the Rheinwaldhorn Glacier of Switzerland and flowing generally north c.820 mi (1,320 km), passing through or bordering on Liechtenstein, Austria, Germany, France, and the Netherlands. It flows through a broad-floored rift valley from Basel to Bingen and a scenic gorge from Bingen to Bonn before forming a vast delta near Emmerich and dividing into the Lek, Waal, and other distributaries that enter the North Sea through several mouths near Rotterdam. The river is navigable by ocean vessels to Cologne and by barges to Basel. The Rhine-Main-Danube Canal links the Rhine with the DANUBE.

Rhineland, region of W Germany, along the Rhine R. The Allies occupied most of the region after WORLD WAR I, until 1930. The Treaty of VERSAILLES (1919) had prohibited German fortifications in the region, but in 1936 the Germans began building the Siegfried Line, an extensive system of defenses that the Allies in WORLD WAR II penetrated with difficulty.

rhinoceros, massive, hoofed MAMMAL of Africa, India, and SE Asia, characterized by one or two horns on the snout made of congealed hair. A thick-skinned vegetarian, it has poor vision but excellent senses of smell and hearing. Solitary and unpredictable, the rhinoceros feeds at night and rests in the shade in the daytime. It has been hunted for its horns, sold powdered as an aphrodisiac and for

use in folk medicines, and three of the five species are near extinction.

rhizome or **rootstock,** fleshy, creeping, underground STEM by means of which some plants propagate themselves. Buds that form at the joints produce new shoots. If a rhizome is split, it does not die (unlike a ROOT) but becomes several plants instead of one. Common rhizome-producing plants are ginger and iris.

Rhode Island, smallest state in the U.S., located in New England; bounded by Massachusetts (N and E), the Atlantic Ocean (S), and Connecticut (W).

Area, 1,214 sq mi (3,144 sq km). *Pop.* (1990) 1,003,464, a 5.9% increase over 1980 pop. *Capital,* Providence. *Statehood,* May 29, 1790 (13th of the original 13 states to ratify the Constitution). *Highest pt.,* Jerimoth Hill, 812 ft (248 m); *lowest pt.,* sea level. *Nickname,* Little Rhody. *Motto,* Hope. *State bird,* Rhode Island red. *State flower,* violet. *State tree,* red maple. *Abbr.,* R.I.; RI.

Land and People. Narragansett Bay cuts inland c.30 mi (50 km) into Rhode Island to Providence and contains several large islands. Coastal lowlands give way to higher terrain and steep, glaciated hills in the west. Rhode Island is the second most densely populated state in the U.S. (after New Jersey); 86% of the population lives in urban areas. PROVIDENCE, the largest city and capital, dominates the state and is followed in size by Warwick, Cranston, and Pawtucket. In 1990 the population was 91% white and 4% African American.

Economy. The state's small agricultural sector is best known for its Rhode Island Red chickens; it also produces greenhouse and dairy products, potatoes, eggs, and other farm products. Rhode Island is intensively industrialized, and the jewelry business in Providence is one of the largest in the world. Other products include toys, machinery, textiles, silverware, and primary and fabricated metals. Narragansett Bay, which abounds in shellfish and flounder, supports a thriving fishing industry. Tourists are attracted to Rhode Island's beaches, the famous mansions of NEWPORT, and Block Island.

Government. The constitution (adopted 1842) provides for a governor elected to a two-year term. The general assembly consists of a 50-seat senate and 100-seat house, with members of both bodies elected for two years. The state is represented in the U.S. Congress by two senators and two representatives and has four electoral votes.

History. After the Puritan Roger WILLIAMS was banished (1635) from the Massachusetts Bay Colony, he purchased land from the NARRAGANSETT and founded a settlement on the site of present-day Providence. New settlers were attracted to the colony by the promise of religious freedom, and a commercial shipping economy flourished. In 1776 Rhode Island became one of the Thirteen Colonies to renounce its allegiance to Great Britain. After the American Revolution, shipping declined, but Samuel Slater built (1790) the first successful cotton-textile mill in the U.S., and an abundance of water power led to the rapid development of manufacturing. Rhode Island's political and economic life was dominated by mill owners until well into the 20th cent., when competition from the South resulted in a continuing decline in the state's textile industry. The growth of new high-technology industries such as electronics and the growth of the service sector, now the chief employer in the state, have helped to revitalize the economy.

Rhodes, Cecil John, 1853–1902, British imperialist and business magnate. After making a fortune (1870s) in the Kimberly diamond fields of South Africa, he entered (1881) the Parliament of the Cape Colony and was (1890–96) prime minister and virtual dictator. He persuaded Britain to annex Bechuanaland in 1884 and conspired to topple the Boer government of the Transvaal. Forced to resign (1896) after he was implicated in Sir Leander Starr JAMESON'S raid into the TRANSVAAL, he devoted himself to the development of the country that was called Rhodesia in his honor (now ZIMBABWE). He also founded the Rhodes scholarships.

Rhodes or **Ródhos,** island (1981 pop. 40,392), c.540 sq mi (1,400 sq km), Greece, in the Aegean Sea, near Turkey; largest of the DODECANESE island group. Its fertile coastal areas produce wheat, tobacco, cotton, and olives. Tourism and fishing are important. Colonized by DORIANS before 1000 B.C., it reached its height as a commercial and cultural center in the 4th–3d cent. B.C. Julius CAESAR studied at its renowned school of rhetoric. After its decline, Rhodes was an ally of Rome. Captured (1204) from the Byzantine Empire during the Crusades, it was held by the KNIGHTS HOSPITALERS (1282–1522) and the Ottoman Turks before it was taken by Italy in 1912. In 1947 it was ceded to Greece. The famed Colossus of Rhodes (see under COLOSSUS), a statue erected (292–280 B.C.) by the citizens of the ancient capital city of Rhodes, was destroyed by an earthquake in 224 B.C.

Rhodesia: see ZIMBABWE.

rhodium (Rh), metallic element, discovered in 1804 by William WOLLASTON. A silver-white, lustrous, brilliant, tarnish-resistant, and chemically-resistant metal, rhodium is used to plate jewelry and searchlight reflectors. Its major use is in platinum and iridium alloys, to which it gives improved strength and the ability to withstand higher temperatures. See ELEMENT (table); PERIODIC TABLE.

rhododendron, shrub (genus *Rhododendron*) of the HEATH family, found chiefly in mountainous areas of the arctic and north temperate zones. They typically have large, shiny, leathery evergreen leaves and clusters of large pink, white, or purplish flowers. North American species include the great laurel, or rose bay (*R. maximum*), West Virginia's state flower; and the Western rhododendron (*R. californicum*), Washington's state flower. AZALEAS are in the same genus.

rhodophyte, member of a division (Rhodophyta) of the multicellular PROTISTS consisting of red ALGAE. Considered PLANTS in some classification systems, rhodophytes are found primarily in warm and temperate marine waters and have a characteristic red or purplish color.

Rhône, major river of France, its lower course forming the cradle of Provençal culture. It rises in the Swiss Alps, flows west through Lake Geneva, and southwest and south (from Lyon) across France before dividing near Arles to form the Grand Rhône and Petit Rhône, which enter the Mediterranean Sea near Marseilles. Major tributaries are the Isère, Saône, and Durance.

rhubarb: see BUCKWHEAT.

rhyme or **rime,** literary artifice used in versification. It appears in Asian poetry but was almost unknown in Greece and Rome. When accentual meters replaced classical quantitative meters, rhyme developed, especially in Latin Christian poetry. In medieval vernacular verse, end rhyme (at a line end), assonance (repeated similar vowel sounds), and alliteration (repeated consonants especially at word beginnings) were common. From 1300 until the 16th-cent. rise of blank verse (see PENTAMETER) rhyme was the outstanding verse device. Many modern poets use imperfect or approximate rhymes (e.g., *groaned* and *ground*). Single, or masculine, rhyme dominates in English, double, or feminine, rhyme in Spanish and Italian; German and French use both. Triple rhymes are uncommon in serious verse. Words spelled but not sounded alike are sometimes called eye rhymes. Set patterns of rhyme form such verse structures as the SONNET and heroic couplet.

rhythm, basic element of music concerned with the duration of tones and the stresses or accents placed upon them. The formulation in the 12th cent. of basic rhythmic patterns (modes) led to the development of meter, the division of a composition into units of equal time value. The rhythmic characteristics are a major factor in the analysis of the style of a composer or period.

Ribbentrop, Joachim von, 1893–1946, German foreign minister under HITLER (1938–45). He was influential in forming the Rome-Berlin Axis (1936) and the German-Soviet pact (1939). He was hanged as a war criminal.

ribbon worm, carnivorous, elongated, often flattened marine worm (phylum Nemertinea) characterized by a distinctive proboscis—sometimes tipped with a sharp spike and secreting a toxic mucus—used for food-capture, defense, and burrowing. Ribbon worms range in size from a fraction of an inch to 90 ft (27 m).

Ribera, Jusepe, José, or **Giuseppe** [rēbā'rä], c.1590–1652, Spanish BAROQUE painter. He was court painter to the Spanish viceroy in Naples. Greatly influenced by CARAVAGGIO, he combined Caravaggesque naturalism with a Spanish feeling of mysticism. His early works, e.g., *Drunken Silenus* (1626; Naples) are somber in tone, but after c.1635 his work shows freer brushwork and brighter colors with a silvery effect, e.g., *Trinity* (1636–37; Prado).

Ricardo, David, 1772–1823, British economist; of Dutch-Jewish par-

entage. After amassing a fortune at an early age, he turned to science and later, influenced by Adam SMITH, to political economy. His major work, *The Principles of Political Economy and Taxation* (1817), containing his important theories on the determination of wages and value, holds that wages tend to stabilize around the subsistence level and that the value of almost any good is a function of the labor needed to produce it. His thinking greatly influenced the development of classical economics.

Ricci, Matteo [rēt'chē], 1552–1610, Italian missionary to China. A JESUIT, he was sent to China in 1582. He made few converts, but brought Christianity into good repute. Ricci sent back to Europe a detailed report on China.

Rice, Elmer, 1892–1967, American dramatist; b. N.Y.C. He is noted for such plays as *The Adding Machine* (1923), a satirical, expressionistic drama; *Street Scene* (1929; Pulitzer; operatic version by Kurt WEILL, 1947), a realistic play about tenement life; and *Dream Girl* (1945), a romantic comedy.

rice, cereal GRAIN (*Oryza sativa*) of the GRASS family, probably native to the Ganges, Tigris, Chang (Yangtze), and Euphrates river deltas. Requiring warmth and abundant moisture, the plant is an annual, from 2 to 6 ft (61 to 183 cm) tall, with a round, jointed stem, long, pointed leaves, and seeds borne in a dense head on separate stalks. Thousands of rice strains are now known, both cultivated and wild. Estimates are that half the world's population subsists wholly or partially on rice. The largest producers are China, India, Indonesia, Bangladesh, and Thailand; most is consumed domestically. Brown rice has greater food value than white, since the outer coatings, which are polished away to yield white rice, contain protein and minerals, while the white endosperm is chiefly carbohydrate. As a food, rice is low in fat and (compared to other grains) protein. The beverage SAKE is brewed from rice.

Rich, Adrienne, 1929–, American poet; b. Baltimore. Her mature poetry, concerned largely with feminist issues and the need for communication, includes *Diving into the Wreck* (1973), *The Dream of a Common Language* (1978), *Time's Power* (1989). *Of Woman Born* (1976) is a prose investigation of motherhood.

Richard, kings of England. **Richard I, Richard Cœur de Lion** [kör də lyôN'], or **Richard Lion-Heart,** 1157–99 (r.1189–99), was duke of Aquitaine from 1172 and fought against his father, HENRY II, and later against his brothers. As king, he set out (1190) on the Third CRUSADE with PHILIP II of France and stormed the city of Acre. Richard concluded a treaty with SALADIN permitting Christians to visit the holy places of Jerusalem. On his return, he was captured (1192) and became the prisoner of Holy Roman Emperor HENRY VI. Henry exacted from Richard a huge ransom and recognition of England's status as a fief of the Empire. Released in 1194, Richard returned briefly to England. He was killed in a minor battle in France. Although he was seldom in England, Richard's military prowess made him a central figure in English romance. **Richard II,** 1367–1400 (r.1377–99), was the son of EDWARD THE BLACK PRINCE. He succeeded his grandfather EDWARD III. His minority was dominated by rival nobles, notably his uncle JOHN OF GAUNT. Richard quelled (1381) the Peasants' Revolt of Wat TYLER and after 1382 began to assert his rule, but met with opposition from the nobles. In 1388 his uncle Thomas of Woodstock, duke of Gloucester, the duke of Hereford, and others forced Richard to dismiss his favorites, but the king soon reasserted his authority. He had Gloucester murdered (1397), but Hereford, banished in 1398, returned (1399), forced Richard to abdicate, and was crowned HENRY IV. Richard died a prisoner at Pontefract Castle, probably violently. **Richard III,** 1452–85 (r.1483–85), was a younger brother of EDWARD IV. He gained control of his 12-year-old nephew EDWARD V, and had himself proclaimed king. Young Edward and his brother were imprisoned and murdered, probably on Richard's orders. In 1485 Henry Tudor, a claimant to the English throne, landed in Wales, defeated and killed Richard at the battle of Bosworth Field, and ascended the throne as HENRY VII. Richard was the last of the Yorkist kings, and his death ended the Wars of the ROSES.

Richard, Maurice [rēshärd'], 1921–, Canadian hockey player. His entire career (1942–60) was spent with the Montreal Canadians. "The Rocket," who set many National Hockey League scoring records, was the first to score 50 goals in a regular season (then 50 games). His career total was 544 goals.

Richard Cœur de Lion: see Richard I under RICHARD, kings of England.

Richard Lion-Heart: see Richard I under RICHARD, kings of England.

Richards, Ann Willis, 1933–, U.S. politician; b. Waco, Tex. A Democrat, she served (1977–82) as county commissioner in Travis co., Tex., before she was elected (1982) to the first of two terms as Texas state treasurer. She was elected governor of Texas in 1990.

Richardson, Elliot Lee, 1920–, U.S. government official; b. Boston. After serving (1965–69) as Republican lieutenant governor and attorney general of Massachusetts, he served (1970–73) in Pres. NIXON's cabinet as secretary of health, education, and welfare; secretary of defense; and attorney general. He resigned in Oct. 1973 rather than carry out Nixon's order to fire the special prosecutor in the WATERGATE AFFAIR. He was U.S. ambassador to Great Britain (1975–76) and ambassador-at-large (1977–80).

Richardson, Henry Hobson, 1838–86, American architect; b. St. James Parish, La. He was noted for his revival of Romanesque design. Trinity Church, Boston (1872–77), his first and finest monumental work, is a superb example of the highly popular "Richardson Romanesque" style. His many other buildings include the Marshall Field wholesale store, Chicago. Richardson also elevated the position of the decorative crafts.

Richardson, John, 1796–1852, first Canadian novelist to write in English. His works include the frontier romances *Wacousta* (1832) and *The Canadian Brothers* (1840).

Richardson, Samuel, 1689–1761, English novelist. A prosperous printer, he was asked to compose a guide to letter writing. Working around a central theme, he wrote instead a moral NOVEL in letter form—*Pamela; or, Virtue Rewarded* (1740). He later wrote two more epistolary novels, *Clarissa Harlowe* (1747–48) and *The History of Sir Charles Grandison* (1753–54). Verbose and sentimental, all were very popular and are today valued for their drama, detail, and insight into women.

Richelieu, Armand Jean du Plessis, cardinal and **duc de** [rēshəlyö'], 1585–1642, chief minister of LOUIS XIII of France. He gained the favor of the king's mother, MARIE DE' MEDICI, and was made secretary of state (1616), cardinal (1622), and chief minister (1624). In 1630 Marie conspired against Richelieu, but the king had her exiled. Richelieu then enjoyed full control of the government until his death. Domestically, he centralized royal authority by destroying the political power of the HUGUENOTS with the capture of La Rochelle (1628) and the Peace of Alais (1629). Conspiracies by the nobles were rigorously suppressed. In foreign affairs, he rejected Marie de' Medici's pro-HAPSBURG policy, and in 1635 France openly entered the THIRTY YEARS WAR against the Hapsburgs. In France the war led to heavy taxation and caused dissatisfaction with his rule. Richelieu encouraged trade and the arts; he was the founder of the learned society known as the French Academy.

Richler, Mordecai, 1931–, Canadian novelist. His comic novels reflect his Jewish upbringing in Montreal. Best known is *The Apprenticeship of Duddy Kravitz* (1959). Others include *St. Urban's Horseman* (1971) and *Solomon Gursky Was Here* (1989).

Richmond, city (1990 pop. 203,056), state capital, E Va., on the James R.; settled 1637, inc. as a city 1782. A deepwater port and financial and commercial center, it is a major tobacco market and manufacturer of tobacco products. Its industries produce chemicals, textiles, and other goods. Laid out in 1737, Richmond became capital of Virginia in 1779. During the CIVIL WAR, it was capital of the CONFEDERACY and the constant object of Union forces. Threatened in the PENINSULAR CAMPAIGN (1862) and WILDERNESS CAMPAIGN (1864), it fell to Gen. GRANT and was burned in April 1865. Richmond National Battlefield Park contains several battle sites. Places of interest include the capitol (1785), designed by Thomas JEFFERSON; the White House of the Confederacy, now a museum; and Hollywood Cemetery, with the graves of James Monroe, John Tyler, Jefferson Davis, and some 18,000 Confederate soldiers.

Richter, Johann Paul Friedrich, pseud. **Jean Paul,** 1763–1825, German novelist. His works combine the idealism of FICHTE with the sentimentality of STURM UND DRANG. *Quintus Fixlein* (1796), *Siebenkäs* (1796–97), *Titan* (1800–1803), and other novels, all popular in his lifetime, are warm, humorous portrayals of simple life.

Richter scale: see EARTHQUAKE.

Ricimer, d. 472, Roman general of the Germanic Suebi tribe. After

defeating the Vandals (a Germanic tribe), he deposed (456) West Roman Emperor Avitus. Thereafter he ruled Italy through his puppet emperors, the most able of whom was MAJORIAN.

Rickenbacker, Edward Vernon, 1890–1973, American war hero and airline executive; b. Columbus, Ohio. Driving racing cars at 16, he set several speed records. In WORLD WAR I he became the leading U.S. air ace by destroying 26 enemy aircraft. As president (1938–53) and chairman (1954–63) he built Eastern Airlines into a major passenger and transport system.

rickets, bone disease caused by a deficiency of vitamin D, often resulting in knock-knees, bowlegs, and deformities of the chest and pelvis. See VITAMIN (table).

Rickover, Hyman George, 1900–86, U.S. admiral; b. Russia. He directed construction of the first atomic-powered submarine, *Nautilus* (launched 1954), and other nuclear ships. Later he became chief of the Naval Reactors Branch of the Atomic Energy Commission. A controversial figure because of his outspoken opinions, he was promoted to full admiral at the age of 73. He was on active duty until 1981; in 1982 he retired.

Ride, Sally K., 1951–, American astrophysicist and astronaut; b. Encino, Calif. With a Ph.D. in physics from Stanford Univ., she joined NASA in 1978, where she was an astronaut (1979–87) and helped design the robot arm for the space shuttle. In 1983 she became the first American woman in space. She also served (1986) on the Presidential commission investigating the CHALLENGER disaster. In 1989 she became professor of physics and director of the California Space Institute at the Univ. of Calif., San Diego.

Sally Ride

Ridgway, Matthew Bunker, 1895–1993, U.S. general; b. Fort Monroe, Va. He led (1942–44) the 82d Airborne Division in the Allied invasion of Europe during WORLD WAR II and replaced (1951) Gen. MACARTHUR as commander of UN forces in the KOREAN WAR. He served as supreme commander (1951–53) of NATO forces in Europe and as army chief of staff (1953–55).

Ridley, Nicholas, c.1500–1555, English prelate, reformer, and Protestant martyr. As bishop of Rochester (1547) he strengthened the Reformed teachings at Cambridge and in 1548 under EDWARD VI took part in compiling the Book of Common Prayer. He became bishop of London in 1550. After the accession of the Roman Catholic MARY I, he was imprisoned (1553) and took part (1554) in the Oxford disputations along with Thomas CRANMER and Hugh LATIMER. Ridley refused to recant his Protestantism and was burned as a heretic with Latimer at Oxford.

Riel, Louis [rēĕl'], 1844–85, Canadian insurgent leader. He led Native Americans and métis (half-breeds) in the RED RIVER SETTLEMENTS of MANITOBA to rebel (1869–70) when their land was transferred from the HUDSON'S BAY COMPANY to the Canadian government, but the rebellion collapsed, and Riel fled. Returning to Canada (1884), he led rebels attempting to secure land titles in SASKATCHEWAN. In an engagement (1885) at Batoche, Riel was captured, tried, and hanged.

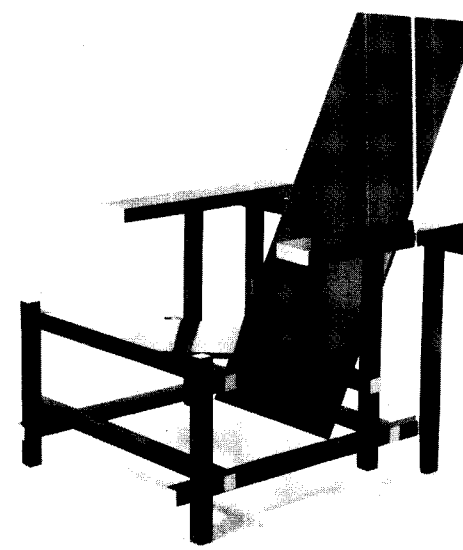
Riemann, (Georg Friedrich) Bernhard [rē'män], 1826–66, German mathematician. His great contributions to mathematics include his work on the theory of the functions of complex variables and his method of representing such functions on coincident planes or sheets (Riemann surfaces). He laid the foundations of a NON-EUCLIDEAN GEOMETRY representing elliptic space and generalized to *n* dimensions the work of Carl GAUSS in differential geometry, thus creating the basic tools for the mathematical expression of the general theory of relativity. Riemann was also interested in mathematical physics, particularly in optics and electromagnetic theory.

Riemenschneider, Tilman [rē'mənshni"dər], c.1460–1531, German RENAISSANCE sculptor. He created slender figures with delicately carved, expressive faces in ordered compositions. His works include the stone *Adam and Eve* (Würzburg Mus.) and the wooden altar in Rothenburg ob der Tauber.

Rienzi [rēĕn'tsē] or **Rienzo, Cola di,** 1313?–1354, Roman popular leader. Pope CLEMENT VI made him a papal notary, and Rienzi went to Rome, where he received (May 1347) wide dictatorial powers, which he claimed to hold under the pope's sovereignty. He sought to rally other cities and dreamed of a popular Italian empire. Clement, aroused at his actions, incited the barons against him, and Rienzi was defeated (1347) and fled. Clement's successor, Innocent VI, sent him (1352) to Italy with Cardinal Albornoz, who made him a senator. Rienzi reentered Rome in triumph, but his violent and arbitrary rule soon led to a popular uprising and his subsequent murder.

Riesener, Jean Henri, 1734–1806, French cabinetmaker. With J.F. Oeben, whom he later succeeded as director of the Arsenal workshop in Paris, he created Louis XV's writing desk. His work is in the Louvre and other collections.

Rietveld, Gerrit Thomas [rēt'fĕlt], 1888–1965, Dutch architect and designer. He created (c.1917) a chair that introduced into furniture



Chair designed by Gerrit Rietveld

design a light, dematerialized effect. A member of the STIJL, he designed buildings that in their weightlessness and equilibrium are related to MONDRIAN's paintings.

rifle: see SMALL ARMS.

Riga [rē'gə], city (1989 pop. 915,000), capital of LATVIA, north-central Europe, on the Daugava R. near its entry into the Gulf of Riga. It is a major Baltic port, rail junction, military base, and leading industrial center. Among its manufactures are machines, ships, and diesel engines. Long settled by Baltic tribes, Riga became (1201) the seat of the Livonian Brothers of the Sword, a German military order dedicated to Christianizing the Baltic region. Riga joined the HANSEATIC LEAGUE in 1282. After the Livonian Order was dissolved (1561) the city passed to Poland (1581), Sweden (1621), and Russia (1721). It became the capital of independent Latvia in 1920 and was the capital of the Latvian SSR (1940–91) while the country was forcibly annexed by the USSR. During World War II Riga was occupied (1941–44) by Germany.

Right, Petition of: see PETITION OF RIGHT.

right ascension: see ASTRONOMICAL COORDINATE SYSTEMS.

rigor mortis: see DEATH.

Riis, Jacob August [rēs], 1849–1914, Danish-American journalist; b. Denmark. After emigrating to the U.S. in 1870, he became a reporter for the New York *Tribune* and *Evening Sun.* His stories about slum dwellings and abuses in lower-class urban life were collected as *How the Other Half Lives* (1890). He founded a pioneer settlement house in New York City (named for him in 1901) and aided public park and playground movements.

Riley, James Whitcomb, 1849–1916, American poet; b. Greenfield, Ind. Known as the Hoosier poet, he wrote popular verse noted for its humor, pathos, and sentimentality, e.g., "Little Orphant Annie," "The Raggedy Man." Collections of his poems include *Rhymes of Childhood* (1890) and *Knee Deep in June* (1912).

Rilke, Rainer Maria [rĭl'kə], 1875–1926, German poet; b. Prague. The greatest lyric poet of modern Germany, sensitive and introspective, he was greatly influenced by his extensive travels. Rilke developed a rich poetic style characterized by striking visual imagery and by symbolism. Although his first book of poetry appeared in 1894, his mature mysticism first found expression 10 years later with *Stories of God* (1904). He achieved fame with *Poems from the Book of Hours* (1905). Well known are the two-volume *New Poems* (1907–8) and Rilke's own favorite verse, his *Duinese Elegies* (1923), which contain his highest praise of human existence. Rilke's reputation has grown enormously since his death.

Rimbaud, Arthur [răNbō'], 1854–91, French poet whose hallucinatory and dreamlike verse anticipated the SYMBOLISTS. Works include *The Drunken Boat; Illuminations,* prose poems; and a confessional autobiography, *Season in Hell.* After a close and violent relationship with VERLAINE (1872–73), Rimbaud stopped writing poetry at age 19 and thereafter wandered through Europe and Africa.

Rimmer, William, 1816–79, American sculptor; b. England. He was a doctor whose knowledge of anatomy is apparent in the few works of stone sculpture that survive, e.g., *Falling Gladiator* (Metropolitan Mus.). Rimmer was also an influential art teacher and the author of texts on drawing.

Rimsky-Korsakov, Nicolai Andreyevich, 1844–1908, Russian composer. One of The FIVE, he used Russian history and legend as a source for most of his operas, e.g., *The Snow Maiden* (1881), *The Maid of Pskov* (1873, rev. 1892), *Le Coq d'Or* (1909). His best-known orchestral work, *Scheherezade* (1888), exemplifies his romantic exoticism and mastery of orchestral color. Among his students was Igor STRAVINSKY.

rings, planetary: see JUPITER; SATURN; URANUS.

ringworm or **tinea,** any of several FUNGAL INFECTIONS of the skin characterized by dry, scaly patches or blisterlike elevations, which usually burn or itch. The most common sites of infection include the scalp, groin (a condition called jock itch), and the feet (a condition called athlete's foot). Ringworm is treated with oral griseofulvin or topical antifungals.

Rio de Janeiro, city (1990 est. pop. 6,042,000), SE Brazil, capital of Rio de Janeiro state, former capital of Brazil, on Guanabara Bay of the Atlantic Ocean. Brazil's second largest city and principal port, Rio (as it is popularly called) has diverse manufactures and handles much of the nation's foreign trade. It is predominantly a modern city, with a new airport and subway system. A cosmopolitan city, long the cultural center of Brazil, it is also its greatest tourist attraction. Rio is celebrated for its pre-Lenten carnival and for its beautiful natural setting within an amphitheater of low mountains. Noted landmarks are Sugar Loaf Mt., which dominates the harbor, and Corcovado peak, with its colossal statue of Jesus. Founded by French HUGUENOTS in 1555, the city was taken by Portugal in the 1560s. It replaced Bahia (now SALVADOR) as Brazil's capital in 1763 and was supplanted by BRASILIA in 1960.

Rio Grande, major North American river, flowing c.1,885 mi (3,000 km) S and SE from the San Juan Mts. (SW Colorado) to the Gulf of Mexico. It forms the U.S.-Mexico boundary between the twin cities of El Paso, Tex., and Juárez, Mex., and Brownsville, Tex., and Matamoros, Mex. The river, known in Mexico as the Río Bravo del Norte, is unnavigable, but is an important source of internationally regulated irrigation.

Riordan, Richard J., 1930–, U.S. business executive and politician; b. Flushing, N.Y. He parlayed an inheritance into a fortune through venture capitalism, real estate, and LEVERAGED BUYOUTS. In 1993 he was elected mayor of Los Angeles, becoming the first Republican to win in 32 years.

RISC processor [*R*educed *I*nstruction *S*et *C*omputer], COMPUTER arithmetic-logic unit that uses a minimal instruction set, emphasizing the instructions used most often and optimizing them for the fastest possible execution. Software for RISC processors must handle more operations than traditional CISC [*C*omplex *I*nstruction *S*et *C*omputer] processors, but RISC processors have advantages in applications that benefit from faster instruction execution, such as engineering and graphics workstations and PARALLEL-PROCESSING systems.

Risorgimento, period of cultural nationalism and political activism in the 19th cent. that led to the unification of Italy. Italy was fragmented in the Middle Ages, and from the 16th to 18th cent. foreign influence was virtually complete. After the Napoleonic wars, revolutionary groups such as the Carbonari emerged. The literature of Alessandro MANZONI, Ugo FOSCOLO, and others stimulated nationalism. Political activity was carried on by three groups. Giuseppe MAZZINI led the radicals, who were republican and anticlerical. The conservative and clerical faction generally advocated a federation headed by the pope. The moderates favored unification under the house of SAVOY, which ruled Sardinia. Sardinia assumed leadership of the Risorgimento in 1848 when revolts broke out across Italy. King Charles Albert of Sardinia tried to drive the Austrians out of N Italy but was defeated at Custoza (1848) and Novara (1849), and abdicated. Revolutions elsewhere were suppressed, including one at Rome, where Mazzini had formed a short-lived republic. The liberal movement, however, gradually coalesced around Charles Albert's son and successor, VICTOR EMMANUEL II, and his minister, the conte di CAVOUR. Cavour sought and received French aid against Austria, but the battles (1859) of Magenta and Solferino were so costly that the French signed a separate armistice. Austria retained Venetia, and Sardinia gained only Lombardy. In 1860 Tuscany, Modena, Parma, Bologna, and the Romagna voted for union with Sardinia. GARIBALDI's spectacular conquest (1860) of the kingdom of the TWO SICILIES was followed by Sardinia's annexation of Umbria and the Marches. The kingdom of Italy was proclaimed in 1861. Italy received Venetia for its role in the AUSTRO-PRUSSIAN WAR of 1866 and seized Rome from the pope in 1870. Unsatisfied Italian nationalism continued in the form of IRREDENTISM.

Ritsos, Yannis, 1909–90, Greek poet. One of modern Greece's best known poets, he moved from classical themes to a deeply personal lyricism. His verse reflects both his own life experience, including his opposition to the Greek junta, which resulted in exile and house arrest.

river, stream of water larger than a brook or creek. Runoff after precipitation flows downward by the shortest and steepest course. Runoffs of sufficient volume and velocity join to form a stream that, by the EROSION of underlying earth and rock, deepens its bed. It becomes perennial when it cuts deeply enough to be fed by groundwater or when it has an unlimited source (e.g., the SAINT LAWRENCE flowing from the Great Lakes). Sea level is the ultimate base level for a river, but the floor of a lake or basin into which a

river flows may become a local and temporary base level. Rivers modify topography by both erosion and deposition (see e.g., DELTA). Young streams have steep-sided valleys, steep gradients, and irregularities in the bed. Mature rivers have valleys with wide floors and a more smoothly graded bed. Old rivers have courses graded to base level and run through broad, flat areas. See also articles on individual rivers, e.g., AMAZON; NILE.

Rivera, Diego, 1886–1957, one of modern Mexico's foremost painters. Inspired by native Mexican art and by his experiences in Europe (1907–9, 1912–21), he painted large murals dealing with Mexican life, history, and social problems, e.g., in the Palace of Fine Arts (Mexico City). Murals in the Detroit Institute of Arts typify his interpretation of industrial America. He was married to Frida KAHLO.

Rivera, Primo de: see PRIMO DE RIVERA, MIGUEL.

river blindness or **onchocerciasis,** disease caused by the parasitic worm, *Onchocerca volvulus.* It is transmitted by blackflies, and results in severe itching, disfiguring lesions, and lesions of the eye that can lead to blindness. It occurs primarily in Africa, Central and South America, and Yemen. The new drugs ivermectin and amocarzine have begun to help control the disease.

Rivers, William Halse Rivers, 1864–1922, English anthropologist, pioneer in the study of mental functions among preliterate peoples. He introduced the genealogical method into sociological research in his classic study *The Todas* (1906). An expedition to Melanesia produced his monumental *History of Melanesian Society* (1914). In *Instinct and the Unconscious* (1920) and *Medicine, Magic, and Religion* (1924) he was among the first to fuse ethnology with psychoanalytic theory.

Riverside, city (1990 pop. 226,505), seat of Riverside co., S Calif.; inc. 1883. It is famous for its orange industry; the forerunner of the California Fruit Growers' Exchange was begun there in 1892. Located in a rapidly growing metropolitan area (1990 pop. 2,588,793) that includes San Bernardino and Ontario, the city now has companies that manufacture electronic and aerospace equipment, aluminum, and other products.

Riviera, fashionable Mediterranean resort area in SE France and N Italy, famed for its scenery, warm climate, and excellent beaches. Major resorts include Nice, Cannes, and Saint-Tropez along the French Côte d'Azure, Monte Carlo in MONACO, and Rapallo, Portofino, and San Remo in Italy.

Riyadh [rēäd'], city (1988 est. pop. 2,150,000), capital of Saudi Arabia. It is situated in an oasis in the central part of the country. The nation's main commercial and transportation center, it has industries including oil refining and cement manufacturing. Its architecture formerly represented the classical Arabic style, but many large modern structures have been built since the 1970s. The city suffered light damage from Iraqi missiles during the PERSIAN GULF WAR.

Rizal, José [rēsäl'], 1861–96, Philippine patriot, author, and physician. His novel *The Lost Eden* (1886) attacked the Spanish regime in the PHILIPPINES, and he was exiled in 1887. After his return (1893), he was arrested and executed for alleged revolutionary activities. His death sparked a revolt.

Rizzio, David [rĭt'sēō], 1533?–1566, favorite of MARY QUEEN OF SCOTS. An Italian musician, he became Mary's secretary. Jealous nobles persuaded Lord DARNLEY, Mary's husband, that Rizzio was her lover, and with Darnley's aid they murdered him in Mary's presence in Holyrood Palace.

Rn, chemical symbol of the element RADON.

RNA or **ribonucleic acid,** NUCLEIC ACID, found mostly in the cytoplasm of CELLS, that is important in the synthesis of proteins. The amount of RNA varies from cell to cell. RNA, like the structurally similar DNA, is a chain made up of subunits called nucleotides; unlike DNA, RNA contains ribose as its sugar and uracil as one of its bases instead of thymine. In protein synthesis, messenger RNA (mRNA) replicates the DNA code for a protein and moves to organelles (specialized cell structures) called ribosomes, which are themselves composed of protein and a type of RNA called ribosomal RNA (rRNA). At the ribosomes, transfer RNA (tRNA) assembles AMINO ACIDS to form the protein specified by the messenger RNA.

roach: see COCKROACH.

road runner: see CUCKOO.

Roanoke, city (1990 pop. 96,397), SW Va., on the Roanoke R.; settled c.1740, inc. 1882. Situated between the Blue Ridge and Allegheny Mts., it is the gateway to the SHENANDOAH VALLEY. It is the region's commercial center, and has railroad shops and industries making a variety of products, including furniture, textile goods, chemicals, and electrical equipment.

Roanoke Island, 12 mi (19 km) long and 3 mi (4.8 km) wide, off the NE coast of North Carolina between Albemarle and Pimlico sounds, site of the earliest English colony in North America. The first colonists, sent out by Sir Walter RALEIGH, landed in Aug. 1585 but returned to England in 1586. A second group, arriving in 1587, disappeared by the time additional supplies were brought from England in 1591. Artifacts from the "lost colony" are displayed in Fort Raleigh National Historic Site on the island.

Robbe-Grillet, Alain [rôb-grēyā'], 1922–, French novelist. He is considered the originator of the French "new novel" in which story is subordinated to structure and the significance of external reality is stressed above psychological motivation or plot development. His works include the novels *Jealousy* (1957), *Topology of a Phantom City* (1975), *Djinn* (tr. 1982), and *Recollections of the Golden Triangle* (tr. 1986); *Last Year at Marienbad* (1961), a screenplay; and *Ghosts in the Mirror* (1984), a memoir.

robbery: see LARCENY.

Robbia: see DELLA ROBBIA.

Robbins, Jerome, 1918–, American dancer and choreographer; b. N.Y.C. He danced in MUSICALS and joined the AMERICAN BALLET THEATRE (1940) and, as associate artistic director, the NEW YORK CITY BALLET (1949). He is noted for his exuberant choreography for musicals, e.g., *West Side Story* (1957), and ballets, e.g., *Fancy Free* (1944) and *Dances at a Gathering* (1969). He succeeded (1969) BALANCHINE as ballet master at the City Ballet and was (1983–90) co–ballet master in chief.

Robert, kings of France. **Robert I,** c.865–923 (r.922–23), revolted (922) against CHARLES III (the Simple) and was crowned king, but was soon killed in battle. His son-in-law, Raoul of Burgundy, succeeded him. **Robert II** (the Pious), 970–1031 (r.963–1031), was the son of HUGH CAPET. Pious and learned, he tried to strengthen royal power and acquired the duchy of BURGUNDY for the crown.

Robert, kings of Scotland. **Robert I** or **Robert the Bruce,** 1274–1329 (r.1306–29), was a skillful and courageous leader who freed Scotland of English control. After he defied EDWARD I of England by being crowned (1306) at Scone, Robert was defeated (1306) at Methven and fled to the island of Rathlin, off the Irish coast. Returning to Scotland in 1307, he defeated EDWARD II at Bannockburn in 1314 and captured Berwick in 1318. He was recognized as king by the English in the Treaty of Northampton (1328). **Robert II,** 1316–90 (r.1371–90), was the founder of the STUART dynasty. During most of his reign his sons directed the government, repelling English invasions and winning a great victory at Otterburn in 1388. Robert's eldest son, **Robert III,** 1340?–1406 (r.1390–1406), was crippled by a horse; thereafter, real power was held by his brother, Robert Stuart, duke of Albany, 1340?–1420.

Robert, dukes of Normandy. **Robert I** (the Magnificent), d. 1035, duke (1027–35), made his illegitimate son William (later WILLIAM I of England) his heir and died on a pilgrimage to Jerusalem. **Robert II** (Robert Curthose), c.1054–1134, duke (1087–1106), succeeded his father, William I of England, in Normandy. He fought against his brothers, WILLIAM II and HENRY I of England. In 1106 he was defeated and imprisoned by Henry.

Robert Curthose: see Robert II under ROBERT, dukes of Normandy.

Robert Grosseteste: see GROSSETESTE, ROBERT.

Robert Guiscard [gēskär'], c.1015–1085, Norman conqueror of S Italy. Robert joined (c.1046) his brothers in S Italy and fought to expel the Byzantines. In 1059 Pope Nicholas II invested him with Apulia, Calabria, and Sicily. Sicily was wrested (1061–91) from the Arabs by Robert's brother Roger, and the Normans gained Calabria (by 1060), Bari (1071), Salerno (1076), and eventually most of Benevento. In 1081 Robert assaulted the Byzantine empire, conquered Corfu, and defeated (1082) Emperor ALEXIUS I. In 1084 he aided Pope GREGORY VII against Holy Roman Emperor HENRY IV. Robert then resumed his eastern wars but died of fever at Cephalonia. He was succeeded in Apulia by his youngest son, Roger

Robert Joffrey Ballet, a major American dance company. It was founded (1954) in New York City by the dancer-choreographer Rob-

ert Joffrey. Its modern repertory includes works choreographed by George BALANCHINE, Antony TUDOR, and Alvin AILEY.

Robert of Courtenay, d. 1225, Latin emperor of CONSTANTINOPLE (1218–28). He was defeated (1224) by Nicaea and Epirus, and his realm was reduced to the city of Constantinople.

Roberts, Kenneth Lewis, 1885–1957, American author; b. Kennebunk, Me. He is known for his series of American historical novels *Chronicles of Arundel* (1930–34). His later novels include *Northwest Passage* (1937) and *Lydia Bailey* (1946).

Robertson, Ethel Richardson: see RICHARDSON, HENRY HANDEL.

Robertson, Oscar, 1938–, American basketball player; b. Charlotte, Tenn. After starring at the Univ. of Cincinnati, Robertson, known as "the Big O," became one of professional basketball's greatest players in his career with the Cincinnati Royals (1960–70) and Milwaukee Bucks (1970–74). Only 6 ft 4 in. (193 cm) in height, he was a superb playmaker (with a record 9,887 lifetime assists) as well as a leading scorer. Robertson's career total of 26,710 points (25.7 per game average) is among the highest achieved.

Robertson, Pat (Marion Gordon Robertson), 1930–, American evangelist and politician, b. Lexington, Va. A Baptist minister, he founded (1960) the Christian Broadcasting Network. As host of a television talk show that blends evangelical religion with conservative politics, he has attained a large following. Robertson campaigned unsuccessfully for the 1988 Republican presidential nomination.

Robert the Bruce: see Robert I under ROBERT, kings of Scotland.

Robeson, Paul, 1898–1976, African-American actor and bass singer; b. Princeton, N.J. He was noted for his roles in Eugene O'NEILL's *Emperor Jones* (1925; film, 1933) and Jerome KERN's *Show Boat* (1928; film, 1936) and for his interpretations of SPIRITUALS. His espousal of leftist causes made him a controversial figure.

Robespierre, Maximilien Marie Isidore [rôbespyĕr'], 1758–94, leader in the FRENCH REVOLUTION, called the Incorruptible. A lawyer, he became attached to the democratic and deistic theories of J.J. ROUSSEAU. He was elected to the STATES-GENERAL (1789) and the National Convention (1792), and became leader of the JACOBINS in their struggle with the GIRONDISTS. In 1793 he was elected to the Committee of Public Safety, which he dominated throughout the REIGN OF TERROR. Robespierre overthrew both the extreme left and the moderates in the Convention and also instituted a new civic religion. Robespierre's position, however, became precarious as the Convention began to feel threatened by the emergency measures of the Terror. On July 27, 1794, rightists joined the PLAIN in a rising in the Convention, and Robespierre was arrested, tried, and guillotined (July 28).

robin or **robin redbreast,** common name for a migratory BIRD of the THRUSH family.

Robin Hood, legendary 12th-cent. English hero who robbed the rich to help the poor. With his band of outlaws he lived in Sherwood Forest. He figures in LANGLAND's *Piers Plowman* and many Middle English ballads.

Robinson, Edward G., 1893–1973, American film actor; b. Romania as Emmanuel Goldenberg. He often played tough guys, e.g., in *Little Caesar* (1930) and *Key Largo* (1948), and character parts, e.g., in *Double Indemnity* (1944).

Robinson, Edwin Arlington, 1869–1935, American poet; b. Head Tide, Me. His most lasting work is his early verse, mainly austere and probing portraits of residents of a small New England town, such as "Miniver Cheevy" and "Richard Cory." His later poems include long psychological narratives, e.g., *Avon's Harvest* (1921), *The Man Who Died Twice* (1924; Pulitzer), and Arthurian romances. Volumes of his collected poems were published in 1921 (Pulitzer) and 1937.

Robinson, Frank, 1935–, African-American baseball player and manager; b. Beaumont, Tex. The only player ever to be voted the Most Valuable Player in both major leagues, he became the first African-American manager in major league history, with the Cleveland Indians (1975–77). He also managed the San Francisco Giants (1981–84) and Baltimore Orioles (1988–91).

Robinson, Jackie (Jack Roosevelt Robinson), 1919–72, African-American baseball player; b. near Cairo, Ga. He was the first African American to play in the major leagues; Robinson excelled in four sports at the Univ. of California, Los Angeles, and in 1945 he was signed by Branch Rickey of the Brooklyn Dodgers. He joined (1946) the Dodgers' farm team in Montreal, where he starred at second base and led the league in batting. In 1947 major-league precedent was shattered when he was brought up to Brooklyn. A fierce competitor, daring base runner, and solid hitter, Robinson led the Dodgers to 6 World Series appearances in his 10 years (1947–56) with the team. He was the first African American to be inducted into (1962) the National Baseball Hall of Fame.

Robinson, Sugar Ray, 1920–89, American boxer; b. Detroit, as Walker Smith. After winning (1946) the welterweight championship, he gained the middleweight title an unprecedented five times between 1951 (knocking out Jake La Motta) and 1958 (defeating Carmen Basilio). Of 202 professional bouts he lost only 19, most of them late in his career. He was rated the best boxer of his time.

Robinson-Patman Act: see under ANTITRUST LAWS.

robotics, the design and construction of self-controlled machines (robots) that sense (by means of vision systems or some other type of sensor) aspects of their environment and that are capable physically (e.g., by means of a mechanical arm) of acting upon it. The Czech dramatist Karel ČAPEK coined the word *robot* (from the Czech *robota,* drudgery) in his 1921 satirical play *R.U.R.,* and robots, or automatons, have long played a role in fantastic literature. Present-day robots, which bear little resemblance to the often humanoid figures of SCIENCE FICTION, are essentially computer-controlled machine tools that can be programmed to perform any of a number of functions, such as welding an automobile chassis or assisting a surgeon in performing delicate operations. Robots can perform dangerous, uncomfortable, tiring, or monotonous tasks, and do them with greater speed and accuracy than can human beings. Robots play an increasingly significant role in the movement toward industrial AUTOMATION and COMPUTER-ASSISTED MANUFACTURING. Robots for use in services, such as delivering meals and supplies in a hospital, have been slower to develop because of the greater complexity of the environment in which they must interact.

Rob Roy [Scottish Gaelic, = red Rob], 1671–1734, Scottish outlaw; b. Robert MacGregor. Deprived of their estates, he and his highland clan lived largely by stealing cattle and selling protection against thieves. Sentenced (1727) to be transported, he was later pardoned. He is remembered chiefly as he figures in Sir Walter SCOTT's novel *Rob Roy* (1818).

Robusti, Jacopo: see TINTORETTO.

Rocard, Michel (Louis Léon), 1930–, French politician. He supported (1974) François MITTERRAND for the presidency and merged his party with the new Socialist party, but later became Mitterrand's rival. He held several ministerial posts from 1981 to 1985. He became premier in 1988 but was replaced by Edith CRESSON in 1991. After the electoral rout of the Socialists in 1993, Rocard became party leader, vowing to broaden and revive the party.

Rochambeau, Jean Baptiste Donatien de Vimeur, comte de [rôshaNbō'], 1725–1807, marshal of France. During the AMERICAN REVOLUTION he landed (1780) at Newport, R.I., with a French army of 6,000, and with Gen. WASHINGTON planned the victorious YORKTOWN CAMPAIGN (1781). In the FRENCH REVOLUTION he commanded the Northern Army, but resigned (1792) and was imprisoned in the REIGN OF TERROR. Napoleon restored his rank.

Rochester, John Wilmot, 2d earl of, 1647–80, English poet and courtier. A notorious Restoration rake, he is best known for the witty and polished *Satyr against Mankind* (1675).

Rochester, city (1990 pop. 231,636; met. area 1,002,410), seat of Monroe co., W N.Y., on the Genesee R. and Lake ONTARIO; inc. 1817. It is a leading producer of optical and photographic equipment, and many other manufactures. Rochester developed as an ERIE CANAL town; its many parks and nurseries earned it the name the "Flower City." The Univ. of Rochester and the Eastman School of Music are among the city's many noted institutions.

rock, aggregate of solid matter composed of one or more of the MINERALS forming the earth's crust. Rocks are commonly divided into three major classes depending on their origin. *Igneous rocks* (e.g., BASALT, GRANITE, OBSIDIAN, PORPHYRY, PUMICE) result from the cooling and solidification of molten matter from the earth's interior. If formed below the surface, such rock is said to be intrusive (as in a BATHOLITH). If formed at the surface, it is extrusive. *Sedi-*

mentary rocks (e.g., CHALK, CLAY, COAL, LIMESTONE, SAND, SANDSTONE, SHALE) originate from the consolidation of sediments deposited chiefly through the action of EROSION on older rocks of all kinds. The characteristic feature of sedimentary rocks is their stratification. *Metamorphic rocks* (e.g., GNEISS, MARBLE, QUARTZITE, SCHIST, SLATE) originate from the alteration of the texture and mineral constituents of existing rocks of any type under extreme heat and pressure within the earth (see METAMORPHISM). See also PETROLOGY.

rock carvings and paintings, designs on rock surfaces attributed to primitive humans; they appear on every continent. The PALEOLITHIC ART of W Europe reached great aesthetic heights in naturalistic cave drawings of animals, hunting scenes, rites, and daily activities; in Australia and the Americas designs were more symbolic and geometric. Stenciled human hands appeared in many places. Petroglyphs were incised with a stone; polychrome pictographs were made with charcoal and earth pigments mixed with grease, gum, or water.

Rockefeller, family of American industrialists, bankers, and philanthropists. **John Davison Rockefeller,** 1839–1937, b. Richford, N.Y., established an oil refinery with partners in 1863, and in 1870 he organized the Standard Oil Co. of Ohio. By strict economy, mergers with competitors, and ruthless elimination of opponents he soon dominated the U.S. oil-refining industry. His numerous companies were consolidated (1899) under the Standard Oil Co. of New Jersey, but the U.S. Supreme Court ordered (1911) this holding company dissolved on antitrust grounds, and the subsidiaries became independent corporations. Rockefeller retired in 1911 with a fabulous fortune. His philanthropies, amounting to some $500 million, included the Rockefeller Institute for Medical Research (1901; now Rockefeller Univ.) and the Rockefeller Foundation (1913); he also founded (1892) the Univ. of Chicago. His brother, **William Rockefeller,** 1841–1922, b. Tioga co., N.Y., was associated with the Standard Oil Co. His vast resources built up the National City Bank of New York. John D. Rockefeller's son, **John Davison Rockefeller, Jr.,** 1874–1960, b. Cleveland, managed his father's interests from 1911. His most notable philanthropies included the restoration of colonial WILLIAMSBURG, Va., and donation of the site of UN headquarters, N.Y.C. He founded (1931) Rockefeller Center and funded Riverside Church (both: N.Y.C.). His five sons all became famous in various fields. **John Davison Rockefeller, 3d,** 1906–78, b. N.Y.C., helped manage the family interests and was active in creating Lincoln Center for the Performing Arts (N.Y.C.) and the United Negro College Fund. **Nelson Aldrich Rockefeller** became vice president of the U.S. (see separate article). **Laurance S. Rockefeller,** 1910–, b. N.Y.C., is noted for his interest in conservation and wildlife protection. **Winthrop Rockefeller,** 1912–73, b. N.Y.C., served (1967–71) as Republican governor of Arkansas. **David Rockefeller,** 1915–, b. N.Y.C., became a leading international banker during his career (1948–81) with the Chase Manhattan Bank, which he headed from 1961. **John Davison Rockefeller, 4th,** 1937–, b. N.Y.C., son of John Davison Rockefeller, 3d, was elected governor of West Virginia on the Democratic ticket in 1977 and 1980 and was elected to the U.S. Senate in 1985.

Rockefeller, Nelson Aldrich, 1908–79, vice president of the U.S. (1974–77); b. Bar Harbor, Me. The second son of John D. Rockefeller, Jr. (see ROCKEFELLER, family), he held several federal posts and was governor of New York for four terms (1966–73). A liberal Republican, he unsuccessfully sought the presidential nomination three times in the 1960s. He was named vice president under the 25th amendment of the CONSTITUTION by Gerald FORD, who had become president upon Richard NIXON's resignation.

Rockefeller Center, building complex in New York City, between 48th and 51st St. and Fifth and Sixth Ave., built between 1931 and 1939. Radio City Music Hall and the central fountain with Paul MANSHIP's statue of Prometheus are well known.

Rockefeller Foundation: see FOUNDATION.

rocket, any vehicle propelled by ejection of the gases produced by combustion of self-contained propellants. Tremendous pressure is exerted on the walls of the combustion chamber, except where the gas exits at the rear; the resulting unbalanced force, or thrust, on the front interior wall of the chamber pushes the rocket forward. The most vital component of any rocket is the propellant, which accounts for 90 to 95% of the rocket's total weight. A propellant consists of two elements, a fuel and an oxidant; engines that are based on the action-reaction principle and that use air instead of carrying their own oxidant are properly called jets (see JET PROPULSION). Liquefied gases, e.g., hydrogen as fuel and oxygen as oxidant, are more powerful propellants, whereas solid explosives, e.g., NITROGLYCERIN as oxidant and nitrocellulose as fuel, are more reliable. The chemical energy of the propellants is released in the form of heat in the combustion chamber. The rocket's exit nozzle usually converges to a narrow throat, then diverges to obtain maximum energy from the exhaust gases moving through it. No currently practical single-stage rocket can reach orbital velocity (5 mi/sec, or 8 km/sec) or the earth's ESCAPE VELOCITY (7 mi/sec, or 11 km/sec). Hence SPACE EXPLORATION requires multistage rockets; two or more rockets are assembled in tandem and ignited in turn; as their fuel is used up, each of the lower stages detaches and falls back to earth. When extremely large thrust is required, several rockets may be clustered and operated simultaneously. Rocket NAVIGATION is usually based on inertial guidance; internal GYROSCOPES are used to detect changes in the position and direction of the rocket.

Rockford, city (1990 pop. 139,426), seat of Winnebago co., N Ill., on the Rock R.; inc. 1839. The state's second largest city, it is in the heart of the Corn Belt and is a hub for regional agriculture. Rockford is also a manufacturing center producing machine tools, screws, fasteners, farm implements, and automobile parts. The city was founded (1834) on the site of a battle in the BLACK HAWK WAR.

rock music, hybrid of African-American and white American musical forms: blues (see JAZZ), rhythm and blues, GOSPEL MUSIC, COUNTRY AND WESTERN MUSIC, and harmony group music. In 1955 Bill Haley's song "Rock Around the Clock" set off a rock 'n' roll craze because of its exciting, heavy beat and the urgent call to dance and action of its lyrics. With songs on adolescent concerns like school, cars, and young love, African-American artists like Chuck Berry vied for popularity with whites like Buddy Holly. Most successful was Elvis PRESLEY. In the 1960s Detroit produced Motown, an African-American style with lead story lines sung over tight harmony by such groups as the Temptations and the Supremes. Rock surged after 1962 as the BEATLES, the ROLLING STONES, and other English groups introduced a sophisticated lyricism. In 1965 the folk singer Bob DYLAN began a folk-rock synthesis. Rock also turned to social protest and rebellion as groups like the Jefferson Airplane spoke to youth seeking new experience through drugs (acid rock). A large-scale production trend brought rock MUSICALS, e.g., *Hair* (1968), and opera, e.g., *Tommy,* by the Who (1969). By the end of the 1960s, rock was heard largely in concert and such festivals as Woodstock, held near Bethel, N.Y., in Aug. 1969. In the 1970s country rock, a fusion of country and western and rock 'n' roll, grew popular, as did disco, a repetitive dance music. English influence returned later in the decade with punk rock, expressing the discontent of working-class youth. Punk's stripped-down form and aggressiveness were echoed in the less political and more art-conscious American new wave. During the 1980s the MUSIC VIDEO became important. By the early 1990s, the pounding rhythms and strong, sometimes shocking spoken lyrics of RAP MUSIC had achieved broad popularity.

Rockne, Knute (Kenneth), 1888–1931, American football coach; b. Norway. He played football at the Univ. of Notre Dame where, with Gus Dorais, he led an upset (1913) of a heavily favored Army team by using the forward pass, a legal but unused tactic. As head coach (1918–31) he established Notre Dame's great football tradition by winning 105 games against 12 losses and 5 ties. He died in a plane crash.

rock 'n' roll: see ROCK MUSIC.

Rockwell, Norman, 1894–1978, American illustrator; b. N.Y.C. Enormously popular, he is best known for his *Saturday Evening Post* covers. Rockwell specialized in finely drawn, richly anecdotal scenes of everyday small-town life.

Rocky Mountain goat, hoofed, ruminant MAMMAL (*Oreamnos americanus*) of the mountains of NW North America. Not a true GOAT, it has a bearded chin; sharp, black horns; and a long, thick, white coat. It is extremely surefooted, and lives on steep cliffs in small herds, feeding on vegetation.

Rocky Mountain National Park: see NATIONAL PARKS (table).

Rocky Mountain sheep: see BIGHORN.

Rocky Mountains, major mountain system of W North America, forming the CONTINENTAL DIVIDE and extending more than 3,000 mi (4,800 km) from New Mexico to Alaska. Mt. Elbert (14,431 ft/4,399 m) is the highest point. The mountains are topographically divided into the Southern, Central, and Northern Rockies (all in the U.S.), the Canadian Rockies (Canada), and the Brooks Range (Alaska). They are rich in minerals and lumber and are the site of several NATIONAL PARKS (see table). These include Rocky Mountain, Yellowstone, Grand Teton, and Glacier national parks in the U.S. and Jasper, Banff, Glacier, Yoho, Kootenay, and Mt. Revelstoke national parks in Canada. The Rockies were long a major barrier to transcontinental travel. The principal U.S. pass, South Pass (SW Wyoming), was crossed by the OREGON TRAIL.

Rocky Mountain spotted fever, infectious disease caused by a rickettsia harbored by wild rodents and other animals and carried by infected ticks that attach themselves to humans. Symptoms include chills, high fever, and a rose-colored skin rash, appearing first on the wrists and ankles and spreading to the trunk, with spots turning deep red and running together. The disease, most prevalent in the NW U.S., is treated effectively with the ANTIBIOTIC tetracycline.
